 Changing ACPI

# Power Management History

## Advanced Power Management (APM)

- † BIOS-based system power management
- † Provides CPU and device power management
- † Called when idle - provides CPU power mgt.
- † Uses device activity timeouts to determine when to transition devices into low power states
- † OS has no knowledge of what APM does
- † Each IBV must refine and maintain APM BIOS code/IP
- † Wide variety of implementations and functionality
  - ✍ No uniform user experience

# ACPI

## Advanced Configuration and Power Interface

- † Conceived by Intel, Microsoft, and Toshiba (the promoters)

## An “interface” specification

- † ACPI/OSPM replaces APM, MPS, and PnP BIOS Spec

## Allow OS-directed Power Management (OSPM)

## Defines

- † Hardware registers - implemented in chipset silicon

- † BIOS interfaces

- ✎ Configuration tables

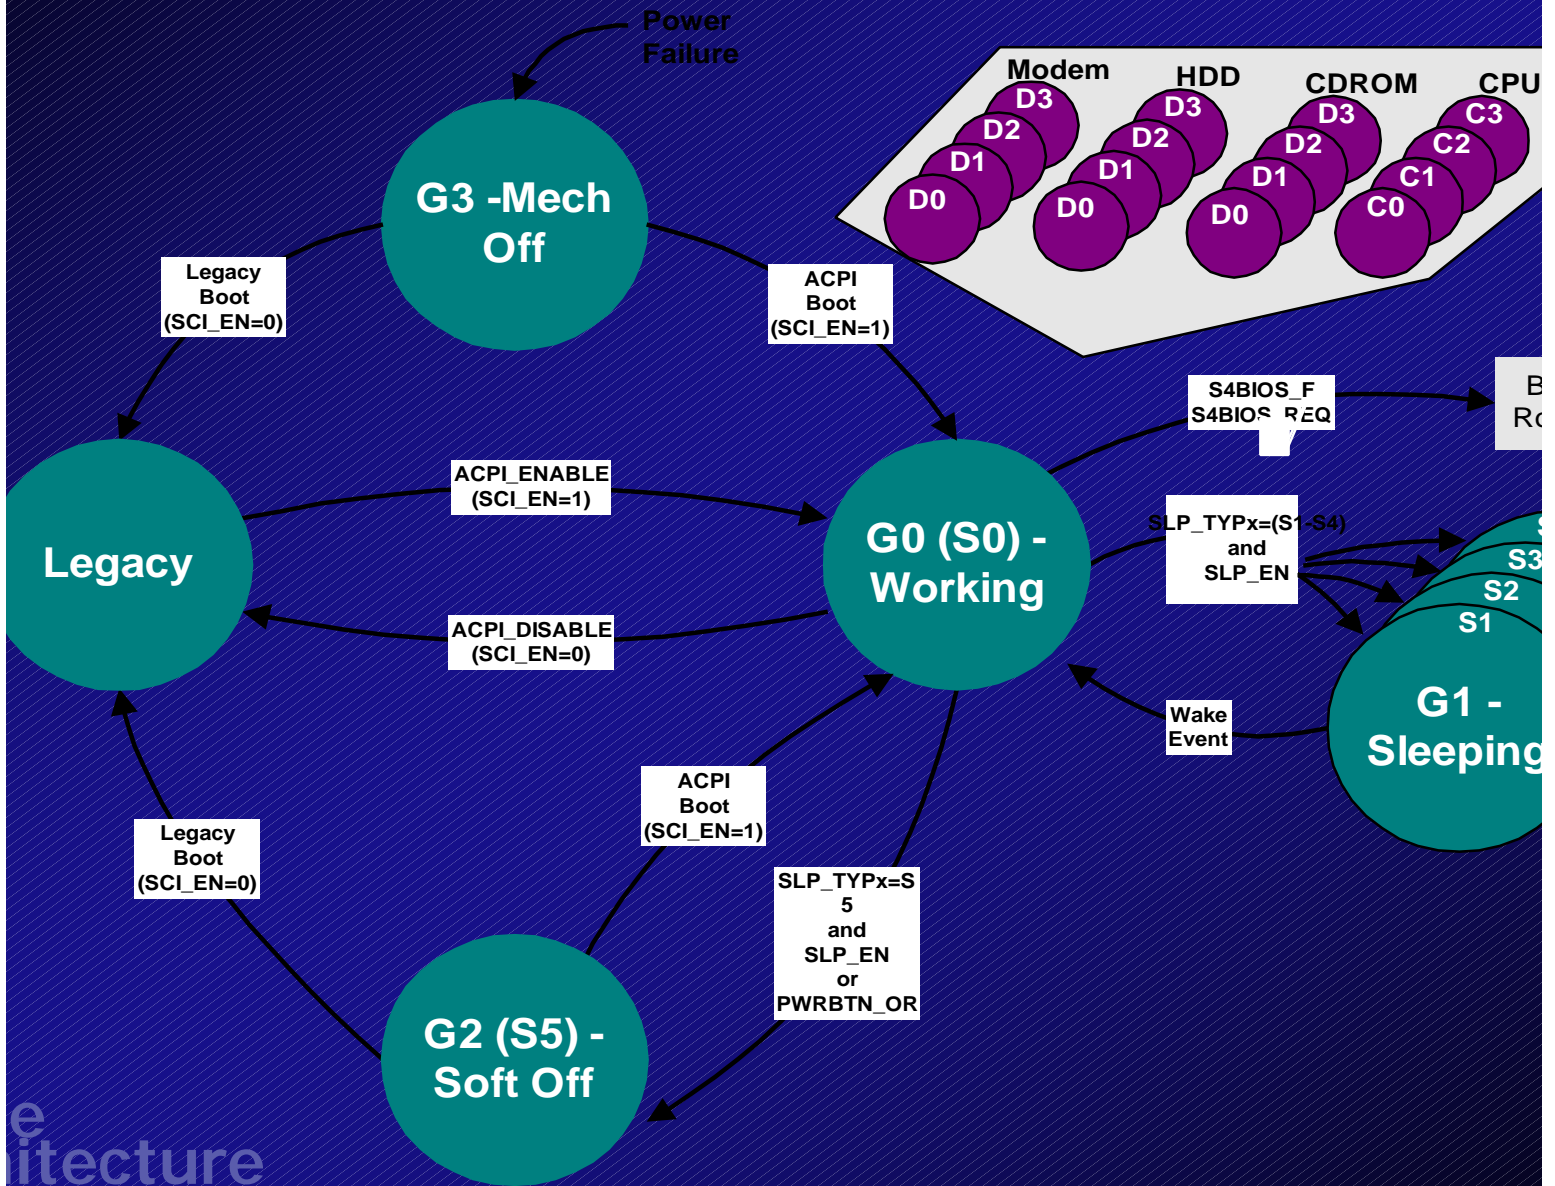

- ✎ Interpreted executable function interface (Control Methods)

- ✎ Motherboard device enumeration and configuration

- † System and device power states

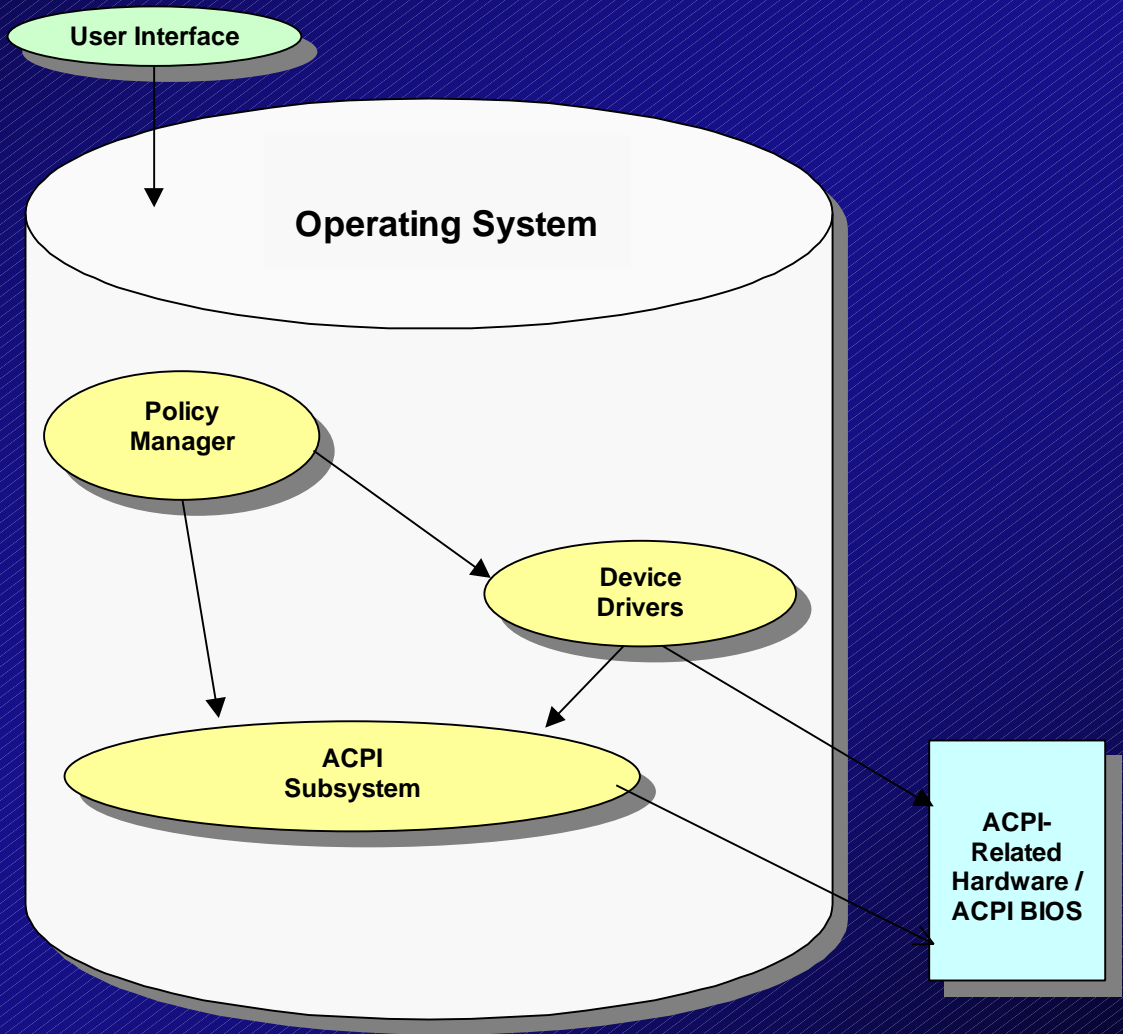

- † ACPI Thermal Model

# ACPI Global States and Transitions

Note: Third Party Brands and Trademarks are Property of Their Respective Owners.

# An ACPI System

# ACPI Software Components

## ACPI Subsystem

- † Consumes ACPI BIOS
- † Interacts with ACPI Hardware

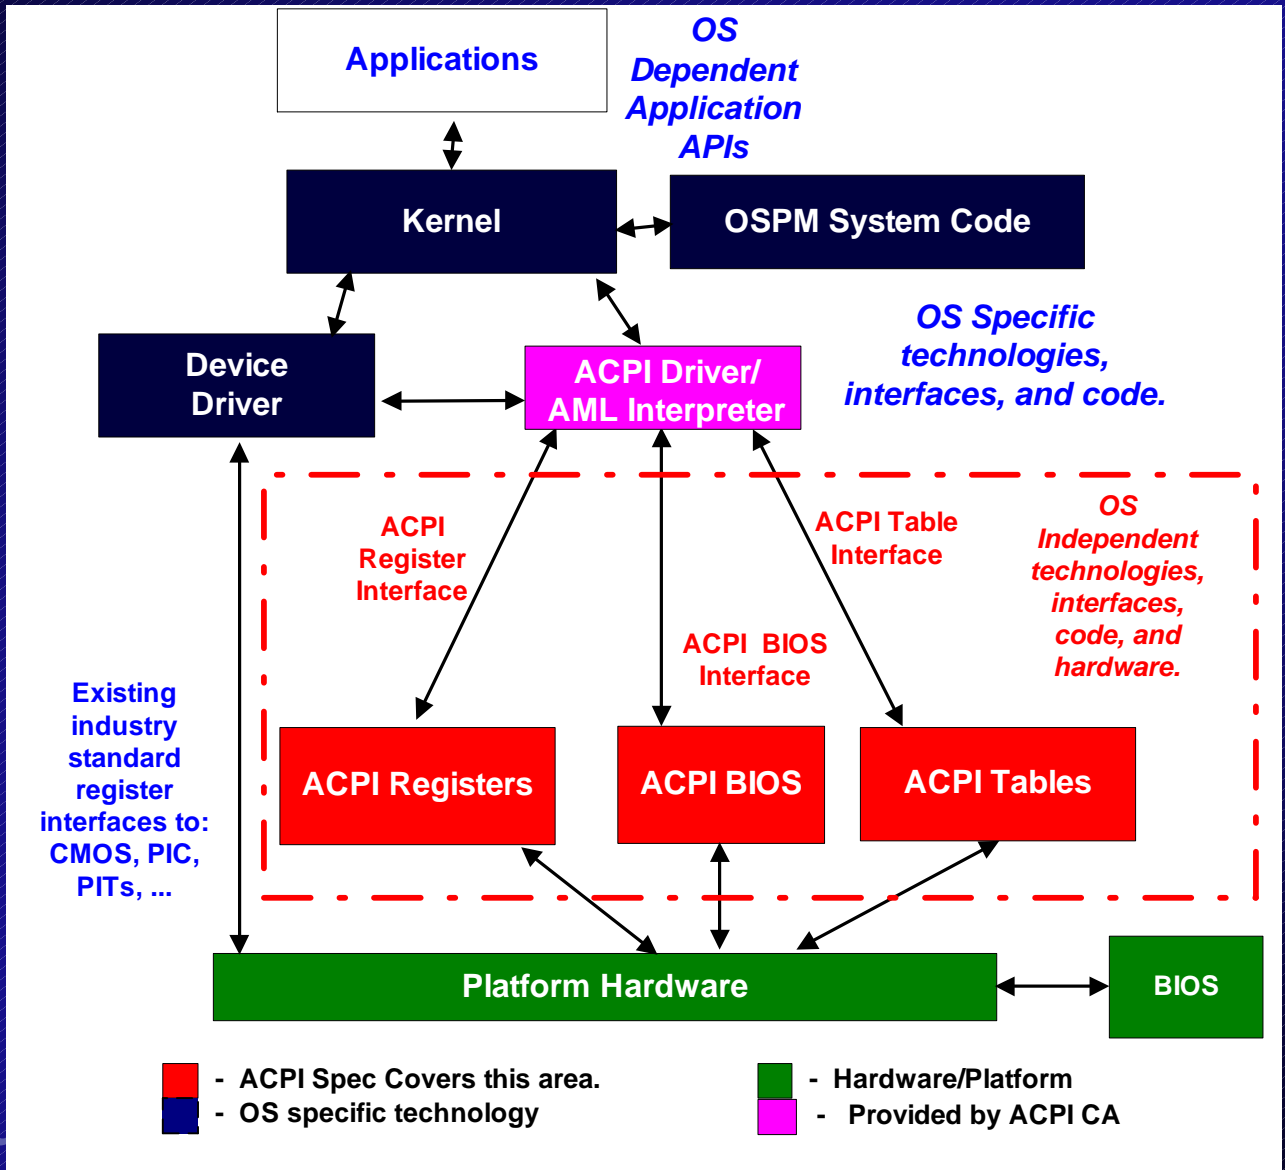

## Policy Manager (OSPM)

- † Sets and Monitors System Policies
- † User Interface
  - ✎ Allows User Input to Policy

## Device Drivers

- † EC, SM Bus, CM Battery, Smart Battery

# ACPI System Overview

Note: Third Party Brands and Trademarks are Property of Their Respective Owners.

# ACPI Specification History

- ❧ ACPI 1.0 released December 1996
- ❧ ACPI 1.0a released July 1998
- ❧ ACPI 1.0b released February 1999
- ❧ ACPI 2.0 released July 2000

# How does ACPI change?

- ⌚ Periodic errata meetings held with promoters
- ⌚ Either spec is updated (e.g. 1.0a, 1.0B, etc) or errata document is posted on the ACPI site:  
<http://www.acpi.info>
