A pointer to the detailed result information of the bulk transfer. Refer to UsbControlTransfer() (Section 17.2.4) for transfer result types (EFI_USB_ERR_x).

Description
This function is used to submit bulk transfer to a target endpoint of a USB device. The target endpoint is specified by DeviceAddress and EndpointAddress. Bulk transfers are designed to support devices that need to communicate relatively large amounts of data at highly variable times where the transfer can use any available bandwidth. Bulk transfers can be used only by full-speed and high-speed devices.

High-speed bulk transfers can be performed using multiple data buffers. The number of buffers that are actually prepared for the transfer is specified by DataBuffersNumber. For full-speed bulk transfers this value is ignored.

Data represents a list of pointers to the data buffers. For full-speed bulk transfers only the data pointed by Data[0] shall be used. For high-speed transfers depending on DataLength there several data buffers can be used. The total number of buffers must not exceed EFI_USB_MAX_BULK_BUFFER_NUM. See “Related Definitions” for the EFI_USB_MAX_BULK_BUFFER_NUM value.

The data transfer direction is determined by the endpoint direction that is encoded in the EndpointAddress parameter. Refer to USB Specification, Revision 2.0 on the Endpoint Address encoding.

The DataToggle parameter is used to track target endpoint’s data sequence toggle bits. The USB provides a mechanism to guarantee data packet synchronization between data transmitter and receiver across multiple transactions. The data packet synchronization is achieved with the data sequence toggle bits and the DATA0/DATA1 PIDs. A bulk endpoint’s toggle sequence is initialized to DATA0 when the endpoint experiences a configuration event. It toggles between DATA0 and DATA1 in each successive data transfer. It is host’s responsibility to track the bulk endpoint’s data toggle sequence and set the correct value for each data packet. The input DataToggle value points to the data toggle value for the first data packet of this bulk transfer; the output DataToggle value points to the data toggle value for
the last successfully transferred data packet of this bulk transfer. The caller should record the data toggle value for use in subsequent bulk transfers to the same endpoint.

If the bulk transfer is successful, then EFI_SUCCESS is returned. If USB transfer cannot be completed within the timeout specified by Timeout, then EFI_TIMEOUT is returned. If an error other than timeout occurs during the USB transfer, then EFI_DEVICE_ERROR is returned and the detailed status code is returned in TransferResult.

EFI_INVALID_PARAMETER is returned if one of the following conditions is satisfied:

- Data is NULL.
- DataLength is 0.
- DeviceSpeed is not valid; the legal values are EFI_USB_SPEED_FULL, EFI_USB_SPEED_HIGH, or EFI_USB_SPEED_SUPER.
- MaximumPacketLength is not valid. The legal value of this parameter is 64 or less for full-speed, 512 or less for high-speed, and 1024 or less for super-speed transactions.
- DataToggle points to a value other than 0 and 1.
- TransferResult is NULL.

EFI_USB2_HC_PROTOCOL.AsyncInterruptTransfer()

Summary

Submits an asynchronous interrupt transfer to an interrupt endpoint of a USB device.
Prototype

```c
typedef EFI_STATUS
  (EFIAPI *EFI_USB2_HC_PROTOCOL_ASYNC_INTERRUPT_TRANSFER) (      
    IN EFI_USB2_HC_PROTOCOL *This,
    IN UINT8 DeviceAddress,
    IN UINT8 EndPointAddress,
    IN UINT8 DeviceSpeed,
    IN UINTN MaximumPacketLength,
    IN BOOLEAN IsNewTransfer,
    IN OUT UINT8 *DataToggle,
    IN UINTN PollingInterval OPTIONAL,
    IN UINTN DataLength OPTIONAL,
    IN EFI_USB2_HC_TRANSACTION_TRANSLATOR *Translator OPTIONAL,
    IN EFI_ASYNC_USB_TRANSFER_CALLBACK CallBackFunction OPTIONAL,
    IN VOID *Context OPTIONAL
  );
```

Parameters

**This** A pointer to the EFI_USB2_HC_PROTOCOL instance. Type EFI_USB2_HC_PROTOCOL is defined in Section 17.1.

**DeviceAddress** Represents the address of the target device on the USB, which is assigned during USB enumeration.

**EndPointAddress** The combination of an endpoint number and an endpoint direction of the target USB device. Each endpoint address supports data transfer in one direction except the control endpoint (whose default endpoint address is zero). It is the caller’s responsibility to make sure that the EndPointAddress represents an interrupt endpoint.

**DeviceSpeed** Indicates device speed. See “Related Definitions” in EFI_USB2_HC_PROTOCOL.ControlTransfer() for a list of the supported values.

**MaximumPacketLength** Indicates the maximum packet size the target endpoint is capable of sending or receiving.

**IsNewTransfer** If TRUE, an asynchronous interrupt pipe is built between the host and the target interrupt endpoint. If FALSE, the specified asynchronous interrupt pipe is canceled. If TRUE, and an interrupt transfer exists for the target endpoint, then EFI_INVALID_PARAMETER is returned.

**DataToggle** A pointer to the data toggle value. On input, it is valid when IsNewTransfer is TRUE, and it indicates the initial data toggle value the asynchronous interrupt transfer should adopt. On output, it is valid when IsNewTransfer is FALSE, and it is updated to indicate the data toggle value of the subsequent asynchronous interrupt transfer.

**PollingInterval** Indicates the interval, in milliseconds, that the asynchronous interrupt transfer is polled. This parameter is required when IsNewTransfer is TRUE.
DataLength: Indicates the length of data to be received at the rate specified by PollingInterval from the target asynchronous interrupt endpoint. This parameter is only required when IsNewTransfer is TRUE.

Translator: A pointer to the transaction translator data.

CallBackFunction: The Callback function. This function is called at the rate specified by PollingInterval. This parameter is only required when IsNewTransfer is TRUE. Refer to UsbAsyncInterruptTransfer() (Section 17.2.4) for the definition of this function type.

Context: The context that is passed to the CallBackFunction. This is an optional parameter and may be NULL.

Description
This function is used to submit asynchronous interrupt transfer to a target endpoint of a USB device. The target endpoint is specified by DeviceAddress and EndpointAddress. In the USB Specification, Revision 2.0, interrupt transfer is one of the four USB transfer types. In the EFI_USB2_HC_PROTOCOL, interrupt transfer is divided further into synchronous interrupt transfer and asynchronous interrupt transfer.

An asynchronous interrupt transfer is typically used to query a device’s status at a fixed rate. For example, keyboard, mouse, and hub devices use this type of transfer to query their interrupt endpoints at a fixed rate. The asynchronous interrupt transfer is intended to support the interrupt transfer type of “submit once, execute periodically.” Unless an explicit request is made, the asynchronous transfer will never retire.

If IsNewTransfer is TRUE, then an interrupt transfer is started at a fixed rate. The rate is specified by PollingInterval, the size of the receive buffer is specified by DataLength, and the callback function is specified by CallBackFunction. Context specifies an optional context that is passed to the CallBackFunction each time it is called. The CallBackFunction is intended to provide a means for the host to periodically process interrupt transfer data.

If IsNewTransfer is TRUE, and an interrupt transfer exists for the target end point, then EFI_INVALID_PARAMETER is returned.

If IsNewTransfer is FALSE, then the interrupt transfer is canceled.

EFI_INVALID_PARAMETER is returned if one of the following conditions is satisfied:

- Data transfer direction indicated by EndPointAddress is other than EfiUsbDataIn.
- IsNewTransfer is TRUE and DataLength is 0.
- IsNewTransfer is TRUE and DataToggle points to a value other than 0 and 1.
- IsNewTransfer is TRUE and PollingInterval is not in the range 1..255.
- IsNewTransfer requested where an interrupt transfer exists for the target end point.

**EFI_USB2_HC_PROTOCOL.SyncInterruptTransfer()**

**Summary**
Submits synchronous interrupt transfer to an interrupt endpoint of a USB device.

**Prototype**
```c
typedef EFI_STATUS
(EFIAPI *EFI_USB2_HC_PROTOCOL_SYNC_INTERRUPT_TRANSFER) ( 
    IN   EFI_USB2_HC_PROTOCOL  *This,
    IN   UINT8                 DeviceAddress,
    IN   UINT8                 EndPointAddress,
    IN   UINT8                 DeviceSpeed,
    IN   UINTN                 MaximumPacketLength,
    IN OUT VOID                *Data,
    IN OUT UINTN               *DataLength,
    IN OUT UINT8               *DataToggle,
    IN   UINTN                 TimeOut,
    IN   EFI_USB2_HC_TRANSACTION_TRANSLATOR *Translator
    OUT  UINT32                *TransferResult
);
```

**Parameters**
- **This** A pointer to the EFI_USB2_HC_PROTOCOL instance. Type EFI_USB2_HC_PROTOCOL is defined in Section 17.1.
- **DeviceAddress** Represents the address of the target device on the USB, which is assigned during USB enumeration.
- **EndPointAddress** The combination of an endpoint number and an endpoint direction of the target USB device. Each endpoint address supports data transfer in one direction except the control endpoint (whose default endpoint address is zero). It is the caller’s responsibility to make sure that the EndPointAddress represents an interrupt endpoint.
- **DeviceSpeed** Indicates device speed. See “Related Definitions” in ControlTransfer() for a list of the supported values.
- **MaximumPacketLength** Indicates the maximum packet size the target endpoint is capable of sending or receiving.
**Data**
A pointer to the buffer of data that will be transmitted to USB device or received from USB device.

**DataLength**
On input, the size, in bytes, of the data buffer specified by **Data**. On output, the number of bytes transferred.

**DataToggle**
A pointer to the data toggle value. On input, it indicates the initial data toggle value the synchronous interrupt transfer should adopt; on output, it is updated to indicate the data toggle value of the subsequent synchronous interrupt transfer.

**TimeOut**
Indicates the maximum time, in milliseconds, which the transfer is allowed to complete.

**Translator**
A pointer to the transaction translator data.

**TransferResult**
A pointer to the detailed result information from the synchronous interrupt transfer. Refer to **UsbControlTransfer()** (Section 17.2.4) for transfer result types (**EFI_USB_ERR_x**).

**Description**
This function is used to submit a synchronous interrupt transfer to a target endpoint of a USB device. The target endpoint is specified by **DeviceAddress** and **EndpointAddress**. In the USB Specification, Revision 2.0, interrupt transfer is one of the four USB transfer types. In the **EFI_USB2_HC_PROTOCOL**, interrupt transfer is divided further into synchronous interrupt transfer and asynchronous interrupt transfer.

The synchronous interrupt transfer is designed to retrieve small amounts of data from a USB device through an interrupt endpoint. A synchronous interrupt transfer is only executed once for each request. This is the most significant difference from the asynchronous interrupt transfer.

If the synchronous interrupt transfer is successful, then **EFI_SUCCESS** is returned. If the USB transfer cannot be completed within the timeout specified by **TimeOut**, then **EFI_TIMEOUT** is returned. If an error other than timeout occurs during the USB transfer, then **EFI_DEVICE_ERROR** is returned and the detailed status code is returned in **TransferResult**.

**EFI_INVALID_PARAMETER** is returned if one of the following conditions is satisfied:

- **Data** is **NULL**.
- **DataLength** is 0.
- **MaximumPacketLength** is not valid. The legal value of this parameter should be 3072 or less for high-speed device, 64 or less for a full-speed device; for a slow device, it is limited to 8 or less. For the full-speed device, it should be 8, 16, 32, or 64; for the slow device, it is limited to 8.
- **DataToggle** points to a value other than 0 and 1.
- **TransferResult** is **NULL**.

**EFI_USB2_HC_PROTOCOL.IsochronousTransfer()**

**Summary**

Submits isochronous transfer to an isochronous endpoint of a USB device.

**Prototype**

```c
typedef EFI_STATUS (EFIAPI *EFI_USB2_HC_PROTOCOL_ISOCHRONOUS_TRANSFER) (
  IN   EFI_USB2_HC_PROTOCOL   *This,
  IN   UINT8                 DeviceAddress,
  IN   UINT8                 EndPointAddress,
  IN   UINT8                 DeviceSpeed,
  IN   UINTN                 MaximumPacketLength,
  IN   UINT8                 DataBuffersNumber,
  IN OUT VOID                *Data[EFI_USB_MAX_ISO_BUFFER_NUM],
  IN   UINTN                 DataLength,
  IN   EFI_USB2_HC_TRANSACTION_TRANSLATOR *Translator,
  OUT  UINT32                *TransferResult
);
```

**Related Definitions**

```c
#define EFI_USB_MAX_ISO_BUFFER_NUM   7
#define EFI_USB_MAX_ISO_BUFFER_NUM1  2
```

**Parameters**

- **This**
  
  A pointer to the EFI_USB2_HC_PROTOCOL instance. Type EFI_USB2_HC_PROTOCOL is defined in Section 17.1.

- **DeviceAddress**
  
  Represents the address of the target device on the USB, which is assigned during USB enumeration.

- **EndPointAddress**
  
  The combination of an endpoint number and an endpoint direction of the target USB device. Each endpoint address supports data transfer in one direction except the control endpoint (whose default endpoint address is 0). It is the caller’s responsibility to make sure that the EndPointAddress represents an isochronous endpoint.
DeviceSpeed
Indicates device speed. The supported values are
\texttt{EFI\_USB\_SPEED\_FULL}, \texttt{EFI\_USB\_SPEED\_HIGH}, or
\texttt{EFI\_USB\_SPEED\_SUPER}.

MaximumPacketLength
Indicates the maximum packet size the target endpoint is capable
of sending or receiving. For isochronous endpoints, this value is used
to reserve the bus time in the schedule, required for the per-frame
data payloads. The pipe may, on an ongoing basis, actually use less
bandwidth than that reserved.

DataBuffersNumber
Number of data buffers prepared for the transfer.

Data
Array of pointers to the buffers of data that will be transmitted to
USB device or received from USB device.

DataLength
 Specifies the length, in bytes, of the data to be sent to or received
from the USB device.

Translator
A pointer to the transaction translator data. See ControlTransfer()
“Description” for the detailed information of this data structure.

TransferResult
A pointer to the detail result information of the isochronous
transfer. Refer to \texttt{UsbControlTransfer()} (Section 17.2.4) for
transfer result types (\texttt{EFI\_USB\_ERR\_x}).

\textbf{Description}

This function is used to submit isochronous transfer to a target endpoint of a USB device. The target
endpoint is specified by \texttt{DeviceAddress} and \texttt{EndpointAddress}. Isochronous transfers are used when
working with isochronous data. It provides periodic, continuous communication between the host and a
device. Isochronous transfers can be used only by full-speed, high-speed, and super-speed devices.

High-speed isochronous transfers can be performed using multiple data buffers. The number of buffers
that are actually prepared for the transfer is specified by \texttt{DataBuffersNumber}. For full-speed
isochronous transfers this value is ignored.

Data represents a list of pointers to the data buffers. For full-speed isochronous transfers only the data
pointed by \texttt{Data[0]} shall be used. For high-speed isochronous transfers and for the split transactions
depending on \texttt{DataLength} there several data buffers can be used. For the high-speed isochronous
transfers the total number of buffers must not exceed \texttt{EFI\_USB\_MAX\_ISO\_BUFFER\_NUM}. For split
transactions performed on full-speed device by high-speed host controller the total number of buffers is
limited to \texttt{EFI\_USB\_MAX\_ISO\_BUFFER\_NUM1}. See “Related Definitions” for the
\texttt{EFI\_USB\_MAX\_ISO\_BUFFER\_NUM} and \texttt{EFI\_USB\_MAX\_ISO\_BUFFER\_NUM1} values.

If the isochronous transfer is successful, then \texttt{EFI\_SUCCESS} is returned. The isochronous transfer is
designed to be completed within one USB frame time, if it cannot be completed, \texttt{EFI\_TIMEOUT} is
returned. If an error other than timeout occurs during the USB transfer, then \texttt{EFI\_DEVICE\_ERROR} is
returned and the detailed status code will be returned in \texttt{TransferResult}.

\texttt{EFI\_INVALID\_PARAMETER} is returned if one of the following conditions is satisfied:

- Data is \texttt{NULL}.
- DataLength is 0.
- DeviceSpeed is not one of the supported values listed above.
• **MaximumPacketLength** is invalid. **MaximumPacketLength** must be 1023 or less for full-speed devices, and 1024 or less for high-speed and super-speed devices.

• **TransferResult** is **NULL**.

### EFI_USB2_HC_PROTOCOL.AsyncIsochronousTransfer()

**Summary**

Submits nonblocking isochronous transfer to an isochronous endpoint of a USB device.

**Prototype**

```c
typedef
 EFI_STATUS
 (EFIAPI * EFI_USB2_HC_PROTOCOL_ASYNC_ISOCHRONOUS_TRANSFER) ( 
  IN   EFI_USB2_HC_PROTOCOL    *This,
  IN   UINT8                   DeviceAddress,
  IN   UINT8                   EndPointAddress,
  IN   UINT8                   DeviceSpeed,
  IN   UINTN                   MaximumPacketLength,
  IN   UINT8                   DataBuffersNumber,
  IN   UINTN                   DataLength,
  IN   EFI_USB2_HC_TRANSACTION_TRANSLATOR  *Translator,
  IN   EFI_ASYNC_USB_TRANSFER_CALLBACK   IsochronousCallBack,
  IN   VOID                     *Context  OPTIONAL
 ) ;
```

**Parameters**

- **This**
  A pointer to the **EFI_USB2_HC_PROTOCOL** instance. Type **EFI_USB2_HC_PROTOCOL** is defined in [Section 17.1](#).

- **DeviceAddress**
  Represents the address of the target device on the USB, which is assigned during USB enumeration.

- **EndPointAddress**
  The combination of an endpoint number and an endpoint direction of the target USB device. Each endpoint address supports data
transfer in one direction except the control endpoint (whose default endpoint address is zero). It is the caller’s responsibility to make sure that the `EndPointAddress` represents an isochronous endpoint.

**DeviceSpeed** Indicates device speed. The supported values are `EFI_USB_SPEED_FULL`, `EFI_USB_SPEED_HIGH`, or `EFI_USB_SPEED_SUPER`.

**MaximumPacketLength** Indicates the maximum packet size the target endpoint is capable of sending or receiving. For isochronous endpoints, this value is used to reserve the bus time in the schedule, required for the per-frame data payloads. The pipe may, on an ongoing basis, actually use less bandwidth than that reserved.

**DataBuffersNumber** Number of data buffers prepared for the transfer.

**Data** Array of pointers to the buffers of data that will be transmitted to USB device or received from USB device.

**DataLength** Specifies the length, in bytes, of the data to be sent to or received from the USB device.

**Translator** A pointer to the transaction translator data. See ControlTransfer() “Description” for the detailed information of this data structure.

**IsochronousCallback** The Callback function. This function is called if the requested isochronous transfer is completed. Refer to `UsbAsyncInterruptTransfer()` (Section 17.2.4) for the definition of this function type.

**Context** Data passed to the `IsochronousCallback` function. This is an optional parameter and may be `NULL`.

**Description**

This is an asynchronous type of USB isochronous transfer. If the caller submits a USB isochronous transfer request through this function, this function will return immediately. When the isochronous transfer completes, the `IsochronousCallback` function will be triggered, the caller can know the transfer results. If the transfer is successful, the caller can get the data received or sent in this callback function.

The target endpoint is specified by `DeviceAddress` and `EndPointAddress`. Isochronous transfers are used when working with isochronous data. It provides periodic, continuous communication between the host and a device. Isochronous transfers can be used only by full-speed, high-speed, and super-speed devices.

High-speed isochronous transfers can be performed using multiple data buffers. The number of buffers that are actually prepared for the transfer is specified by `DataBuffersNumber`. For full-speed isochronous transfers this value is ignored.

Data represents a list of pointers to the data buffers. For full-speed isochronous transfers only the data pointed by `Data[0]` shall be used. For high-speed isochronous transfers and for the split transactions depending on `DataLength` there several data buffers can be used. For the high-speed isochronous transfers the total number of buffers must not exceed `EFI_USB_MAX_ISO_BUFFER_NUM`. For split transactions performed on full-speed device by high-speed host controller the total number of buffers is limited to `EFI_USB_MAX_ISO_BUFFER_NUM1`. See “Related Definitions” in `IsochronousTransfer()` section for the `EFI_USB_MAX_ISO_BUFFER_NUM` and `EFI_USB_MAX_ISO_BUFFER_NUM1` values.
**EFI_INVALID_PARAMETER** is returned if one of the following conditions is satisfied:

- Data is NULL.
- DataLength is 0.
- DeviceSpeed is not one of the supported values listed above.
- MaximumPacketLength is invalid. MaximumPacketLength must be 1023 or less for full-speed devices and 1024 or less for high-speed and super-speed devices.

**EFI_USB2_HC_PROTOCOL.GetRootHubPortStatus()**

**Summary**

Retrieves the current status of a USB root hub port.

**Prototype**

```
typedef
EFI_STATUS
(EFIAPI *EFI_USB2_HC_PROTOCOL_GET_ROOTHUB_PORT_STATUS) (  
    IN EFI_USB2_HC_PROTOCOL  *This,
    IN UINT8                  PortNumber,
    OUT EFI_USB_PORT_STATUS   *PortStatus
);
```

**Parameters**

- **This**
  - A pointer to the EFI_USB2_HC_PROTOCOL instance. Type EFI_USB2_HC_PROTOCOL is defined in Section 17.1.

- **PortNumber**
  - Specifies the root hub port from which the status is to be retrieved. This value is zero based. For example, if a root hub has two ports, then the first port is numbered 0, and the second port is numbered 1.

- **PortStatus**
  - A pointer to the current port status bits and port status change bits. The type EFI_USB_PORT_STATUS is defined in “Related Definitions” below.
**Related Definitions**

```c
typedef struct {
    UINT16 PortStatus;
    UINT16 PortChangeStatus;
} EFI_USB_PORT_STATUS;
```

---

**PortStatus**

Contains current port status bitmap. The root hub port status bitmap is unified with the USB hub port status bitmap. See **Table 17-1** for a reference, which is borrowed from *Chapter 11, HubSpecification, of USB Specification, Revision 1.1.*

**PortChangeStatus**

Contains current port status change bitmap. The root hub port change status bitmap is unified with the USB hub port status bitmap. See **Table 17-2** for a reference, which is borrowed from *Chapter 11, Hub Specification, of USB Specification, Revision 1.1.*

0 = High-speed device is not attached to this port  
1 = High-speed device attached to this port  
NOTE: this bit has precedence over Bit 9; if set, bit 9 must be ignored. |
| 11  | **Super Speed Device Attached:** (USB_PORT_STAT_SUPER_SPEED) This field indicates whether the connected device is a super-speed device.  
0 = Super-speed device is not attached to this port.  
1 = Super-speed device is attached to this port.  
NOTE: This bit has precedence over Bit 9 and Bit 10; if set bits 9,10 must be ignored. |
| 12  | Reserved.  
Bit returns 0 when read. |
| 13  | The host controller owns the specified port.  
0 = Controller does not own the port.  
1 = Controller owns the port |
| 14-15 | Reserved  
These bits return 0 when read. |
Description

This function is used to retrieve the status of the root hub port specified by PortNumber.

EFI_USB_PORT_STATUS describes the port status of a specified USB port. This data structure is designed to be common to both a USB root hub port and a USB hub port.

The number of root hub ports attached to the USB host controller can be determined with the function GetRootHubPortStatus(). If PortNumber is greater than or equal to the number of ports returned by GetRootHubPortNumber(), then EFI_INVALID_PARAMETER is returned. Otherwise, the status of the USB root hub port is returned in PortStatus, and EFI_SUCCESS is returned.

EFI_USB2_HC_PROTOCOL.SetRootHubPortFeature()

Summary

Sets a feature for the specified root hub port.
Prototype

typedef
EFI_STATUS
(EFIAPI *EFI_USB2_HC_PROTOCOL_SET_ROOTHUB_PORT_FEATURE) (  
    IN EFI_USB2_HC_PROTOCOL *This,
    IN UINT8 PortNumber,
    IN EFI_USB_PORT_FEATURE PortFeature
    );

Parameters

This 
A pointer to the EFI_USB2_HC_PROTOCOL instance. Type EFI_USB2_HC_PROTOCOL is defined in Section 17.1.

PortNumber 
Specifies the root hub port whose feature is requested to be set. This value is zero based. For example, if a root hub has two ports, then the first port is number 0, and the second port is numbered 1.

PortFeature 
Indicates the feature selector associated with the feature set request. The port feature indicator is defined in “Related Definitions” and Table 17-3 below.

Related Definitions

typedef enum {
    EfiUsbPortEnable            = 1,
    EfiUsbPortSuspend           = 2,
    EfiUsbPortReset             = 4,
    EfiUsbPortPower             = 8,
    EfiUsbPortOwner             = 13,
    EfiUsbPortConnectChange     = 16,
    EfiUsbPortEnableChange      = 17,
    EfiUsbPortSuspendChange     = 18,
    EfiUsbPortOverCurrentChange = 19,
    EfiUsbPortResetChange       = 20
} EFI_USB_PORT_FEATURE;

The feature values specified in the enumeration variable have special meaning. Each value indicates its bit index in the port status and status change bitmaps, if combines these two bitmaps into a 32-bit bitmap. The meaning of each port feature is listed in Table 17-3.

Table 17-3 USB Port Features

<table>
<thead>
<tr>
<th>Port Feature</th>
<th>For SetRootHubPortFeature</th>
<th>For ClearRootHubPortFeature</th>
</tr>
</thead>
<tbody>
<tr>
<td>EfiUsbPortEnable</td>
<td>Enable the given port of the root hub.</td>
<td>Disable the given port of the root hub.</td>
</tr>
<tr>
<td>EfiUsbPortSuspend</td>
<td>Put the given port into suspend state.</td>
<td>Restore the given port from the previous suspend state.</td>
</tr>
</tbody>
</table>
**Description**

This function sets the feature specified by `PortFeature` for the USB root hub port specified by `PortNumber`. Setting a feature enables that feature or starts a process associated with that feature. For the meanings about the defined features, please refer to Table 17-1 and Table 17-2.

The number of root hub ports attached to the USB host controller can be determined with the function `GetRootHubPortStatus()`. If `PortNumber` is greater than or equal to the number of ports returned by `GetRootHubPortNumber()`, then `EFI_INVALID_PARAMETER` is returned. If `PortFeature` is not `EfiUsbPortEnable`, `EfiUsbPortSuspend`, `EfiUsbPortReset` nor `EfiUsbPortPower`, then `EFI_INVALID_PARAMETER` is returned.

**EFI_USB2_HC_PROTOCOL.ClearRootHubPortFeature()**

**Summary**
Clears a feature for the specified root hub port.

**Prototype**
```c
typedef
EFI_STATUS
(EFIAPI *EFI_USB2_HC_PROTOCOL_ClearRootHubPortFeature)(
    IN EFI_USB2_HC_PROTOCOL    *This,
    IN UINT8                   PortNumber,
    IN EFI_USB_PORT_FEATURE    PortFeature
);
```

**Parameters**
- **This**: A pointer to the EFI_USB2_HC_PROTOCOL instance. Type EFI_USB2_HC_PROTOCOL is defined in Section 17.1.
- **PortNumber**: Specifies the root hub port whose feature is requested to be cleared. This value is zero-based. For example, if a root hub has two ports, then the first port is number 0, and the second port is numbered 1.
- **PortFeature**: Indicates the feature selector associated with the feature clear request. The port feature indicator (EFI_USB_PORT_FEATURE) is defined in the “Related Definitions” section of the SetRootHubPortFeature() function description and in Table 17-3.

**Description**
This function clears the feature specified by PortFeature for the USB root hub port specified by PortNumber. Clearing a feature disables that feature or stops a process associated with that feature. For the meanings about the defined features, refer to Table 17-1 and Table 17-2.

The number of root hub ports attached to the USB host controller can be determined with the function GetRootHubPortStatus(). If PortNumber is greater than or equal to the number of ports returned by GetRootHubPortNumber(), then EFI_INVALID_PARAMETER is returned. If PortFeature is not EfiUsbPortEnable, EfiUsbPortSuspend, EfiUsbPortPower, EfiUsbPortConnectChange, EfiUsbPortResetChange, EfiUsbPortEnableChange, EfiUsbPortSuspendChange, or EfiUsbPortOverCurrentChange, then EFI_INVALID_PARAMETER is returned.
17.2 USB Driver Model

17.2.1 Scope

Section 17.2 describes the USB Driver Model. This includes the behavior of USB Bus Drivers, the behavior of a USB Device Drivers, and a detailed description of the EFI USB I/O Protocol. This document provides enough material to implement a USB Bus Driver, and the tools required to design and implement USB Device Drivers. It does not provide any information on specific USB devices.

The material contained in this section is designed to extend this specification and the UEFI Driver Model in a way that supports USB device drivers and USB bus drivers. These extensions are provided in the form of USB specific protocols. This document provides the information required to implement a USB Bus Driver in system firmware. The document also contains the information required by driver writers to design and implement USB Device Drivers that a platform may need to boot a UEFI-compliant OS.

The USB Driver Model described here is intended to be a foundation on which a USB Bus Driver and a wide variety of USB Device Drivers can be created. USB Driver Model Overview

The USB Driver Stack includes the USB Bus Driver, USB Host Controller Driver, and individual USB device drivers.

Figure 17-2 USB Bus Controller Handle

In the USB Bus Driver Design, the USB Bus Controller is managed by two drivers. One is USB Host Controller Driver, which consumes its parent bus EFI_XYZ_I/O_PROTOCOL, and produces EFI_USB2_HC_PROTOCOL and attaches it to the Bus Controller Handle. The other one is USB Bus Driver, which consumes EFI_USB2_HC_PROTOCOL, and performs bus enumeration. Figure 17-2 shows protocols that are attached to the USB Bus Controller Handle. Detailed descriptions are presented in the following sections.
17.2.2 USB Bus Driver

USB Bus Driver performs periodic Enumeration on the USB Bus. In USB bus enumeration, when a new USB controller is found, the bus driver does some standard configuration for that new controller, and creates a device handle for it. The EFI_USB_IO_PROTOCOL and the EFI DEVICE_PATH_PROTOCOL are attached to the device handle so that the USB controller can be accessed. The USB Bus Driver is also responsible for connecting USB device drivers to USB controllers. When a USB device is detached from a USB bus, the USB bus driver will stop that USB controller, and uninstall the EFI_USB_IO_PROTOCOL and the EFI_DEVICE_PATH_PROTOCOL from that handle. A detailed description is given in Section 17.2.2.3.

17.2.2.1 USB Bus Driver Entry Point

Like all other device drivers, the entry point for a USB Bus Driver attaches the EFI_DRIVER_BINDING_PROTOCOL to image handle of the USB Bus Driver.

17.2.2.2 Driver Binding Protocol for USB Bus Drivers

The Driver Binding Protocol contains three services. These are Supported(), Start(), and Stop(). Supported() tests to see if the USB Bus Driver can manage a device handle. A USB Bus Driver can only manage a device handle that contains EFI_USB2_HC_PROTOCOL.

The general idea is that the USB Bus Driver is a generic driver. Since there are several types of USB Host Controllers, an EFI_USB2_HC_PROTOCOL is used to abstract the host controller interface. Actually, a USB Bus Driver only requires an EFI_USB2_HC_PROTOCOL.

The Start() function tells the USB Bus Driver to start managing the USB Bus. In this function, the USB Bus Driver creates a device handle for the root hub, and creates a timer to monitor root hub connection changes.

The Stop() function tells the USB Bus Driver to stop managing a USB Host Bus Controller. The Stop() function simply deconfigures the devices attached to the root hub. The deconfiguration is a recursive process. If the device to be deconfigured is a USB hub, then all USB devices attached to its downstream ports will be deconfigured first, then itself. If all of the child devices handles have been destroyed then the EFI_USB2_HC_PROTOCOL is closed. Finally, the Stop()unction will then place the USB Host Bus Controller in a quiescent state.

17.2.2.3 USB Hot-Plug Event

Hot-Plug is one of the most important features provided by USB. A USB bus driver implements this feature through two methods. There are two types of hubs defined in the USB specification. One is the USB root hub, which is implemented in the USB Host controller. A timer event is created for the root hub. The other one is a USB Hub. An event is created for each hub that is correctly configured. All these events are associated with the same trigger which is USB bus numerator.

When USB bus enumeration is triggered, the USB Bus Driver checks the source of the event. This is required because the root hub differs from standard USB hub in checking the hub status. The status of a root hub is retrieved through the EFI_USB2_HC_PROTOCOL, and that status of a standard USB hub is retrieved through a USB control transfer. A detailed description of the enumeration process is presented in the next section.
17.2.2.4 USB Bus Enumeration

When the periodic timer or the hubs notify event is signaled, the USB Bus Driver will perform bus numeration.

1. Determine if the event is from the root hub or a standard USB hub.
2. Determine the port on which the connection change event occurred.
3. Determine if it is a connection change or a disconnection change.
4. If a connect change is detected, then a new device has been attached. Perform the following:
   a. Reset and enable that port.
   b. Configure the new device.
   c. Parse the device configuration descriptors; get all of its interface descriptors (i.e., all USB controllers), and configure each interface.
   d. Create a new handle for each interface (USB Controller) within the USB device. Attach the `EFI_DEVICE_PATH_PROTOCOL`, and the `EFI_USB_IO_PROTOCOL` to each handle.
   e. Connect the USB Controller to a USB device driver with the Boot Service `EFI_BOOT_SERVICES.ConnectController()` if applicable.
   f. If the USB Controller is a USB hub, create a Hub notify event which is associated with the USB Bus Enumerator, and submit an Asynchronous Interrupt Transfer Request (See Section 17.2.4).

5. If a disconnect change, then a device has been detached from the USB Bus. Perform the following:
   a. If the device is not a USB Hub, then find and deconfigure the USB Controllers within the device. Then, stop each USB controller with `EFI_BOOT_SERVICES.DisconnectController()`, and uninstall the `EFI_DEVICE_PATH_PROTOCOL` and the `EFI_USB_IO_PROTOCOL` from the controller’s handle. If the `EFI_BOOT_SERVICES.DisconnectController()` call fails this process must be retried on a subsequent timer tick.
   b. If the USB controller is USB hub controller, first find and deconfigure all its downstream USB devices (this is a recursive process, since there may be additional USB hub controllers on the downstream ports), then deconfigure USB hub controller itself.

17.2.3 USB Device Driver

A USB Device Driver manages a USB Controller and produces a device abstraction for use by a preboot application.

17.2.3.1 USB Device Driver Entry Point

Like all other device drivers, the entry point for a USB Device Driver attaches `EFI.Driver_BINDING_PROTOCOL` to image handle of the USB Device Driver.

17.2.3.2 Driver Binding Protocol for USB Device Drivers

The Driver Binding Protocol contains three services. These are `Supported()`, `Start()`, and `Stop()`.
The `Supported()` function tests to see if the USB Device Driver can manage a device handle. This function checks to see if a controller can be managed by the USB Device Driver. This is done by opening the `EFI_USB_IO_PROTOCOL` bus abstraction on the USB Controller handle, and using the services to determine if this USB Controller matches the profile that the USB Device Driver is capable of managing.

The `Start()` function tells the USB Device Driver to start managing a USB Controller. It opens the `EFI_USB_IO_PROTOCOL` instance from the handle for the USB Controller. This protocol instance is used to perform USB packet transmission over the USB bus. For example, if the USB controller is USB keyboard, then the USB keyboard driver would produce and install the `EFI_SIMPLE_TEXT_INPUT_PROTOCOL` to the USB controller handle.

The `Stop()` function tells the USB Device Driver to stop managing a USB Controller. It removes the I/O abstraction protocol instance previously installed in `Start()` from the USB controller handle. It then closes the `EFI_USB_IO_PROTOCOL`.

### 17.2.4 USB I/O Protocol

This section provides a detailed description of the `EFI_USB_IO_PROTOCOL`. This protocol is used by code, typically drivers, running in the EFI boot services environment to access USB devices like USB keyboards, mice and mass storage devices. In particular, functions for managing devices on USB buses are defined here.

The interfaces provided in the `EFI_USB_IO_PROTOCOL` are for performing basic operations to access USB devices. Typically, USB devices are accessed through the four different transfers types:

- **Controller Transfer**: Typically used to configure the USB device into an operation mode.
- **Interrupt Transfer**: Typically used to get periodic small amount of data, like USB keyboard and mouse.
- **Bulk Transfer**: Typically used to transfer large amounts of data like reading blocks from USB mass storage devices.
- **Isochronous Transfer**: Typically used to transfer data at a fixed rate like voice data.

This protocol also provides mechanisms to manage and configure USB devices and controllers.

**`EFI_USB_IO_PROTOCOL`**

**Summary**

Provides services to manage and communicate with USB devices.

**GUID**

```c
#define EFI_USB_IO_PROTOCOL_GUID "\{0x2B2F68D6,0x0CD2,0x44cf,\}
   {0x8E,0x8B,0xBB,0xA2,0x0B,0x1B,0x5B,0x75}\}
```

**Protocol Interface Structure**

```c
typedef struct _EFI_USB_IO_PROTOCOL {
    EFI_USB_IO_CONTROL_TRANSFER       UsbControlTransfer;
    EFI_USB_IO_BULK_TRANSFER          UsbBulkTransfer;
} EFI_USB_IO_PROTOCOL;
```
EFI_USB_IO_ASYNC_INTERRUPT_TRANSFER

EFI_USB_IO_SYNC_INTERRUPT_TRANSFER

EFI_USB_IO_ISOCHRONOUS_TRANSFER

EFI_USB_IO_ASYNC_ISOCHRONOUS_TRANSFER

UsbAsyncIsochronousTransfer;

EFI_USB_IO_GET_DEVICE_DESCRIPTOR

EFI_USB_IO_GET_CONFIG_DESCRIPTOR

EFI_USB_IO_GET_INTERFACE_DESCRIPTOR

EFI_USB_IO_GET_ENDPOINT_DESCRIPTOR

EFI_USB_IO_GET_SUPPORTED_LANGUAGES

EFI_USB_IO_PORT_RESET

} EFI_USB_IO_PROTOCOL;

Parameters

UsbControlTransfer  Accesses the USB Device through USB Control Transfer Pipe. See the

UsbControlTransfer() function description.

UsbBulkTransfer  Accesses the USB Device through USB Bulk Transfer Pipe. See the

UsbBulkTransfer() function description.

UsbAsyncInterruptTransfer  Non-block USB interrupt transfer. See the

UsbAsyncInterruptTransfer() function description.

UsbSyncInterruptTransfer  Accesses the USB Device through USB Synchronous

Interrupt Transfer Pipe. See the UsbSyncInterruptTransfer() function description.

UsbIsochronousTransfer  Accesses the USB Device through USB Isochronous Transfer Pipe. See the

UsbIsochronousTransfer() function description.

UsbAsyncIsochronousTransfer  Nonblock USB isochronous transfer. See the

UsbAsyncIsochronousTransfer() function description.

UsbGetDeviceDescriptor  Retrieves the device descriptor of a USB device. See the

UsbGetDeviceDescriptor() function description.

UsbGetConfigDescriptor  Retrieves the activated configuration descriptor of a USB device. See the

UsbGetConfigDescriptor() function description.

UsbGetInterfaceDescriptor  Retrieves the interface descriptor of a USB Controller. See the

UsbGetInterfaceDescriptor() function description.

UsbGetEndpointDescriptor  Retrieves the endpoint descriptor of a USB Controller. See the

UsbGetEndpointDescriptor() function description.
UsbGetStringDescriptor
Retrieves the string descriptor inside a USB Device. See the
UsbGetStringDescriptor() function description.

UsbGetSupportedLanguages
Retrieves the array of languages that the USB device supports. See
the UsbGetSupportedLanguages() function description.

UsbPortReset
Resets and reconfigures the USB controller. See the
UsbPortReset() function description.

Description
The EFI_USB_IO_PROTOCOL provides four basic transfers types described in the USB 1.1 Specification. These include control transfer, interrupt transfer, bulk transfer and isochronous transfer. The EFI_USB_IO_PROTOCOL also provides some basic USB device/controller management and configuration interfaces. A USB device driver uses the services of this protocol to manage USB devices.

EFI_USB_IO_PROTOCOL.UsbControlTransfer()

Summary
This function is used to manage a USB device with a control transfer pipe. A control transfer is typically used to perform device initialization and configuration.

Prototype

typedef
    EFI_STATUS
        (EFIAPI *EFI_USB_IO_CONTROL_TRANSFER) (  
        IN   EFI_USB_IO_PROTOCOL *This,  
        IN   EFI_USB_DEVICE_REQUEST *Request,  
        IN   EFI_USB_DATA_DIRECTION Direction,  
        IN   UINT32 Timeout,  
        IN OUT VOID *Data OPTIONAL,  
        IN UINTN DataLength OPTIONAL,  
        OUT UINT32 *Status  
        );

Parameters

This
A pointer to the EFI_USB_IO_PROTOCOL instance. Type
EFI_USB_IO_PROTOCOL is defined in Section 17.2.4.

Request
A pointer to the USB device request that will be sent to the USB
device. See “Related Definitions” below.

Direction
Indicates the data direction. See “Related Definitions” below for this
type.

Data
A pointer to the buffer of data that will be transmitted to USB device
or received from USB device.

Timeout
Indicating the transfer should be completed within this time frame.
The units are in milliseconds. If Timeout is 0, then the caller must
wait for the function to be completed until **EFI_SUCCESS** or **EFI_DEVICE_ERROR** is returned.

**DataLength**

The size, in bytes, of the data buffer specified by **Data**.

**Status**

A pointer to the result of the USB transfer.

### Related Definitions

```c
typedef enum {
    EfiUsbDataIn,
    EfiUsbDataOut,
    EfiUsbNoData
} EFI_USB_DATA_DIRECTION;
```

```c
// Error code for USB Transfer Results

#define EFI_USB_NOERROR        0x0000
#define EFI_USB_ERR_NOTEXECUTE 0x0001

#define EFI_USB_ERRBUFFER      0x0004
#define EFI_USB_ERRBABBLE      0x0008
#define EFI_USB_ERRNAK         0x0010
#define EFI_USB_ERRCRC         0x0020
#define EFI_USB_ERRTIMEOUT     0x0040
#define EFI_USB_ERRBITSTUFF    0x0080
#define EFI_USB_ERRSYSTEM      0x0100
```

```c
typedef struct {
    UINT8 RequestType;
    UINT8 Request;
    UINT16 Value;
    UINT16 Index;
    UINT16 Length;
} EFI_USB_DEVICE_REQUEST;
```

**RequestType**

The field identifies the characteristics of the specific request.

**Request**

This field specifies the particular request.

**Value**

This field is used to pass a parameter to USB device that is specific to the request.

**Index**

This field is also used to pass a parameter to USB device that is specific to the request.

**Length**

This field specifies the length of the data transferred during the second phase of the control transfer. If it is 0, then there is no data phase in this transfer.
Description
This function allows a USB device driver to communicate with the USB device through a Control Transfer. There are three control transfer types according to the data phase. If the Direction parameter is EfiUsbNoData, Data is NULL, and DataLength is 0, then no data phase exists for the control transfer. If the Direction parameter is EfiUsbDataOut, then Data specifies the data to be transmitted to the device, and DataLength specifies the number of bytes to transfer to the device. In this case there is an OUT DATA stage followed by a SETUP stage. If the Direction parameter is EfiUsbDataIn, then Data specifies the data that is received from the device, and DataLength specifies the number of bytes to receive from the device. In this case there is an IN DATA stage followed by a SETUP stage. After the USB transfer has completed successfully, EFI_SUCCESS is returned. If the transfer cannot be completed due to timeout, then EFI_TIMEOUT is returned. If an error other than timeout occurs during the USB transfer, then EFI_DEVICE_ERROR is returned and the detailed status code is returned in Status.

Status Code Returned

<table>
<thead>

**EFI_USB_IO_PROTOCOL.UsbBulkTransfer()**

Summary
This function is used to manage a USB device with the bulk transfer pipe. Bulk Transfers are typically used to transfer large amounts of data to/from USB devices.

Prototype
typedef EFI_STATUS (EFIAPI *EFI_USB_IO_BULK_TRANSFER) (  
  IN EFI_USB_IO_PROTOCOL *This,  
  IN UINT8 DeviceEndpoint,  
  IN OUT VOID *Data,  
  IN OUT UINTN *DataLength,  
  IN UINTN Timeout,  
  OUT UINT32 *Status  
  );

Parameters
**This** A pointer to the EFI_USB_IO_PROTOCOL instance. Type EFI_USB_IO_PROTOCOL is defined in Section 17.2.4.
**DeviceEndpoint**  
The destination USB device endpoint to which the device request is being sent. *DeviceEndpoint* must be between 0x01 and 0x0F or between 0x81 and 0x8F, otherwise *EFI_INVALID_PARAMETER* is returned. If the endpoint is not a BULK endpoint, *EFI_INVALID_PARAMETER* is returned. The MSB of this parameter indicates the endpoint direction. The number “1” stands for an IN endpoint, and “0” stands for an OUT endpoint.

**Data**  
A pointer to the buffer of data that will be transmitted to USB device or received from USB device.

**DataLength**  
On input, the size, in bytes, of the data buffer specified by *Data*. On output, the number of bytes that were actually transferred.

**Timeout**  
Indicating the transfer should be completed within this time frame. The units are in milliseconds. If *Timeout* is 0, then the caller must wait for the function to be completed until *EFI_SUCCESS* or *EFI_DEVICE_ERROR* is returned.

**Status**  
This parameter indicates the USB transfer status.

**Description**  
This function allows a USB device driver to communicate with the USB device through Bulk Transfer. The transfer direction is determined by the endpoint direction. If the USB transfer is successful, then *EFI_SUCCESS* is returned. If USB transfer cannot be completed within the *Timeout* frame, *EFI_TIMEOUT* is returned. If an error other than timeout occurs during the USB transfer, then *EFI_DEVICE_ERROR* is returned and the detailed status code will be returned in the *Status* parameter.

**EEI_USB_IO_PROTOCOL.UsbAsyncInterruptTransfer()**

**Summary**  
This function is used to manage a USB device with an interrupt transfer pipe. An Asynchronous Interrupt Transfer is typically used to query a device’s status at a fixed rate. For example, keyboard, mouse, and hub devices use this type of transfer to query their interrupt endpoints at a fixed rate.
Prototype

```c
typedef EFI_STATUS
(EFIAPI *EFI_USB_IO_ASYNC_INTERRUPT_TRANSFER) (  
  IN EFI_USB_IO_PROTOCOL *This,  
  IN UINT8 DeviceEndpoint,  
  IN BOOLEAN IsNewTransfer,  
  IN UINTN PollingInterval OPTIONAL,  
  IN UINTN DataLength OPTIONAL,  
  IN EFI_ASYNC_USB_TRANSFER_CALLBACK InterruptCallBack OPTIONAL,  
  IN VOID *Context OPTIONAL  
);
```

Parameters

- **This** A pointer to the EFI_USB_IO_PROTOCOL instance. Type EFI_USB_IO_PROTOCOL is defined in Section 17.2.4.
- **DeviceEndpoint** The destination USB device endpoint to which the device request is being sent. DeviceEndpoint must be between 0x01 and 0x0F or between 0x81 and 0x8F, otherwise EFI_INVALID_PARAMETER is returned. If the endpoint is not an INTERRUPT endpoint, EFI_INVALID_PARAMETER is returned. The MSB of this parameter indicates the endpoint direction. The number “1” stands for an IN endpoint, and “0” stands for an OUT endpoint.
- **IsNewTransfer** If TRUE, a new transfer will be submitted to USB controller. If FALSE, the interrupt transfer is deleted from the device’s interrupt transfer queue. If TRUE, and an interrupt transfer exists for the target endpoint, then EFI_INVALID_PARAMETER is returned.
- **PollingInterval** Indicates the periodic rate, in milliseconds, that the transfer is to be executed. This parameter is required when IsNewTransfer is TRUE. The value must be between 1 to 255, otherwise EFI_INVALID_PARAMETER is returned. The units are in milliseconds.
- **DataLength** Specifies the length, in bytes, of the data to be received from the USB device. This parameter is only required when IsNewTransfer is TRUE.
- **Context** Data passed to the InterruptCallBack function. This is an optional parameter and may be NULL.
- **InterruptCallBack** The Callback function. This function is called if the asynchronous interrupt transfer is completed. This parameter is required when IsNewTransfer is TRUE. See “Related Definitions” for the definition of this type.
**Related Definitions**

```c
typedef
EFI_STATUS
(EFIAPI * EFI_ASYNC_USB_TRANSFER_CALLBACK) (  
    IN VOID *Data,
    IN UINTN DataLength,
    IN VOID *Context,
    IN UINT32 Status
);
```

- **Data**
  - Data received or sent via the USB Asynchronous Transfer, if the transfer completed successfully.

- **DataLength**
  - The length of Data received or sent via the Asynchronous Transfer, if transfer successfully completes.

- **Context**
  - Data passed from `UsbAsyncInterruptTransfer()` request.

- **Status**
  - Indicates the result of the asynchronous transfer.

**Description**

This function allows a USB device driver to communicate with a USB device with an Interrupt Transfer. Asynchronous Interrupt transfer is different than the other four transfer types because it is a nonblocking transfer. The interrupt endpoint is queried at a fixed rate, and the data transfer direction is always in the direction from the USB device towards the system.

If `IsNewTransfer` is `TRUE`, then an interrupt transfer is started at a fixed rate. The rate is specified by `PollingInterval`, the size of the receive buffer is specified by `DataLength`, and the callback function is specified by `InterruptCallback`. If `IsNewTransfer` is `TRUE`, and an interrupt transfer exists for the target end point, then `EFI_INVALID_PARAMETER` is returned.

If `IsNewTransfer` is `FALSE`, then the interrupt transfer is canceled.

**Status Code Returned**

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The asynchronous USB transfer request has been successfully executed.</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>The asynchronous USB transfer request failed. When an interrupt transfer exists for the target end point and a new transfer is requested, <code>EFI_INVALID_PARAMETER</code> is returned.</td>
</tr>
</tbody>
</table>

**Examples**

Below is an example of how an asynchronous interrupt transfer is used. The example shows how a USB Keyboard Device Driver can periodically receive data from interrupt endpoint.
EFI_USB_IO_PROTOCOL  *UsbIo;
EFI_STATUS                Status;
USB_KEYBOARD_DEV          *UsbKeyboardDevice;
EFI_USB_INTERRUPT_CALLBACK KeyboardHandle;

...  
Status = UsbIo->UsbAsyncInterruptTransfer(
       UsbIo,
       UsbKeyboardDevice->IntEndpointAddress,
       TRUE,
       UsbKeyboardDevice->IntPollingInterval,
       8,
       KeyboardHandle,
       UsbKeyboardDevice
    );

...

// The following is the InterruptCallback function. If there is
// any results got from Asynchronous Interrupt Transfer,
// this function will be called.

EFI_STATUS KeyboardHandler(
    IN VOID    *Data,
    IN UINTN   DataLength,
    IN VOID    *Context,
    IN UINT32  Result
)
{
    USB_KEYBOARD_DEV  *UsbKeyboardDevice;
    UINTN           I;

    if (EFI_ERROR(Result))
    {
        //
        // Something error during this transfer,
        // just to some recovery work
        //
        ...

        return EFI_DEVICE_ERROR;
    }

    UsbKeyboardDevice = (USB_KEYBOARD_DEV *)Context;
for(I = 0; I < DataLength; I++)
{
    ParsedData(Data[I]);
    ...
}

return EFI_SUCCESS;
}

EFI_USB_IO_PROTOCOL.UsbSyncInterruptTransfer()

Summary
This function is used to manage a USB device with an interrupt transfer pipe. The difference between
UsbAsyncInterruptTransfer() and UsbSyncInterruptTransfer() is that the Synchronous
interrupt transfer will only be executed one time. Once it returns, regardless of its status, the interrupt
request will be deleted in the system.

Prototype
typedef
EFI_STATUS
(EFI_API *EFI_USB_IO_SYNC_INTERRUPT_TRANSFER) (  
    IN   EFI_USB_IO_PROTOCOL  *This,
    IN   UINT8         DeviceEndpoint,
    IN OUT VOID       *Data,
    IN OUT UINTN      *DataLength,
    IN   UINTN         Timeout,
    OUT  UINT32       *Status
);

Parameters
This A pointer to the EFI_USB_IO_PROTOCOL instance. Type
EFI_USB_IO_PROTOCOL is defined in Section 17.2.4.

DeviceEndpoint The destination USB device endpoint to which the device request is
being sent. DeviceEndpoint must be between 0x01 and 0x0F or
between 0x81 and 0x8F, otherwise EFI_INVALID_PARAMETER is
returned. If the endpoint is not an INTERRUPT endpoint,
EFI_INVALID_PARAMETER is returned. The MSB of this parameter
indicates the endpoint direction. The number “1” stands for an IN
endpoint, and “0” stands for an OUT endpoint.

Data A pointer to the buffer of data that will be transmitted to USB device
or received from USB device.

DataLength On input, then size, in bytes, of the buffer Data. On output, the
amount of data actually transferred.

Timeout The time out, in milliseconds, for this transfer. If Timeout is 0, then
the caller must wait for the function to be completed until
EFI_SUCCESS or EFI_DEVICE_ERROR is returned. If the transfer is
not completed in this time frame, then EFI_TIMEOUT is returned.
**Status**

This parameter indicates the USB transfer status.

**Description**

This function allows a USB device driver to communicate with a USB device through a synchronous interrupt transfer. The `UsbSyncInterruptTransfer()` differs from `UsbAsyncInterruptTransfer()` described in the previous section in that it is a blocking transfer request. The caller must wait for the function return, either successfully or unsuccessfully.

**Status Code Returned**

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The sync interrupt transfer has been successfully executed.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>The parameter <code>DeviceEndpoint</code> is not valid.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>Data is <code>NULL</code>.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>DataLength is <code>NULL</code>.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>Status is <code>NULL</code>.</td>
</tr>
<tr>
<td>EFI_OUT_OF_RESOURCES</td>
<td>The request could not be completed due to a lack of resources.</td>
</tr>
<tr>
<td>EFI_TIMEOUT</td>
<td>The transfer cannot be completed within <code>Timeout</code> timeframe.</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>The transfer failed other than timeout, and the transfer status is returned in <code>Status</code>.</td>
</tr>
</tbody>
</table>

**EFI_USB_IO_PROTOCOL.UsbIsochronousTransfer()**

**Summary**

This function is used to manage a USB device with an isochronous transfer pipe. An Isochronous transfer is typically used to transfer streaming data.

**Prototype**

```c
typedef EFI_STATUS
    (EFIAPIC * EFI_USB_IO_ISOCHRONOUS_TRANSFER) (
    IN EFI_USB_IO_PROTOCOL *This,
    IN UINT8 DeviceEndpoint,
    IN OUT VOID *Data,
    IN UINTN DataLength,
    OUT UINT32 *Status
    );
```

**Parameters**

- **This**
  
  A pointer to the EFI_USB_IO_PROTOCOL instance. Type `EFI_USB_IO_PROTOCOL` is defined in Section 17.2.4.

- **DeviceEndpoint**
  
  The destination USB device endpoint to which the device request is being sent. `DeviceEndpoint` must be between 0x01 and 0x0F or between 0x81 and 0x8F, otherwise `EFI_INVALID_PARAMETER` is returned. If the endpoint is not an ISOCRONOUS endpoint, `EFI_INVALID_PARAMETER` is returned. The MSB of this parameter
indicates the endpoint direction. The number “1” stands for an IN endpoint, and “0” stands for an OUT endpoint.

**Data**
A pointer to the buffer of data that will be transmitted to USB device or received from USB device.

**DataLength**
The size, in bytes, of the data buffer specified by `Data`.

**Status**
This parameter indicates the USB transfer status.

**Description**
This function allows a USB device driver to communicate with a USB device with an Isochronous Transfer. The type of transfer is different than the other types because the USB Bus Driver will not attempt to perform error recovery if transfer fails. If the USB transfer is completed successfully, then `EFI_SUCCESS` is returned. The isochronous transfer is designed to be completed within 1 USB frame time, if it cannot be completed, `EFI_TIMEOUT` is returned. If the transfer fails due to other reasons, then `EFI_DEVICE_ERROR` is returned and the detailed error status is returned in `Status`. If the data length exceeds the maximum payload per USB frame time, then it is this function’s responsibility to divide the data into a set of smaller packets that fit into a USB frame time. If all the packets are transferred successfully, then `EFI_SUCCESS` is returned.

**Status Code Returned**

<table>
<thead>
<tr>
<th>Status Code Returned</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The isochronous transfer has been successfully executed.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>The parameter <code>DeviceEndpoint</code> is not valid.</td>
</tr>
<tr>
<td>EFI_OUT_OF_RESOURCES</td>
<td>The request could not be completed due to a lack of resources.</td>
</tr>
<tr>
<td>EFI_TIMEOUT</td>
<td>The transfer cannot be completed within the 1 USB frame time.</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>The transfer failed due to the reason other than timeout, The error status is returned in <code>Status</code>.</td>
</tr>
<tr>
<td>EFI_UNSUPPORTED</td>
<td>The implementation doesn’t support an Isochronous transfer function.</td>
</tr>
</tbody>
</table>

**EFI_USB_IO_PROTOCOL.UsbAsyncIsochronousTransfer()**

**Summary**
This function is used to manage a USB device with an isochronous transfer pipe. An asynchronous Isochronous transfer is a nonblocking USB isochronous transfer.
Prototype

typedef
    EFI_STATUS
    (EFIAPI *EFI_USB_IO_ASYNC_ISOCHRONOUS_TRANSFER) ( 
        IN EFI_USB_IO_PROTOCOL       *This,
        IN UINT8                    DeviceEndpoint,
        IN OUT VOID                *Data,
        IN UINTN                   DataLength,
        IN EFI_ASYNC_USB_TRANSFER_CALLBACK IsochronousCallback,
        IN VOID                     *Context OPTIONAL
    );

Parameters

This
    A pointer to the EFI_USB_IO_PROTOCOL instance. Type EFI_USB_IO_PROTOCOL is defined in Section 17.2.4.

DeviceEndpoint
    The destination USB device endpoint to which the device request is being sent. DeviceEndpoint must be between 0x01 and 0x0F or between 0x81 and 0x8F, otherwise EFI_INVALID_PARAMETER is returned. If the endpoint is not an ISOCHRONOUS endpoint, EFI_INVALID_PARAMETER is returned. The MSB of this parameter indicates the endpoint direction. The number “1” stands for an IN endpoint, and “0” stands for an OUT endpoint.

Data
    A pointer to the buffer of data that will be transmitted to USB device or received from USB device.

DataLength
    Specifies the length, in bytes, of the data to be sent to or received from the USB device.

Context
    Data passed to the IsochronousCallback() function. This is an optional parameter and may be NULL.

IsochronousCallback
    The IsochronousCallback() function. This function is called if the requested isochronous transfer is completed. See the “Related Definitions” section of the UsbAsyncInterruptTransfer() function description.

Description

This is an asynchronous type of USB isochronous transfer. If the caller submits a USB isochronous transfer request through this function, this function will return immediately. When the isochronous transfer completes, the IsochronousCallback() function will be triggered, the caller can know the transfer results. If the transfer is successful, the caller can get the data received or sent in this callback function.
Status Code Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The asynchronous isochronous transfer has been successfully submitted to the system.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>The parameter DeviceEndpoint is not valid.</td>
</tr>
<tr>
<td>EFI_OUT_OF_RESOURCES</td>
<td>The request could not be submitted due to a lack of resources.</td>
</tr>
<tr>
<td>EFI_UNSUPPORTED</td>
<td>The implementation doesn’t support an asynchronous isochronous transfer function.</td>
</tr>
</tbody>
</table>

EFI_USB_IO_PROTOCOL.UsbGetDeviceDescriptor()

Summary
Retrieves the USB Device Descriptor.

Prototype

```c
typedef
    EFI_STATUS
    (EFIAPI *EFI_USB_IO_GET_DEVICE_DESCRIPTOR) (
    IN  EFI_USB_IO_PROTOCOL   *This,
    OUT EFI_USB_DEVICE_DESCRIPTOR *DeviceDescriptor
    );
```

Parameters

- **This** A pointer to the EFI_USB_IO_PROTOCOL instance. Type EFI_USB_IO_PROTOCOL is defined in Section 17.2.4.
- **DeviceDescriptor** A pointer to the caller allocated USB Device Descriptor. See “Related Definitions” for a detailed description.
Related Definitions

```c
//
// See USB1.1 for detail description.
//
typedef struct {
    UINT8     Length;
    UINT8     DescriptorType;
    UINT16    BcdUSB;
    UINT8     DeviceClass;
    UINT8     DeviceSubClass;
    UINT8     DeviceProtocol;
    UINT8     MaxPacketSize0;
    UINT16    IdVendor;
    UINT16    IdProduct;
    UINT16    BcdDevice;
    UINT8     StrManufacturer;
    UINT8     StrProduct;
    UINT8     StrSerialNumber;
    UINT8     NumConfigurations;
} EFI_USB_DEVICE_DESCRIPTOR;
```

Description

This function is used to retrieve information about USB devices. This information includes the device class, subclass, and the number of configurations the USB device supports. If `DeviceDescriptor` is `NULL`, then `EFI_INVALID_PARAMETER` is returned. If the USB device descriptor is not found, then `EFI_NOT_FOUND` is returned. Otherwise, the device descriptor is returned in `DeviceDescriptor`, and `EFI_SUCCESS` is returned.

Status Code Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The device descriptor was retrieved successfully.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>DeviceDescriptor is NULL.</td>
</tr>
<tr>
<td>EFI_NOT_FOUND</td>
<td>The device descriptor was not found. The device may not be configured.</td>
</tr>
</tbody>
</table>

`EFI_USB_IO_PROTOCOL.UsbGetConfigDescriptor()`

Summary

Retrieves the USB Device Configuration Descriptor.
Prototype

typedef
EFI_STATUS
( EFINIPI *EFI_USB_IO_GET_CONFIG_DESCRIPTOR) ( 
    IN   EFI_USB_IO_PROTOCOL *This,
    OUT EFI_USB_CONFIG_DESCRIPTOR *ConfigurationDescriptor 
);

Parameters

This A pointer to the EFI USB_IO_PROTOCOL instance. Type EFI_USB_IO_PROTOCOL is defined in Section 17.2.4.

ConfigurationDescriptor A pointer to the caller allocated USB Active Configuration Descriptor. See “Related Definitions” for a detailed description.

Related Definitions

//
// See USB1.1 for detail description.
//
typedef struct {
    UINT8 Length;
    UINT8 DescriptorType;
    UINT16 TotalLength;
    UINT8 NumInterfaces;
    UINT8 ConfigurationValue;
    UINT8 Configuration;
    UINT8 Attributes;
    UINT8 MaxPower;
} EFI_USB_CONFIG_DESCRIPTOR;

Description

This function is used to retrieve the active configuration that the USB device is currently using. If ConfigurationDescriptor is NULL, then EFI_INVALID_PARAMETER is returned. If the USB controller does not contain an active configuration, then EFI_NOT_FOUND is returned. Otherwise, the active configuration is returned in ConfigurationDescriptor, and EFI_SUCCESS is returned.
Status Code Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The active configuration descriptor was retrieved successfully.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>ConfigurationDescriptor is NULL.</td>
</tr>
<tr>
<td>EFI_NOT_FOUND</td>
<td>An active configuration descriptor cannot be found. The device may not be configured.</td>
</tr>
</tbody>
</table>

**EFI_USB_IO_PROTOCOL.UsbGetInterfaceDescriptor()**

**Summary**
Retrieves the Interface Descriptor for a USB Device Controller. As stated earlier, an interface within a USB device is equivalently to a USB Controller within the current configuration.

**Prototype**
```c
typedef EFI_STATUS (EFIAPI *EFI_USB_IO_GET_INTERFACE_DESCRIPTOR) (
    IN EFI_USB_IO_PROTOCOL *This,
    OUT EFI_USB_INTERFACE_DESCRIPTOR *InterfaceDescriptor
);
```

**Parameters**
- **This**
  A pointer to the EFI_USB_IO_PROTOCOL instance. Type EFI_USB_IO_PROTOCOL is defined in Section 17.2.4.
- **InterfaceDescriptor**
  A pointer to the caller allocated USB Interface Descriptor within the configuration setting. See “Related Definitions” for a detailed description.

**Related Definitions**
```c
//
// See USB1.1 for detail description.
//
typedef struct {
    UINT8 Length;
    UINT8 DescriptorType;
    UINT8 InterfaceNumber;
    UINT8 AlternateSetting;
    UINT8 NumEndpoints;
    UINT8 InterfaceClass;
    UINT8 InterfaceSubClass;
    UINT8 InterfaceProtocol;
    UINT8 Interface;
} EFI_USB_INTERFACE_DESCRIPTOR;
```

**Description**
This function is used to retrieve the interface descriptor for the USB controller. If InterfaceDescriptor is NULL, then EFI_INVALID_PARAMETER is returned. If the USB controller
does not contain an interface descriptor, then `EFI_NOT_FOUND` is returned. Otherwise, the interface
descriptor is returned in `InterfaceDescriptor`, and `EFI_SUCCESS` is returned.

**Status Code Returned**

<table>
<thead>
<tr>
<th>Status Code Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The interface descriptor retrieved successfully.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>InterfaceDescriptor is <strong>NULL</strong>.</td>
</tr>
<tr>
<td>EFI_NOT_FOUND</td>
<td>The interface descriptor cannot be found. The device may not be correctly configured.</td>
</tr>
</tbody>
</table>

**EFI_USB_IO_PROTOCOL.UsbGetEndpointDescriptor()**

**Summary**
Retrieves an Endpoint Descriptor within a USB Controller.

**Prototype**

```c
typedef EFI_STATUS
(EFI_API *EFI_USB_IO_GET_ENDPOINT_DESCRIPTOR) (
  IN  EFI_USB_IO_PROTOCOL  *This,
  IN  UINT8                EndpointIndex,
  OUT EFI_USB_ENDPOINT_DESCRIPTOR *EndpointDescriptor
);
```

**Parameters**

- **This**
  A pointer to the `EFI_USB_IO_PROTOCOL` instance. Type `EFI_USB_IO_PROTOCOL` is defined in [Section 17.2.4](#).

- **EndpointIndex**
  Indicates which endpoint descriptor to retrieve. The valid range is 0..15.

- **EndpointDescriptor**
  A pointer to the caller allocated USB Endpoint Descriptor of a USB controller. See “Related Definitions” for a detailed description.
Related Definitions

```c
typedef struct {
    UINT8 Length;
    UINT8 DescriptorType;
    UINT8 EndpointAddress;
    UINT8 Attributes;
    UINT16 MaxPacketSize;
    UINT8 Interval;
} EFI_USB_ENDPOINT_DESCRIPTOR;
```

Description

This function is used to retrieve an endpoint descriptor within a USB controller. If `EndpointIndex` is not in the range 0..15, then `EFI_INVALID_PARAMETER` is returned. If `EndpointDescriptor` is `NULL`, then `EFI_INVALID_PARAMETER` is returned. If the endpoint specified by `EndpointIndex` does not exist within the USB controller, then `EFI_NOT_FOUND` is returned. Otherwise, the endpoint descriptor is returned in `EndpointDescriptor`, and `EFI_SUCCESS` is returned.

Status Code Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The endpoint descriptor was retrieved successfully.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td><code>EndpointIndex</code> is not valid.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td><code>EndpointDescriptor</code> is <code>NULL</code>.</td>
</tr>
<tr>
<td>EFI_NOT_FOUND</td>
<td>The endpoint descriptor cannot be found. The device may not be correctly configured.</td>
</tr>
</tbody>
</table>

Examples

The following code fragment shows how to retrieve all the endpoint descriptors from a USB controller.
EFI_USB_IO_PROTOCOL *UsbIo;
EFI_USB_INTERFACE_DESCRIPTOR InterfaceDesc;
EFI_USB_ENDPOINT_DESCRIPTOR EndpointDesc;
UINTN Index;

Status = UsbIo->GetInterfaceDescriptor (UsbIo, &InterfaceDesc);

for(Index = 0; Index < InterfaceDesc.NumEndpoints; Index++) {
    Status = UsbIo->GetEndpointDescriptor(UsbIo, Index, &EndpointDesc);
}

EFI_USB_IO_PROTOCOL.UsbGetStringDescriptor()

Summary
Retrieves a string stored in a USB Device.

Prototype

typedef
    EFI_STATUS
    (EFI_API *EFI_USB_IO_GET_STRING_DESCRIPTOR) (  
        IN  EFI_USB_IO_PROTOCOL *This,
        IN  UINT16 LangID,
        IN  UINT8 StringID,
        OUT CHAR16 **String
    );

Parameters
This A pointer to the EFI_USB_IO_PROTOCOL instance. Type EFI_USB_IO_PROTOCOL is defined in Section 17.2.4.
LangID The Language ID for the string being retrieved. See the UsbGetSupportedLanguages() function description for a more detailed description.
StringID The ID of the string being retrieved.
String A pointer to a buffer allocated by this function with EFI_BOOT_SERVICES.AllocatePool() to store the string. If this function returns EFI_SUCCESS, it stores the string the caller wants to get. The caller should release the string buffer with EFI_BOOT_SERVICES.FreePool() after the string is not used any more.
Description
This function is used to retrieve strings stored in a USB device. The string to retrieve is identified by a language and an identifier. The language is specified by `LangID`, and the identifier is specified by `StringID`. If the string is found, it is returned in `String`, and `EFI_SUCCESS` is returned. If the string cannot be found, then `EFI_NOT_FOUND` is returned. The string buffer is allocated by this function with `AllocatePool()`. The caller is responsible for calling `FreePool()` for `String` when it is no longer required.

Status Code Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The string was retrieved successfully.</td>
</tr>
<tr>
<td>EFI_NOT_FOUND</td>
<td>The string specified by <code>LangID</code> and <code>StringID</code> was not found.</td>
</tr>
<tr>
<td>EFI_OUT_OF_RESOURCES</td>
<td>There are not enough resources to allocate the return buffer <code>String</code>.</td>
</tr>
</tbody>
</table>

**EFI_USB_IO_PROTOCOL.UsbGetSupportedLanguages()**

Summary
Retrieves all the language ID codes that the USB device supports.

Prototype

```c
typedef EFI_STATUS (EFIAPI *EFI_USB_IO_GET_SUPPORTED_LANGUAGES)(
    IN EFI_USB_IO_PROTOCOL *This,
    OUT UINT16 *LangIDTable,
    OUT UINT16 *TableSize
);
```

Parameters

- **This**
  A pointer to the `EFI_USB_IO_PROTOCOL` instance. Type `EFI_USB_IO_PROTOCOL` is defined in [Section 17.2.4](#).

- **LangIDTable**
  Language ID for the string the caller wants to get. This is a 16-bit ID defined by Microsoft. This buffer pointer is allocated and maintained by the USB Bus Driver, the caller should not modify its contents.

- **TableSize**
  The size, in bytes, of the table `LangIDTable`.

Description
Retrieves all the language ID codes that the USB device supports.
Status Code Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The support languages were retrieved successfully.</td>
</tr>
</tbody>
</table>

**EFI_USB_IO_PROTOCOL.UsbPortReset()**

**Summary**

Resets and reconfigures the USB controller. This function will work for all USB devices except USB Hub Controllers.

**Prototype**

```c
typedef EFI_STATUS (EFIAPI *EFI_USB_IO_PORT_RESET) (
    IN EFI_USB_IO_PROTOCOL *This
);
```

**Parameters**

- `This` A pointer to the EFI_USB_IO_PROTOCOL instance. Type `EFI_USB_IO_PROTOCOL` is defined in Section 17.2.4.

**Description**

This function provides a reset mechanism by sending a RESET signal from the parent hub port. A reconfiguration process will happen (that includes setting the address and setting the configuration). This reset function does not change the bus topology. A USB hub controller cannot be reset using this function, because it would impact the downstream USB devices. So if the controller is a USB hub controller, then `EFI_INVALID_PARAMETER` is returned.

**Status Code Returned**

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The USB controller was reset.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>If the controller specified by <code>This</code> is a USB hub.</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>An error occurred during the reconfiguration process.</td>
</tr>
</tbody>
</table>

**17.3 USB Function Protocol**

This section describes the USB Function Protocol, enabling a USB Function device with a UEFI driver that implements the protocol to communicate with a USB Host device.

The USB Function Protocol provides an I/O abstraction for a USB Controller operating in Function mode (also commonly referred to as Device, Peripheral, or Target mode) and the mechanisms by which the USB Function can communicate with the USB Host. It is used by other UEFI drivers or applications to perform data transactions and basic USB controller management over a USB Function port.

This simple protocol only supports USB 2.0 bulk transfers on systems with a single configuration and a single interface. It does not support isochronous or interrupt transfers, alternate interfaces, or USB 3.0 functionality. Future revisions of this protocol may support these or additional features.
EFI_USBFN_IO_PROTOCOL

Summary
Provides basic data transactions and basic USB controller management for a USB Function port.

GUID

```c
// {32D2963A-FE5D-4f30-B633-6E5DC55803CC}
#define EFI_USBFN_IO_PROTOCOL_GUID
{0x32d2963a, 0xfe5d, 0x4f30,
 {0xb6, 0x33, 0x6e, 0x5d, 0xc5, 0x58, 0x3, 0xcc}};
```

Revision Number

```c
#define EFI_USBFN_IO_PROTOCOL_REVISION 0x00010001
```

Protocol Interface Structure

```c
typedef struct _EFI_USBFN_IO_PROTOCOL {
  UINT32 Revision;
  EFI_USBFN_IO_DETECT_PORT DetectPort;
  EFI_USBFN_IO_CONFIGURE_ENABLE_ENDPOINTS ConfigureEnableEndpoints;
  EFI_USBFN_IO_GET_ENDPOINT_MAX_PACKET_SIZE GetEndpointMaxPacketSize;
  EFI_USBFN_IO_GET_DEVICE_INFO GetDeviceInfo;
  EFI_USBFN_IO_GET_VENDOR_ID_PRODUCT_ID GetVendorIdProductId;
  EFI_USBFN_IO_ABORT_TRANSFER AbortTransfer;
  EFI_USBFN_IO_GET_ENDPOINTSTALL_STATE GetEndpointStallState;
  EFI_USBFN_IO_SET_ENDPOINTSTALL_STATE SetEndpointStallState;
  EFI_USBFN_IO_EVENTHANDLER EventHandler;
  EFI_USBFN_IO_TRANSFER Transfer;
  EFI_USBFN_IO_GET_MAXTRANSFERSIZE GetMaxTransferSize;
  EFI_USBFN_IO_ALLOCATE_TRANSFER_BUFFER AllocateTransferBuffer;
  EFI_USBFN_IO_FREE_TRANSFER_BUFFER FreeTransferBuffer;
  EFI_USBFN_IO_START_CONTROLLER StartController;
  EFI_USBFN_IO_STOP_CONTROLLER StopController;
  EFI_USBFN_IO_SET_ENDPOINTPOLICY SetEndpointPolicy;
  EFI_USBFN_IO_GET_ENDPOINTPOLICY GetEndpointPolicy;
} EFI_USBFN_IO_PROTOCOL;
```
Parameters

Revision
The revision to which the EFI_USBFWN_IO_PROTOCOL adheres. All future revisions must be backwards compatible. If a future version is not backwards compatible, a different GUID must be used.

DetectPort
Returns information about the USB port type. See EFI_USBFWN_IO_PROTOCOL.DetectPort(), "Related Definitions" for more details.

ConfigureEnableEndpoints
Initializes all endpoints based on supplied device and configuration descriptors. Enables the device by setting the run/stop bit.

GetEndpointMaxPacketSize
Returns the maximum packet size of the specified endpoint.

GetDeviceInfo
Returns device specific information based on the supplied identifier as a Unicode string.

GetVendorIdProductId
Returns the vendor-id and product-id of the device.

AbortTransfer
Aborts the transfer on the specified endpoint.

GetEndpointStallState
Returns the stall state on the specified endpoint.

SetEndpointStallState
Sets or clears the stall state on the specified endpoint.

EventHandler
This function is called repeatedly to get information on USB bus states, receive-completion and transmit-completion events on the endpoints, and notification on setup packet on endpoint 0.

Transfer
This function handles transferring data to or from the host on the specified endpoint, depending on the direction specified.

GetMaxTransferSize
The maximum supported transfer size in bytes.

AllocateTransferBuffer
Allocates a transfer buffer of the specified size that satisfies the controller requirements.

FreeTransferBuffer
Deallocates the memory allocated for the transfer buffer by EFI_USBFWN_IO_PROTOCOL.AllocateTransferBuffer() function.

StartController
This function initializes the hardware and the internal data structures. The port must not be activated by this function.

StopController
This function disables the device by deactivating the port.

SetEndpointPolicy
This function sets the configuration policy for the specified non-control endpoint. There are a few calling restrictions for this function. See the EFI_USBFWN_IO_PROTOCOL.SetEndpointPolicy() function definition for more details.

GetEndpointPolicy
This function retrieves the configuration policy for the specified non-control endpoint.
Description
This protocol provides basic data transactions and USB controller management for a USB Function port. It provides a lightweight communication mechanism between a USB Host and a USB Function in the UEFI environment.

Like other UEFI device drivers, the entry point for a USB function driver attaches EFI_DRIVER_BINDING_PROTOCOL to image handle of EFI_USBFN_IO_PROTOCOL driver.

The driver binding protocol contains three services, Supported, Start and Stop.

The Supported function must test to see if this driver supports a given controller.

The Start function must supply power to the USB controller if needed, initialize hardware and internal data structures, and then return. The port must not be activated by this function.

The Stop function must disable the USB controller and power it off if needed.

EFI_USBFN_IO_PROTOCOL.DetectPort()

Summary
Returns information about what USB port type was attached.

Prototype
typedef EFI_STATUS (EFIAPI * EFI_USBFN_IO_DETECT_PORT) (IN EFI_USBFN_IO_PROTOCOL *This,
OUT EFI_USBFN_PORT_TYPE *PortType);

Parameters
This A pointer to the EFI_USBFN_IO_PROTOCOL instance.
PortType Returns the USB port type. Refer to the Related Definitions for this function below for details.

Description
Returns information about the USB port type attached. Refer to the "Related Definitions" below for further details.
Status Codes

EFI_SUCCESS The function returned successfully.
EFI_INVALID_PARAMETER A parameter is invalid.
EFI_DEVICE_ERROR The physical device reported an error.
EFI_NOT_READY The physical device is busy or not ready to process this request or there is no USB port attached to the device.

Related Definitions

typedef enum _EFI_USBFN_PORT_TYPE {
  EfiUsbUnknownPort = 0,
  EfiUsbStandardDownstreamPort,
  EfiUsbChargingDownstreamPort,
  EfiUsbDedicatedChargingPort,
  EfiUsbInvalidDedicatedChargingPort
} EFI_USBFN_PORT_TYPE;

Unknown Port Driver internal default port type, this is never returned by the driver with a success status code.

Standard Downstream Port Standard USB host; refer to USB Battery Charging Specification, Revision 1.2 in Section Q.1 for details and the link.

Charging Downstream Port Standard USB host with special charging properties; refer to USB Battery Charging Specification, Revision 1.2, Section Q.1 for the details and link.

Dedicated Charging Port A wall-charger, not USB host; refer to USB Battery Charging Specification, Revision 1.2, Section Q.1 for details and the link.

Invalid Dedicated Charging Port – Neither a USB host nor a dedicated charging port as defined by the USB Battery Charging Specification, Revision 1.2. (See Section Q.1 for details and the link.) An example is a USB charger that raises the voltages on D+/D-, causing the charger to look like an SDP even though it will never issue a setup packet to the upstream facing port.

EFI_USBFN_IO_PROTOCOL.ConfigureEnableEndpoints()

Summary
Configures endpoints based on supplied device and configuration descriptors.

Prototype
typedef
EFI_STATUS
(EIFIAPI * EFI_USBFN_IO_CONFIGURE_ENABLE_ENDPOINTS) (
    IN EFI_USBFIN_IO_PROTOCOL    *This,
    IN EFI_USB_DEVICE_INFO      *DeviceInfo
);  

Parameters
This A pointer to the EFI_USBFIN_IO_PROTOCOL instance.
DeviceInfo A pointer to EFI_USBFIN_DEVICE_INFO instance. Refer to the "Related Definitions" for this function below for details.

Description
Assuming that the hardware has already been initialized, this function configures the endpoints using the device information supplied by DeviceInfo, activates the port, and starts receiving USB events.

This function must ignore the bMaxPacketSize0 field of the Standard Device Descriptor and the wMaxPacketSize field of the Standard Endpoint Descriptor that are made available through DeviceInfo.

Status Codes
EFI_SUCCESS The function returned successfully.
EFI_INVALID_PARAMETER A parameter is invalid.
EFI_DEVICE_ERROR The physical device reported an error.
EFI_NOT_READY The physical device is busy or not ready to process this request.
EFI_OUT_OF_RESOURCES The request could not be completed due to lack of resources.

Related Definitions
typedef struct {
    EFI_USB_INTERFACE_DESCRIPTOR    *InterfaceDescriptor;
    EFI_USB_ENDPOINT_DESCRIPTOR** EndpointDescriptorTable;
} EFI_USB_INTERFACE_INFO;
typedef struct {
    EFI_USB_CONFIG_DESCRIPTOR  *ConfigDescriptor;
    EFI_USB_INTERFACE_INFO    **InterfaceInfoTable;
} EFI_USB_CONFIG_INFO;

typedef struct {
    EFI_USB_DEVICE_DESCRIPTOR *DeviceDescriptor;
    EFI_USB_CONFIG_INFO      **ConfigInfoTable;
} EFI_USB_DEVICE_INFO;

USB_DEVICE_DESCRIPTOR, USB_CONFIG_DESCRIPTOR, USB_INTERFACE_DESCRIPTOR, and USB_ENDPOINT_DESCRIPTOR are defined in Section 17.2.4.

EFI_USBFN_IO_PROTOCOL.GetEndpointMaxPacketSize()

Summary
Returns the maximum packet size of the specified endpoint type for the supplied bus speed.

Prototype

typedef
EFI_STATUS
(EIFIAPI * EFI_USBFN_IO_GET_ENDPOINT_MAXPACKET_SIZE) (  
    IN EFI_USBFN_IO_PROTOCOL   *This,  
    IN EFI_USB_ENDPOINT_TYPE   EndpointType,  
    IN EFI_USB_BUS_SPEED       BusSpeed,  
    OUT UINT16                 *MaxPacketSize
    );

Parameters

This      A pointer to the EFI_USBFN_IO_PROTOCOL instance.
EndDatepointType  Endpoint type as defined as EFI_USB_ENDPOINT_TYPE in the "Related Definitions" for this function below for details.
BusSpeed Bus speed as defined as EFI_USB_BUS_SPEED in the "Related Definitions" for the EventHandle function for details.
MaxPacketSize The maximum packet size, in bytes, of the specified endpoint type.

Description

Returns the maximum packet size of the specified endpoint type for the supplied bus speed. If the BusSpeed is UsbBusSpeedUnknown, the maximum speed the underlying controller supports is assumed.

This protocol currently does not support isochronous or interrupt transfers. Future revisions of this protocol may eventually support it.

EFI_USBFN_IO_PROTOCOL.GetDeviceInfo()

Summary

Returns device specific information based on the supplied identifier as a Unicode string.

Prototype

typedef EFI_STATUS
(EFIAPIC * EFI_USBFN_IO_GET_DEVICE_INFO) (
    IN EFI_USBFN_IO_PROTOCOL *This,
    IN EFI_USBFN_DEVICE_INFO_ID Id,
    IN OUT UINTN *BufferSize,
    OUT VOID *Buffer OPTIONAL
);

Parameters

This    A pointer to the EFI_USBFN_IO_PROTOCOL instance.
Id      The requested information id. Refer to the "Related Definitions" for this function below for details.
BufferSize On input, the size of the Buffer in bytes. On output, the amount of data returned in Buffer in bytes.
Buffer   A pointer to a buffer to return the requested information as a Unicode string.

Description

Returns device specific information based on the supplied identifier as a Unicode string. If the supplied Buffer isn’t large enough, or is NULL, the method fails with EFI_BUFFER_TOO_SMALL and the required size is returned through BufferSize. All returned strings are in Unicode format.

An Id of EfiUsbDeviceInfoUnknown is treated as an invalid parameter.
Status Codes

- **EFI_SUCCESS**: The function returned successfully.
- **EFI_INVALID_PARAMETER**: One or more of the following conditions is TRUE:
  - BufferSize is NULL.
  - *BufferSize is not 0 and Buffer is NULL.
  - *Id is invalid.
- **EFI_DEVICE_ERROR**: The physical device reported an error.
- **EFI_NOT_READY**: The physical device is busy or not ready to process this request.
- **EFI_BUFFER_TOO_SMALL**: The buffer is too small to hold the buffer.
  - *BufferSize has been updated with the size needed to hold the request string.

Related Definitions

typedef enum _EFI_USBFN_DEVICE_INFO_ID
{
    EfiUsbDeviceInfoUnknown = 0,

    EfiUsbDeviceInfoManufacturerName,
    EfiUsbDeviceInfoProductName
} EFI_USBFN_DEVICE_INFO_ID;

**EFI_USBFN_IO_PROTOCOL.GetVendorIdProductId()**

**Summary**
Returns the vendor-id and product-id of the device.

**Prototype**

typedef EFI_STATUS
(EFIAPI * EFI_USBFN_IO_GET_VENDOR_ID_PRODUCT_ID) (  
    IN EFI_USBFN_IO_PROTOCOL *This,  
    OUT UINT16 *Vid,  
    OUT UINT16 *Pid  
);

**Parameters**

- **This**: A pointer to the **EFI_USBFN_IO_PROTOCOL** instance.
- **Vid**: Returned vendor-id of the device.
- **Pid**: Returned product-id of the device.

**Description**
Returns vendor-id and product-id of the device.
Status Codes

EFI_SUCCESS The function returned successfully.
EFI_INVALID_PARAMETER A parameter is invalid.
EFI_NOT_FOUND Unable to return the vendor-id or the product-id

Related Definitions
Vendor IDs (VIDs) are 16-bit numbers that represent the device's vendor company and are assigned and maintained by the USB-IF. Product IDs (PIDs) are 16-bit numbers assigned by each vendor to the device.

**EFI_USBFN_IO_PROTOCOL.AbortTransfer()**

**Summary**
Aborts the transfer on the specified endpoint.

**Prototype**

```c
typedef EFI_STATUS
(EFIAPI * EFI_USBFN_IO_ABORT_TRANSFER) (EFI_USBFN_IO_PROTOCOL *This,
IN UINT8 EndpointIndex,
IN EFI_USBFN_ENDPOINT_DIRECTION Direction);
```

**Parameters**

- **This** A pointer to the **EFI_USBFN_IO_PROTOCOL** instance.
- **EndpointIndex** Indicates the endpoint on which the ongoing transfer needs to be canceled.
- **Direction** Direction of the endpoint. Refer to the "Related Definitions" for this function (below) for details.

**Description**
Aborts the transfer on the specified endpoint. This function should fail with **EFI_INVALID_PARAMETER** if the specified direction is incorrect for the endpoint.

**Status Codes**

- EFI_SUCCESS The function returned successfully.
- EFI_INVALID_PARAMETER A parameter is invalid.
- EFI_DEVICE_ERROR The physical device reported an error.
- EFI_NOT_READY The physical device is busy or not ready to process this request.

**Related Definitions**

```c
typedef enum _EFI_USBFN_ENDPOINT_DIRECTION
{
    EfiUsbEndpointDirectionHostOut = 0,
```
EfiUsbEndpointDirectionHostIn,
EfiUsbEndpointDirectionDeviceTx = EfiUsbEndpointDirectionHostIn,
EfiUsbEndpointDirectionDeviceRx = EfiUsbEndpointDirectionHostOut
} EFI_USBFN_ENDPOINT_DIRECTION;

**EFI_USBFN_IO_PROTOCOL.GetEndpointStallState()**

**Summary**
Returns the stall state on the specified endpoint.

**Prototype**

typedef
EFI_STATUS
(EIFIAPI * EFI_USBFN_IO_GET_ENDPOINTSTALL_STATE) (  
IN EFI_USBFN_IO_PROTOCOL *This,
IN UINT8 EndpointIndex,
IN EFI_USBFN_ENDPOINT_DIRECTION Direction,
IN OUT BOOLEAN *State
);

**Parameters**
- **This**
  A pointer to the EFI_USBFN_IO_PROTOCOL instance.
- **EndpointIndex**
  Indicates the endpoint.
- **Direction**
  Direction of the endpoint. Refer to the "Related Definitions" for
  EFI_USBFN_IO_PROTOCOL.AbortTransfer() for details.
- **State**
  Boolean, true value indicates that the endpoint is in a stalled state,
  false otherwise.

**Description**
Returns the stall state on the specified endpoint. This function would fail with
EFI_INVALID_PARAMETER if the specified direction is incorrect for the endpoint.

**Status Codes**
- EFI_SUCCESS
  The function returned successfully.
- EFI_INVALID_PARAMETER
  A parameter is invalid.
- EFI_DEVICE_ERROR
  The physical device reported an error.
- EFI_NOT_READY
  The physical device is busy or not ready to process this request.

**EFI_USBFN_IO_PROTOCOL.SetEndpointStallState()**

**Summary**
Sets or clears the stall state on the specified endpoint.
Prototype

typedef EFI_STATUS
(EIFIAPI * EFI_USBFN_IO_SET_ENDPOINT_STALL_STATE) ( 
IN EFI_USBFN_IO_PROTOCOL        *This,
IN UINT8                   EndpointIndex,
IN EFI_USBFN_ENDPOINT_DIRECTION Direction,
IN BOOLEAN                 State
);

Parameters

This A pointer to the EFI_USBFN_IO_PROTOCOL instance.
EndpointIndex Indicates the endpoint.
Direction Direction of the endpoint. Refer to the "Related Definitions" for the
EFI_USBFN_IO_PROTOCOL.AbortTransfer() function for
details.
State Requested stall state on the specified endpoint. True value causes
the endpoint to stall; false value clears an existing stall.

Description

Sets or clears the stall state on the specified endpoint. This function would fail with
EFI_INVALID_PARAMETER if the specified direction is incorrect for the endpoint.

Status Codes

EFI_SUCCESS The function returned successfully.
EFI_INVALID_PARAMETER A parameter is invalid.
EFI_DEVICE_ERROR The physical device reported an error.
EFI_NOT_READY The physical device is busy or not ready to process this request.
EFI_USBFN_IO_PROTOCOL.EventHandler()

Summary
This function is called repeatedly to get information on USB bus states, receive-completion and transmit-completion events on the endpoints, and notification on setup packet on endpoint 0.

Prototype

```c
typedef
  EFI_STATUS
  (EFIAPI * EFI_USBFN_IO_EVENTHANDLER) ( 
    IN EFI_USBFN_IO_PROTOCOL       *This,
    OUT EFI_USBFN_MESSAGE          *Message,
    IN OUT UINTN                   *PayloadSize,
    OUT EFI_USBFN_MESSAGE_PAYLOAD  *Payload
  );
```

Parameters

- **This** A pointer to the EFI_USBFN_IO_PROTOCOL instance.
- **Message** Indicates the event that initiated this notification. Refer to the "Related Definitions" for this function (below) for all possible types.
- **PayloadSize** On input, the size of the memory pointed by Payload. On output, the amount of data returned in Payload.
- **Payload** A pointer to EFI_USBFN_MESSAGE_PAYLOAD instance to return additional payload for current message. Refer to the "Related Definitions" for this function (below) for details on the type.

Description
This function is called repeatedly to get information on USB bus states, receive-completion and transmit-completion events on the endpoints, and notification on setup packet on endpoint 0. A class driver must call EFI_USBFN_IO_PROTOCOL.EventHandler() repeatedly to receive updates on the transfer status and number of bytes transferred on various endpoints. Refer to Figure 17-3 for details.
A few messages have an associated payload that is returned in the supplied buffer. The following table describes various messages and their payload:

<table>
<thead>
<tr>
<th>Message</th>
<th>Payload</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EfiUsbMsgSetupPacket</td>
<td>EFI_USB_DEVICE_REQUEST</td>
<td>SETUP packet was received.</td>
</tr>

EFI_USBFN_IO_PROTOCOL.Transfer()

Summary
This function handles transferring data to or from the host on the specified endpoint, depending on the direction specified.

Prototype

typedef EFI_STATUS (EFIAPI *EFI_USBFN_IO_TRANSFER) (    
    IN EFI_USBFN_IO_PROTOCOL *This,
    IN UINT8 EndpointIndex,
    IN EFI_USBFN_ENDPOINT_DIRECTION Direction,
    IN OUT UINTN *BufferSize,
    IN OUT VOID *Buffer
    );

Parameters
This A pointer to the EFI_USBFN_IO_PROTOCOL instance.
EndpointIndex Indicates the endpoint on which TX or RX transfer needs to take place.
Direction Direction of the endpoint. Refer to the "Related Definitions" of the EFI_USBFN_IO_PROTOCOL.AbortTransfer() function for details.
BufferSize If Direction is EfiUsbEndpointDirectionDeviceRx: On input, the size of the Buffer in bytes. On output, the amount of data returned in Buffer in bytes.
If Direction is EfiUsbEndpointDirectionDeviceTx: On input, the size of the Buffer in bytes. On output, the amount of data transmitted in bytes.
Buffer If Direction is EfiUsbEndpointDirectionDeviceRx: The Buffer to return the received data.
If Direction is EfiUsbEndpointDirectionDeviceTx: The Buffer that contains the data to be transmitted.

Note: This buffer is allocated and freed using the EFI_USBFN_IO_PROTOCOL.AbortTransfer() and EFI_USBFN_IO_PROTOCOL.FreeTransferBuffer() functions. The caller of this function must not free or reuse the buffer until EfiUsbMsgEndpointStatusChangedRx or EfiUsbMsgEndpointStatusChangedTx message was received along with the address of the transfer buffer as part of the message payload. Refer to the function definition for
**EFI_USBFIN_IO_PROTOCOL.EventHandler()** for more information on various messages and their payloads.

**Description**

This function handles transferring data to or from the host on the specified endpoint, depending on the direction specified.

<table>
<thead>
<tr>
<th>Direction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EfiUsbEndpointDirectionDeviceTx</td>
<td>Start a transmit transfer on the specified endpoint and return immediately.</td>
</tr>
<tr>
<td>EfiUsbEndpointDirectionDeviceRx</td>
<td>Start a receive transfer on the specified endpoint and return immediately with available data.</td>
</tr>
</tbody>
</table>

A class driver must call **EFI_USBFIN_IO_PROTOCOL.EventHandler()** repeatedly to receive updates on the transfer status and the number of bytes transferred on various endpoints. Upon an update of the transfer status, the **Buffer** field of the **EFI_USBFIN_TRANSFER_RESULT** structure (as described in the function description for **EFI_USBFIN_IO_PROTOCOL.EventHandler()**) must be initialized with the **Buffer** pointer that was supplied to this method.

The overview of the call sequence is illustrated in the Figure 17-3.

This function should fail with **EFI_INVALID_PARAMETER** if the specified direction is incorrect for the endpoint.

**Status codes**

- **EFI_SUCCESS** The function returned successfully.
- **EFI_INVALID_PARAMETER** A parameter is invalid.
- **EFI_DEVICE_ERROR** The physical device reported an error.
- **EFI_NOT_READY** The physical device is busy or not ready to process this request.

**EFI_USBFIN_IO_PROTOCOL.GetMaxTransferSize()**

**Summary**

Returns the maximum supported transfer size.

**Prototype**

```c
typedef EFI_STATUS
  (EFIAPI * EFI_USBFIN_IO_GET_MAXTRANSFER_SIZE) (IN EFI_USBFIN_IO_PROTOCOL *This,
  OUT UINTN MaxTransferSize);
```

**Parameters**

- **This** A pointer to the **EFI_USBFIN_IO_PROTOCOL** instance.
**MaxTransferSize**  The maximum supported transfer size, in bytes.

**Description**
Returns the maximum number of bytes that the underlying controller can accommodate in a single transfer.

**Status Codes**
- **EFI_SUCCESS**: The function returned successfully.
- **EFI_INVALID_PARAMETER**: A parameter is invalid.
- **EFI_DEVICE_ERROR**: The physical device reported an error.
- **EFI_NOT_READY**: The physical device is busy or not ready to process this request.

**EFI_USBFN_IO_PROTOCOL.AllocateTransferBuffer()**

**Summary**
Allocates a transfer buffer of the specified size that satisfies the controller requirements.

**Prototype**
```
typedef
    EFI_STATUS
    (EFIAPI * EFI_USBFN_IO_ALLOCATE_TRANSFER_BUFFER) (
        IN EFI_USBFN_IO_PROTOCOL  *This,
        IN UINTN                  Size,
        OUT VOID                 **Buffer
    );
```

**Parameters**
- **This**: A pointer to the `EFI_USBFN_IO_PROTOCOL` instance.
- **Size**: The number of bytes to allocate for the transfer buffer.
- **Buffer**: A pointer to a pointer to the allocated buffer if the call succeeds; undefined otherwise.

**Description**
The `AllocateTransferBuffer()` function allocates a memory region of `Size` bytes and returns the address of the allocated memory that satisfies the underlying controller requirements in the location referenced by `Buffer`.

The allocated transfer buffer must be freed using a matching call to `EFI_USBFN_IO_PROTOCOL.FreeTransferBuffer()` function.
Status Codes

EFI_SUCCESS The function returned successfully.
EFI_INVALID_PARAMETER A parameter is invalid.
EFI_OUT_OF_RESOURCES The requested transfer buffer could not be allocated.

EFI_USBFN_IO_PROTOCOL.FreeTransferBuffer()

Summary
Deallocations the memory allocated for the transfer buffer by the
EFI_USBFN_IO_PROTOCOL.AllocateTransferBuffer() function.

Prototype

typedef
EFI_STATUS
(EFIAPI * EFI_USBFN_IO_FREE_TRANSFER_BUFFER) (  
    IN EFI_USBFN_IO_PROTOCOL  *This,
    IN VOID                  *Buffer
);

Parameters

This A pointer to the EFI_USBFN_IO_PROTOCOL instance.
Buffer A pointer to the transfer buffer to deallocate.

Description
The EFI_USBFN_IO_PROTOCOL.FreeTransferBuffer() function deallocates the memory specified by Buffer. The Buffer that is freed must have been allocated by
EFI_USBFN_IO_PROTOCOL.AllocateTransferBuffer().

Status Codes

EFI_SUCCESS The function returned successfully.
EFI_INVALID_PARAMETER A parameter is invalid.

EFI_USBFN_IO_PROTOCOL.StartController()

Summary
This function supplies power to the USB controller if needed and initializes the hardware and the internal data structures. The port must not be activated by this function.
Prototype

typedef

EFI_STATUS

(EIFIAPI * EFI_USBFN_IO_START_CONTROLLER) (IN EFI_USBFN_IO_PROTOCOL *This);

Parameters

This A pointer to the EFI_USBFN_IO_PROTOCOL instance.

Description

This function starts the hardware by supplying power to the USB controller if needed, and initializing the hardware and internal data structures. The port must not be activated by this function.

Status codes

EFI_SUCCESS The function returned successfully.
EFI_INVALID_PARAMETER A parameter is invalid.
EFI_DEVICE_ERROR The physical device reported an error.

EFI_USBFN_IO_PROTOCOL.StopController()

Summary

This function stops the USB hardware device.

Prototype

typedef

EFI_STATUS

(EIFIAPI * EFI_USBFN_IO_STOP_CONTROLLER) (IN EFI_USBFN_IO_PROTOCOL *This);

Parameters

This A pointer to the EFI_USBFN_IO_PROTOCOL instance.

Description

This function stops the USB hardware device
Status codes

- EFI_SUCCESS: The function returned successfully.
- EFI_INVALID_PARAMETER: A parameter is invalid.
- EFI_DEVICE_ERROR: The physical device reported an error.

EFI_USBFN_IO_PROTOCOL.SetEndpointPolicy()

Summary
This function sets the configuration policy for the specified non-control endpoint. Refer to the description for calling restrictions.

Prototype

```c
typedef
EFI_STATUS
(EIFIAPI * EFI_USBFN_SET_ENDPOINT_POLICY) (  
    IN EFI_USBFN_IO_PROTOCOL *This,  
    IN UINT8 EndpointIndex,  
    IN EFI_USBFN_ENDPOINT_DIRECTION Direction,  
    IN EFI_USBFN_POLICY_TYPE PolicyType,  
    IN UINTN BufferSize,  
    IN VOID *Buffer  
);
```

Parameters

- **This**: A pointer to the EFI_USBFN_IO_PROTOCOL instance.
- **EndpointIndex**: Indicates the non-control endpoint for which the policy needs to be set.
- **Direction**: Direction of the endpoint. Refer to the "Related Definitions" for the EFI_USBFN_IO_PROTOCOL.AbortTransfer() function for details.
- **PolicyType**: Policy type the user is trying to set for the specified non-control endpoint. Refer to "Related Definitions" for this function below for details.
- **BufferSize**: The size of the Buffer in bytes.
- **Buffer**: The new value for the policy parameter that PolicyType specifies. Refer to "Related Definitions" for this function below for details.

Description
This function sets the configuration policy for the specified non-control endpoint. This function can only be called before EFI_USBFN_IO_PROTOCOL.StartController() or after EFI_USBFN_IO_PROTOCOL.StopController() has been called.
**Status codes**

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The function returned successfully.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>A parameter is invalid.</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>The physical device reported an error.</td>
</tr>
<tr>
<td>EFI_UNSUPPORTED</td>
<td>Changing this policy value is not supported.</td>
</tr>
</tbody>
</table>

**Related Definitions**

```c
typedef enum _EFI_USBFN_POLICY_TYPE
{
    EfiUsbPolicyUndefined = 0,
    EfiUsbPolicyMaxTransactionSize,
    EfiUsbPolicyZeroLengthTerminationSupport,
    EfiUsbPolicyZeroLengthTermination
} EFI_USBFN_POLICY_TYPE;
```

**EfiUsbPolicyUndefined**

Invalid policy value that must never be used across driver boundary. If used, the function must not return a success status code.

**EfiUsbPolicyMaxTransactionSize**

EfiUsbPolicyMaxTransactionSize is only used with `EFI_USBFN_IO_PROTOCOL.GetEndpointPolicy()`. It provides the size of the largest single transaction (delivery of service to an endpoint) supported by a controller. It must be greater than or equal to the maximum transfer size that can be retrieved by calling `EFI_USBFN_IO_PROTOCOL.GetMaxTransferSize()`.

<table>
<thead>
<tr>
<th>BufferSize</th>
<th>GetEndpointPolicy BufferSize</th>
<th>SetEndpointPolicy BufferSize</th>
</tr>
</thead>
<tbody>
<tr>
<td>4 bytes, sizeof(UINT32)</td>
<td>EFI_STATUS</td>
<td>EFI_UNSUPPORTED</td>
</tr>
</tbody>
</table>

**EfiUsbPolicyZeroLengthTerminationSupport**

EfiUsbPolicyZeroLengthTerminationSupport is only used with `EFI_USBFN_IO_PROTOCOL.GetEndpointPolicy()`. It is TRUE if the USB controller is capable of automatically handling zero length packets when the transfer size is a multiple of USB maximum packet size and FALSE if it is not supported by the controller.

<table>
<thead>
<tr>
<th>BufferSize</th>
<th>GetEndpointPolicy BufferSize</th>
<th>SetEndpointPolicy BufferSize</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 byte, sizeof (BOOLEAN)</td>
<td>EFI_STATUS</td>
<td>EFI_UNSUPPORTED</td>
</tr>
</tbody>
</table>
EfiUsbPolicyZeroLengthTermination

When used with
EFI_USBFN_IO_PROTOCOL.GetEndpointPolicy(), a TRUE value is returned if the USB controller hardware is configured to automatically handle zero length packets when the transfer size is a multiple of USB maximum packet size; a FALSE value is returned if the controller hardware is not configured to do this.

Using EFI_USBFN_IO_PROTOCOL.SetEndpointPolicy() to set the EfiUsbPolicyZeroLengthTermination policy is only applicable to USB controller hardware capable of supporting automatic zero length packet termination. When this value is set to TRUE, the controller must be configured to handle zero length termination for the specified endpoint. When this value is set to FALSE, the controller must be configured to not handle zero length termination for the specified endpoint.

The USB controller’s default policy must not enable automatic zero length packet termination, even if the hardware is capable of supporting it.

**EFI_USBFN_IO_PROTOCOL.GetEndpointPolicy()**

**Summary**

This function retrieves the configuration policy for the specified non-control endpoint. There are no associated calling restrictions for this function.

**Prototype**

```c
typedef EFI_STATUS
(EFIAPI * EFI_USBFN_GET_ENDPOINT_POLICY) (  
  IN EFI_USBFN_IO_PROTOCOL        *This,  
  IN UINT8 EndpointIndex,  
  IN EFI_USBFN_ENDPOINT_DIRECTION Direction,  
  IN EFI_USBFN_POLICY_TYPE        PolicyType,  
  IN OUT UINTN                    *BufferSize,  
  IN OUT VOID                     *Buffer  
);  
```

**Parameters**

- **This**: A pointer to the EFI_USBFN_IO_PROTOCOL instance.
- **EndpointIndex**: Indicates the non-control endpoint for which the policy needs to be set.
Direction

Direction of the endpoint. Refer to the "Related Definitions" for the EFI_USBFN_IO_PROTOCOL.AbortTransfer() function for details.

PolicyType

Policy type the user is trying to retrieve for the specified non-control endpoint. Refer to the "Related Definitions" for the EFI_USBFN_IO_PROTOCOL.SetEndpointPolicy() function for details.

BufferSize

On input, the size of Buffer in bytes. On output, the amount of data returned in Buffer in bytes.

Buffer

A pointer to a buffer to return requested endpoint policy value. Refer to the "Related Definitions" for the EFI_USBFN_IO_PROTOCOL.SetEndpointPolicy() function for size requirements of various policy types.

Description

This function retrieves the configuration policy for the specified non-control endpoint. This function has no calling restrictions.

Status codes

EFI_SUCCESS

The function returned successfully.

EFI_INVALID_PARAMETER

A parameter is invalid.

EFI_DEVICE_ERROR

The physical device reported an error.

EFI_UNSUPPORTED

The specified policy value is not supported.

EFI_BUFFER_TOO_SMALL

Supplied buffer is not large enough to hold requested policy value.

18 - Protocols — Debugger Support

This chapter describes a minimal set of protocols and associated data structures necessary to enable the creation of source level debuggers for EFI. It does not fully define a debugger design. Using the services described in this document, it should also be possible to implement a variety of debugger solutions.

18.1 Overview

Efficient UEFI driver and application development requires the availability of source level debugging facilities. Although completely on-target debuggers are clearly possible, UEFI debuggers are generally expected to be remotely hosted. That is to say, the debugger itself will be split between two machines, which are the host and target. A majority of debugger code runs on the host that is typically responsible for disassembly, symbol management, source display, and user interface. Similarly, a smaller piece of code runs on the target that establishes the communication to the host and proxies requests from the host. The on-target code is known as the “debug agent.”

The debug agent design is subdivided further into two parts, which are the processor/platform abstraction and the debugger host specific communication grammar. This specification describes architectural interfaces for the former only. Specific implementations for various debugger host communication grammars can be created that make use of the facilities described in this specification.

The processor/platform abstraction is presented as a pair of protocol interfaces, which are the Debug Support protocol and the Debug Port protocol.

The Debug Support protocol abstracts the processor’s debugging facilities, namely a mechanism to manage the processor’s context via caller-installable exception handlers.

The Debug Port protocol abstracts the device that is used for communication between the host and target. Typically this will be a 16550 serial port, 1394 device, or other device that is nominally a serial stream.

Furthermore, a table driven, quiescent, memory-only mechanism for determining the base address of PE32+ images is provided to enable the debugger host to determine where images are located in memory.

Aside from timing differences that occur because of running code associated with the debug agent and user initiated changes to the machine context, the operation of the on-target debugger component must be transparent to the rest of the system. In addition, no portion of the debug agent that runs in interrupt context may make any calls to EFI services or other protocol interfaces.

The services described in this document do not comprise a complete debugger, rather they provide a minimal abstraction required to implement a wide variety of debugger solutions.

18.2 EFI Debug Support Protocol

This section defines the EFI Debug Support protocol which is used by the debug agent.

18.2.1 EFI Debug Support Protocol Overview

The debug-agent needs to be able to gain control of the machine when certain types of events occur; i.e., breakpoints, processor exceptions, etc. Additionally, the debug agent must also be able to periodically
gain control during operation of the machine to check for asynchronous commands from the host. The EFI Debug Support protocol services enable these capabilities.

The EFI Debug Support protocol interfaces produce callback registration mechanisms which are used by the debug agent to register functions that are invoked either periodically or when specific processor exceptions. When they are invoked by the Debug Support driver, these callback functions are passed the current machine context record. The debug agent may modify this context record to change the machine context which is restored to the machine after the callback function returns. The debug agent does not run in the same context as the rest of UEFI and all modifications to the machine context are deferred until after the callback function returns.

It is expected that there will typically be two instances of the EFI Debug Support protocol in the system. One associated with the native processor instruction set (IA-32, x64, ARM, RISC-V, or Itanium processor family), and one for the EFI virtual machine that implements EFI byte code (EBC).

While multiple instances of the EFI Debug Support protocol are expected, there must never be more than one for any given instruction set.

**EFI_DEBUG_SUPPORT_PROTOCOL**

**Summary**

This protocol provides the services to allow the debug agent to register callback functions that are called either periodically or when specific processor exceptions occur.

**GUID**

```c
#define EFI_DEBUG_SUPPORT_PROTOCOL_GUID
{0x2755590C,0x6F3C,0x42FA,
{0x9E,0xA4,0xA3,0xBA,0x54,0x3C,0xDA,0x25}}
```

**Protocol Interface Structure**

```c
typedef struct {
    EFI_INSTRUCTION_SET_ARCHITECTURE   Isa;
    EFI_GET_MAXIMUM_PROCESSOR_INDEX    GetMaximumProcessorIndex;
    EFI_REGISTER_PERIODIC_CALLBACK    RegisterPeriodicCallback;
    EFI_REGISTER_EXCEPTION_CALLBACK   RegisterExceptionCallback;
    EFI_INVALIDATE_INSTRUCTION_CACHE  InvalidateInstructionCache;
} EFI_DEBUG_SUPPORT_PROTOCOL;
```

**Parameters**

- **Isa**
  
  Declares the processor architecture for this instance of the EFI Debug Support protocol.
GetMaximumProcessorIndex

Returns the maximum processor index value that may be used with EFI_DEBUG_SUPPORT_PROTOCOL.RegisterPeriodicCallback() and EFI_DEBUG_SUPPORT_PROTOCOL.RegisterExceptionCallback(). See the EFI_DEBUG_SUPPORT_PROTOCOL.GetMaximumProcessorIndex() function description.

RegisterPeriodicCallback

Registers a callback function that will be invoked periodically and asynchronously to the execution of EFI. See the RegisterPeriodicCallback() function description.

RegisterExceptionCallback

Registers a callback function that will be called each time the specified processor exception occurs. See the RegisterExceptionCallback() function description.

InvalidateInstructionCache

Invalidate the instruction cache of the processor. This is required by processor architectures where instruction and data caches are not coherent when instructions in the code under debug has been modified by the debug agent. See theEFI_DEBUG_SUPPORT_PROTOCOL.InvalidateInstructionCache() function description.

Related Definitions

Refer to the Microsoft PE/COFF Specification revision 6.2 or later for IMAGE_FILE_MACHINE definitions.

Note: At the time of publication of this specification, the latest revision of the PE/COFF specification was 6.2. The definition of IMAGE_FILE_MACHINE_EBC is not included in revision 6.2 of the PE/COFF specification. It will be added in a future revision of the PE/COFF specification.
// Machine type definition

typedef enum {
    IsaIa32 = IMAGE_FILE_MACHINE_I386,  // 0x014C
    IsaX64 = IMAGE_FILE_MACHINE_X64,     // 0x8664
    IsaIpf = IMAGE_FILE_MACHINE_IA64,    // 0x0200
    IsaEbc = IMAGE_FILE_MACHINE_EBC,     // 0x0EBC
    IsaArm = IMAGE_FILE_MACHINE_ARMTHUMB_MIXED // 0x1C2
    IsaAArch64 = IMAGE_FILE_MACHINE_AARCH64 // 0xAA64
    IsaRISCV32 = IMAGE_FILE_MACHINE_RISCV32 // 0x5032
    IsaRISCV64 = IMAGE_FILE_MACHINE_RISCV64 // 0x5064
    IsaRISCV128 = IMAGE_FILE_MACHINE_RISCV128 // 0x5128
} EFI_INSTRUCTION_SET_ARCHITECTURE;

Description

The EFI Debug Support protocol provides the interfaces required to register debug agent callback functions and to manage the processor’s instruction stream as required. Registered callback functions are invoked in interrupt context when the specified event occurs.

The driver that produces the EFI Debug Support protocol is also responsible for saving the machine context prior to invoking a registered callback function and restoring it after the callback function returns prior to returning to the code under debug. If the debug agent has modified the context record, the modified context must be used in the restore operation.

Furthermore, if the debug agent modifies any of the code under debug (to set a software breakpoint for example), it must call the `InvalidateInstructionCache()` function for the region of memory that has been modified.

**EFI_DEBUG_SUPPORT_PROTOCOL.GetMaximumProcessorIndex()**

**Summary**

Returns the maximum value that may be used for the `ProcessorIndex` parameter in `EFI_DEBUG_SUPPORT_PROTOCOL.RegisterPeriodicCallback()` and `EFI_DEBUG_SUPPORT_PROTOCOL.RegisterExceptionCallback()`.

**Prototype**

```c
typedef
    EFI_STATUS
(EFIAPIC *EFI_GET_MAXIMUM_PROCESSOR_INDEX) ( 
    IN EFI_DEBUG_SUPPORT_PROTOCOL *This,
    OUT UINTN *MaxProcessorIndex
);
```

**Parameters**

- **This**
  A pointer to the `EFI_DEBUG_SUPPORT_PROTOCOL` instance. Type `EFI_DEBUG_SUPPORT_PROTOCOL` is defined in this section.
MaxProcessorIndex  Pointer to a caller-allocated UINTN in which the maximum supported processor index is returned.

Description
The **GetMaximumProcessorIndex()** function returns the maximum processor index in the output parameter MaxProcessorIndex. This value is the largest value that may be used in the ProcessorIndex parameter for both **RegisterPeriodicCallback()** and **RegisterExceptionCallback()**. All values between 0 and MaxProcessorIndex must be supported by **RegisterPeriodicCallback()** and **RegisterExceptionCallback()**.

It is the responsibility of the caller to insure all parameters are correct. There is no provision for parameter checking by **GetMaximumProcessorIndex()**. The implementation behavior when an invalid parameter is passed is not defined by this specification.

**EFI_DEBUG_SUPPORT_PROTOCOL.RegisterPeriodicCallback()**

Summary
Registers a function to be called back periodically in interrupt context.

Prototype

```c
typedef EFI_STATUS (EFIAPI *EFI_REGISTER_PERIODIC_CALLBACK) (
    IN EFI_DEBUG_SUPPORT_PROTOCOL  *This,
    IN UINTN                       ProcessorIndex,
    IN EFI_PERIODIC_CALLBACK       PeriodicCallback
); 
```

Description

The `RegisterPeriodicCallback()` function registers and enables the on-target debug agent’s periodic entry point. To unregister and disable calling the debug agent’s periodic entry point, call `RegisterPeriodicCallback()` passing a `NULL` `PeriodicCallback` parameter.

The implementation must handle saving and restoring the processor context to/from the system context record around calls to the registered callback function.

If the interrupt is also used by the firmware for the EFI time base or some other use, two rules must be observed. First, the registered callback function must be called before any EFI processing takes place. Second, the Debug Support implementation must perform the necessary steps to pass control to the firmware’s corresponding interrupt handler in a transparent manner.

There is no quality of service requirement or specification regarding the frequency of calls to the registered `PeriodicCallback` function. This allows the implementation to mitigate a potential adverse impact to EFI timer based services due to the latency induced by the context save/restore and the associated callback function.

It is the responsibility of the caller to insure all parameters are correct. There is no provision for parameter checking by `RegisterPeriodicCallback()`. The implementation behavior when an invalid parameter is passed is not defined by this specification.

**EFI_DEBUG_SUPPORT_PROTOCOL.RegisterExceptionCallback()**

Summary

Registers a function to be called when a given processor exception occurs.
Prototype

```c
typedef EFI_STATUS
(EFIAPI *REGISTER_EXCEPTION_CALLBACK) (
    IN EFI_DEBUG_SUPPORT_PROTOCOL *This,
    IN UINTN ProcessorIndex,
    IN EFI_EXCEPTION_CALLBACK ExceptionCallback,
    IN EFI_EXCEPTION_TYPE ExceptionType
);
```

Parameters

- **This**: A pointer to the `EFI_DEBUG_SUPPORT_PROTOCOL` instance. Type `EFI_DEBUG_SUPPORT_PROTOCOL` is defined in [Section 18.2](#).
- **ProcessorIndex**: Specifies which processor the callback function applies to.
- **ExceptionCallback**: A pointer to a function of type `EXCEPTION_CALLBACK` that is called when the processor exception specified by `ExceptionType` occurs. Passing `NULL` unregisters any previously registered function associated with `ExceptionType`.
- **ExceptionType**: Specifies which processor exception to hook.
typedef VOID (*EFI_EXCEPTION_CALLBACK) (  
    IN EFI_EXCEPTION_TYPE ExceptionType,  
    IN OUT EFI_SYSTEM_CONTEXT SystemContext  
);

#define EXCEPT_RISCV_SUPERVISOR_EXTERNAL_INT      9
#define EXCEPT_RISCV_MACHINE_EXTERNAL_INT        11

**Description**

The `RegisterExceptionCallback()` function registers and enables an exception callback function for the specified exception. The specified exception must be valid for the instruction set architecture. To unregister the callback function and stop servicing the exception, call `RegisterExceptionCallback()` passing a `NULL` `ExceptionCallback` parameter.

The implementation must handle saving and restoring the processor context to/from the system context record around calls to the registered callback function. No chaining of exception handlers is allowed.

It is the responsibility of the caller to insure all parameters are correct. There is no provision for parameter checking by `RegisterExceptionCallback()`. The implementation behavior when an invalid parameter is passed is not defined by this specification.

</tbody>
</table>

**EFI_DEBUG_SUPPORT_PROTOCOL.InvalidateInstructionCache()**

**Summary**
Invalidates processor instruction cache for a memory range. Subsequent execution in this range causes a fresh memory fetch to retrieve code to be executed.

**Prototype**

```c
typedef EFI_STATUS (EFIAPI *EFI_INVALIDATE_INSTRUCTION_CACHE) (
    IN EFI_DEBUG_SUPPORT_PROTOCOL *This,
    IN UINTN ProcessorIndex,
    IN VOID *Start,
    IN UINT64 Length
);
```

**Parameters**

- **This**
  A pointer to the EFI_DEBUG_SUPPORT_PROTOCOL instance. Type EFI_DEBUG_SUPPORT_PROTOCOL is defined in Section 18.2.

- **ProcessorIndex**
  Specifies which processor’s instruction cache is to be invalidated.

- **Start**
  Specifies the physical base of the memory range to be invalidated.

- **Length**
  Specifies the minimum number of bytes in the processor’s instruction cache to invalidate.

**Description**

Typical operation of a debugger may require modifying the code image that is under debug. This can occur for many reasons, but is typically done to insert/remove software break instructions. Some processor architectures do not have coherent instruction and data caches so modifications to the code image require that the instruction cache be explicitly invalidated in that memory region.

The **InvalidateInstructionCache()** function abstracts this operation from the debug agent and provides a general purpose capability to invalidate the processor’s instruction cache.

It is the responsibility of the caller to insure all parameters are correct. There is no provision for parameter checking by EFI_DEBUG_SUPPORT_PROTOCOL.RegisterExceptionCallback(). The implementation behavior when an invalid parameter is passed is not defined by this specification.
### 18.3 EFI Debugport Protocol

This section defines the EFI Debugport protocol. This protocol is used by debug agent to communicate with the remote debug host.

#### 18.3.1 EFI Debugport Overview

Historically, remote debugging has typically been done using a standard UART serial port to connect the host and target. This is obviously not possible in a legacy reduced system that does not have a UART. The Debugport protocol solves this problem by providing an abstraction that can support many different types of debugport hardware. The debug agent should use this abstraction to communicate with the host.

The interface is minimal with only reset, read, write, and poll abstractions. Since these functions are called in interrupt context, none of them may call any EFI services or other protocol interfaces.

Debugport selection and configuration is handled by setting defaults via an environment variable which contains a full device path to the debug port. This environment variable is used during the debugport driver’s initialization to configure the debugport correctly. The variable contains a full device path to the debugport, with the last node (prior to the terminal node) being a debugport messaging node. See Section 18.3.2 for details.

The driver must also produce an instance of the EFI Device Path protocol to indicate what hardware is being used for the debugport. This may be used by the OS to maintain the debugport across a call to `EFI_BOOT_SERVICES.ExitBootServices()`.

**EFI_DEBUGPORT_PROTOCOL**

**Summary**

This protocol provides the communication link between the debug agent and the remote host.

**GUID**

```c
#define EFI_DEBUGPORT_PROTOCOL_GUID \
{0xEBA4E8D2,0x3858,0x41EC,\ 
  {0xA2,0x81,0x26,0x47,0xBA,0x96,0x60,0xD0}}
```
Protocol Interface Structure

typedef struct {
   EFI_DEBUGPORT_RESET   Reset;
   EFI_DEBUGPORT_WRITE   Write;
   EFI_DEBUGPORT_READ    Read;
   EFI_DEBUGPORT_POLL    Poll;
} EFI_DEBUGPORT_PROTOCOL;

Parameters
Reset
   Resets the debugport hardware.
Write
   Send a buffer of characters to the debugport device.
Read
   Receive a buffer of characters from the debugport device.
Poll
   Determine if there is any data available to be read from the debugport device.

Description
The Debugport protocol is used for byte stream communication with a debugport device. The debugport can be a standard UART Serial port, a USB-based character device, or potentially any character-based I/O device.

The attributes for all UART-style debugport device interfaces are defined in the DEBUGPORT variable (see Section 18.3.2).

EFI_DEBUGPORT_PROTOCOL.Reset()

Summary
Resets the debugport.

Prototype

typedef
   EFI_STATUS
   (EFIAPI *EFI_DEBUGPORT_RESET) (  
      IN EFI_DEBUGPORT_PROTOCOL   *This
   );

Parameters
This
   A pointer to the EFI_DEBUGPORT_PROTOCOL instance. Type EFI_DEBUGPORT_PROTOCOL is defined in Section 18.3.

Description
The Reset() function resets the debugport device.

It is the responsibility of the caller to insure all parameters are valid. There is no provision for parameter checking by Reset(). The implementation behavior when an invalid parameter is passed is not defined by this specification.
Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The debugport device was reset and is in usable state.</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>The debugport device could not be reset and is unusable.</td>
</tr>
</tbody>
</table>

**EFI_DEBUGPORT_PROTOCOL.Write()**

**Summary**

Writes data to the debugport.

**Prototype**

```c
typedef EFI_STATUS
    (EFIAPI *EFI_DEBUGPORT_WRITE) (    
    IN EFI_DEBUGPORT_PROTOCOL  *This,    
    IN UINT32    Timeout,    
    IN OUT UINTN *BufferSize,    
    IN VOID       *Buffer    
    );
```

**Parameters**

- **This** A pointer to the EFI_DEBUGPORT_PROTOCOL instance. Type EFI_DEBUGPORT_PROTOCOL is defined in Section 18.3.
- **Timeout** The number of microseconds to wait before timing out a write operation.
- **BufferSize** On input, the requested number of bytes of data to write. On output, the number of bytes of data actually written.
- **Buffer** A pointer to a buffer containing the data to write.

**Description**

The `Write()` function writes the specified number of bytes to a debugport device. If a timeout error occurs while data is being sent to the debugport, transmission of this buffer will terminate, and EFI_TIMEOUT will be returned. In all cases the number of bytes actually written to the debugport device is returned in BufferSize.

It is the responsibility of the caller to insure all parameters are valid. There is no provision for parameter checking by `Write()`. The implementation behavior when an invalid parameter is passed is not defined by this specification.
Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The data was written.</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>The device reported an error.</td>
</tr>
<tr>
<td>EFI_TIMEOUT</td>
<td>The data write was stopped due to a timeout.</td>
</tr>
</tbody>
</table>

**EFI_DEBUGPORT_PROTOCOL.Read()**

**Summary**
Reads data from the debugport.

**Prototype**
```c
typedef EFI_STATUS (EFIAPI *EFI_DEBUGPORT_READ) (  
    IN EFI_DEBUGPORT_PROTOCOL  *This,  
    IN UINT32                  Timeout,  
    IN OUT UINTN               *BufferSize,  
    OUT VOID                   *Buffer  
);
```

**Parameters**
- **This** A pointer to the EFI_DEBUGPORT_PROTOCOL instance. Type EFI_DEBUGPORT_PROTOCOL is defined in Section 18.3.
- **Timeout** The number of microseconds to wait before timing out a read operation.
- **BufferSize** A pointer to an integer which, on input contains the requested number of bytes of data to read, and on output contains the actual number of bytes of data read and returned in Buffer.
- **Buffer** A pointer to a buffer into which the data read will be saved.

**Description**
The Read() function reads a specified number of bytes from a debugport. If a timeout error or an overrun error is detected while data is being read from the debugport, then no more characters will be read, and EFI_TIMEOUT will be returned. In all cases the number of bytes actually read is returned in *BufferSize.

It is the responsibility of the caller to insure all parameters are valid. There is no provision for parameter checking by Read(). The implementation behavior when an invalid parameter is passed is not defined by this specification.
Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The data was read.</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>The debugport device reported an error.</td>
</tr>
<tr>
<td>EFI_TIMEOUT</td>
<td>The operation was stopped due to a timeout or overrun.</td>
</tr>
</tbody>
</table>

EFI_DEBUGPORT_PROTOCOL.Poll()

Summary
Checks to see if any data is available to be read from the debugport device.

Prototype
```c
typedef EFI_STATUS (EFIAPI *EFI_DEBUGPORT_POLL) (
    IN EFI_DEBUGPORT_PROTOCOL *This
);
```

Parameters
- **This**: A pointer to the EFI_DEBUGPORT_PROTOCOL instance. Type EFI_DEBUGPORT_PROTOCOL is defined in Section 18.3.

Description
The Poll() function checks if there is any data available to be read from the debugport device and returns the result. No data is actually removed from the input stream. This function enables simpler debugger design since buffering of reads is not necessary by the caller.

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>At least one byte of data is available to be read.</td>
</tr>
<tr>
<td>EFI_NOT_READY</td>
<td>No data is available to be read.</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>The debugport device is not functioning correctly.</td>
</tr>
</tbody>
</table>

18.3.2 Debugport Device Path

The debugport driver must establish and maintain an instance of the EFI Device Path protocol for the debugport. A graceful handoff of debugport ownership between the EFI Debugport driver and an OS debugport driver requires that the OS debugport driver can determine the type, location, and configuration of the debugport device.

The Debugport Device Path is a vendor-defined messaging device path with no data, only a GUID. It is used at the end of a conventional device path to tag the device for use as the debugport. For example, a typical UART debugport would have the following fully qualified device path:

```
PciRoot(0)/Pci(0x1f,0)/ACPI(PNP0501,0)/UART(115200,N,8,1)/DebugPort()
```

The Vendor_GUID that defines the debugport device path is the same as the debugport protocol GUID, as defined below.
Table 18-1 shows all fields of the debugport device path.

**Table 18-1 Debugport Messaging Device Path**

</tr>
</tbody>
</table>

### 18.3.3 EFI Debugport Variable

Even though there may be more than one hardware device that could function as a debugport in a system, only one debugport may be active at a time. The DEBUGPORT variable is used to declare which hardware device will act as the debugport, and what communication parameters it should assume.

Like all EFI variables, the DEBUGPORT variable has both a name and a GUID. The name is “DEBUGPORT.” The GUID is the same as the `EFI_DEBUGPORT_PROTOCOL_GUID`:

```c
#define EFI_DEBUGPORT_VARIABLE_NAME L"DEBUGPORT"
#define EFI_DEBUGPORT_VARIABLE_GUID EFI_DEBUGPORT_PROTOCOL_GUID
```

The data contained by the DEBUGPORT variable is a fully qualified debugport device path (see Section 18.3.2).

The desired communication parameters for the debugport are declared in the DEBUGPORT variable. The debugport driver must read this variable during initialization to determine how to configure the debug port.

To reduce the required complexity of the debugport driver, the debugport driver is not required to support all possible combinations of communication parameters. What combinations of parameters are possible is implementation specific.

Additionally debugport drivers implemented for PNP0501 devices, that is debugport devices with a PNP0501 ACPI node in the device path, must support the following defaults. These defaults must be used in the absence of a DEBUGPORT variable, or when the communication parameters specified in the DEBUGPORT variable are not supported by the driver.

- Baud : 115200
- 8 data bits
- No parity
- 1 stop bit
- No flow control (See Appendix A for flow control details)

In the absence of the DEBUGPORT variable, the selection of which port to use as the debug port is implementation specific.
Future revisions of this specification may define new defaults for other debugport types.

The debugport device path must be constructed to reflect the actual settings for the debugport. Any code needing to know the state of the debug port must reference the device path rather than the DEBUGPORT variable, since the debugport may have assumed a default setting in spite of the existence of the DEBUGPORT variable.

If it is not possible to configure the debug port using either the settings declared in the DEBUGPORT variable or the default settings for the particular debugport type, the driver initialization must not install any protocol interfaces and must exit with an error.

### 18.4 EFI Debug Support Table

This chapter defines the EFI Debug Support Table which is used by the debug agent or an external debugger to determine loaded image information in a quiescent manner.

#### 18.4.1 Overview

Every executable image loaded in EFI is represented by an EFI handle populated with an instance of the EFI_LOADED_IMAGE_PROTOCOL protocol. This handle is known as an “image handle.” The associated Loaded Image protocol provides image information that is of interest to a source level debugger. Normal EFI executables can access this information by using EFI services to locate all instances of the Loaded Image protocol.

A debugger has two problems with this scenario. First, if it is an external hardware debugger, the location of the EFI system table is not known. Second, even if the location of the EFI system table is known, the services contained therein are generally unavailable to a debugger either because it is an on-target debugger that is running in interrupt context, or in the case of an external hardware debugger there is no debugger code running on the target at all.

Since a source level debugger must be capable of determining image information for all loaded images, an alternate mechanism that does not use EFI services must be provided. Two features are added to the EFI system software to enable this capability.

First, an alternate mechanism of locating the EFI system table is required. A check-summed structure containing the physical address of the EFI system table is created and located on a 4M aligned memory address. A hardware debugger can search memory for this structure to determine the location of the EFI system table.

Second, an EFI_CONFIGURATION_TABLE is published that leads to a database of pointers to all instances of the Loaded Image protocol. Several layers of indirection are used to allow dynamically managing the data as images are loaded and unloaded. Once the address of the EFI system table is known, it is possible to discover a complete and accurate list of EFI images. (Note that the EFI core itself must be represented by an instance of the Loaded Image protocol.)

Figure 18-1 illustrates the table indirection and pointer usage.
18.4.2 EFI System Table Location

The EFI system table can be located by an off-target hardware debugger by searching for the EFI_SYSTEM_TABLE_POINTER structure. The EFI_SYSTEM_TABLE_POINTER structure is located on a 4M boundary as close to the top of physical memory as feasible. It may be found searching for the EFI_SYSTEM_TABLE_SIGNATURE on each 4M boundary starting at the top of memory and scanning down. When the signature is found, the entire structure must be verified using the Crc32 field. The 32-bit CRC of the entire structure is calculated assuming the Crc32 field is zero. This value is then written to the Crc32 field.

\[
\text{typedef struct _EFI_SYSTEM_TABLE_POINTER} \\
\quad \{ \\
\quad \quad \text{UINT64 Signature;} \\
\quad \quad \text{EFI_PHYSICAL_ADDRESS EfiSystemTableBase;} \\
\quad \quad \text{UINT32 Crc32;} \\
\quad \} \text{ EFI_SYSTEM_TABLE(Pointer);}
\]

**Signature**
A constant UINT64 that has the value EFI_SYSTEM_TABLE_SIGNATURE (see the EFI 1.0 specification).

**EfiSystemTableBase**
The physical address of the EFI system table.

**Crc32**
A 32-bit CRC value that is used to verify the EFI_SYSTEM_TABLE(Pointer) structure is valid.

18.4.3 EFI Image Info

The EFI_DEBUG_IMAGE_INFO_TABLE is an array of pointers to EFI_DEBUG_IMAGE_INFO unions. Each member of an EFI_DEBUG_IMAGE_INFO union is a pointer to a data structure representing a particular image type. For each image that has been loaded, there is an appropriate image data structure with a
pointer to it stored in the EFI_DEBUG_IMAGE_INFO_TABLE. Data structures for normal images and SMM images are defined. All other image types are reserved for future use.

The process of locating the EFI_DEBUG_IMAGE_INFO_TABLE begins with an EFI configuration table.

```
// EFI_DEBUG_IMAGE_INFO_TABLE configuration table
// GUID declaration - {49152E77-1ADA-4764-B7A2-7AFE0ED95E8B}

#define EFI_DEBUG_IMAGE_INFO_TABLE_GUID  
  {0x49152E77,0x1ADA,0x4764,\ 
   0xB7,0xA2,0x7A,0xFE,0xFE,0xD9,0x5E,0x8B }
```

The address reported in the EFI configuration table entry of this type will be referenced as physical and will not be fixed up when transition from preboot to runtime phase.

The configuration table leads to an EFI_DEBUG_IMAGE_INFO_TABLE_HEADER structure that contains a pointer to the EFI_DEBUG_IMAGE_INFO_TABLE and some status bits that are used to control access to the EFI_DEBUG_IMAGE_INFO_TABLE when it is being updated.

```
// UpdateStatus bits
//
#define EFI_DEBUG_IMAGE_INFO_UPDATE_IN_PROGRESS 0x01
#define EFI_DEBUG_IMAGE_INFO_TABLE_MODIFIED     0x02

typedef struct {
  volatile UINT32   UpdateStatus;
  UINT32           TableSize;
  EFI_DEBUG_IMAGE_INFO  *EfiDebugImageInfoTable;
} EFI_DEBUG_IMAGE_INFO_TABLE_HEADER;
```

**UpdateStatus**

UpdateStatus is used by the system to indicate the state of the debug image info table.

The EFI_DEBUG_IMAGE_INFO_UPDATE_IN_PROGRESS bit must be set when the table is being modified. Software consuming the table must qualify the access to the table with this bit.

The EFI_DEBUG_IMAGE_INFO_TABLE_MODIFIED bit is always set by software that modifies the table. It may be cleared by software that consumes the table once the entire table has been read. It is essentially a sticky version of the EFI_DEBUG_IMAGE_INFO_UPDATE_IN_PROGRESS bit and is intended to provide an efficient mechanism to minimize the number of times the table must be scanned by the consumer.

**TableSize**

The number of EFI_DEBUG_IMAGE_INFO elements in the array pointed to by EfiDebugImageInfoTable.

**EfiDebugImageInfoTable**

A pointer to the first element of an array of EFI_DEBUG_IMAGE_INFO structures.
#define EFI_DEBUG_IMAGE_INFO_TYPE_NORMAL 0x01

typedef union {
    UINT32 *ImageInfoType;
    EFI_DEBUG_IMAGE_INFO_NORMAL *NormalImage;
} EFI_DEBUG_IMAGE_INFO;

typedef struct {
    UINT32 ImageInfoType;
    EFI_LOADED_IMAGE_PROTOCOL *LoadedImageProtocolInstance;
    EFI_HANDLE ImageHandle;
} EFI_DEBUG_IMAGE_INFO_NORMAL;

ImageInfoType Indicates the type of image info structure. For PE32 EFI images, this is set to EFI_DEBUG_IMAGE_INFO_TYPE_NORMAL.

LoadedImageProtocolInstance A pointer to an instance of the loaded image protocol for the associated image.

ImageHandle Indicates the image handle of the associated image.
19 - Protocols — Compression Algorithm Specification

In EFI firmware storage, binary codes/data are often compressed to save storage space. These compressed codes/data are extracted into memory for execution at boot time. This demands an efficient lossless compression/decompression algorithm. The compressor must produce small compressed images, and the decompressor must operate fast enough to avoid delays at boot time.

This chapter describes in detail the UEFI compression/decompression algorithm, as well as the EFI Decompress Protocol. The EFI Decompress Protocol provides a standard decompression interface for use at boot time.

19.1 Algorithm Overview

In this chapter, the term “character” denotes a single byte and the term “string” denotes a series of concatenated characters.

The compression/decompression algorithm used in EFI firmware storage is a combination of the LZ77 algorithm and Huffman Coding. The LZ77 algorithm replaces a repeated string with a pointer to the previous occurrence of the string. Huffman Coding encodes symbols in a way that the more frequently a symbol appears in a text, the shorter the code that is assigned to it.

The compression process contains two steps:

- The first step is to find repeated strings (using LZ77 algorithm) and produce intermediate data.
  
  Beginning with the first character, the compressor scans the source data and determines if the characters starting at the current position can form a string previously appearing in the text. If a long enough matching string is found, the compressor will output a pointer to the string. If the pointer occupies more space than the string itself, the compressor will output the original character at the current position in the source data. Then the compressor advances to the next position and repeats the process. To speed up the compression process, the compressor dynamically maintains a String Info Log to record the positions and lengths of strings encountered, so that string comparisons are performed quickly by looking up the String Info Log.

  Because a compressor cannot have unlimited resources, as the compression continues the compressor removes “old” string information. This prevents the String Info Log from becoming too large. As a result, the algorithm can only look up repeated strings within the range of a fixed-sized “sliding window” behind the current position.

  In this way, a stream of intermediate data is produced which contains two types of symbols: the Original Characters (to be preserved in the decompressed data), and the Pointers (representing a previous string). A Pointer consists of two elements: the String Position and the String Length, representing the location and the length of the target string, respectively.

- To improve the compression ratio further, Huffman Coding is utilized as the second step.

  The intermediate data (consisting of original characters and pointers) is divided into Blocks so that the compressor can perform Huffman Coding on a Block immediately after it is generated; eliminating the need for a second pass from the beginning after the intermediate data has been generated. Also, since symbol frequency distribution may differ in different parts of the intermediate data, Huffman Coding can be optimized for each specific Block. The compressor determines Block Size for each Block according to the specifications defined in Section 19.2.
In each Block, two symbol sets are defined for Huffman Coding. The **Char&Len Set** consists of the Original Characters plus the String Lengths and the **Position Set** consists of String Positions (Note that the two elements of a Pointer belong to separate symbol sets). The Huffman Coding schemes applied on these two symbol sets are independent.

The algorithm uses “canonical” Huffman Coding so a Huffman tree can be represented as an array of code lengths in the order of the symbols in the symbol set. This code length array represents the Huffman Coding scheme for the symbol set. Both the Char&Len Set code length array and the Position Set code length array appear in the Block Header.

Huffman coding is used on the code length array of the Char&Len Set to define a third symbol set. The **Extra Set** is defined based on the code length values in the Char&Len Set code length array. The code length array for the Huffman Coding of Extra Set also appears in the Block Header together with the other two code length arrays. For exact format of the Block Header, see Section 19.2.3.1.

The decompression process is straightforward given that the compression process is known. The decompressor scans the compressed data and decodes the symbols one by one, according to the Huffman code mapping tables generated from code length arrays. Along the process, if it encounters an original character, it outputs it; if it encounters a pointer, it looks it up in the already decompressed data and outputs the associated string.

### 19.2 Data Format

This section describes in detail the format of the compressed data produced by the compressor. The compressed data serves as input to the decompressor and can be fully extracted to the original source data.

#### 19.2.1 Bit Order

In computer data representation, a byte is the minimum unit and there is no differentiation in the order of bits within a byte. However, the compressed data is a sequence of bits rather than a sequence of bytes and as a result the order of bits in a byte needs to be defined. In a compressed data stream, the higher bits are defined to precede the lower bits in a byte. **Figure 19-1** illustrates a compressed data sequence written as bytes from left to right. For each byte, the bits are written in an order with bit 7 (the highest bit) at the left and bit 0 (the lowest bit) at the right. Concatenating the bytes from left to right forms a bit sequence.

![Figure 19-1 Bit Sequence of Compressed Data](OM13173)
The bits of the compressed data are actually formed by a sequence of data units. These data units have variable bit lengths. The bits of each data unit are arranged so that the higher bit of the data unit precedes the lower bit of the data unit.

### 19.2.2 Overall Structure

The compressed data begins with two 32-bit numerical fields: the compressed size and the original size. The compressed data following these two fields is composed of one or more Blocks. Each Block is a unit for Huffman Coding with a coding scheme independent of the other Blocks. Each Block is composed of a Block Header containing the Huffman code trees for this Block and a Block Body with the data encoded using the coding scheme defined by the Huffman trees. The compressed data is terminated by an additional byte of zero.

The overall structure of the compressed data is shown in Figure 19-2.

![Figure 19-2 Compressed Data Structure](image)

Note the following:

- Blocks are of variable lengths.
- Block lengths are counted by bits and not necessarily divisible by 8. Blocks are tightly packed (there are no padding bits between blocks). Neither the starting position nor ending position of a Block is necessarily at a byte boundary. However, if the last Block is not terminated at a byte boundary, there should be some bits of 0 to fill up the remaining bits of the last byte of the block, before the terminator byte of 0.
- Compressed Size = Size in bytes of (Block 0 + Block 1 + ... + Block N + Filling Bits (if any) + Terminator).
- Original Size is the size in bytes of original data.
- Both Compressed Size and Original Size are “little endian” (starting from the least significant byte).

### 19.2.3 Block Structure

A Block is composed of a Block Header and a Block Body, as shown in Figure 19-3. These two parts are packed tightly (there are no padding bits between them). The lengths in bits of Block Header and Block Body are not necessarily divisible by eight.
19.2.3.1 Block Header

The Block Header contains the Huffman encoding information for this block. Since “canonical” Huffman Coding is being used, a Huffman tree is represented as an array of code lengths in increasing order of the symbols in the symbol set. Code lengths are limited to be less than or equal to 16 bits. This requires some extra handling of Huffman codes in the compressor, which is described in Section 19.3.

There are three code length arrays for three different symbol sets in the Block Header: one for the Extra Set, one for the Char&Len Set, and one for the Position Set.

The Block Header is composed of the tightly packed (no padding bits) fields described in Table 19-1.

Table 19-1 Block Header Fields

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Length (bits)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Block Size</td>
<td>16</td>
<td>The size of this Block. Block Size is defined as the number of original characters plus the number of pointers that appear in the Block Body: Block Size = Number of Original Characters in the Block Body + Number of Pointers in the Block Body.</td>
</tr>
<tr>
<td>Extra Set Code Length Array Size</td>
<td>5</td>
<td>The number of code lengths in the Extra Set Code Length Array. The Extra Set Code Length Array contains code lengths of the Extra Set in increasing order of the symbols, and if all symbols greater than a certain symbol have zero code length, the Extra Set Code Length Array terminates at the last nonzero code length symbol. Since there are 19 symbols in the Extra Set (see the description of the Char&amp;Len Set Code Length Array), the maximum Extra Set Code Length Array Size is 19.</td>
</tr>
<tr>
<td>Extra Set Code Length Array</td>
<td>Variable</td>
<td>If Extra Set Code Length Array Size is 0, then this field is a 5-bit value that represents the only Huffman code used. If Extra Set Code Length Array Size is not 0, then this field is an encoded form of a concatenation of code lengths in increasing order of the symbols. The concatenation of Code lengths are encoded as follows: If a code length is less than 7, then it is encoded as a 3-bit value; if a code length is equal to or greater than 7, then it is encoded as a series of “1”s followed by a terminating “0.” The number of “1”s = Code length – 4. For example, code length “ten” is encoded as “111110”; code length “seven” is encoded as “1110.” After the third length of the code length concatenation, a 2-bit value is used to indicate the number of consecutive zero lengths immediately after the third length. (Note this 2-bit value only appears once after the third length, and does NOT appear multiple times after every 3rd length.) This 2-bit value ranges from 0 to 3. For example, if the 2-bit value is “00,” then it means there are no zero lengths at the point, and following encoding starts from the fourth code length; if the 2-bit value is “10” then it means the fourth and fifth length are zero and following encoding starts from the sixth code length.</td>
</tr>
</tbody>
</table>
19.2.3.2 Block Body

The Block Body is simply a mixture of Original Characters and Pointers, while each Pointer has two elements: String Length preceding String Position. All these data units are tightly packed together.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Length (bits)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Position Set Code Length Array Size</td>
<td>4</td>
<td>The number of code lengths in the Position Set Code Length Array. The Position Set Code Length Array contains code lengths of Position Set in increasing order of the symbols in the Position Set, and if all symbols greater than a certain symbol have zero code length, the Position Set Code Length Array terminates at the last nonzero code length symbol. Since there are 14 symbols in the Position Set (see 3.3.2), the maximum Position Set Code Length Array Size is 14.</td>
</tr>
<tr>
<td>Char&amp;Len Set Code Length Array</td>
<td>Variable</td>
<td>If Char&amp;Len Set Code Length Array Size is 0, then this field is a 9-bit value that represents the only Huffman code used. If Char&amp;Len Set Code Length Array Size is not 0, then this field is an encoded form of a concatenation of code lengths in increasing order of the symbols. The concatenation of Code lengths are two-step encoded: Step 1: If a code length is not zero, then it is encoded as “code length + 2”; if a code length is zero, then the number of consecutive zero lengths starting from this code length is counted -- if the count is equal to or less than 2, then the code “0” is used for each zero length; if the count is greater than 2 and less than 19, then the code “1” followed by a 4-bit value of “count – 3” is used for these consecutive zero lengths; if the count is equal to 19, then it is treated as “1 + 18,” and a code “0” and a code “1” followed by a 4-bit value of “15” are used for these consecutive zero lengths; if the count is greater than 19, then the code “2” followed by a 9-bit value of “count – 20” is used for these consecutive zero lengths. Step 2: The second step encoding is a Huffman encoding of the codes produced by first step. (While encoding codes “1” and “2,” their appended values are not encoded and preserved in the resulting text). The code lengths of generated Huffman tree are just the contents of the Extra Set Code Length Array.</td>
</tr>
<tr>
<td>Position Set Code Length Array Size</td>
<td>4</td>
<td>The number of code lengths in the Position Set Code Length Array. The Position Set Code Length Array contains code lengths of Position Set in increasing order of the symbols in the Position Set, and if all symbols greater than a certain symbol have zero code length, the Position Set Code Length Array terminates at the last nonzero code length symbol. Since there are 14 symbols in the Position Set (see 3.3.2), the maximum Position Set Code Length Array Size is 14.</td>
</tr>
<tr>
<td>Position Set Code Length Array</td>
<td>Variable</td>
<td>If Position Set Code Length Array Size is 0, then this field is a 5-bit value that represents the only Huffman code used. If Position Set Code Length Array Size is not 0, then this field is an encoded form of a concatenation of code lengths in increasing order of the symbols. The concatenation of Code lengths are encoded as follows: If a code length is less than 7, then it is encoded as a normal 3-bit value; if a code length is equal to or greater than 7, then it is encoded as a series of “1”s followed by a terminating “0.” The number of “1”s = Code length – 4. For example, code length “10” is encoded as “111110”; code length “7” is encoded as “1110.”</td>
</tr>
</tbody>
</table>
The Original Characters, String Lengths and String Positions are all Huffman coded using the Huffman trees presented in the Block Header, with some additional variations. The exact format is described below:

An Original Character is a byte in the source data. A String Length is a value that is greater than 3 and less than 257 (this range should be ensured by the compressor). By calculating “(String Length – 3) | 0x100,” a value set is obtained that ranges from 256 to 509. By combining this value set with the value set of Original Characters (0 ~ 255), the Char&Len Set (ranging from 0 to 509) is generated for Huffman Coding.

A String Position is a value that indicates the distance between the current position and the target string. The String Position value is defined as “Current Position – Starting Position of the target string - 1.” The String Position value ranges from 0 to 8190 (so 8192 is the “sliding window” size, and this range should be ensured by the compressor). The lengths of the String Position values (in binary form) form a value set ranging from 0 to 13 (it is assumed that value 0 has length of 0). This value set is the Position Set for Huffman Coding. The full representation of a String Position value is composed of two consecutive parts: one is the Huffman code for the value length; the other is the actual String Position value of “length - 1” bits (excluding the highest bit since the highest bit is always “1”). For example, String Position value 18 is represented as: Huffman code for “5” followed by “0010.” If the value length is 0 or 1, then no value is appended to the Huffman code. This kind of representation favors small String Position values, which is a hint for compressor design.

19.3 Compressor Design

The compressor takes the source data as input and produces a compressed image. This section describes the design used in one possible implementation of a compressor that follows the UEFI Compression Algorithm. The source code that illustrates an implementation of this specific design is listed in Appendix H.

19.3.1 Overall Process

The compressor scans the source data from the beginning, character by character. As the scanning proceeds, the compressor generates Original Characters or Pointers and outputs the compressed data packed in a series of Blocks representing individual Huffman coding units.

The compressor maintains a String Info Log containing data that facilitates string comparison. Old data items are deleted and new data items are inserted regularly.

The compressor does not output a Pointer immediately after it sees a matching string for the current position. Instead, it delays its decision until it gets the matching string for the next position. The compressor has two criteria at hand: one is that the former match length should be no shorter than three characters; the other is that the former match length should be no shorter than the latter match length.
Only when these two criteria are met does the compressor output a Pointer to the former matching string.

The overall process of compression can be described by following pseudo code:

```
Set the Current Position at the beginning of the source data;
Delete the outdated string info from the String Info Log;
Search the String Info Log for matching string;
Add the string info of the current position into the String Info Log;
WHILE not end of source data DO
    Remember the last match;
    Advance the Current Position by 1;
    Delete the outdated String Info from the String Info Log;
    Search the String Info Log for matching string;
    Add the string info of the Current Position into the String Info Log;
    IF the last match is shorter than 3 characters or this match is longer than
    the last match THEN
        Call Output() to output the character at the previous position as an
        Original Character;
    ELSE
        Call Output() to output a Pointer to the last matching string;
        WHILE (--last match length) > 0 DO
            Advance the Current Position by 1;
            Delete the outdated piece of string info from the String Info Log;
            Add the string info of the current position into the String Info Log;
        ENDWHILE
    ENDIF
ENDWHILE

The Output() is the function that is responsible for generating Huffman codes and Blocks. It accepts an Original Character or a Pointer as input and maintains a Block Buffer to temporarily store data units that are to be Huffman coded. The following pseudo code describes the function:

```
FUNCTION NAME: Output
INPUT: an Original Character or a Pointer

Put the Original Character or the Pointer into the Block Buffer;
Advance the Block Buffer position pointer by 1;
IF the Block Buffer is full THEN
    Encode the Char&Len Set in the Block buffer;
    Encode the Position Set in the Block buffer;
    Encode the Extra Set;
    Output the Block Header containing the code length arrays;
    Output the Block Body containing the Huffman encoded Original Characters and
    Pointers;
    Reset the Block Buffer position pointer to point to the beginning of the
    Block buffer;
ENDIF
```

19.3.2 String Info Log

The provision of the String Info Log is to speed up the process of finding matching strings. The design of this has significant impact on the overall performance of the compressor. This section describes in detail how String Info Log is implemented and the typical operations on it.
19.3.2.1 Data Structures

The String Info Log is implemented as a set of search trees. These search trees are dynamically updated as the compression proceeds through the source data. The structure of a typical search tree is depicted in Figure 19-5.

There are three types of nodes in a search tree: the root node, internal nodes, and leaves. The root node has a "character" attribute, which represents the starting character of a string. Each edge also has a "character" attribute, which represents the next character in the string. Each internal node has a "level" attribute, which indicates the character on any edge that leads to its child nodes is the "level + 1"th character in the string. Each internal node or leaf has a "position" attribute that indicates the string’s starting position in the source data.

To speed up the tree searching, a hash function is used. Given the parent node and the edge-character, the hash function will quickly find the expected child node.

19.3.2.2 Searching the Tree

Traversing the search tree is performed as follows:

The following example uses the search tree shown in Figure 19-5 above. Assume that the current position in the source data contains the string “camxrsxpj....”

1. The starting character “c” is used to find the root of the tree. The next character “a” is used to follow the edge from node 1 to node 2. The “position” of node 2 is 500, so a string starting with
“ca” can be found at position 500. The string at the current position is compared with the string starting at position 500.

2. Node 2 is at Level 3; so at most three characters are compared. Assume that the three-character comparison passes.

3. The fourth character “x” is used to follow the edge from Node 2 to Node 5. The position value of node 5 is 400, which means there is a string located in position 400 that starts with “cam” and the character at position 403 is an “x.”

4. Node 5 is at Level 8, so the fifth to eighth characters of the source data are compared with the string starting at position 404. Assume the strings match.

5. At this point, the ninth character “p” has been reached. It is used to follow the edge from Node 5 to Node 7.

6. This process continues until a mismatch occurs, or the length of the matching strings exceeds the predefined MAX_MATCH_LENGTH. The most recent matching string (which is also the longest) is the desired matching string.

19.3.2.3 Adding String Info

String info needs to be added to the String Info Log for each position in the source data. Each time a search for a matching string is performed, the new string info is inserted for the current position. There are several cases that can be discussed:

1. No root is found for the first character. A new tree is created with the root node labeled with the starting character and a child leaf node with its edge to the root node labeled with the second character in the string. The “position” value of the child node is set to the current position.

2. One root node matches the first character, but the second character does not match any edge extending from the root node. A new child leaf node is created with its edge labeled with the second character. The “position” value of the new leaf child node is set to the current position.

3. A string comparison succeeds with an internal node, but a matching edge for the next character does not exist. This is similar to (2) above. A new child leaf node is created with its edge labeled with the character that does not exist. The “position” value of the new leaf child node is set to the current position.

4. A string comparison exceeds MAX_MATCH_LENGTH. Note: This only happens with leaf nodes. For this case, the “position” value in the leaf node is updated with the current position.

5. If a string comparison with an internal node or leaf node fails (mismatch occurs before the “Level + 1”th character is reached or MAX_MATCH_LENGTH is exceeded), then a “split” operation is performed as follows:

Suppose a comparison is being performed with a level 9 Node, at position 350, and the current position is 1005. If the sixth character at position 350 is an “x” and the sixth character at position 1005 is a “y,” then a mismatch will occur. In this case, a new internal node and a new child node are inserted into the tree, as depicted in Figure 19-6.
Figure 19-6 Node Split

The b) portion of Figure 19-6 has two new inserted nodes, which reflects the new string information that was found at the current position. The process splits the old node into two child nodes, and that is why this operation is called a “split.”

19.3.2.4 Deleting String Info

The String Info Log will grow as more and more string information is logged. The size of the String Info Log must be limited, so outdated information must be removed on a regular basis. A sliding window is maintained behind the current position, and the searches are always limited within the range of the sliding window. Each time the current position is advanced, outdated string information that falls outside the sliding window should be removed from the tree. The search for outdated string information is simplified by always updating the nodes’ “position” attribute when searching for matching strings.

19.3.3 Huffman Code Generation

Another major component of the compressor design is generation of the Huffman Code.

Huffman Coding is applied to the Char&Len Set, the Position Set, and the Extra Set. The Huffman Coding used here has the following features:

- The Huffman tree is represented as an array of code lengths (“canonical” Huffman Coding);
- The maximum code length is limited to 16 bits.
The Huffman code generation process can be divided into three steps. These are the generation of Huffman tree, the adjustment of code lengths, and the code generation.

### 19.3.3.1 Huffman Tree Generation

This process generates a typical Huffman tree. First, the frequency of each symbol is counted, and a list of nodes is generated with each node containing a symbol and the symbol’s frequency. The two nodes with the lowest frequency values are merged into a single node. This new node becomes the parent node of the two nodes that are merged. The frequency value of this new parent node is the sum of the two child nodes’ frequency values. The node list is updated to include the new parent node but exclude the two child nodes that are merged. This process is repeated until there is a single node remaining that is the root of the generated tree.

### 19.3.3.2 Code Length Adjustment

The leaf nodes of the tree generated by the previous step represent all the symbols that were generated. Traditionally the code for each symbol is found by traversing the tree from the root node to the leaf node. Going down a left edge generates a “0,” and going down a right edge generates a “1.” However, a different approach is used here. The number of codes of each code length is counted. This generates a 16-element `LengthCount` array, with `LengthCount[i] = Number Of Codes whose Code Length is i`. Since a code length may be longer than 16 bits, the sixteenth entry of the `LengthCount` array is set to the Number Of Codes whose Code Length is greater than or equal to 16.

The `LengthCount` array goes through further adjustment described by following code:

```c
INT32 i, k;
UINT32 cum;

cum = 0;
for (i = 16; i > 0; i--) {
    cum += LengthCount[i] << (16 - i);
}
while (cum != (1U << 16)) {
    LengthCount[16]--;
    for (i = 15; i > 0; i--) {
        if (LengthCount[i] != 0) {
            LengthCount[i]--;
            LengthCount[i+1] += 2;
            break;
        }
    }
    cum--;
}
```

### 19.3.3.3 Code Generation

In the previous step, the count of each length was obtained. Now, each symbol is going to be assigned a code. First, the length of the code for each symbol is determined. Naturally, the code lengths are assigned in such a way that shorter codes are assigned to more frequently appearing symbols. A `CodeLength` array is generated with `CodeLength[i] = the code length of symbol i`. Given this array, a code
is assigned to each symbol using the algorithm described by the pseudo code below (the resulting codes are stored in array Code such that Code[i] = the code assigned to symbol i):

```c
INT32 i;
UINT16 Start[18];

Start[1] = 0;
for (i = 1; i <= 16; i++) {
    Start[i + 1] = (UINT16)((Start[i] + LengthCount[i]) << 1);
}
for (i = 0; i < NumberOfSymbols; i++) {
    Code[i] = Start[CodeLength[i]]++;  
}
```

The code length adjustment process ensures that no code longer than the designated length will be generated. As long as the decompressor has the CodeLength array at hand, it can regenerate the codes.

### 19.4 Decompressor Design

The decompressor takes the compressed data as input and produces the original source data. The main tasks for the decompressor are decoding Huffman codes and restoring Pointers to the strings to which they point.

The following pseudo code describes the algorithm used in the design of a decompressor. The source code that illustrates an implementation of this design is listed in Appendix I.

```
WHILE not end of data DO
    IF at block boundary THEN
        Read in the Extra Set Code Length Array;
        Generate the Huffman code mapping table for the Extra Set;
        Read in and decode the Char&Len Set Code Length Array;
        Generate the Huffman code mapping table for the Char&Len Set;
        Read in the Position Set Code Length Array;
        Generate the Huffman code mapping table for the Position Set;
        ENDF
        Get next code;
        Look the code up in the Char&Len Set code mapping table.
        Store the result as C;
        IF C < 256 (it represents an Original Character) THEN
            Output this character;
        ELSE (it represents a String Length)
            Transform C to be the actual String Length value;
            Get next code and look it up in the Position Set code mapping table, and with some additional transformation, store the result as P;
            Output C characters starting from the position “Current Position – P”;
        ENDIF
        ENDF
    ENDWHILE
```
19.5 Decompress Protocol

This section provides a detailed description of the `EFI_DECOMPRESS_PROTOCOL`.

**EFI_DECOMPRESS_PROTOCOL**

Summary

Provides a decompression service.

GUID

```c
#define EFI_DECOMPRESS_PROTOCOL_GUID \
  {0xd8117cfe,0x94a6,0x11d4,\ 
   {0x9a,0x3a,0x00,0x90,0x27,0x3f,0xc1,0x4d}}
```

Protocol Interface Structure

```c
typedef struct _EFI_DECOMPRESS_PROTOCOL {
  EFI_DECOMPRESS_GET_INFO   GetInfo;
  EFI_DECOMPRESS_DECOMPRESS Decompress;
} EFI_DECOMPRESS_PROTOCOL;
```

Parameters

**GetInfo**

Given the compressed source buffer, this function retrieves the size of the uncompressed destination buffer and the size of the scratch buffer required to perform the decompression. It is the caller’s responsibility to allocate the destination buffer and the scratch buffer prior to calling `EFI_DECOMPRESS_PROTOCOL.Decompress()`. See the `EFI_DECOMPRESS_PROTOCOL.GetInfo()` function description.

**Decompress**

Decompresses a compressed source buffer into an uncompressed destination buffer. It is the caller’s responsibility to allocate the destination buffer and a scratch buffer prior to making this call. See the `Decompress()` function description.

Description

The `EFI_DECOMPRESS_PROTOCOL` provides a decompression service that allows a compressed source buffer in memory to be decompressed into a destination buffer in memory. It also requires a temporary scratch buffer to perform the decompression. The `GetInfo()` function retrieves the size of the destination buffer and the size of the scratch buffer that the caller is required to allocate. The `Decompress()` function performs the decompression. The scratch buffer can be freed after the decompression is complete.

**EFI_DECOMPRESS_PROTOCOL.GetInfo()**

Summary

Given a compressed source buffer, this function retrieves the size of the uncompressed buffer and the size of the scratch buffer required to decompress the compressed source buffer.
Prototype

```c
typedef EFI_STATUS
(EFI_API *EFI_DECOMPRESS_GET_INFO) (
  IN  EFI_DECOMPRESS_PROTOCOL *This,
  IN  VOID *Source, 
  IN  UINT32 SourceSize, 
  OUT UINT32 *DestinationSize, 
  OUT UINT32 *ScratchSize 
);
```

Parameters

- **This**: A pointer to the EFI_DECOMPRESS_PROTOCOL instance. Type EFI_DECOMPRESS_PROTOCOL is defined in Section 19.5.
- **Source**: The source buffer containing the compressed data.
- **SourceSize**: The size, in bytes, of the source buffer.
- **DestinationSize**: A pointer to the size, in bytes, of the uncompressed buffer that will be generated when the compressed buffer specified by Source and SourceSize is decompressed.
- **ScratchSize**: A pointer to the size, in bytes, of the scratch buffer that is required to decompress the compressed buffer specified by Source and SourceSize.

Description

The `GetInfo()` function retrieves the size of the uncompressed buffer and the temporary scratch buffer required to decompress the buffer specified by Source and SourceSize. If the size of the uncompressed buffer or the size of the scratch buffer cannot be determined from the compressed data specified by Source and SourceData, then EFI_INVALID_PARAMETER is returned. Otherwise, the size of the uncompressed buffer is returned in DestinationSize, the size of the scratch buffer is returned in ScratchSize, and EFI_SUCCESS is returned.

The `GetInfo()` function does not have scratch buffer available to perform a thorough checking of the validity of the source data. It just retrieves the “Original Size” field from the beginning bytes of the source data and output it as DestinationSize. And ScratchSize is specific to the decompression implementation.
Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The size of the uncompressed data was returned in DestinationSize and the size of the scratch buffer was returned in ScratchSize.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>The size of the uncompressed data or the size of the scratch buffer cannot be determined from the compressed data specified by Source and SourceSize.</td>
</tr>
</tbody>
</table>

**EFI_DECOMPRESS_PROTOCOL.Decompress()**

**Summary**

Decompresses a compressed source buffer.

**Prototype**

```c
typedef EFI_STATUS (EFIAPI *EFI_DECOMPRESS_DECOMPRESS) (
    IN  EFI_DECOMPRESS_PROTOCOL *This,
    IN   VOID      *Source,
    IN   UINT32    SourceSize,
    IN OUT VOID   *Destination,
    IN   UINT32    DestinationSize,
    IN OUT VOID   *Scratch,
    IN   UINT32    ScratchSize
);
```

**Parameters**

- **This**
  A pointer to the EFI_DECOMPRESS_PROTOCOL instance. Type **EFI_DECOMPRESS_PROTOCOL** is defined in [Section 19.5](#).

- **Source**
  The source buffer containing the compressed data.

- **SourceSize**
  The size of source data.

- **Destination**
  On output, the destination buffer that contains the uncompressed data.

- **DestinationSize**
  The size of the destination buffer. The size of the destination buffer needed is obtained from **EFI_DECOMPRESS_PROTOCOL.GetInfo()**.

- **Scratch**
  A temporary scratch buffer that is used to perform the decompression.

- **ScratchSize**
  The size of scratch buffer. The size of the scratch buffer needed is obtained from **GetInfo()**.

**Description**

The **Decompress()** function extracts decompressed data to its original form.
This protocol is designed so that the decompression algorithm can be implemented without using any memory services. As a result, the `Decompress()` function is not allowed to call `EFI_BOOT_SERVICES.AllocatePool()` or `EFI_BOOT_SERVICES.AllocatePages()` in its implementation. It is the caller’s responsibility to allocate and free the `Destination` and `Scratch` buffers.

If the compressed source data specified by `Source` and `SourceSize` is successfully decompressed into `Destination`, then `EFI_SUCCESS` is returned. If the compressed source data specified by `Source` and `SourceSize` is not in a valid compressed data format, then `EFI_INVALID_PARAMETER` is returned.

**Status Codes Returned**

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>Decompression completed successfully, and the uncompressed buffer is returned in <code>Destination</code>.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>The source buffer specified by <code>Source</code> and <code>SourceSize</code> is corrupted (not in a valid compressed format).</td>
</tr>
</tbody>
</table>
20 - Protocols — ACPI Protocols

EFI_ACPI_TABLE_PROTOCOL

Summary
This protocol may be used to install or remove an ACPI table from a platform.

GUID
#define EFI_ACPI_TABLE_PROTOCOL_GUID
{0xffe06bdd, 0x6107, 0x46a6,
{0x7b, 0xb2, 0x5a, 0x9c, 0x7e, 0xc5, 0x27, 0x5c}}

Protocol Interface Structure
typedef struct _EFI_ACPI_TABLE_PROTOCOL {
  EFI_ACPI_TABLE_INSTALL_ACPI_TABLE InstallAcpiTable;
  EFI_ACPI_TABLE_UNINSTALL_ACPI_TABLE UninstallAcpiTable;
} EFI_ACPI_TABLE_PROTOCOL;

Parameters
InstallAcpiTable Installs an ACPI table into the system.
UninstallAcpiTable Removes a previously installed ACPI table from the system.

Description
The EFI_ACPI_TABLE_PROTOCOL provides the ability for a component to install and uninstall ACPI tables from a platform.

EFI_ACPI_TABLE_PROTOCOL.InstallAcpiTable()

Summary
Installs an ACPI table into the RSDT/XSDT.

Prototype
typedef EFI_STATUS
(EIFIAPIC *EFI_ACPI_TABLE_INSTALL_ACPI_TABLE) (IN EFI_ACPI_TABLE_PROTOCOL *This,
IN VOID *AcpiTableBuffer,
IN UINTN AcpiTableBufferSize,
OUT UINTN *TableKey,
);

Parameters
This A pointer to a EFI_ACPI_TABLE_PROTOCOL.
AcpiTableBuffer A pointer to a buffer containing the ACPI table to be installed.
AcpiTableBufferSize
Specifies the size, in bytes, of the AcpiTableBuffer buffer.

TableKey
Returns a key to refer to the ACPI table.

Description
The InstallAcpiTable() function allows a caller to install an ACPI table. The ACPI table may either by a System Description Table or the FACS. For all tables except for the DSDT and FACS, a copy of the table will be linked by the RSDT/XSDT. For the FACS and DSDT, the pointer to a copy of the table will be updated in the FADT, if present.

To prevent namespace collision, ACPI tables may be created using UEFI ACPI table format. See Appendix O. If this protocol is used to install a table with a signature already present in the system, the new table will not replace the existing table. It is a platform implementation decision to add a new table with a signature matching an existing table or disallow duplicate table signatures and return EFI_ACCESS_DENIED.

On successful output, TableKey is initialized with a unique key. Its value may be used in a subsequent call to UninstallAcpiTable to remove an ACPI table.

On successful output, the EFI ACPI_TABLE_PROTOCOL will ensure that the checksum field is correct for both the RSDT/XSDT table and the copy of the table being installed that is linked by the RSDT/XSDT.

On successful completion, this function reinstalls the relevant EFI_CONFIGURATION_TABLE pointer to the RSDT.

Status Codes Returned

- EFI_SUCCESS
  The table was successfully inserted

- EFI_INVALID_PARAMETER
  The AcpiTableBuffer is NULL, the TableKey is NULL; the AcpiTableBufferSize, and the size field embedded in the ACPI table pointed to by AcpiTableBuffer are not in sync.

- EFI_OUT_OF_RESOURCES
  Insufficient resources exist to complete the request.

- EFI_ACCESS_DENIED
  The table signature matches a table already present in the system and platform policy does not allow duplicate tables of this type.

EFI ACPI_TABLE_PROTOCOL.UninstallAcpiTable()

Summary
Removes an ACPI table from the RSDT/XSDT.
Prototype
typedef EFI_STATUS (EFIAPI *EFI_ACPI_TABLE_UNINSTALL_ACPI_TABLE) ( 
    IN EFI_ACPI_TABLE_PROTOCOL *This, 
    IN UINTN TableKey, 
); 

Parameters
This A pointer to a EFI_ACPI_TABLE_PROTOCOL.
TableKey Specifies the table to uninstall. The key was returned from InstallAcpiTable().

Description
The UninstallAcpiTable() function allows a caller to remove an ACPI table. The routine will remove its reference from the RSDT/XSDT. A table is referenced by the TableKey parameter returned from a prior call to InstallAcpiTable().

On successful completion, this function reinstalls the relevant EFI_CONFIGURATION_TABLE pointer to the RSDT.

Status Codes Returned
  EFI_SUCCESS The table was successfully inserted
  EFI_NOT_FOUND TableKey does not refer to a valid key for a table entry.
  EFI_OUT_OF_RESOURCES Insufficient resources exist to complete the request.
21 - Protocols — String Services

21.1 Unicode Collation Protocol

This section defines the Unicode Collation protocol. This protocol is used to allow code running in the boot services environment to perform lexical comparison functions on Unicode strings for given languages.

EFI_UNICODE_COLLATION_PROTOCOL

Summary

Is used to perform case-insensitive comparisons of strings.

GUID

#define EFI_UNICODE_COLLATION_PROTOCOL2_GUID 
{
    0xa4c751fc, 0x23ae, 0x4c3e,
    {0x92, 0xe9, 0x49, 0x64, 0xcf, 0x63, 0xf3, 0x49}
}

Protocol Interface Structure

typedef struct {
    EFI_UNICODE_COLLATION_STMTTCOLL    StriColl;
    EFI_UNICODE_COLLATION_METAIMATCH    MetaiMatch;
    EFI_UNICODE_COLLATION_STRLWR        StrLwr;
    EFI_UNICODE_COLLATION_STRUPR        StrUp;
    EFI_UNICODE_COLLATION_FATTOSTR      FatToStr;
    EFI_UNICODE_COLLATION_STRTOFAT      StrToFat;
    CHAR8 *SupportedLanguages;
} EFI_UNICODE_COLLATION_PROTOCOL;

Parameters

StriColl        Performs a case-insensitive comparison of two Null-terminated strings. See the StriColl() function description.

MetaiMatch      Performs a case-insensitive comparison between a Null-terminated pattern string and a Null-terminated string. The pattern string can use the ‘?’ wildcard to match any character, and the ‘*’ wildcard to match any substring. See the MetaiMatch() function description.

StrLwr          Converts all the characters in a Null-terminated string to lowercase characters. See the StrLwr() function description.

StrUp            Converts all the characters in a Null-terminated string to uppercase characters. See the StrUp() function description.

FatToStr        Converts an 8.3 FAT file name using an OEM character set to a Null-terminated string. See the FatToStr() function description.

StrToFat        Converts a Null-terminated string to legal characters in a FAT filename using an OEM character set. See the StrToFat() function description.
SupportedLanguages

A Null-terminated ASCII string array that contains one or more language codes. This array is specified in RFC 4646 format. See Appendix M for the format of language codes and language code arrays.

Description

The EFI_UNICODE_COLLATION_PROTOCOL is used to perform case-insensitive comparisons of strings.

One or more of the EFI_UNICODE_COLLATION_PROTOCOL instances may be present at one time. Each protocol instance can support one or more language codes. The language codes supported in the EFI_UNICODE_COLLATION_PROTOCOL are declared in SupportedLanguages.

The SupportedLanguages is a Null-terminated ASCII string array that contains one or more supported language codes. This is the list of language codes that this protocol supports. See Appendix M for the format of language codes and language code arrays.

The main motivation for this protocol is to help support file names in a file system driver. When a file is opened, a file name needs to be compared to the file names on the disk. In some cases, this comparison needs to be performed in a case-insensitive manner. In addition, this protocol can be used to sort files from a directory or to perform a case-insensitive file search.

EFI_UNICODE_COLLATION_PROTOCOL.StriColl()

Summary

Performs a case-insensitive comparison of two Null-terminated strings.

Prototype

typedef INTN (EFIAPI *EFI_UNICODE_COLLATION_STRICOLL) (IN EFI_UNICODE_COLLATION_PROTOCOL *This,
IN CHAR16 *s1,
IN CHAR16 *s2);

Parameters

This A pointer to the EFI_UNICODE_COLLATION_PROTOCOL instance. Type EFI_UNICODE_COLLATION_PROTOCOL is defined above.

s1 A pointer to a Null-terminated string.

s2 A pointer to a Null-terminated string.

Description

The StriColl() function performs a case-insensitive comparison of two Null-terminated strings.

This function performs a case-insensitive comparison between the string $s1$ and the string $s2$ using the rules for the language codes that this protocol instance supports. If $s1$ is equivalent to $s2$, then 0 is returned. If $s1$ is lexically less than $s2$, then a negative number will be returned. If $s1$ is lexically greater than $s2$, then a positive number will be returned. This function allows strings to be compared and sorted.
**Status Codes Returned**

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>s1 is equivalent to s2.</td>
</tr>
<tr>
<td>&gt; 0</td>
<td>s1 is lexically greater than s2.</td>
</tr>
<tr>
<td>&lt; 0</td>
<td>s1 is lexically less than s2.</td>
</tr>
</tbody>
</table>

**EFI_UNICODE_COLLATION_PROTOCOL.MetaiMatch()**

**Summary**
Performs a case-insensitive comparison of a Null-terminated pattern string and a Null-terminated string.

**Prototype**

```c
typedef BOOLEAN (EFIAPI *EFI_UNICODE_COLLATION_METAIMATCH) (
    IN EFI_UNICODE_COLLATION_PROTOCOL *This,
    IN CHAR16 *String,
    IN CHAR16 *Pattern
);
```

**Parameters**

- **This**
  A pointer to the EFI_UNICODE_COLLATION_PROTOCOL instance. Type **EFI_UNICODE_COLLATION_PROTOCOL** is defined above.
- **String**
  A pointer to a Null-terminated string.
- **Pattern**
  A pointer to a Null-terminated string.

**Description**

The **MetaiMatch()** function performs a case-insensitive comparison of a Null-terminated pattern string and a Null-terminated string.

This function checks to see if the pattern of characters described by **Pattern** are found in **String**. The pattern check is a case-insensitive comparison using the rules for the language codes that this protocol instance supports. If the pattern match succeeds, then **TRUE** is returned. Otherwise **FALSE** is returned.

The following syntax can be used to build the string **Pattern**:

- *****
  Match 0 or more characters.
- **?**
  Match any one character.
- **[<char1><char2>...<charN>]**
  Match any character in the set.
- **[<char1>-<char2>]**
  Match any character between <char1> and <char2>.
- **<char>**
  Match the character <char>.

Following is an example pattern for English:

- ***.FW**
  Matches all strings that end in “.FW” or “.fw” or “.Fw” or “.FW.”
- **[a-z]**
  Match any letter in the alphabet.
- **[@#$%^&*()]**
  Match any one of these symbols.
**String Services**

### Status Codes Returned

<table>
<thead>
<tr>
<th>TRUE</th>
<th>Pattern was found in String.</th>
</tr>
</thead>
<tbody>
<tr>
<td>FALSE</td>
<td>Pattern was not found in String.</td>
</tr>
</tbody>
</table>

### EFI_UNICODE_COLLATION_PROTOCOL.StrLwr()

**Summary**

Converts all the characters in a Null-terminated string to lowercase characters.

**Prototype**

```c
typedef VOID (EFIAPI *EFI_UNICODE_COLLATION_StrLwr) (
    IN EFI_UNICODE_COLLATION_PROTOCOL *This,
    IN OUT CHAR16 *String
);
```

**Parameters**

- **This**
  
  A pointer to the EFI_UNICODE_COLLATION_PROTOCOL instance. Type **EFI_UNICODE_COLLATION_PROTOCOL** is defined above.

- **String**
  
  A pointer to a Null-terminated string.

**Description**

This function walks through all the characters in String, and converts each one to its lowercase equivalent if it has one. The converted string is returned in String.

### EFI_UNICODE_COLLATION_PROTOCOL.StrUpr()

**Summary**

Converts all the characters in a Null-terminated string to uppercase characters.
Prototype

typedef VOID
    (EFIAPI *EFI_UNICODE_COLLATION_STRUPR) (  
        IN EFI_UNICODE_COLLATION_PROTOCOL *This,  
        IN OUT CHAR16 *String
    );

Parameters

    This A pointer to the EFI_UNICODE_COLLATION_PROTOCOL instance.  
        Type EFI_UNICODE_COLLATION_PROTOCOL is defined above.

    String A pointer to a Null-terminated string.

Description

This function walks through all the characters in String, and converts each one to its uppercase 
equivalent if it has one. The converted string is returned in String.

EFI_UNICODE_COLLATION_PROTOCOL.FatToStr()

Summary

Converts an 8.3 FAT file name in an OEM character set to a Null-terminated string.

Prototype

    typedef VOID
        (EFIAPI *EFI_UNICODE_COLLATION_FATTOSTR) (  
            IN EFI_UNICODE_COLLATION_PROTOCOL *This,  
            IN UINTN FatSize,  
            IN CHAR8 *Fat,  
            OUT CHAR16 *String
        );

Parameters

    This A pointer to the EFI_UNICODE_COLLATION_PROTOCOL instance.  
        Type EFI_UNICODE_COLLATION_PROTOCOL is defined above.

    FatSize The size of the string Fat in bytes.

    Fat A pointer to a Null-terminated string that contains an 8.3 file name  
        encoded using an 8-bit OEM character set.

    String A pointer to a Null-terminated string. The string must be allocated in  
        advance to hold FatSize characters.

Description

This function converts the string specified by Fat with length FatSize to the Null-terminated string  
specified by String. The characters in Fat are from an OEM character set.
**EFI_UNICODE_COLLATION_PROTOCOL.StrToFat()**

**Summary**
Converts a Null-terminated string to legal characters in a FAT filename using an OEM character set.

**Prototype**
```c
typedef
BOOLEAN
(EIFIAPI *EFI_UNICODE_COLLATION_STRTOFAT) (  
   IN EFI_UNICODE_COLLATION_PROTOCOL *This,  
   IN CHAR16 *String,  
   IN UINTN FatSize,  
   OUT CHAR8 *Fat
);
```

**Parameters**
- **This**: A pointer to the EFI_UNICODE_COLLATION_PROTOCOL instance. Type EFI_UNICODE_COLLATION_PROTOCOL is defined above.
- **String**: A pointer to a Null-terminated string.
- **FatSize**: The size of the string Fat in bytes.
- **Fat**: A pointer to a string that contains the converted version of String using legal FAT characters from an OEM character set.

**Description**
This function converts the characters from String into legal FAT characters in an OEM character set and stores them in the string Fat. This conversion continues until either FatSize bytes are stored in Fat, or the end of String is reached. The characters ‘.’ (period) and ‘ ’ (space) are ignored for this conversion. Characters that map to an illegal FAT character are substituted with an ‘_’. If no valid mapping from a character to an OEM character is available, then it is also substituted with an ‘_’. If any of the character conversions are substituted with a ‘_’, then TRUE is returned. Otherwise FALSE is returned.

**Status Codes Returned**

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>One or more conversions failed and were substituted with ‘_’.</td>
</tr>
<tr>
<td>FALSE</td>
<td>None of the conversions failed.</td>
</tr>
</tbody>
</table>

**21.2 Regular Expression Protocol**

This section defines the Regular Expression Protocol. This protocol is used to match Unicode strings against Regular Expression patterns.
**EFI_REGULAR_EXPRESSION_PROTOCOL**

**Summary**

**GUID**

```c
define EFI_REGULAR_EXPRESSION_PROTOCOL_GUID \ 
{ 0xB3F79D9A, 0x436C, 0xDC11,\ 
{ 0xB0, 0x52, 0xCD, 0x85, 0xDF, 0x52, 0x4C, 0xE6 } }
```

**Protocol Interface Structure**

```c
typedef struct {
    EFI_REGULAR_EXPRESSION_MATCH MatchString;
    EFI_REGULAR_EXPRESSION_GET_INFO GetInfo;
} EFI_REGULAR_EXPRESSION_PROTOCOL;
```

**Parameters**

- **MatchString**
  Search the input string for anything that matches the regular expression.

- **GetInfo**
  Returns information about the regular expression syntax types supported by the implementation.

**EFI_REGULAR_EXPRESSION_PROTOCOL.MatchString()**

**Summary**

Checks if the input string matches to the regular expression pattern.

**Prototype**

```c
typedef EFI_STATUS
EFI_API *EFI_REGULAR_EXPRESSION_MATCH) ( 
    IN   EFI_REGULAR_EXPRESSION_PROTOCOL *This,
    IN   CHAR16            *String,
    IN   CHAR16            *Pattern,
    IN   EFI_REGEX_SYNTAX_TYPE     *SyntaxType, OPTIONAL
    OUT  BOOLEAN            *Result,
    OUT  EFI_REGEX_CAPTURE       **Captures, OPTIONAL
    OUT UINTN              *CapturesCount
);
```

**Parameters**

- **This**
  A pointer to the `EFI_REGULAR_EXPRESSION_PROTOCOL` instance. Type `EFI_REGULAR_EXPRESSION_PROTOCOL` is defined in above.

- **String**
  A pointer to a NULL terminated string to match against the regular expression string specified by `Pattern`.

- **Pattern**
  A pointer to a NULL terminated string that represents the regular expression.
SyntaxType

A pointer to the `EFI_REGEX_SYNTAX_TYPE` that identifies the regular expression syntax type to use. May be NULL in which case the function will use its default regular expression syntax type.

Result

On return, points to `TRUE` if `String` fully matches against the regular expression `Pattern` using the regular expression `SyntaxType`. Otherwise, points to `FALSE`.

Captures

A Pointer to an array of `EFI_REGEX_CAPTURE` objects to receive the captured groups in the event of a match. The full sub-string match is put in `Captures[0]`, and the results of N capturing groups are put in `Captures[1:N]`. If `Captures` is NULL, then this function doesn't allocate the memory for the array and does not build up the elements. It only returns the number of matching patterns in `CapturesCount`. If `Captures` is not NULL, this function returns a pointer to an array and builds up the elements in the array. `CapturesCount` is also updated to the number of matching patterns found. It is the caller’s responsibility to free the memory pool in `Captures` and in each `CapturePtr` in the array elements.

CapturesCount

On output, `CapturesCount` is the number of matching patterns found in `String`. Zero means no matching patterns were found in the string.

Description

The `MatchString()` function performs a matching of a Null-terminated input string with the NULL-terminated pattern string. The pattern string syntax type is optionally identified in `SyntaxType`.

This function checks to see if `String` fully matches against the regular expression described by `Pattern`. The pattern check is performed using regular expression rules that are supported by this implementation, as indicated in the return value of `GetInfo` function. If the pattern match succeeds, then `TRUE` is returned in `Result`. Otherwise `FALSE` is returned.

Related Definitions

```c
typedef struct {
    CONST CHAR16 *CapturePtr;
    UINTN Length;
} EFI_REGEX_CAPTURE;
```

*CapturePtr

Pointer to the start of the captured sub-expression within matched `String`.

Length

Length of captured sub-expression.

EFI_REGULAR_EXPRESSION_PROTOCOL.GetInfo()

Summary
Returns information about the regular expression syntax types supported by the implementation.

Prototype
```c
typedef
EFI_STATUS
EFIAPIC *EFI_REGULAR_EXPRESSION_GET_INFO) (  
    IN   EFI_REGULAR_EXPRESSION_PROTOCOL* This,    
    IN OUT UINTN             *RegExSyntaxTypeListSize,  
    OUT  EFI_REGEX_SYNTAX_TYPE *RegExSyntaxTypeList 
);
```

Parameters
- **This**: A pointer to the EFI_REGULAR_EXPRESSION_PROTOCOL instance.
- **RegExSyntaxTypeListSize**: On input, the size in bytes of RegExSyntaxTypeList. On output with a return code of EFI_SUCCESS, the size in bytes of the data returned in RegExSyntaxTypeList. On output with a return code of EFI_BUFFER_TOO_SMALL, the size of RegExSyntaxTypeList required to obtain the list.
- **RegExSyntaxTypeList**: A caller-allocated memory buffer filled by the driver with one EFI_REGEX_SYNTAX_TYPE element for each supported regular expression syntax type. The list must not change across multiple calls to the same driver. The first syntax type in the list is the default type for the driver.

Description
This function returns information about supported regular expression syntax types. A driver implementing the EFI_REGULAR_EXPRESSION_PROTOCOL protocol need not support more than one regular expression syntax type, but shall support a minimum of one regular expression syntax type.

21.2.1 EFI Regular Expression Syntax Type Definitions

Summary

This sub-section provides EFI_GUID values for a selection of EFI_REGULAR_EXPRESSION_PROTOCOL syntax types. The types listed are optional, not meant to be exhaustive and may be augmented by vendors or other industry standards.

Prototype

For regular expression rules specified in the POSIX Extended Regular Expression (ERE) Syntax:

```c
#define EFI_REGEX_SYNTAX_TYPE_POSIX_EXTENDED_GUID \ 
  {0x5F05B20F, 0x4A56, 0xC231,\ 
   { 0xFA, 0x0B, 0xA7, 0xB1, 0xF1, 0x10, 0x04, 0x1D }}
```

For regular expression rules specified in the Perl standard:

```c
#define EFI_REGEX_SYNTAX_TYPE_PERL_GUID \ 
  {0x63E60A51, 0x497D, 0xD427,\ 
   { 0xC4, 0xA5, 0xB8, 0xAB, 0xDC, 0x3A, 0xAE, 0xB6 }}
```

For regular expression rules specified in the ECMA 262 Specification:

```c
#define EFI_REGEX_SYNTAX_TYPE_ECMA_262_GUID \ 
  { 0x9A473A4A, 0x4CEB, 0xB95A, 0x41,\ 
    { 0x5E, 0x5B, 0xA0, 0xBC, 0x63, 0x9B, 0x2E }}
```

For regular expression rules specified in the POSIX Extended Regular Expression (ERE) Syntax, where the Pattern and String input strings need to be converted to ASCII:
#define EFI_REGEX_SYNTAX_TYPE_POSIX_EXTENDED_ASCII_GUID  
{0x3FD32128, 0x4BB1, 0xF632,  
 { 0xBE, 0x4F, 0xBA, 0xBF, 0x85, 0xC9, 0x36, 0x76 }}

For regular expression rules specified in the Perl standard, where the Pattern and String input strings need to be converted to ASCII:

#define EFI_REGEX_SYNTAX_TYPE_PERL_ASCII_GUID  
{0x87DFB76D, 0x4B58, 0xEF3A,  
 { 0xF7, 0xC6, 0x16, 0xA4, 0x2A, 0x68, 0x28, 0x10 }}

For regular expression rules specified in the ECMA 262 Specification, where the Pattern and String input strings need to be converted to ASCII:

#define EFI_REGEX_SYNTAX_TYPE_ECMA_262_ASCII_GUID  
{ 0xB2284A2F, 0x4491, 0x6D9D,  
 { 0xEA, 0xB7, 0x11, 0xB0, 0x67, 0xD4, 0x9B, 0x9A }}

(See Appendix Q for more information.)

(See References for more information.)
22 - EFI Byte Code Virtual Machine

This section defines an EFI Byte Code (EBC) Virtual Machine that can provide platform- and processor-independent mechanisms for loading and executing EFI device drivers.

22.1 Overview

The current design for option ROMs that are used in personal computer systems has been in place since 1981. Attempts to change the basic design requirements have failed for a variety of reasons. The EBC Virtual Machine described in this chapter is attempting to help achieve the following goals:

- Abstract and extensible design
- Processor independence
- OS independence
- Build upon existing specifications when possible
- Facilitate the removal of legacy infrastructure
- Exclusive use of EFI Services

One way to satisfy many of these goals is to define a pseudo or virtual machine that can interpret a predefined instruction set. This will allow the virtual machine to be ported across processor and system architectures without changing or recompiling the option ROM. This specification defines a set of machine level instructions that can be generated by a C compiler.

The following sections are a detailed description of the requirements placed on future option ROMs.

22.1.1 Processor Architecture Independence

Option ROM images shall be independent of supported 32-bit and supported 64-bit architectures. In order to abstract the architectural differences between processors option ROM images shall be EBC. This model is presented below:

- 64-bit C source code
- The EFI EBC image is the flashed image
- The system BIOS implements the EBC interpreter
- The interpreter handles 32 vs. 64 bit issues

Current Option ROM technology is processor dependent and heavily reliant upon the existence of the PC-AT infrastructure. These dependencies inhibit the evolution of both hardware and software under the veil of “backward compatibility.” A solution that isolates the hardware and support infrastructure through abstraction will facilitate the uninhibited progression of technology.

22.1.2 OS Independent

Option ROMs shall not require or assume the existence of a particular OS.

22.1.3 EFI Compliant

Option ROM compliance with EFI requires (but is not limited to) the following:
• Little endian layout
• Single-threaded model with interrupt polling if needed
• Where EFI provides required services, EFI is used exclusively. These include:
  — Console I/O
  — Memory Management
  — Timer services
  — Global variable access
• When an Option ROM provides EFI services, the EFI specification is strictly followed:
  — Service/protocol installation
  — Calling conventions
  — Data structure layouts
  — Guaranteed return on services

22.1.4 Coexistence of Legacy Option ROMs
The infrastructure shall support coexistent Legacy Option ROM and EBC Option ROM images. This case would occur, for example, when a Plug and Play Card has both Legacy and EBC Option ROM images flashed. The details of the mechanism used to select which image to load is beyond the scope of this document. Basically, a legacy System BIOS would not recognize an EBC Option ROM and therefore would never load it. Conversely, an EFI Firmware Boot Manager would only load images that it supports.

The EBC Option ROM format must utilize a legacy format to the extent that a Legacy System BIOS can:
• Determine the type of the image, in order to ignore the image. The type must be incompatible with currently defined types.
• Determine the size of the image, in order to skip to the next image.

22.1.5 Relocatable Image
An EBC option ROM image shall be eligible for placement in any system memory area large enough to accommodate it.

Current option ROM technology requires images to be shadowed in system memory address range 0xC0000 to 0xEFFFF on a 2048 byte boundary. This dependency not only limits the number of Option ROMs, it results in unused memory fragments up to 2 KiB.

22.1.6 Size Restrictions Based on Memory Available
EBC option ROM images shall not be limited to a predetermined fixed maximum size.

Current option ROM technology limits the size of a preinitialization option ROM image to 128 KiB (126 KiB actual). Additionally, in the DDIM an image is not allowed to grow during initialization. It is inevitable that 64-bit solutions will increase in complexity and size. To avoid revisiting this issue, EBC option ROM size is only limited by available system memory. EFI memory allocation services allow device drivers to claim as much memory as they need, within limits of available system memory.

The PCI specification limits the size of an image stored in an option ROM to 16 MB. If the driver is stored on the hard drive then the 16MB option ROM limit does not apply. In addition, the PE/COFF object format limits the size of images to 2 GB.
22.2 Memory Ordering

The term memory ordering refers to the order in which a processor issues reads (loads) and writes (stores) out onto the bus to system memory. The EBC Virtual Machine enforces strong memory ordering, where reads and writes are issued on the system bus in the order they occur in the instruction stream under all circumstances.

22.3 Virtual Machine Registers

The EBC virtual machine utilizes a simple register set. There are two categories of VM registers: general purpose registers and dedicated registers. All registers are 64-bits wide. There are eight (8) general-purpose registers (R0-R7), which are used by most EBC instructions to manipulate or fetch data. Table 22-1 lists the general-purpose registers in the VM and the conventions for their usage during execution.

Table 22-1 General Purpose VM Registers

<table>
<thead>
<tr>
<th>Index</th>
<th>Register</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>R0</td>
<td>Points to the top of the stack</td>
</tr>
<tr>
<td>1-3</td>
<td>R1-R3</td>
<td>Preserved across calls</td>
</tr>
<tr>
<td>4-7</td>
<td>R4-R7</td>
<td>Scratch, not preserved across calls</td>
</tr>
</tbody>
</table>

Register R0 is used as a stack pointer and is used by the CALL, RET, PUSH, and POP instructions. The VM initializes this register to point to the incoming arguments when an EBC image is started or entered. This register may be modified like any other general purpose VM register using EBC instructions. Register R7 is used for function return values.

Unlike the general-purpose registers, the VM dedicated registers have specific purposes. There are two dedicated registers: the instruction pointer (IP), and the flags (Flags) register. Specialized instructions provide access to the dedicated registers. These instructions reference the particular dedicated register by its assigned index value. Table 22-2 lists the dedicated registers and their corresponding index values.

Table 22-2 Dedicated VM Registers

<table>
<thead>
<tr>
<th>Index</th>
<th>Register</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>FLAGS</td>
<td>Bit Description</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0 C = Condition code</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1 SS = Single step</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2..63 Reserved</td>
</tr>
<tr>
<td>1</td>
<td>IP</td>
<td>Points to current instruction</td>
</tr>
<tr>
<td>2..7</td>
<td>Reserved</td>
<td>Not defined</td>
</tr>
</tbody>
</table>

The VM Flags register contains VM status and context flags. Table 22-3 lists the descriptions of the bits in the Flags register.
Table 22-3 VM Flags Register

<table>
<thead>
<tr>
<th>Bit</th>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>C</td>
<td>Condition code. Set to 1 if the result of the last compare was true, or set</td>
</tr>
<tr>
<td></td>
<td></td>
<td>to 0 if the last compare was false. Used by conditional JMP instructions.</td>
</tr>
<tr>
<td>1</td>
<td>S</td>
<td>Single-step. If set, causes the VM to generate a single-step exception</td>
</tr>
<tr>
<td></td>
<td></td>
<td>after executing each instruction. The bit is not cleared by the VM</td>
</tr>
<tr>
<td></td>
<td></td>
<td>following the exception.</td>
</tr>
<tr>
<td>2..63</td>
<td>-</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

The VM IP register is used as an instruction pointer and holds the address of the currently executing EBC instruction. The virtual machine will update the IP to the address of the next instruction on completion of the current instruction, and will continue execution from the address indicated in IP. The IP register can be moved into any general-purpose register (R0-R7). Data manipulation and data movement instructions can then be used to manipulate the value. The only instructions that may modify the IP are the JMP, CALL, and RET instructions. Since the instruction set is designed to use words as the minimum instruction entity, the low order bit (bit 0) of IP is always cleared to 0. If a JMP, CALL, or RET instruction causes bit 0 of IP to be set to 1, then an alignment exception occurs.

22.4 Natural Indexing

The natural indexing mechanism is the critical functionality that enables EBC to be executed unchanged on 32- or 64-bit systems. Natural indexing is used to specify the offset of data relative to a base address. However, rather than specifying the offset as a fixed number of bytes, the offset is encoded in a form that specifies the actual offset in two parts: a constant offset, and an offset specified as a number of natural units (where one natural unit = sizeof (VOID *)). These two values are used to compute the actual offset to data at runtime. When the VM decodes an index during execution, the resultant offset is computed based on the natural processor size. The encoded indexes themselves may be 16, 32, or 64 bits in size. Table 22-4 describes the fields in a natural index encoding.

Table 22-4 Index Encoding

<table>
<thead>
<tr>
<th>Bit #</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>N</td>
<td>Sign bit (sign), most significant bit</td>
</tr>
<tr>
<td>N-3..N-1</td>
<td>Bits assigned to natural units (w)</td>
</tr>
<tr>
<td>A..N-4</td>
<td>Constant units (c)</td>
</tr>
<tr>
<td>0..A-1</td>
<td>Natural units (n)</td>
</tr>
</tbody>
</table>

As shown in Table 22-4, for a given encoded index, the most significant bit (bit N) specifies the sign of the resultant offset after it has been calculated. The sign bit is followed by three bits (N-3..N-1) that are used to compute the width of the natural units field (n). The value (w) from this field is multiplied by the index size in bytes to determine the actual width (A) of the natural units field (n). Once the width of the natural units field has been determined, then the natural units (n) and constant units (c) can be extracted. The offset is then calculated at runtime according to the following equation:

$$\text{Offset} = (c + n \times \text{sizeof (VOID *)))} \times \text{sign}$$
The following sections describe each of these fields in more detail.

22.4.1 Sign Bit
The sign bit determines the sign of the index once the offset calculation has been performed. All index computations using “n” and “c” are done with positive numbers, and the sign bit is only used to set the sign of the final offset computed.

22.4.2 Bits Assigned to Natural Units
This 3-bit field that is used to determine the width of the natural units field. The units vary based on the size of the index according to Table 22-5. For example, for a 16-bit index, the value contained in this field would be multiplied by 2 to get the actual width of the natural-units field.

Table 22-5 Index Size in Index Encoding

<table>
<thead>
<tr>
<th>Index Size</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>16 bits</td>
<td>2 bits</td>
</tr>
<tr>
<td>32 bits</td>
<td>4 bits</td>
</tr>
<tr>
<td>64 bits</td>
<td>8 bits</td>
</tr>
</tbody>
</table>

22.4.3 Constant
The constant is the number of bytes in the index that do not scale with processor size. When the index is a 16-bit value, the maximum constant is 4095. This index is achieved when the bits assigned to natural units is 0.

22.4.4 Natural Units
Natural units are used when a structure has fields that can vary with the architecture of the processor. Fields that precipitate the use of natural units include pointers and EFI INTN and UINTN data types. The size of one pointer or INTN/UINTN equals one natural unit. The natural units field in an index encoding is a count of the number of natural fields whose sizes (in bytes) must be added to determine a field offset.

As an example, assume that a given EBC instruction specifies a 16-bit index of 0xA048. This breaks down into:

- Sign bit (bit 15) = 1 (negative offset)
- Bits assigned to natural units (w, bits 14-12) = 2. Multiply by index size in bytes = 2 x 2 = 4 (A)
- c = bits 11-4 = 4
- n = bits 3-0 = 8

On a 32-bit machine, the offset is then calculated to be:
- Offset = (4 + 8 * 4) * -1 = -36
- On a 64-bit machine, the offset is calculated to be:
- Offset = (4 + 8 * 8) * -1 = -68
22.5 EBC Instruction Operands

The VM supports an EBC instruction set that performs data movement, data manipulation, branching, and other miscellaneous operations typical of a simple processor. Most instructions operate on two operands, and have the general form:

```
INSTRUCTION Operand1, Operand2
```

Typically, instruction operands will be one of the following:

- Direct
- Indirect
- Indirect with index
- Immediate

The following subsections explain these operands.

22.5.1 Direct Operands

When a direct operand is specified for an instruction, the data to operate upon is contained in one of the VM general-purpose registers \( R0-R7 \). Syntactically, an example of direct operand mode could be the \( \text{ADD} \) instruction:

```
ADD64 R1, R2
```

This form of the instruction utilizes two direct operands. For this particular instruction, the VM would take the contents of register \( R2 \), add it to the contents of register \( R1 \), and store the result in register \( R1 \).

22.5.2 Indirect Operands

When an indirect operand is specified, a VM register contains the address of the operand data. This is sometimes referred to as register indirect, and is indicated by prefixing the register operand with “@.” Syntactically, an example of an indirect operand mode could be this form of the \( \text{ADD} \) instruction:

```
ADD32 R1, @R2
```

For this instruction, the VM would take the 32-bit value at the address specified in \( R2 \), add it to the contents of register \( R1 \), and store the result in register \( R1 \).

22.5.3 Indirect with Index Operands

When an indirect with index operand is specified, the address of the operand is computed by adding the contents of a register to a decoded natural index that is included in the instruction. Typically with indexed addressing, the base address will be loaded in the register and an index value will be used to indicate the offset relative to this base address. Indexed addressing takes the form

```
@R1 (+n, +c)
```

where:

- \( R1 \) is one of the general-purpose registers (\( R0-R7 \)) which contains the base address
- \( +n \) is a count of the number of “natural” units offset. This portion of the total offset is computed at runtime as \( n * \text{sizeof(VOID*)} \)
• \( +c \) is a byte offset to add to the natural offset to resolve the total offset.

The values of \( n \) and \( c \) can be either positive or negative, though they must both have the same sign. These values get encoded in the indexes associated with EBC instructions as shown in Table 22-4. Indexes can be 16-, 32-, or 64-bits wide depending on the instruction. An example of indirect with index syntax would be:

\[
\text{ADD32 R1, @R2 (+1, +8)}
\]

This instruction would take the address in register \( R2 \), add \((8 + 1 \times \text{sizeof (VOID*)})\), read the 32-bit value at the address, add the contents of \( R1 \) to the value, and store the result back to \( R1 \).

### 22.5.4 Immediate Operands

Some instructions support an immediate operand, which is simply a value included in the instruction encoding. The immediate value may or may not be sign extended, depending on the particular instruction. One instruction that supports an immediate operand is \texttt{MOVI}. An example usage of this instruction is:

\[
\text{MOVIww R1, 0x1234}
\]

This instruction moves the immediate value 0x1234 directly into VM register \( R1 \). The immediate value is contained directly in the encoding for the MOVI instruction.

### 22.6 EBC Instruction Syntax

Most EBC instructions have one or more variations that modify the size of the instruction and/or the behavior of the instruction itself. These variations will typically modify an instruction in one or more of the following ways:

- The size of the data being operated upon
- The addressing mode for the operands
- The size of index or immediate data
- To represent these variations syntactically in this specification the following conventions are used:
  - Natural indexes are indicated with the “Index” keyword, and may take the form of “Index16,” “Index32,” or “Index64” to indicate the size of the index value supported. Sometimes the form Index16|32|64 is used here, which is simply a shorthand notation for Index16|Index32|Index64. A natural index is encoded per Table 22-4 and is resolved at runtime.
  - Immediate values are indicated with the “Immed” keyword, and may take the form of “Immed16,” “Immed32,” or “Immed64” to indicate the size of the immediate value supported. The shorthand notation Immed16|32|64 is sometimes used when different size immediate values are supported.
  - Terms in brackets \([ \) ] are required.
  - Terms in braces \{ \} are optional.
  - Alternate terms are separated by a vertical bar \|\).
• The form R₁ and R₂ represent Operand 1 register and Operand 2 register respectfully, and can typically be any VM general-purpose register R₀-R₇.
• Within descriptions of the instructions, brackets [ ] enclosing a register and/or index indicate that the contents of the memory pointed to by the enclosed contents are used.

22.7 Instruction Encoding

Most EBC instructions take the form:

\[ \text{INSTRUCTION } R₁, \ R₂ \ \text{Index|Immed} \]

For those instructions that adhere to this form, the binary encoding for the instruction will typically consist of an opcode byte, followed by an operands byte, followed by two or more bytes of immediate or index data. Thus the instruction stream will be:

\((1 \text{ Byte Opcode}) + (1 \text{ Byte Operands}) + (\text{Immediate data|Index data})\)

22.7.1 Instruction Opcode Byte Encoding

The first byte of an instruction is the opcode byte, and an instruction’s actual opcode value consumes 6 bits of this byte. The remaining two bits will typically be used to indicate operand sizes and/or presence or absence of index or immediate data. Table 22-6 defines the bits in the opcode byte for most instructions, and their usage.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Sym</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>6..7</td>
<td>Modifiers</td>
<td>One or more of: \Index or immediate data present/absent\ Operand size Index or immediate data size</td>
</tr>
<tr>
<td>0..5</td>
<td>Op</td>
<td>Instruction opcode</td>
</tr>
</tbody>
</table>

For those instructions that use bit 7 to indicate the presence of an index or immediate data and bit 6 to indicate the size of the index or immediate data, if bit 7 is 0 (no immediate data), then bit 6 is ignored by the VM. Otherwise, unless otherwise specified for a given instruction, setting unused bits in the opcode byte results in an instruction encoding exception when the instruction is executed. Setting the modifiers field in the opcode byte to reserved values will also result in an instruction encoding exception.

22.7.2 Instruction Operands Byte Encoding

The second byte of most encoded instructions is an operand byte, which encodes the registers for the instruction operands and whether the operands are direct or indirect. Table 22-7 defines the encoding for the operand byte for these instructions. Unless otherwise specified for a given instruction, setting unused bits in the operand byte results in an instruction encoding exception when the instruction is executed. Setting fields in the operand byte to reserved values will also result in an instruction encoding exception.
22.7.3 Index/Immediate Data Encoding
Following the operand bytes for most instructions is the instruction’s immediate data. The immediate data is, depending on the instruction and instruction encoding, either an unsigned or signed literal value, or an index encoded using natural encoding. In either case, the size of the immediate data is specified in the instruction encoding.

For most instructions, the index/immediate value in the instruction stream is interpreted as a signed immediate value if the register operand is direct. This immediate value is then added to the contents of the register to compute the instruction operand. If the register is indirect, then the data is usually interpreted as a natural index (see Section 22.4) and the computed index value is added to the contents of the register to get the address of the operand.

22.8 EBC Instruction Set
The following sections describe each of the EBC instructions in detail. Information includes an assembly-language syntax, a description of the instruction functionality, binary encoding, and any limitations or unique behaviors of the instruction.

ADD

Syntax

\[
\text{ADD}[32|64] \ {\@}R_1, \ {\@}R_2 \ \{\text{Index16}|\text{Immed16}\}
\]

Description

Adds two signed operands and stores the result to Operand 1. The operation can be performed on either 32-bit (ADD32) or 64-bit (ADD64) operands.
Operation

**Operand 1 <= Operand 1 + Operand 2**

Table 22-8 ADD Instruction Encoding

<table>
<thead>
<tr>
<th>BYTE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Bit Description</td>
</tr>
</tbody>
</table>
| 7    | 0 = Immediate/index absent  
|      | 1 = Immediate/index present |
| 6    | 0 = 32-bit operation  
|      | 1 = 64-bit operation |
| 0..5 | Opcode = 0x0C |
| 1    | Bit Description |
| 7    | 0 = Operand 2 direct  
|      | 1 = Operand 2 indirect |
| 4..6 | Operand 2 |
| 3    | 0 = Operand 1 direct  
|      | 1 = Operand 1 indirect |
| 0..2 | Operand 1 |
| 2..3 | Optional 16-bit immediate data/index |

Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index and the Operand 2 value is fetched from memory as a signed value at address \([R_2 + \text{Index16}]\).
- If Operand 2 is direct, then the immediate data is considered a signed immediate value and is added to the \(R_2\) register contents such that \(\text{Operand 2} = \text{R}_2 + \text{Immed16}\).
- If the instruction is ADD32 and Operand 1 is direct, then the result is stored back to the Operand 1 register with the upper 32 bits cleared.

AND

**Syntax**

\[
\text{AND}[32|64] \{@\text{R}_1\}, \{@\text{R}_2\} \{\text{Index16}|\text{Immed16}\}
\]

**Description**

Performs a logical AND operation on two operands and stores the result to Operand 1. The operation can be performed on either 32-bit (AND32) or 64-bit (AND64) operands.
Operation

**Operand 1 <= Operand 1 AND Operand 2**

Table 22-9 AND Instruction Encoding

<table>
<thead>
<tr>
<th>BYTE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Bit Description</td>
</tr>
<tr>
<td>7</td>
<td>0 = Immediate/index absent</td>
</tr>
<tr>
<td></td>
<td>1 = Immediate/index present</td>
</tr>
<tr>
<td>6</td>

</tr>
<tr>
<td>0..2</td>
<td>Operand 1</td>
</tr>
<tr>
<td>2..3</td>
<td>Optional 16-bit immediate data/index</td>
</tr>
</tbody>
</table>

Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory as an unsigned value at address [R2 + Index16].
- If Operand 2 is direct, then the immediate data is considered a signed immediate value and is added to the register contents such that Operand 2 = R2 + Immed16.
- If the instruction is AND32 and Operand 1 is direct, then the result is stored to the Operand 1 register with the upper 32 bits cleared.

**ASHR**

Syntax

`ASHR[32|64] {@}R1, {@}R2 {Index16|Immed16}`

Description

Performs an arithmetic right-shift of a signed 32-bit (ASHR32) or 64-bit (ASHR64) operand and stores the result back to Operand 1.
Operation

Operand 1 <= Operand 1 SHIFT-RIGHT Operand 2

Table 22-10 ASHR Instruction Encoding

<table>
<thead>
<tr>
<th>BYTE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>

</tr>
<tr>
<td>0..2</td>
<td>Operand 1</td>
</tr>
<tr>
<td>2..3</td>
<td>Optional 16-bit immediate data/index</td>
</tr>
</tbody>
</table>

Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory as a signed value at address \([R_2 + \text{Index16}]\).
- If Operand 2 is direct, then the immediate data is considered a signed immediate value and is added to the register contents such that \(\text{Operand 2} = R_2 + \text{Immed16}\).
- If the instruction is ASHR32, and Operand 1 is direct, then the result is stored back to the Operand 1 register with the upper 32 bits cleared.

BREAK

Syntax

BREAK [break code]

Description

The BREAK instruction is used to perform special processing by the VM. The break code specifies the functionality to perform.

BREAK 0 – Runaway program break. This indicates that the VM is likely executing code from cleared memory. This results in a bad break exception.

BREAK 1 – Get virtual machine version. This instruction returns the 64-bit virtual machine revision number in VM register R7. The encoding is shown in Table 22-11 and Table 22-12. A VM that conforms to this version of the specification should return a version number of 0x00010000.
Table 22-11 VM Version Format

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-32</td>
<td>Reserved = 0</td>
</tr>
<tr>
<td>31..16</td>
<td>VM major version</td>
</tr>
<tr>
<td>15..0</td>
<td>VM minor version</td>
</tr>
</tbody>
</table>

**BREAK 3** – Debug breakpoint. Executing this instruction results in a debug break exception. If a debugger is attached or available, then it may halt execution of the image.

**BREAK 4** – System call. There are no system calls supported for use with this break code, so the VM will ignore the instruction and continue execution at the following instruction.

**BREAK 5** – Create thunk. This causes the interpreter to create a thunk for the EBC entry point whose 32-bit IP-relative offset is stored at the 64-bit address in VM register R7. The interpreter then replaces the contents of the memory location pointed to by R7 to point to the newly created thunk. Since all EBC IP-relative offsets are relative to the next instruction or data object, the original offset is off by 4, so must be incremented by 4 to get the actual address of the entry point.

**BREAK 6** – Set compiler version. An EBC C compiler can insert this break instruction into an executable to set the compiler version used to build an EBC image. When the VM executes this instruction it takes the compiler version from register R7 and may perform version compatibility checking. The compiler version number follows the same format as the VM version number returned by the BREAK 1 instruction.

Table 22-12 BREAK Instruction Encoding

<table>
<thead>
<tr>
<th>Byte</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Opcode = 0x00</td>
</tr>
<tr>
<td>1</td>
<td>0 = Runaway program break</td>
</tr>
<tr>
<td></td>
<td>1 = Get virtual machine version</td>
</tr>
<tr>
<td></td>
<td>3 = Debug breakpoint</td>
</tr>
<tr>
<td></td>
<td>4 = System call</td>
</tr>
<tr>
<td></td>
<td>5 = Create thunk</td>
</tr>
<tr>
<td></td>
<td>6 = Set compiler version</td>
</tr>
</tbody>
</table>

**Behaviors and Restrictions**

- Executing an undefined BREAK code results in a bad break exception.
- Executing BREAK 0 results in a bad break exception.
CALL

Syntax

CALL32{EX}{a} {@}R1 {Immed32|Index32}
CALL64{EX}{a} Immed64

Description

The CALL instruction pushes the address of the following instruction on the stack and jumps to a subroutine. The subroutine may be either EBC or native code, and may be to an absolute or IP-relative address. CALL32 is used to jump directly to EBC code within a given application, whereas CALLEX is used to jump to external code (either native or EBC), which requires thunking. Functionally, the CALL does the following:

```
R0 = R0 - 8;
PUSH64 ReturnAddress
if (Opcode.ImmedData64Bit) {
  if (Operands.EbcCall) {
    IP = Immed64;
  } else {
    NativeCall (Immed64);
  }
} else {
  if (Operand1 != R0) {
    Addr = Operand1;
  } else {
    Addr = Immed32;
  }
  if (Operands.EbcCall) {
    if (Operands.RelativeAddress) {
      IP += Addr + SizeOfThisInstruction;
    } else {
      IP = Addr
    }
  } else {
    if (Operands.RelativeAddress) {
      NativeCall (IP + Addr)
    } else {
      NativeCall (Addr)
    }
  }
}
```

Operation

```
R0 <= R0 - 16
[R0] <= IP + SizeOfThisInstruction
IP <= IP + SizeOfThisInstruction + Operand 1 (relative CALL)
IP <= Operand 1 (absolute CALL)
```
BEHAVIOR AND RESTRICTIONS

- For the CALL32 forms, if Operand 1 is indirect, then the immediate data is interpreted as an index, and the Operand 1 value is fetched from memory address \([R_1 + \text{Index32}]\).

- For the CALL32 forms, if Operand 1 is direct, then the immediate data is considered a signed immediate value and is added to the Operand 1 register contents such that Operand 1 = \(R_1 + \text{Immed32}\).

- For the CALLEX forms, the VM must fix up the stack pointer and execute a call to native code in a manner compatible with the native code such that the callee is able to access arguments passed on the VM stack.

- For the CALLEX forms, the value returned by the callee should be returned in \(R7\).

- For the CALL64 forms, the Operand 1 fields are ignored.

- If Byte7:Bit6 = 1 (CALL64), then Byte1:Bit4 is assumed to be 0 (absolute address)

- For CALL32 forms, if Operand 1 register = \(R0\), then the register operand is ignored and only the immediate data is used in the calculation of the call address.

- Prior to the call, the VM will decrement the stack pointer \(R0\) by 16 bytes, and store the 64-bit return address on the stack.

- Offsets for relative calls are relative to the address of the instruction following the CALL instruction.

---

| 0..2 | Operand 1 |
| 2..5 | Optional 32-bit index/immediate for CALL32 |
| 2..9 | Required 64-bit immediate data for CALL64 |
CMP

Syntax

```
CMP[32|64][eq|lte|gte|ulte|ugte] R1, {@}R2 {Index16|Immed16}
```

Description

The CMP instruction is used to compare Operand 1 to Operand 2. Supported comparison modes are =, <=, >=, unsigned <=, and unsigned >=. The comparison size can be 32 bits (CMP32) or 64 bits (CMP64). The effect of this instruction is to set or clear the condition code bit in the Flags register per the comparison results. The operands are compared as signed values except for the CMPulte and CMPugte forms.

Operation

- **CMPeq**: Flags.C <= (Operand 1 == Operand 2)
- **CMPlte**: Flags.C <= (Operand 1 <= Operand 2)
- **CMPgte**: Flags.C <= (Operand 1 >= Operand 2)
- **CMPulte**: Flags.C <= (Operand 1 <= Operand 2) (unsigned)
- **CMPugte**: Flags.C <= (Operand 1>= Operand 2) (unsigned)

Table 22-14 CMP Instruction Encoding

<table>
<thead>
<tr>
<th>BYTE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Bit</td>
</tr>
</tbody>
</table>

1 = 64-bit comparison |
| 0..5 | Opcode      |
|      | 0x05 = CMPeq compare equal  
0x06 = CMPlte compare signed less then/equal  
0x07 = CMPgte compare signed greater than/equal  
0x08 = CMPulte compare unsigned less than/equal  
0x09 = CMPugte compare unsigned greater than/equal |
| 1    | Bit         |
| 7    | 0 = Operand 2 direct  
1 = Operand 2 indirect |
| 4..6 | Operand 2 |
| 3    | Reserved = 0 |
| 0..2 | Operand 1 |
| 2..3 | Optional 16-bit immediate data/index |
Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory address [R2 + Index16].
- If Operand 2 is direct, then the immediate data is considered a signed immediate value and is added to the register contents such that Operand 2 = R2 + Immed16.
- Only register direct is supported for Operand 1.

CMPI

Syntax

CMPI{32|64}{w|d}{eq|lte|gte|ulte|ugte} {@}R1 {Index16}, Immed16|Immed32

Description

Compares two operands, one of which is an immediate value, for =, <=, >=, unsigned <=, or unsigned >=, and sets or clears the condition flag bit in the Flags register accordingly. Comparisons can be performed on a 32-bit (CMPI32) or 64-bit (CMPI64) basis. The size of the immediate data can be either 16 bits (CMPIw) or 32 bits (CMPId).

Operation

| CMPIeq: Flags.C <= (Operand 1 == Operand 2) |
| CMPIlte: Flags.C <= (Operand 1 <= Operand 2) |
| CMPIgte: Flags.C <= (Operand 1 >= Operand 2) |
| CMPIulte: Flags.C <= (Operand 1 <= Operand 2) |
| CMPIugte: Flags.C <= (Operand 1>= Operand 2) |

Table 22-15 CMPI Instruction Encoding

<table>
<thead>
<tr>
<th>BYTE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Bit</td>
</tr>
</tbody>
</table>
| 7    | 0 = 16-bit immediate data  
1 = 32-bit immediate data |
| 6    | 0 = 32-bit comparison  
1 = 64-bit comparison |
| 0..5 | Opcode      |
|      | 0x2D = CMPIeq compare equal  
0x2E = CMPIlte compare signed less then/equal  
0x2F = CMPIgte compare signed greater than/equal  
0x30 = CMPIulte compare unsigned less than/equal  
0x31 = CMPIugte compare unsigned greater than/equal |
Behaviors and Restrictions

- The immediate data is fetched as a signed value.
- If the immediate data is smaller than the comparison size, then the immediate data is sign-extended appropriately.
- If Operand 1 is direct, and an Operand 1 index is specified, then an instruction encoding exception is generated.

DIV

Syntax

```
DIV[32|64] {@}R1, {@}R2 {Index16|Immed16}
```

Description

Performs a divide operation on two signed operands and stores the result to Operand 1. The operation can be performed on either 32-bit (DIV32) or 64-bit (DIV64) operands.

Operation

```
Operand 1 <= Operand 1 / Operand 2
```

Table 22-16 DIV Instruction Encoding

<table>
<thead>
<tr>
<th>BYTE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Bit</td>
</tr>
</tbody>
</table>
| 7    | 0 = Immediate/index absent
|      | 1 = Immediate/index present |
| 6    | 0 = 32-bit operation
|      | 1 = 64-bit operation |
| 0..5 | Opcode = 0x10 |
Behaviors and Restrictions
- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory as a signed value at address [R2 + Index16].
- If Operand 2 is direct, then the immediate data is considered a signed value and is added to the register contents such that Operand 2 = R2 + Immed16
- If the instruction is DIV32 form, and Operand 1 is direct, then the upper 32 bits of the result are set to 0 before storing to the Operand 1 register.
- A divide-by-0 exception occurs if Operand 2 = 0.

DIVU

Syntax
DIVU[32|64] {@}R1, {@}R2 {Index16|Immed16}

Description
Performs a divide operation on two unsigned operands and stores the result to Operand 1. The operation can be performed on either 32-bit (DIVU32) or 64-bit (DIVU64) operands.

Operation
Operand 1 \( \leftarrow \) Operand 1 \( \div \) Operand 2

Table 22-17 DIVU Instruction Encoding

<table>
<thead>
<tr>
<th>BYTE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>6</td>
<td>0 = 32-bit operation&lt;br&gt;1 = 64-bit operation</td>
</tr>
<tr>
<td>0..5</td>
<td>Opcode = 0x11</td>
</tr>
</tbody>
</table>
Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the value is fetched from memory as an unsigned value at address [R2 + Index16].
- If Operand 2 is direct, then the immediate data is considered an unsigned value and is added to the Operand 2 register contents such that Operand 2 = R2 + Immed16.
- For the DIVU32 form, if Operand 1 is direct then the upper 32 bits of the result are set to 0 before storing back to the Operand 1 register.
- A divide-by-0 exception occurs if Operand 2 = 0.

**EXTNDB**

**Syntax**

```
EXTNDB[32|64] {@}R1, {@}R2 {Index16|Immed16}
```

**Description**

Sign-extend a byte value and store the result to Operand 1. The byte can be signed extended to 32 bits (EXTNDB32) or 64 bits (EXTNDB64).

**Operation**

```
Operand 1 <= (sign extended) Operand 2
```

**Table 22-18 EXTNDB Instruction Encoding**

<table>
<thead>
<tr>
<th>BYTE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Bit</td>
</tr>
<tr>
<td>7</td>
<td>0 = Immediate/index absent</td>

</tr>
<tr>
<td></td>
<td>1 = 64-bit operation</td>
</tr>
<tr>
<td>0..5</td>
<td>Opcode = 0x1A</td>
</tr>
</tbody>
</table>
Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the byte Operand 2 value is fetched from memory as a signed value at address \([R_2 + \text{Index16}]\).
- If Operand 2 is direct, then the immediate data is considered a signed immediate value, is added to the signed-extended byte from the Operand 2 register, and the byte result is sign extended to 32 or 64 bits.
- If the instruction is EXTNDB32 and Operand 1 is direct, then the 32-bit result is stored in the Operand 1 register with the upper 32 bits cleared.

**EXTNDD**

**Syntax**

`EXTNDD[32|64] \{@\}R_1, \{@\}R_2 \{\text{Index16}|\text{Immed16}\}`

**Description**

Sign-extend a 32-bit Operand 2 value and store the result to Operand 1. The Operand 2 value can be extended to 32 bits (EXTNDD32) or 64 bits (EXTNDD64).

**Operation**

`Operand 1 \leftarrow \text{(sign extended) Operand 2}`

**Table 22-19 EXTNDD Instruction Encoding**

<table>
<thead>
<tr>
<th>BYTE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Bit Description</td>
</tr>
</tbody>
</table>
| 7    | 0 = Immediate/index absent  
       | 1 = Immediate/index present |
| 6    | 0 = 32-bit operation  
       | 1 = 64-bit operation |
| 0..5 | Opcode = 0x1C |
Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the 32-bit value is fetched from memory as a signed value at address \([R2 + \text{Index16}]\).
- If Operand 2 is direct, then the immediate data is considered a signed immediate value such that Operand 2 = \(R2 + \text{Immed16}\), and the value is sign extended to 32 or 64 bits accordingly.
- If the instruction is EXTND32 and Operand 1 is direct, then the result is stored in the Operand 1 register with the upper 32 bits cleared.

**EXTNDW**

Syntax

\[
\text{EXTNDW}[32|64] \{@\}R1, \{@\}R2 \{\text{Index16}|\text{Immed16}\}
\]

Description

Sign-extend a 16-bit Operand 2 value and store the result back to Operand 1. The value can be signed extended to 32 bits (EXTNDW32) or 64 bits (EXTNDW64).

Operation

\[\text{Operand 1} \Leftarrow (\text{sign extended}) \text{Operand 2}\]

Table 22-20 EXTNDW Instruction Encoding

<table>
<thead>
<tr>
<th>BYTE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Bit Description</td>
</tr>
</tbody>
</table>
| 7    | 0 = Immediate/index absent  
1 = Immediate/index present  |
| 6    | 0 = 32-bit operation   
1 = 64-bit operation     |
| 0..5 | Opcode = 0x1B         |
Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the word value is fetched from memory as a signed value at address \([R_2 + \text{Index16}]\).
- If Operand 2 is direct, then the immediate data is considered a signed immediate value such that Operand 2 = \(R_2 + \text{Immed16}\), and the value is sign extended to 32 or 64 bits accordingly.
- If the instruction is EXTNDW32 and Operand 1 is direct, then the 32-bit result is stored in the Operand 1 register with the upper 32 bits cleared.

### JMP

**Syntax**

\[
\begin{align*}
\text{JMP32}\{\text{cs}\mid \text{cc}\} \ { @} R_1 \ { \text{Immed32}\mid \text{Index32}} \\
\text{JMP64}\{\text{cs}\mid \text{cc}\} \ \text{Immed64}
\end{align*}
\]

**Description**

The JMP instruction is used to conditionally or unconditionally jump to a relative or absolute address and continue executing EBC instructions. The condition test is done using the condition bit in the VM Flags register. The JMP64 form only supports an immediate value that can be used for either a relative or absolute jump. The JMP32 form adds support for indirect addressing of the JMP offset or address. The JMP is implemented as:

```c
if (ConditionMet) {
    if (Operand.RelativeJump) {
        IP += Operand1 + SizeOfThisInstruction;
    } else {
        IP = Operand1;
    }
} else {
    IP = Operand1;
}
```

**Operation**

\[
\begin{align*}
\text{IP} & \leq \text{Operand 1 (absolute address)} \\
\text{IP} & \leq \text{IP + SizeOfThisInstruction + Operand 1 (relative address)}
\end{align*}
\]
Table 22-21 JMP Instruction Encoding

<table>
<thead>
<tr>
<th>Byte</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Bit  Description</td>
</tr>
</tbody>
</table>
| 7    | 0 = Immediate/index data absent  
      | 1 = Immediate/index data present  |
| 6    | 0 = JMP32  
      | 1 = JMP64  |
| 0..5 | Opcode = 0x01             |
| 1    | Bit  Description          |
| 7    | 0 = Unconditional jump  
      | 1 = Conditional jump      |
| 6    | 0 = Jump if Flags.C is clear (cc)  
      | 1 = Jump if Flags.C is set (cs)  |
| 5    | Reserved = 0              |
| 4    | 0 = Absolute address      
      | 1 = Relative address      |
| 3    | 0 = Operand 1 direct      
      | 1 = Operand 1 indirect    |
| 0..2 | Operand 1                  |
| 2..5 | Optional 32-bit immediate data/index for JMP32 |
| 2..9 | 64-bit immediate data for JMP64 |

Behaviors and Restrictions

- Operand 1 fields are ignored for the JMP64 forms
- If the instruction is JMP32, and Operand 1 register = R0, then the register contents are assumed to be 0.
- If the instruction is JMP32, and Operand 1 is indirect, then the immediate data is interpreted as an index, and the jump offset or address is fetched as a 32-bit signed value from address [R1 + Index32]
- If the instruction is JMP32, and Operand 1 is direct, then the immediate data is considered a signed immediate value such that Operand 1 = R1 + Immed32
- If the jump is unconditional, then Byte1:Bit6 (condition) is ignored
- If the instruction is JMP64, and Byte0:Bit7 is clear (no immediate data), then an instruction encoding exception is generated.
- If the instruction is JMP32, and Operand 2 is indirect, then the Operand 2 value is read as a natural value from memory address [R1 + Index32]
- An alignment check exception is generated if the jump is taken and the target address is odd.
JMP8

Syntax

\[ \text{JMP8}\{\text{cs|cc}\} \text{ Immed8} \]

Description

Conditionally or unconditionally jump to a relative offset and continue execution. The offset is a signed one-byte offset specified in the number of words. The offset is relative to the start of the following instruction.

Operation

\[ \text{IP} = \text{IP} + \text{SizeOfThisInstruction} + (\text{Immed8} \times 2) \]

Table 22-22 JMP8 Instruction Encoding

<table>
<thead>
<tr>
<th>BYTE</th>

</tr>
<tr>
<td>0..5</td>
<td>Opcode = 0x02</td>
</tr>
<tr>
<td>1</td>
<td>Immediate data (signed word offset)</td>
</tr>
</tbody>
</table>

Behaviors and Restrictions

- If the jump is unconditional, then Byte0:Bit6 (condition) is ignored

LOADSP

Syntax

\[ \text{LOADSP} \text{ [Flags], R2} \]

Description

This instruction loads a VM dedicated register with the contents of a VM general-purpose register R0-R7. The dedicated register is specified by its index as shown in Table 22-2.
Operation

\[
\text{Operand 1} \leftarrow R_2
\]

Table 22-23 LOADSP Instruction Encoding

<table>
<thead>
<tr>
<th>BYTE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Bit Description</td>
</tr>
<tr>
<td>6..7</td>
<td>Reserved = 0</td>
</tr>
<tr>
<td>0..5</td>
<td>Opcode = 0x29</td>
</tr>
<tr>
<td>1</td>
<td>7 Reserved</td>
</tr>
<tr>
<td>4..6</td>
<td>Operand 2 general purpose register</td>
</tr>
<tr>
<td>3</td>
<td>Reserved</td>
</tr>
<tr>
<td>0..2</td>
<td>Operand 1 dedicated register index</td>
</tr>
</tbody>
</table>

Behaviors and Restrictions

- Attempting to load any register (Operand 1) other than the Flags register results in an instruction encoding exception.
- Specifying a reserved dedicated register index results in an instruction encoding exception.
- If Operand 1 is the Flags register, then reserved bits in the Flags register are not modified by this instruction.

MOD

Syntax

\[
\text{MOD}[32|64] \{@\!R_1, \{@\!R_2 \{\text{Index16|Immed16}\}
\]

Description

Perform a modulus on two signed 32-bit (MOD32) or 64-bit (MOD64) operands and store the result to Operand 1.

Operation

\[
\text{Operand 1} \leftarrow \text{Operand 1} \text{ MOD } \text{Operand 2}
\]

Table 22-24 MOD Instruction Encoding

<table>
<thead>
<tr>
<th>BYTE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Bit Description</td>
</tr>
<tr>
<td>7</td>
<td>0 = Immediate/index absent</td>

</tr>
<tr>
<td></td>
<td>1 = 64-bit operation</td>
</tr>
<tr>
<td>0..5</td>
<td>Opcode = 0x12</td>
</tr>
</tbody>
</table>
Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory as a signed value at address \([R_2 + \text{Index16}]\).
- If Operand 2 is direct, then the immediate data is considered a signed immediate value such that Operand 2 = \(R_2 + \text{Immed16}\), and the value is sign extended to 32 or 64 bits accordingly.
- If Operand 2 = 0, then a divide-by-zero exception is generated.

MODU

Syntax

\[
\text{MODU}[32|64] \{@\}R_1, \{@\}R_2 \{\text{Index16}|\text{Immed16}\}
\]

Description

Perform a modulus on two unsigned 32-bit (MODU32) or 64-bit (MODU64) operands and store the result to Operand 1.

Operation

\[
\text{Operand 1} \leftarrow \text{Operand 1} \mod \text{Operand 2}
\]

Table 22-25 MODU Instruction Encoding

<table>
<thead>
<tr>
<th>BYTE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Bit Description</td>
</tr>
</tbody>
</table>
| 7    | 0 = Immediate/index absent  
      | 1 = Immediate/index present |
| 6    | 0 = 32-bit operation  
      | 1 = 64-bit operation |
| 0..5 | Opcode = 0x13 |
Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory as an unsigned value at address \([R2 + \text{Index16}]\).
- If Operand 2 is direct, then the immediate data is considered an unsigned immediate value such that \(\text{Operand 2} = R2 + \text{Immed16}\).
- If \(\text{Operand 2} = 0\), then a divide-by-zero exception is generated.

**MOV**

**Syntax**

\[
\begin{align*}
\text{MOV}[b|w|d|q]\{w|d\} \{@\}R1 \{\text{Index16|32}\}, \{@\}R2 \{\text{Index16|32}\} \\
\text{MOVqq} \{@\}R1 \{\text{Index64}\}, \{@\}R2 \{\text{Index64}\}
\end{align*}
\]

**Description**

This instruction moves data from Operand 2 to Operand 1. Both operands can be indexed, though both indexes are the same size. In the instruction syntax for the first form, the first variable character indicates the size of the data move, which can be 8 bits (b), 16 bits (w), 32 bits (d), or 64 bits (q). The optional character indicates the presence and size of the index value(s), which may be 16 bits (w) or 32 bits (d). The MOVqq instruction adds support for 64-bit indexes.

**Operation**

\(\text{Operand 1} \leftarrow \text{Operand 2}\)

**Table 22-26 MOV Instruction Encoding**

<table>
<thead>
<tr>
<th>Byte</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Bit</td>
</tr>
<tr>
<td>0</td>
<td>0 = Operand 2 direct</td>
</tr>
<tr>
<td></td>
<td>1 = Operand 2 indirect</td>
</tr>
<tr>
<td>7</td>
<td>0 = Operand 1 direct</td>
</tr>
<tr>
<td></td>
<td>1 = Operand 1 indirect</td>
</tr>
<tr>
<td>6</td>
<td>0 = Operand 2 index absent</td>
</tr>
<tr>
<td></td>
<td>1 = Operand 2 index present</td>
</tr>
</tbody>
</table>
Behaviors and Restrictions

- If an index is specified for Operand 1, and Operand 1 is direct, then an instruction encoding exception is generated.

**MOVI**

**Syntax**

\[ \text{MOVI[b|w|d|q][w|d|q]} \{@\}R1 \{Index16\}, \text{Immed16|32|64} \]

**Description**

This instruction moves a signed immediate value to Operand 1. In the instruction syntax, the first variable character specifies the width of the move, which may be 8 bits (b), 16 bits (w), 32-bits (d), or 64 bits (q). The second variable character specifies the width of the immediate data, which may be 16 bits (w), 32 bits (d), or 64 bits (q).

**Operation**

\[ \text{Operand 1} \leftarrow \text{Operand 2} \]
Table 22-27 MOVI Instruction Encoding

<table>
<thead>
<tr>
<th>BYTE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Bit Description</td>
</tr>
</tbody>
</table>
| 6..7 | 0 = Reserved  
1 = Immediate data is 16 bits (w)  
2 = Immediate data is 32 bits (d)  
3 = Immediate data is 64 bits (q) |
| 0..5 | Opcode = 0x37 |
| 1    | Bit Description |
| 7    | Reserved = 0 |
| 6    | 0 = Operand 1 index absent  
1 = Operand 1 index present |
| 4..5 | 0 = 8 bit (b) move  
1 = 16 bit (w) move  
2 = 32 bit (d) move  
3 = 64 bit (q) move |
| 3    | 0 = Operand 1 direct  
1 = Operand 1 indirect |
| 0..2 | Operand 1 |
| 2..3 | Optional 16-bit index |
| 2..3/4..5 | 16-bit immediate data |
| 2..5/4..7 | 32-bit immediate data |
| 2..9/4..11 | 64-bit immediate data |

Behaviors and Restrictions
• Specifying an index value with Operand 1 direct results in an instruction encoding exception.
• If the immediate data is smaller than the move size, then the value is sign-extended to the width of the move.
• If Operand 1 is a register, then the value is stored to the register with bits beyond the move size cleared.

MOVI

Syntax

\[ \text{MOVI}[w|d|q] \ \{@\}R1 \ \{Index16\}, \ Index16|32|64 \]

Description
This instruction moves an indexed value of form (+n, +c) to Operand 1. The index value is converted from (+n, +c) format to a signed offset per the encoding described in Table 22-4. The size of the Operand 2 index data can be 16 (w), 32 (d), or 64 (q) bits.
Operation

**Operand 1 <= Operand 2 (index value)**

Table 22-28 MOVIn Instruction Encoding

<table>
<thead>
<tr>
<th>BYTE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Bit Description</td>
</tr>
</tbody>
</table>
| 6..7 | 0 = Reserved  
1 = Operand 2 index value is 16 bits (w)  
2 = Operand 2 index value is 32 bits (d)  
3 = Operand 2 index value is 64 bits (q) |
| 0..5 | Opcode = 0x38 |
| 1    | Bit Description |
| 7    | Reserved |
| 6    | 0 = Operand 1 index absent  
1 = Operand 1 index present |
| 4..5 | Reserved = 0 |
| 3    | 0 = Operand 1 direct  
1 = Operand 1 indirect |
| 0..2 | Operand 1 |
| 2..3 | Optional 16-bit Operand 1 index |
| 2..3/4..5 | 16-bit Operand 2 index |
| 2..5/4..7 | 32-bit Operand 2 index |
| 2..9/4..11 | 64-bit Operand 2 index |

Behaviors and Restrictions

- Specifying an Operand 1 index when Operand 1 is direct results in an instruction encoding exception.
- The Operand 2 index is sign extended to the size of the move if necessary.
- If the Operand 2 index size is smaller than the move size, then the value is truncated.
- If Operand 1 is direct, then theOperand 2 value is sign extended to 64 bits and stored to the Operand 1 register.

**MOVn**

**Syntax**

\[
MOVn{w|d} \{@\}R1 \{Index16|32\}, \{@\}R2 \{Index16|32\}
\]

**Description**

This instruction loads an unsigned natural value from Operand 2 and stores the value to Operand 1. Both operands can be indexed, though both operand indexes are the same size. The operand index(s) can be 16 bits (w) or 32 bits (d).
Operation

\[
\text{Operand1} \leftarrow (\text{UINTN})\text{Operand2}
\]

Table 22-29 MOVn Instruction Encoding

<table>
<thead>
<tr>
<th>BYTE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Bit</td>
</tr>
</tbody>
</table>
| 7    | 0 = Operand 1 index absent  
      | 1 = Operand 1 index present |
| 6    | 0 = Operand 2 index absent  
      | 1 = Operand 2 index present |
| 0..5 | 0x32 = MOVnw opcode  
      | 0x33 = MOVnd opcode |
| 1    | Bit         |
| 7    | 0 = Operand 2 direct  
      | 1 = Operand 2 indirect |
| 4..6 | Operand 2    |
| 3    | 0 = Operand 1 direct  
      | 1 = Operand 1 indirect |
| 0..2 | Operand 1    |
| 2..3 | Optional Operand 1 16-bit index |
| 2..3/4..5 | Optional Operand 2 16-bit index |
| 2..5 | Optional Operand 1 32-bit index |
| 2..5/6..9 | Optional Operand 2 32-bit index |

Behaviors and Restrictions

- If an index is specified for Operand 2, and Operand 2 register is direct, then the Operand 2 index value is added to the register contents such that Operand 2 = (UINTN)(R2 + Index).
- If an index is specified for Operand 1, and Operand 1 is direct, then an instruction encoding exception is generated.
- If Operand 1 is direct, then the Operand 2 value will be 0-extended to 64 bits on a 32-bit machine before storing to the Operand 1 register.

MOVREL

Syntax

\[
\text{MOVREL}[w|d|q] \{@\}R1 \{\text{Index16}\}, \text{Immed16}\{32|64\}
\]

Description

This instruction fetches data at an IP-relative immediate offset (Operand 2) and stores the result to Operand 1. The offset is a signed offset relative to the following instruction. The fetched data is unsigned and may be 16 (w), 32 (d), or 64 (q) bits in size.
Operation

\[
\text{Operand 1} \leftarrow [\text{IP} + \text{SizeOfThisInstruction} + \text{Immed}]
\]

Table 22-30 MOVREL Instruction Encoding

<table>
<thead>
<tr>
<th>BYTE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Bit Description</td>
</tr>
</tbody>
</table>
| 6..7 | 0 = Reserved  
     | 1 = Immediate data is 16 bits (w)  
     | 2 = Immediate data is 32 bits (d)  
     | 3 = Immediate data is 64 bits (q)  |
| 0..5 | Opcode = 0x39 |
| 1    | Bit Description |
| 7    | Reserved = 0 |
| 6    | 0 = Operand 1 index absent  
     | 1 = Operand 1 index present |
| 4..5 | Reserved = 0 |
| 3    | 0 = Operand 1 direct  
     | 1 = Operand 1 indirect |
| 0..2 | Operand 1 |
| 2..3 | Optional 16-bit Operand 1 index |
| 2..3/4..5 | 16-bit immediate offset |
| 2..5/4..7 | 32-bit immediate offset |
| 2..9/4..11 | 64-bit immediate offset |

Behaviors and Restrictions

- If an Operand 1 index is specified and Operand 1 is direct, then an instruction encoding exception is generated.

MOVsn

Syntax

\[
\text{MOVsn}\{w\} \{R_1\}, \{Index16\}, \{R_2\} \{Index16|Immed16\} \\
\text{MOVsn}\{d\} \{R_1\} \{Index32\}, \{R_2\} \{Index32|Immed32\}
\]

Description

Moves a signed natural value from Operand 2 to Operand 1. Both operands can be indexed, though the indexes are the same size. Indexes can be either 16 bits (MOVsnw) or 32 bits (MOVsnd) in size.
Operation

\[ \text{Operand 1} \leq \text{Operand 2} \]

Table 22-31 MOVsn Instruction Encoding

<table>
<thead>
<tr>
<th>BYTE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Bit</td>
</tr>
</tbody>
</table>
| 7    | 0 = Operand 1 index absent  
9 = Operand 1 index present |
| 6    | 0 = Operand 2 index/immediate data absent  
1 = Operand 2 index/immediate data present |
| 0..5 | 0x25 = MOVsnw opcode  
0x26 = MOVsnd opcode |
| 1    | Bit         |
| 7    | 0 = Operand 2 direct  
1 = Operand 2 indirect |
| 4..6 | Operand 2 |
| 3    | 0 = Operand 1 direct  
1 = Operand 1 indirect |
| 0..2 | Operand 1  |
| 2..3 | Optional 16-bit Operand 1 index (MOVsnw)  |
| 2..3/4..5 | Optional 16-bit Operand 2 index (MOVsnw)  |
| 2..5 | Optional 32-bit Operand 1 index/immediate data (MOVsnd)  |
| 2..5/6..9 | Optional 32-bit Operand 2 index/immediate data (MOVsnd)  |

Behaviors and Restrictions

- If Operand 2 is direct, and Operand 2 index/immediate data is specified, then the immediate value is read as a signed immediate value and is added to the contents of Operand 2 register such that Operand 2 = R2 + Immed.
- If Operand 2 is indirect, and Operand 2 index/immediate data is specified, then the immediate data is interpreted as an index and the Operand 2 value is fetched from memory as a signed value at address [R2 + Index16].
- If an index is specified for Operand 1, and Operand 1 is direct, then an instruction encoding exception is generated.
- If Operand 1 is direct, then the Operand 2 value is sign-extended to 64-bits on 32-bit native machines.
MUL

Syntax

\texttt{MUL[32|64] \{@\}R1, \{@\}R2 \{Index16|Immed16\}}

Description
Perform a signed multiply of two operands and store the result back to Operand 1. The operands can be either 32 bits (MUL32) or 64 bits (MUL64).

Operation

\texttt{Operand 1 \Leftarrow Operand \ast Operand 2}

Table 22-32 MUL Instruction Encoding

<table>
<thead>
<tr>
<th>BYTE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Bit Description</td>
</tr>
</tbody>
</table>
| 7    | 0 = Operand 2 immediate/index absent  
               1 = Operand 2 immediate/index present |
| 6    | 0 = 32-bit operation  
               1 = 64-bit operation |
| 0..5 | Opcode = 0x0E |
| 1    | Bit Description |

| 3    | 0 = Operand 1 direct  
               1 = Operand 1 indirect |
| 0..2 | Operand 1 |
| 2..3 | Optional 16-bit Operand 2 immediate data/index |

Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory as a signed value at address \([R_2 + \text{Index16}].

- If Operand 2 is direct, then the immediate data is considered a signed immediate value and is added to the Operand 2 register contents such that Operand 2 = R_2 + \text{Immed16}.

- If the instruction is MUL32, and Operand 1 is direct, then the result is stored to Operand 1 register with the upper 32 bits cleared.
MULU

Syntax

MULU[32|64] {@}R1, {@}R2 {Index16|Immed16}

Description

Performs an unsigned multiply of two 32-bit (MULU32) or 64-bit (MULU64) operands, and stores the result back to Operand 1.

Operation

Operand 1 <= Operand * Operand 2

Table 22-33 MULU Instruction Encoding

</tr>
<tr>
<td>0..2</td>
<td>Operand 1</td>
</tr>
<tr>
<td>2..3</td>
<td>Optional 16-bit immediate data/index</td>
</tr>
</tbody>
</table>

Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory as an unsigned value at address [R2 + Index16].
- If Operand 2 is direct, then the immediate data is considered a signed immediate value and is added to the Operand 2 register contents such that Operand 2 = R2 + Immed16.
- If the instruction is MULU32 and Operand 1 is direct, then the result is written to the Operand 1 register with the upper 32 bits cleared.
NEG

Syntax

```
NEG[32|64] {@}R1, {@}R2 {Index16|Immed16}
```

Description

Multiply Operand 2 by negative 1, and store the result back to Operand 1.Operand 2 is a signed value and fetched as either a 32-bit (NEG32) or 64-bit (NEG64) value.

Operation

```
Operand 1 <= -1 * Operand 2
```

Table 22-34 NEG Instruction Encoding

<tr>
<td>0..2</td>
<td>Operand 1</td>
</tr>
<tr>
<td>2..3</td>
<td>Optional 16-bit immediate data/index</td>
</tr>
</tbody>
</table>

Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory as a signed value at address [R2 + Index16].
- If Operand 2 is direct, then the immediate data is considered a signed immediate value and is added to the Operand 2 register contents such that Operand 2 = R2 + Immed16.
- If the instruction is NEG32 and Operand 1 is direct, then the result is stored in Operand 1 register with the upper 32-bits cleared.
NOT

Syntax
NOT[32|64] {@}R1, {@}R2 {Index16|Immed16}

Description
Performs a logical NOT operation on Operand 2, an unsigned 32-bit (NOT32) or 64-bit (NOT64) value, and stores the result back to Operand 1.

Operation
Operand 1 <= NOT Operand 2

Table 22-35 NOT Instruction Encoding

</tr>
<tr>
<td>0..2</td>
<td>Operand 1</td>
</tr>
<tr>
<td>2..3</td>
<td>Optional 16-bit immediate data/index</td>
</tr>
</tbody>
</table>

Behaviors and Restrictions
- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory as an unsigned value at address \([R_2 + Index16]\).
- If Operand 2 is direct, then the immediate data is considered a signed immediate value and is added to the Operand 2 register contents such that Operand 2 = R_2 + Immed16.
- If the instruction is NOT32 and Operand 1 is a register, then the result is stored in the Operand 1 register with the upper 32 bits cleared.
OR

Syntax

$$\text{OR}^{[32|64]} \{@\}R_1, \{@\}R_2 \{\text{Index16|Immed16}\}$$

Description
Performs a bit-wise OR of two 32-bit (OR32) or 64-bit (OR64) operands, and stores the result back to Operand 1.

Operation

$$\text{Operand 1} \leftarrow \text{Operand 1 OR Operand 2}$$

Table 22-36 OR Instruction Encoding

<table>
<thead>
<tr>
<th>BYTE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Bit Description</td>
</tr>
</tbody>
</table>
| 7    | 0 = Operand 2 immediate/index absent  
        1 = Operand 2 immediate/index present |

        1 = Operand 1 indirect |
| 0..2 | Operand 1 |
| 2..3 | Optional 16-bit immediate data/index |

Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory as an unsigned value at address $$[R_2 + \text{Index16}]$$.

- If Operand 2 is direct, then the immediate data is considered a signed immediate value and is added to the Operand 2 register contents such that $$\text{Operand 2} = R_2 + \text{Immed16}$$.

- If the instruction is OR32 and Operand 1 is direct, then the result is stored to Operand 1 register with the upper 32 bits cleared.
POP

Syntax

\[ \text{POP[32|64]} \{\text{@}\}R_1 \{\text{Index16}\|\text{Immed16}\} \]

Description

This instruction pops a 32-bit (POP32) or 64-bit (POP64) value from the stack, stores the result to Operand 1, and adjusts the stack pointer \( R_0 \) accordingly.

Operation

\[
\begin{align*}
\text{Operand 1} & \leftarrow [R_0] \\
R_0 & \leftarrow R_0 + 4 \quad \text{(POP32)} \\
R_0 & \leftarrow R_0 + 8 \quad \text{(POP64)}
\end{align*}
\]

| 1    | Bit Description |
| 7..4 | Reserved = 0 |
| 3    | 0 = Operand 1 direct  
|      | 1 = Operand 1 indirect |
| 0..2 | Operand 1 |
| 2..3 | Optional 16-bit immediate data/index |

Behaviors and Restrictions

- If Operand 1 is direct, and an index/immediate data is specified, then the immediate data is read as a signed value and is added to the value popped from the stack, and the result stored to the Operand 1 register.
- If Operand 1 is indirect, then the immediate data is interpreted as an index, and the value popped from the stack is stored to address \([R_1 + \text{Index16}]\).
- If the instruction is POP32, and Operand 1 is direct, then the popped value is sign-extended to 64 bits before storing to the Operand 1 register.
POPn

Syntax

\[ \text{POPn } \{\text{@}R1 \{\text{Index16|Immed16}\} \]

Description

Read an unsigned natural value from memory pointed to by stack pointer \( R0 \), adjust the stack pointer accordingly, and store the value back to Operand 1.

Operation

\[
\begin{align*}
\text{Operand 1} & \Leftarrow (\text{UINTN})[R0] \\
R0 & \Leftarrow R0 + \text{sizeof (VOID *)}
\end{align*}
\]

Table 22-38 POPn Instruction Encoding

</tr>
<tr>
<td>0..2</td>
<td>Operand 1</td>
</tr>
<tr>
<td>2..3</td>
<td>Optional 16-bit immediate data/index</td>
</tr>
</tbody>
</table>

Behaviors and Restrictions

- If Operand 1 is direct, and an index/immediate data is specified, then the immediate data is fetched as a signed value and is added to the value popped from the stack and the result is stored back to the Operand 1 register.
- If Operand 1 is indirect, and an index/immediate data is specified, then the immediate data is interpreted as a natural index and the value popped from the stack is stored at \([R1 + \text{Index16}]\).
- If Operand 1 is direct, and the instruction is executed on a 32-bit machine, then the result is stored to the Operand 1 register with the upper 32 bits cleared.
PUSH

Syntax

\[ \text{PUSH}^{[32|64]} \{@\text{R1} \{\text{Index16}|\text{Immed16}\} \]

Description
Adjust the stack pointer \( \text{R0} \) and store a 32-bit (PUSH32) or 64-bit (PUSH64) Operand 1 value on the stack.

Operation

\[ \begin{align*}
\text{R0} & \leftarrow \text{R0} - 4 \quad (\text{PUSH32}) \\
\text{R0} & \leftarrow \text{R0} - 8 \quad (\text{PUSH64}) \\
[\text{R0}] & \leftarrow \text{Operand 1}
\end{align*} \]

       | 1 = Operand 1 indirect |
| 0..2 | Operand 1 |
| 2..3 | Optional 16-bit immediate data/index |

Behaviors and Restrictions

- If Operand 1 is direct, and an index/immediate data is specified, then the immediate data is read as a signed value and is added to the Operand 1 register contents such that Operand 1 = \( \text{R1} + \text{Immed16} \).
- If Operand 1 is indirect, and an index/immediate data is specified, then the immediate data is interpreted as a natural index and the pushed value is read from \([\text{R1} + \text{Index16}]\).

PUSHn

Syntax

\[ \text{PUSHn} \{@\text{R1} \{\text{Index16}|\text{Immed16}\} \]

Description
Adjust the stack pointer \( \text{R0} \), and store a natural value on the stack.
Operation

\[
R0 \leftarrow R0 - \text{sizeof (VOID *)}
\]

\[
[R0] \leftarrow \text{Operand 1}
\]

Table 22-40 PUSHn Instruction Encoding

</tr>
<tr>
<td>0..2</td>
<td>Operand 1</td>
</tr>
<tr>
<td>2..3</td>
<td>Optional 16-bit immediate data/index</td>
</tr>
</tbody>
</table>

Behaviors and Restrictions

- If Operand 1 is direct, and an index/immediate data is specified, then the immediate data is fetched as a signed value and is added to the Operand 1 register contents such that Operand 1 = R1 + Immed16.

- If Operand 1 is indirect, and an index/immediate data is specified, then the immediate data is interpreted as a natural index and the Operand 1 value pushed is fetched from [R1 + Index16].

RET

Syntax

\[
\text{RET}
\]

Description

This instruction fetches the return address from the stack, sets the IP to the value, adjusts the stack pointer register R0, and continues execution at the return address. If the RET is a final return from the EBC driver, then execution control returns to the caller, which may be EBC or native code.

Operation

\[
\text{IP} \leftarrow [R0]
\]

\[
R0 \leftarrow R0 + 16
\]
Behaviors and Restrictions
- An alignment exception will be generated if the return address is not aligned on a 16-bit boundary.

**SHL**

**Syntax**

\[
\text{SHL}[32|64] \{@R_1, \{@R_2 \{\text{Index16|Immed16}}
\]

**Description**

Left-shifts Operand 1 by Operand 2 bit positions and stores the result back to Operand 1. The operand sizes may be either 32-bits (SHL32) or 64 bits (SHL64).

**Operation**

\[\text{Operand 1} \ll \text{Operand 2} \]

**Table 22-42 SHL Instruction Encoding**

</tr>
<tr>
<td>0..2</td>
<td>Operand 1</td>
</tr>
<tr>
<td>2..3</td>
<td>Optional 16-bit immediate data/index</td>
</tr>
</tbody>
</table>
Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory as an unsigned value at address [R2 + Index16].

- If Operand 2 is direct, then the immediate data is considered a signed immediate value and is added to the Operand 2 register contents such that Operand 2 = R2 + Immed16.

- If the instruction is SHL32, and Operand 1 is direct, then the result is stored to the Operand 1 register with the upper 32 bits cleared.

**SHR**

**Syntax**

```
SHR[32|64] {@}R1, {@}R2 {Index16|Immed16}
```

**Description**

Right-shifts unsigned Operand 1 by Operand 2 bit positions and stores the result back to Operand 1. The operand sizes may be either 32-bits (SHR32) or 64 bits (SHR64).

**Operation**

```
Operand 1 <= Operand 1 >> Operand 2
```

**Table 22-43 SHR Instruction Encoding**

| 3    | 0 = Operand 1 direct  
|      | 1 = Operand 1 indirect          |
| 0..2 | Operand 1                      |
| 2..3 | Optional 16-bit immediate data/index |

Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory as an unsigned value at address [R2 + Index16].

- If Operand 2 is direct, then the immediate data is considered a signed immediate value and is added to the Operand 2 register contents such that Operand 2 = R2 + Immed16.
• If the instruction is SHR32, and Operand 1 is direct, then the result is stored to the Operand 1 register with the upper 32 bits cleared.

STORESP

Syntax

STORESP R1, [IP|Flags]

Description

This instruction transfers the contents of a dedicated register to a general-purpose register. See Table 22-2 for the VM dedicated registers and their corresponding index values.

Operation

Operand 1 <= Operand 2

Table 22-44 STORESP Instruction Encoding

<table>
<thead>
<tr>
<th>BYTE</th>

<td>4..6 Operand 2 dedicated register index</td>
</tr>
<tr>
<td></td>
<td>3</td>
</tr>
<tr>
<td></td>
<td>0..2 Operand 1 general purpose register</td>
</tr>
</tbody>
</table>

Behaviors and Restrictions

• Specifying an invalid dedicated register index results in an instruction encoding exception.

SUB

Syntax

SUB[32|64] {@}R1, {@}R2 {Index16|Immed16}

Description

Subtracts a 32-bit (SUB32) or 64-bit (SUB64) signed Operand 2 value from a signed Operand 1 value of the same size, and stores the result to Operand 1.
Operation

\[
\text{Operand 1} \leftarrow \text{Operand 1} - \text{Operand 2}
\]

Table 22-45 SUB Instruction Encoding

<table>
<thead>
<tr>
<th>BYTE</th>
<th>Description</th>

| 6    | 0 = 32-bit operation        
1 = 64-bit operation          |
| 0..5 | Opcode = 0x0D                |

Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory as a signed value at address [R2 + Index16].
- If Operand 2 is direct, then the immediate data is considered a signed immediate value and is added to the Operand 2 register contents such that Operand 2 = R2 + Immed16.
- If the instruction is SUB32 and Operand 1 is direct, then the result is stored to the Operand 1 register with the upper 32 bits cleared.

XOR

Syntax

\[
\text{XOR[32|64]} \{@\text{R}_1\}, \{@\text{R}_2\} \{\text{Index16|Immed16}\}
\]

Description

Performs a bit-wise exclusive OR of two 32-bit (XOR32) or 64-bit (XOR64) operands, and stores the result back to Operand 1.
Operation

Operand 1 <= Operand 1 XOR Operand 2

Table 22-46 XOR Instruction Encoding

<table>
<thead>
<tr>

</tr>
<tr>
<td>0..2</td>
<td>Operand 1</td>
</tr>
<tr>
<td>2..3</td>
<td>Optional 16-bit immediate data/index</td>
</tr>
</tbody>
</table>

Behaviors and Restrictions

- If Operand 2 is indirect, then the immediate data is interpreted as an index, and the Operand 2 value is fetched from memory as an unsigned value at address \([R_2 + \text{Index16}]\).
- If Operand 2 is direct, then the immediate data is considered a signed immediate value and is added to the Operand 2 register contents such that Operand 2 = \(R_2 + \text{Immed16}\).
- If the instruction is XOR32 and Operand1 is direct, then the result is stored to the Operand 1 register with the upper 32-bits cleared.

22.9 Runtime and Software Conventions

22.9.1 Calling Outside VM

Calls can be made to routines in other modules that are native or in another VM. It is the responsibility of the calling VM to prepare the outgoing arguments correctly to make the call outside the VM. It is also the responsibility of the VM to prepare the incoming arguments correctly for the call from outside the VM. Calls outside the VM must use the `CALL` instruction.

22.9.2 Calling Inside VM

Calls inside VM can be made either directly using the `CALL` or `CALLEX` instructions. Using direct CALL instructions is an optimization.
22.9.3 Parameter Passing
Parameters are pushed on the VM stack per the CDECL calling convention. Per this convention, the last argument in the parameter list is pushed on the stack first, and the first argument in the parameter list is pushed on the stack last.

All parameters are stored or accessed as natural size (using naturally sized instruction) except 64-bit integers, which are pushed as 64-bit values. 32-bit integers are pushed as natural size (since they should be passed as 64-bit parameter values on 64-bit machines).

22.9.4 Return Values
Return values of 8 bytes or less in size are returned in general-purpose register R7. Return values larger than 8 bytes are not supported.

22.9.5 Binary Format
PE32+ format will be used for generating binaries for the VM. A VarBss section will be included in the binary image. All global and static variables will be placed in this section. The size of the section will be based on worst-case 64-bit pointers. Initialized data and pointers will also be placed in the VarBss section, with the compiler generating code to initialize the values at runtime.

22.10 Architectural Requirements
This section provides a high level overview of the architectural requirements that are necessary to support execution of EBC on a platform.

22.10.1 EBC Image Requirements
All EBC images will be PE32+ format. Some minor additions to the format will be required to support EBC images. See the Microsoft Portable Executable and Common Object File Format Specification pointed to in Appendix Q for details of this image file format.

A given EBC image must be executable on different platforms, independent of whether it is a 32- or 64-bit processor. All EBC images should be driver implementations.

22.10.2 EBC Execution Interfacing Requirements
EBC drivers will typically be designed to execute in an (usually preboot) EFI environment. As such, EBC drivers must be able to invoke protocols and expose protocols for use by other drivers or applications. The following execution transitions must be supported:

- EBC calling EBC
- EBC calling native code
- Native code calling EBC
- Native code calling native code
- Returning from all the above transitions

Obviously native code calling native code is available by default, so is not discussed in this document.
To maintain backward compatibility with existing native code, and minimize the overhead for non-EBC drivers calling EBC protocols, all four transitions must be seamless from the application perspective. Therefore, drivers, whether EBC or native, shall not be required to have any knowledge of whether or not the calling code, or the code being called, is native or EBC compiled code. The onus is put on the tools and interpreter to support this requirement.

22.10.3 Interfacing Function Parameters Requirements
To allow code execution across protocol boundaries, the interpreter must ensure that parameters passed across execution transitions are handled in the same manner as the standard parameter passing convention for the native processor.

22.10.4 Function Return Requirements
The interpreter must support standard function returns to resume execution to the caller of external protocols. The details of this requirement are specific to the native processor. The called function must not be required to have any knowledge of whether or not the caller is EBC or native code.

22.10.5 Function Return Values Requirements
The interpreter must support standard function return values from called protocols. The exact implementation of this functionality is dependent on the native processor. This requirement applies to return values of 64 bits or less. The called function must not be required to have any knowledge of whether or not the caller is EBC or native code. Note that returning of structures is not supported.

22.11 EBC Interpreter Protocol
The EFI EBC protocol provides services to execute EBC images, which will typically be loaded into option ROMs.

EFI_EBC_PROTOCOL

Summary
This protocol provides the services that allow execution of EBC images.
GUID

#define EFI_EBC_PROTOCOL_GUID \
{0x13ac6dd1,0x73d0,0x11d4,\ 
 {0xb0,0x6b,0x00,0xaa,0x00,0xbd,0xe7}}

Protocol Interface Structure

typedef struct _EFI_EBC_PROTOCOL {
  EFI_EBC_CREATEThunk CreateThunk;
  EFI_EBC_UNLOAD_IMAGE UnloadImage;
  EFI_EBC_REGISTER_ICACHE_FLUSH RegisterICacheFlush;
  EFI_EBC_GET_VERSION GetVersion;
} EFI_EBC_PROTOCOL;

Parameters

CreateThunk  Creates a thunk for an EBC image entry point or protocol service, and returns a pointer to the thunk. See the CreateThunk() function description.

UnloadImage  Called when an EBC image is unloaded to allow the interpreter to perform any cleanup associated with the image's execution. See the UnloadImage() function description.

RegisterICacheFlush  Called to register a callback function that the EBC interpreter can call to flush the processor instruction cache after creating thunks. See the RegisterICacheFlush() function description.

GetVersion  Called to get the version of the associated EBC interpreter. See the GetVersion() function description.

Description

The EFI EBC protocol provides services to load and execute EBC images, which will typically be loaded into option ROMs. The image loader will load the EBC image, perform standard relocations, and invoke the CreateThunk() service to create a thunk for the EBC image's entry point. The image can then be run using the standard EFI start image services.

EFI_EBC_PROTOCOL.CreateThunk()

Summary

Creates a thunk for an EBC entry point, returning the address of the thunk.
Prototype

typedef
EFI_STATUS
(EIFIAPI *EFI_EBC_CREATE_THUNK) (
    IN EFI_EBC_PROTOCOL *This,
    IN EFI_HANDLE ImageHandle,
    IN VOID *EbcEntryPoint,
    OUT VOID **Thunk
);

Parameters

This A pointer to the EFI_EBC_PROTOCOL instance. This protocol is defined in Section 22.11.

ImageHandle Handle of image for which the thunk is being created.

EbcEntryPoint Address of the actual EBC entry point or protocol service the thunk should call.

Thunk Returned pointer to a thunk created.

Description

A PE32+ EBC image, like any other PE32+ image, contains an optional header that specifies the entry point for image execution. However for EBC images this is the entry point of EBC instructions, so is not directly executable by the native processor. Therefore when an EBC image is loaded, the loader must call this service to get a pointer to native code (thunk) that can be executed which will invoke the interpreter to begin execution at the original EBC entry point.

Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The function completed successfully.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>Image entry point is not 2-byte aligned.</td>
</tr>
<tr>
<td>EFI_OUT_OF_RESOURCES</td>
<td>Memory could not be allocated for the thunk.</td>
</tr>
</tbody>
</table>

EFI_EBC_PROTOCOL.UnloadImage()

Summary

Called prior to unloading an EBC image from memory.
Prototype

typedef
EFI_STATUS
(EIFIAPI *EFI_EBC_UNLOAD_IMAGE) (
    IN EFI_EBC_PROTOCOL *This,
    IN EFI_HANDLE ImageHandle
);

Parameters

This A pointer to the EFI_EBC_PROTOCOL instance. This protocol is defined in Section 22.11.

ImageHandle Image handle of the EBC image that is being unloaded from memory.

Description

This function is called after an EBC image has exited, but before the image is actually unloaded. It is intended to provide the interpreter with the opportunity to perform any cleanup that may be necessary as a result of loading and executing the image.

Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The function completed successfully.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>Image handle is not recognized as belonging to an EBC image that has been executed.</td>
</tr>
</tbody>
</table>

EFI_EBC_PROTOCOL.RegisterICacheFlush()

Summary

Registers a callback function that the EBC interpreter calls to flush the processor instruction cache following creation of thunks.

Prototype

typedef
EFI_STATUS
(* EFI_EBC_REGISTER_ICACHE_FLUSH) (
    IN EFI_EBC_PROTOCOL *This,
    IN EBC_ICACHE_FLUSH Flush
);

Parameters

This A pointer to the EFI_EBC_PROTOCOL instance. This protocol is defined in Section 22.11.

Flush Pointer to a function of type EBC_ICACHE_FLUSH. See “Related Definitions” below for a detailed description of this type.
Related Definitions

typedef
EFI_STATUS
(* EBC_ICACHE_FLUSH) (  
    IN EFI_PHYSICAL_ADDRESS Start,
    IN UINT64 Length
    );

Start       The beginning physical address to flush from the processor’s instruction cache.
Length      The number of bytes to flush from the processor’s instruction cache.

This is the prototype for the Flush callback routine. A pointer to a routine of this type is passed to the EBC EFI_EBC_REGISTER_ICACHE_FLUSH protocol service.

Description

An EBC image’s original PE32+ entry point is not directly executable by the native processor. Therefore to execute an EBC image, a thunk (which invokes the EBC interpreter for the image’s original entry point) must be created for the entry point, and the thunk is executed when the EBC image is started. Since the thunks may be created on-the-fly in memory, the processor’s instruction cache may require to be flushed after thunks are created. The caller to this EBC service can provide a pointer to a function to flush the instruction cache for any thunks created after the CreateThunk() service has been called. If an instruction-cache flush callback is not provided to the interpreter, then the interpreter assumes the system has no instruction cache, or that flushing the cache is not required following creation of thunks.

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The function completed successfully.</td>
</tr>
</tbody>
</table>

EFI_EBC_PROTOCOL.GetVersion()

Summary
Called to get the version of the interpreter.

Prototype

typedef
EFI_STATUS
(* EFI_EBC_GET_VERSION) (  
    IN EFI_EBC_PROTOCOL *This,
    OUT UINT64 *Version
    );

Parameters

This                     A pointer to the EFI_EBC_PROTOCOL instance. This protocol is defined in Section 22.11.
Version                  Pointer to where to store the returned version of the interpreter.
Description
This function is called to get the version of the loaded EBC interpreter. The value and format of the returned version is identical to that returned by the EBC \texttt{BREAK 1} instruction.

Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The function completed successfully.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>Version pointer is \texttt{NULL}.</td>
</tr>
</tbody>
</table>

22.12 EBC Tools

22.12.1 EBC C Compiler
This section describes the responsibilities of the EBC C compiler. To fully specify these responsibilities requires that the thunking mechanisms between EBC and native code be described.

22.12.2 C Coding Convention
The EBC C compiler supports only the C programming language. There is no support for C++, inline assembly, floating point types/operations, or C calling conventions other than CDECL.

Pointer type in C is supported only as 64-bit pointer. The code should be 64-bit pointer ready (not assign pointers to integers and vice versa).

The compiler does not support user-defined sections through pragmas.

Global variables containing pointers that are initialized will be put in the uninitialized VarBss section and the compiler will generate code to initialize these variables during load time. The code will be placed in an init text section. This compiler-generated code will be executed before the actual image entry point is executed.

22.12.3 EBC Interface Assembly Instructions
The EBC instruction set includes two forms of a \texttt{CALL} instruction that can be used to invoke external protocols. Their assembly language formats are:

\begin{verbatim}
CALLEX  Immed64
CALLEX32  @R1  {Immed32}
\end{verbatim}

Both forms can be used to invoke external protocols at an absolute address specified by the immediate data and/or register operand. The second form also supports jumping to code at a relative address. When one of these instructions is executed, the interpreter is responsible for thunking arguments and then jumping to the destination address. When the called function returns, code begins execution at the EBC instruction following the CALL instruction. The process by which this happens is called thunking. Later sections describe this operation in detail.

22.12.4 Stack Maintenance and Argument Passing
There are several EBC assembly instructions that directly manipulate the stack contents and stack pointer. These instructions operate on the EBC stack, not the interpreter stack. The instructions include the EBC \texttt{PUSH}, \texttt{POP}, \texttt{PUSHn}, and \texttt{POPN}, and all forms of the \texttt{MOV} instructions.
These instructions must adjust the EBC stack pointer in the same manner as equivalent instructions of the native instruction set. With this implementation, parameters pushed on the stack by an EBC driver can be accessed normally for stack-based native code. If native code expects parameters in registers, then the interpreter thunking process must transfer the arguments from EBC stack to the appropriate processor registers. The process would need to be reversed when native code calls EBC.

22.12.5 Native to EBC Arguments Calling Convention

The calling convention for arguments passed to EBC functions follows the standard CDECL calling convention. The arguments must be pushed as their native size. After the function arguments have been pushed on the stack, execution is passed to the called EBC function. The overhead of thunking the function parameters depends on the standard parameter passing convention for the host processor. The implementation of this functionality is left to the interpreter.

22.12.6 EBC to Native Arguments Calling Convention

When EBC makes function calls via function pointers, the EBC C compiler cannot determine whether the calls are to native code or EBC. It therefore assumes that the calls are to native code, and emits the appropriate EBC CALLEX instructions. To be compatible with calls to native code, the calling convention of EBC calling native code must follow the parameter passing convention of the native processor. The EBC C compiler generates EBC instructions that push all arguments on the stack. The interpreter is then responsible for performing the necessary thunking. The exact implementation of this functionality is left to the interpreter.

22.12.7 EBC to EBC Arguments Calling Convention

If the EBC C compiler is able to determine that a function call is to a local function, it can emit a standard EBC CALL instruction. In this case, the function arguments are passed as described in the other sections of this specification.

22.12.8 Function Returns

When EBC calls an external function, the thunking process includes setting up the host processor stack or registers such that when the called function returns, execution is passed back to the EBC at the instruction following the call. The implementation is left to the interpreter, but it must follow the standard function return process of the host processor. Typically this will require the interpreter to push the return address on the stack or move it to a processor register prior to calling the external function.

22.12.9 Function Return Values

EBC function return values of 8 bytes or less are returned in VM general-purpose register R7. Returning values larger than 8 bytes on the stack is not supported. Instead, the caller or callee must allocate memory for the return value, and the caller can pass a pointer to the callee, or the callee can return a pointer to the value in the standard return register R7.

If an EBC function returns to native code, then the interpreter thunking process is responsible for transferring the contents of R7 to an appropriate location such that the caller has access to the value using standard native code. Typically the value will be transferred to a processor register. Conversely, if a native function returns to an EBC function, the interpreter is responsible for transferring the return value from the native return memory or register location into VM register R7.
22.12.10 Thunking

Thunking is the process by which transitions between execution of native and EBC are handled. The major issues that must be addressed for thunking are the handling of function arguments, how the external function is invoked, and how return values and function returns are handled. The following sections describe the thunking process for the possible transitions.

22.12.10.1 Thunking EBC to Native Code

By definition, all external calls from within EBC are calls to native code. The EBC CALLEX instructions are used to make these calls. A typical application for EBC calling native code would be a simple “Hello World” driver. For a UEFI driver, the code could be written as shown below.

```c
EFI_STATUS EfiMain (
    IN EFI_HANDLE      ImageHandle,
    IN EFI_SYSTEM_TABLE   *ST
) {
    ST->ConOut->OutputString(ST->ConOut, L"Hello World!");
    return EFI_SUCCESS;
}
```

This C code, when compiled to EBC assembly, could result in two PUSHn instructions to push the parameters on the stack, some code to get the absolute address of the OutputString() function, then a CALLEX instruction to jump to native code. Typical pseudo assembly code for the function call could be something like the following:

```assembly
PUSHn _HelloString
PUSHn _ConOut
MOVnw R1, _OutputString
CALLEX64R1
```

The interpreter is responsible for executing the PUSHn instructions to push the arguments on the EBC stack when interpreting the PUSHn instructions. When the CALLEX instruction is encountered, it must thunk to external native code. The exact thunking mechanism is native processor dependent. For example, a supported 32-bit thunking implementation could simply move the system stack pointer to point to the EBC stack, then perform a CALL to the absolute address specified in VM register R1. However, the function calling convention for the Itanium processor family calls for the first 8 function arguments being passed in registers. Therefore, the Itanium processor family thunking mechanism requires the arguments to be copied from the EBC stack into processor registers. Then a CALL can be performed to jump to the absolute address in VM register R1. Note that since the interpreter is not aware of the number of arguments to the function being called, the maximum amount of data may be copied from the EBC stack into processor registers.

22.12.10.2 Thunking Native Code to EBC

An EBC driver may install protocols for use by other EBC drivers, or UEFI drivers or applications. These protocols provide the mechanism by which external native code can call EBC. Typical C code to install a generic protocol is shown below.
EFI_STATUS Foo(UINT32 Arg1, UINT32 Arg2);

MyProtInterface->Service1= Foo;

Status = LibInstallProtocolInterfaces (&Handle, &MyProtGUID, MyProtInterface, NULL);

To support thunking native code to EBC, the EBC compiler resolves all EBC function pointers using one level of indirection. In this way, the address of an EBC function actually becomes the address of a piece of native (thunk) code that invokes the interpreter to execute the actual EBC function. As a result of this implementation, any time the address of an EBC function is taken, the EBC C compiler must generate the following:

- A 64-bit function pointer data object that contains the actual address of the EBC function
- EBC initialization code that is executed before the image entry point that will execute EBC \texttt{BREAK} 5 instructions to create thunks for each function pointer data object
- Associated relocations for the above

So for the above code sample, the compiler must generate EBC initialization code similar to the following. This code is executed prior to execution of the actual EBC driver’s entry point.

\begin{verbatim}
MOVqq R7, Foo_pointer; get address of Foo function pointer
BREAK 5; create a thunk for the function
\end{verbatim}

The \texttt{BREAK} instruction causes the interpreter to create native thunk code elsewhere in memory, and then modify the memory location pointed to by R7 to point to the newly created thunk code for EBC function Foo. From within EBC, when the address of Foo is taken, the address of the thunk is actually returned. So for the assignment of the protocol Service1 above, the EBC C compiler will generate something like the following:

\begin{verbatim}
MOVqq R7, Foo_pointer; get address of Foo function pointer
MOVq R7, @R7; one level of indirection
MOVn R6, _MyProtInterface->Service1; get address of variable
MOVqq @R6, R7; address of thunk to ->Service1
\end{verbatim}

22.12.10.3 Thunking EBC to EBC

EBC can call EBC via function pointers or protocols. These two mechanisms are treated identically by the EBC C compiler, and are performed using EBC \texttt{CALLLEX} instructions. For EBC to call EBC, the EBC being called must have provided the address of the function. As described above, the address is actually the address of native thunk code for the actual EBC function. Therefore, when EBC calls EBC, the interpreter assumes native code is being called so prepares function arguments accordingly, and then makes the call. The native thunk code assumes native code is calling EBC, so will basically “undo” the preparation of function arguments, and then invoke the interpreter to execute the actual EBC function of interest.
22.12.11 EBC Linker

New constants must be defined for use by the linker in processing EBC images. For EBC images, the linker must set the machine type in the PE file header accordingly to indicate that the image contains EBC.

```
#define IMAGE_FILE_MACHINE_EBC 0x0EBC
```

In addition, the linker must support EBC images with of the following subsystem types as set in a PE32+ optional header:

```
#define IMAGE_SUBSYSTEM_EFI_APPLICATION       10
#define IMAGE_SUBSYSTEM_EFI_BOOT_SERVICE_DRIVER    11
#define IMAGE_SUBSYSTEM_EFI_RUNTIME_DRIVER       12
```

For EFI EBC images and object files, the following relocation types must be supported:

```
// No relocations required
#define IMAGE_REL_EBC_ABSOLUTE  0x0000
// 32-bit address w/o image base
#define IMAGE_REL_EBC_ADDR32NB  0x0001
// 32-bit relative address from byte following relocs
#define IMAGE_REL_EBC_REL32    0x0002
// Section table index
#define IMAGE_REL_EBC_SECTION   0x0003
// Offset within section
#define IMAGE_REL_EBC_SECREL   0x0004
```

The ADDR32NB relocation is used internally to the linker when RVAs are emitted. It also is used for version resources which probably will not be used. The REL32 relocation is for PC relative addressing on code. The SECTION and SECREL relocations are used for debug information.

22.12.12 Image Loader

The EFI image loader is responsible for loading an executable image into memory and applying relocation information so that an image can execute at the address in memory where it has been loaded prior to execution of the image. For EBC images, the image loader must also invoke the interpreter protocol to create a thunk for the image entry point and return the address of this thunk. After loading the image in this manner, the image can be executed in the standard manner. To implement this functionality, only minor changes will be made to EFI service EFI_BOOT_SERVICES.LoadImage(), and no changes should be made to EFI_BOOT_SERVICES.StartImage().

After the image is unloaded, the EFI image load service must call the EBC EFI_BOOT_SERVICES.UnLoadImage() service to perform any cleanup to complete unloading of the image. Typically this will include freeing up any memory allocated for thunks for the image during load and execution.

22.12.13 Debug Support

The interpreter must support debugging in an EFI environment per the EFI debug support protocol.
22.13 VM Exception Handling

This section lists the different types of exceptions that the VM may assert during execution of an EBC image. If a debugger is attached to the EBC driver via the EFI debug support protocol, then the debugger should be able to capture and identify the exception type. If a debugger is not attached, then depending on the severity of the exception, the interpreter may do one of the following:

- Invoke the EFI ASSERT() macro, which will typically display an error message and halt the system
- Sit in a while(1) loop to hang the system
- Ignore the exception and continue execution of the image (minor exceptions only)

It is a platform policy decision as to the action taken in response to EBC exceptions. The following sections describe the exceptions that may be generated by the VM.

22.13.1 Divide By 0 Exception

A divide-by-0 exception can occur for the EBC instructions DIV, DIVU, MOD, and MODU.

22.13.2 Debug Break Exception

A debug break exception occurs if the VM encounters a BREAK instruction with a break code of 3.

22.13.3 Invalid Opcode Exception

An invalid opcode exception will occur if the interpreter encounters a reserved opcode during execution.

22.13.4 Stack Fault Exception

A stack fault exception can occur if the interpreter detects that function nesting within the interpreter or system interrupts was sufficient to potentially corrupt the EBC image’s stack contents. This exception could also occur if the EBC driver attempts to adjust the stack pointer outside the range allocated to the driver.

22.13.5 Alignment Exception

An alignment exception can occur if the particular implementation of the interpreter does not support unaligned accesses to data or code. It may also occur if the stack pointer or instruction pointer becomes misaligned.

22.13.6 Instruction Encoding Exception

An instruction encoding exception can occur for the following:

- For some instructions, if an Operand 1 index is specified and Operand 1 is direct
- If an instruction encoding has reserved bits set to values other than 0
- If an instruction encoding has a field set to a reserved value.
22.13.7 Bad Break Exception

A bad break exception occurs if the VM encounters a BREAK instruction with a break code of 0, or any other unrecognized or unsupported break code.

22.13.8 Undefined Exception

An undefined exception can occur for other conditions detected by the VM. The cause of such an exception is dependent on the VM implementation, but will most likely include internal VM faults.

22.14 Option ROM Formats

The new option ROM capability is designed to be a departure from the legacy method of formatting an option ROM. PCI local bus add-in cards are the primary targets for this design although support for future bus types will be added as necessary. EFI EBC drivers can be stored in option ROMs or on hard drives in an EFI system partition.

The new format defined for the UEFI specification is intended to coexist with legacy format PCI Expansion ROM images. This provides the ability for IHVs to make a single option ROM binary that contains both legacy and new format images at the same time. This is important for the ability to have single add-in card SKUs that can work in a variety of systems both with and without native support for UEFI. Support for multiple image types in this way provides a smooth migration path during the period before widespread adoption of UEFI drivers as the primary means of support for software needed to accomplish add-in card operation in the pre-OS boot timeframe.

22.14.1 EFI Drivers for PCI Add-in Cards

The location mechanism for UEFI drivers in PCI option ROM containers is described fully in Section 11.3. Readers should refer to this section for complete details of the scheme and associated data structures.

22.14.2 Non-PCI Bus Support

EFI expansion ROMs are not supported on any other bus besides PCI local bus in the current revision of the UEFI specification.

This means that support for UEFI drivers in legacy ISA add-in card ROMs is explicitly excluded.

Support for UEFI drivers to be located on add-in card type devices for future bus designs other than PCI local bus will be added to future revisions of the UEFI specification. This support will depend upon the specifications that govern such new bus designs with respect to the mechanisms defined for support of driver code on devices.
23 - Firmware Update and Reporting

The UEFI Firmware Management Protocol provides an abstraction for device to provide firmware management support. The base requirements for managing device firmware images include identifying firmware image revision level and programming the image into the device.

The protocol for managing firmware provides the following services.

- Get the attributes of the current firmware image. Attributes include revision level.
- Get a copy of the current firmware image. As an example, this service could be used by a management application to facilitate a firmware roll-back.
- Program the device with a firmware image supplied by the user.
- Label all the firmware images within a device with a single version.

When UEFI Firmware Management Protocol (FMP) instance is intended to perform the update of an option ROM loaded from a PCI or PCI Express device, it is recommended that the FMP instance be attached to the handle with **EFI_LOADED_IMAGE_PROTOCOL** for said Option ROM.

When the FMP instance is intended to update internal device firmware, or a combination of device firmware and Option ROM, the FMP instance may instead be attached to the Controller handle of the device. However in the case where multiple devices represented by multiple controller handles are served by the same firmware store, only a single Controller handle should expose FMP. In all cases a specific updatable hardware firmware store must be represented by exactly one FMP instance.

Care should be taken to ensure that the FMP instance reports current version data that accurately represents the actual contents of the firmware store of the device exposing FMP, because in some cases the device driver currently operating the device may have been loaded from another device or media.

23.1 Firmware Management Protocol

**EFI_FIRMWARE_MANAGEMENT_PROTOCOL**

Summary

Firmware Management application invokes this protocol to manage device firmware.

GUID

```c
// {86C77A67-0B97-4633-A187-49104D0685C7}
#define EFI_FIRMWARE_MANAGEMENT_PROTOCOL_GUID \
    { 0x86c77a67, 0xb97, 0x4633, \ 
    {0xa1, 0x87, 0x49, 0x10, 0x4d, 0x06, 0x85, 0xc7 } }
```
Protocol

typedef struct _EFI_FIRMWARE_MANAGEMENT_PROTOCOL {
    EFI_FIRMWARE_MANAGEMENT_PROTOCOL_GET_IMAGE_INFO GetImageInfo;
    EFI_FIRMWARE_MANAGEMENT_PROTOCOL_GET_IMAGE GetImage;
    EFI_FIRMWARE_MANAGEMENT_PROTOCOL_SET_IMAGE SetImage;
    EFI_FIRMWARE_MANAGEMENT_PROTOCOL_CHECK_IMAGE CheckImage;
    EFI_FIRMWARE_MANAGEMENT_PROTOCOL_GET_PACKAGE_INFO GetPackageInfo;
    EFI_FIRMWARE_MANAGEMENT_PROTOCOL_SET_PACKAGE_INFO SetPackageInfo;
} EFI_FIRMWARE_MANAGEMENT_PROTOCOL;

Members

GetImageInfo
    Returns information about the current firmware image(s) of the device.
GetImage
    Retrieves a copy of the current firmware image of the device.
SetImage
    Updates the device firmware image of the device.
CheckImage
    Checks if the firmware image is valid for the device.
GetPackageInfo
    Returns information about the current firmware package.
SetPackageInfo
    Updates information about the firmware package.

EFI_FIRMWARE_MANAGEMENT_PROTOCOL.GetImageInfo()

Summary
Returns information about the current firmware image(s) of the device.
typedef EFI_STATUS
(EFIAPI *EFI_FIRMWARE_MANAGEMENT_PROTOCOL_GET_IMAGE_INFO) (  
  IN EFI_FIRMWARE_MANAGEMENT_PROTOCOL *This,  
  IN OUT UINTN *ImageInfoSize,  
  IN OUT EFI_FIRMWARE_IMAGE_DESCRIPTOR *ImageInfo,  
  OUT UINT32 *DescriptorVersion  
  OUT UINT8 *DescriptorCount,  
  OUT UINTN *DescriptorSize,  
  OUT UINT32 *PackageVersion,  
  OUT CHAR16 **PackageVersionName  
) ;

Parameters

This
A pointer to the EFI_FIRMWARE_MANAGEMENT_PROTOCOL instance.

ImageInfoSize
A pointer to the size, in bytes, of the ImageInfo buffer. On input, this is the size of the buffer allocated by the caller. On output, it is the size of the buffer returned by the firmware if the buffer was large enough, or the size of the buffer needed to contain the image(s) information if the buffer was too small.

ImageInfo
A pointer to the buffer in which firmware places the current image(s) information. The information is an array of EFI_FIRMWARE_IMAGE_DESCRIPTORs. See “Related Definitions”. May be NULL with a zero ImageInfoSize in order to determine the size of the buffer needed.

DescriptorVersion
A pointer to the location in which firmware returns the version number associated with the EFI_FIRMWARE_IMAGE_DESCRIPTOR. See “Related Definitions”.

DescriptorCount
A pointer to the location in which firmware returns the number of descriptors or firmware images within this device.

DescriptorSize
A pointer to the location in which firmware returns the size, in bytes, of an individual EFI_FIRMWARE_IMAGE_DESCRIPTOR.
PackageVersion

A version number that represents all the firmware images in the device. The format is vendor specific and new version must have a greater value than the old version. If PackageVersion is not supported, the value is 0xFFFFFFFF. A value of 0xFFFFFFFF indicates that package version comparison is to be performed using PackageVersionName. A value of 0xFFFFFFFD indicates that package version update is in progress.

PackageVersionName

A pointer to a pointer to a null-terminated string representing the package version name. The buffer is allocated by this function with AllocatePool(), and it is the caller’s responsibility to free it with a call to FreePool().

Related Definitions

```c
typedef struct {
  UINT8 ImageIndex;
  EFI_GUID ImageTypeId;
  UINT64 ImageId;
  CHAR16 *ImageIdName;
  UINT32 Version;
  CHAR16 *VersionName;
  UINTN Size;
  UINT64 AttributesSupported;
  UINT64 AttributesSetting;
  UINT64 Compatibilities;
  // Introduced with DescriptorVersion 2+
  UINT32 LowestSupportedImageVersion;
  // Introduced with DescriptorVersion 3+
  UINT32 LastAttemptVersion;
  UINT32 LastAttemptStatus;
  UINT64 HardwareInstance;
  // Introduced with DescriptorVersion 4+
  EFI_FMP_DEP *Dependencies;
} EFI_FIRMWARE_IMAGE_DESCRIPTOR;
```

ImageIndex

A unique number identifying the firmware image within the device. The number is between 1 and DescriptorCount.

ImageTypeId

A unique GUID identifying the firmware image type.

ImageId

A unique number identifying the firmware image.
**ImageIdName**
A pointer to a null-terminated string representing the firmware image name.

**Version**
Identifies the version of the device firmware. The format is vendor specific and new version must have a greater value than an old version.

**VersionName**
A pointer to a null-terminated string representing the firmware image version name.

**Size**
Size of the image in bytes. If size=0, then only ImageIndex and ImageTypeId are valid.

**AttributesSupported**
Image attributes that are supported by this device. See “Image Attribute Definitions” for possible returned values of this parameter. A value of 1 indicates the attribute is supported and the current setting value is indicated in AttributesSetting. A value of 0 indicates the attribute is not supported and the current setting value in AttributesSetting is meaningless.

**AttributesSetting**
Image attributes. See “Image Attribute Definitions” for possible returned values of this parameter.

**Compatibilities**
Image compatibilities. See “Image Compatibility Definitions” for possible returned values of this parameter.

**LowestSupportedImageVersion**
Describes the lowest ImageDescriptor version that the device will accept. Only present in version 2 or higher.

**LastAttemptVersion**
Describes the version that was last attempted to update. If no update attempted the value will be 0. If the update attempt was improperly formatted and no version number was available then the value will be zero. Only present in version 3 or higher.

**LastAttemptStatus**
Describes the status that was last attempted to update. If no update has been attempted the value will be LAST_ATTEMPT_STATUS_SUCCESS. See "Related Definitions" in Section 23.4 for Last Attempt Status values. Only present in version 3 or higher.

**HardwareInstance**
An optional number to identify the unique hardware instance within the system for devices that may have multiple instances (Example: a plug in pci network card). This number must be unique within the namespace of the ImageTypeId GUID and ImageIndex. For FMP instances that have multiple descriptors for a single hardware instance, all descriptors must have the same HardwareInstance value. This number must be consistent between boots and should be based on some sort of
hardware identified unique id (serial number, etc) whenever possible. If a hardware based number is not available the FMP provider may use some other characteristic such as device path, bus/dev/function, slot num, etc for generating the HardwareInstance. For implementations that will never have more than one instance a zero can be used. A zero means the FMP provider is not able to determine a unique hardware instance number or a hardware instance number is not needed. Only present in version 3 or higher.

Dependencies
A pointer to an array of FMP depex expression op-codes that are terminated by an EFI_FMP_DEP_END op-code.

The attribute IMAGE_ATTRIBUTE_IMAGE_UPDATABLE indicates that this device supports firmware image update.

The attribute IMAGE_ATTRIBUTE_RESET_REQUIRED indicates a reset of the device is required for the new firmware image to take effect after a firmware update. The device is the device hosting the firmware image.

The attribute IMAGE_ATTRIBUTE_AUTHENTICATION_REQUIRED indicates authentication is required to perform the following image operations: GetImage(), SetImage(), and CheckImage(). See “Image Attribute – Authentication”.

The attribute IMAGE_ATTRIBUTE_DEPENDENCY indicates that there is an EFI_FIRMWARE_IMAGE_DEP section associated with the image. See “Image Attribute – Dependency”.

Dependencies
An array of FMP depex expression op-codes that are terminated by an END op-code (see related definitions below.)
The attribute `IMAGE_ATTRIBUTE_IN_USE` indicates the current state of the firmware image. This distinguishes firmware images in a device that supports redundant images.

The attribute `IMAGE_ATTRIBUTE_UEFI_IMAGE` indicates that this image is an EFI compatible image.

```c
#define IMAGE_COMPATIBILITY_CHECK_SUPPORTED 0x0000000000000001
```

Values from 0x0000000000000002 thru 0x000000000000FFFF are reserved for future assignments.

Values from 0x0000000000010000 thru 0xFFFFFFFFFFFFFFFF are used by firmware vendor for compatibility check.

```c
#define EFI_FIRMWARE_IMAGE_DESCRIPTOR_VERSION 3
```

Description

GetImageInfo() is the only required function. GetImage(), SetImage(), CheckImage(), GetPackageInfo(), and SetPackageInfo() shall return EFI_UNSUPPORTED if not supported by the driver.
A package can have one to many firmware images. The firmware images can have the same version naming or different version naming. **PackageVersion** may be used as the representative version for all the firmware images. **PackageVersion** can be obtained from **GetPackageInfo()**. **PackageVersion** is also available in **GetImageInfo()** as **GetPackageInfo()** is optional. It also ensures the package version is in sync with the versions of the images within the package by returning the package version and image version(s) in a single function call.

The value of **ImageTypeID** is implementation specific. This feature facilitates vendor to target a single firmware release to cover multiple products within a product family. As an example, a vendor has an initial product A and then later developed a product B that is of the same product family. Product A and product B will have the same **ImageTypeID** to indicate firmware compatibility between the two products.

To determine image attributes, software must use both **AttributesSupported** and **AttributesSetting**. An attribute setting in **AttributesSetting** is meaningless if the corresponding attribute is not supported in **AttributesSupported**.

**Compatibilities** are used to ensure the targeted firmware image supports the current hardware configuration. **Compatibilities** are set based on the current hardware configuration and firmware update policy should match the current settings to those supported by the new firmware image, and only permits update to proceed if the new firmware image settings are equal or greater than the current hardware configuration settings. For example, if this function returns **Compatibilities** = 0x0000000000070001 and the new firmware image supports settings=0x0000000000030001, then the update policy should block the firmware update and notify the user that updating the hardware with the new firmware image may render the hardware inoperable. This situation usually occurs when updating the hardware with an older version of firmware.

The authentication support leverages the authentication scheme employed in variable authentication. Please reference **EFI_VARIABLE_AUTHENTICATION** in the “Variable Services” section of “Services – Runtime Services” chapter.

If **IMAGE_ATTRIBUTE_AUTHENTICATION_REQUIRED** is supported and clear, then authentication is not required to perform the firmware image operations. In firmware image operations, the image pointer points to the start of the firmware image and the image size is the firmware image.

If **IMAGE_ATTRIBUTE_AUTHENTICATION_REQUIRED** is supported and set, then authentication is required to perform the firmware image operations. In firmware image operations, the image pointer points to the start of the **authentication data** and the image size is the size of the **authentication data** and the size of the firmware image.
If `IMAGE_ATTRIBUTE_DEPENDENCY` is supported and set, then there are dependencies associated with the image. See the [Dependency Expression Instruction Set](#) for details on the format of the dependency op-codes and how they are to be used.

**EFI_FIRMWARE_MANAGEMENT_PROTOCOL.GetImage()**

**Summary**
Retrieves a copy of the current firmware image of the device.

**Protocol**

```c
typedef
EFI_STATUS
(EIFIAPI *EFI_FIRMWARE_MANAGEMENT_PROTOCOL_GET_IMAGE) (  
    IN EFI_FIRMWARE_MANAGEMENT_PROTOCOL *This,  
    IN UINT8 ImageIndex,  
    OUT VOID *Image,  
    IN OUT UINTN *ImageSize
);
```

**Parameters**

- **This**
  A pointer to the `EFI_FIRMWARE_MANAGEMENT_PROTOCOL` instance.

- **ImageIndex**
  A unique number identifying the firmware image(s) within the device. The number is between 1 and `DescriptorCount`.

- **Image**
  Points to the buffer where the current image is copied to. May be NULL with a zero `ImageSize` in order to determine the size of the buffer needed.

- **ImageSize**
  On entry, points to the size of the buffer pointed to by `Image`, in bytes. On return, points to the length of the image, in bytes.
Related Definitions
None

Description
This function allows a copy of the current firmware image to be created and saved. The saved copy could later be used, for example, in firmware image recovery or rollback.

**EFI_FIRMWARE_MANAGEMENT_PROTOCOL.SetImage()**

Summary
Updates the firmware image of the device.

Protocol
```c
typedef EFI_STATUS
(EIFIAPI *EFI_FIRMWARE_MANAGEMENT_PROTOCOL_SET_IMAGE) (  
    IN EFI_FIRMWARE_MANAGEMENT_PROTOCOL *This,  
    IN UINT8 ImageIndex,  
    IN CONST VOID *Image,  
    IN UINTN ImageSize,  
    IN CONST VOID *VendorCode,  
    IN EFI_FIRMWARE_MANAGEMENT_UPDATE_IMAGE_PROGRESS Progress,  
    OUT CHAR16 **AbortReason
 ) ;
```

Parameters

This  
A pointer to the **EFI_FIRMWARE_MANAGEMENT_PROTOCOL** instance.

ImageIndex  
A unique number identifying the firmware image(s) within the device. The number is between 1 and DescriptorCount.

Image  
Points to the new image.
**ImageSize**

Size of the new image in bytes.

**VendorCode**

This enables vendor to implement vendor-specific firmware image update policy. Null indicates the caller did not specify the policy or use the default policy.

**Progress**

A function used by the driver to report the progress of the firmware update.

**AbortReason**

A pointer to a pointer to a null-terminated string providing more details for the aborted operation. The buffer is allocated by this function with AllocatePool(), and it is the caller’s responsibility to free it with a call to FreePool().

**Related Definitions**

```c
typedef
EFI_STATUS
(EFIAPI *EFI_FIRMWARE_MANAGEMENT_UPDATE_IMAGE_PROGRESS) (
    IN UINTN Completion
);
```

Completion

A value between 1 and 100 indicating the current completion progress of the firmware update. Completion progress is reported as from 1 to 100 percent. A value of 0 is used by the driver to indicate that progress reporting is not supported.

On EFI_SUCCESS, SetImage() continues to do the callback if supported. On NOT EFI_SUCCESS, SetImage() discontinues the callback and completes the update and returns.

**Description**

This function updates the hardware with the new firmware image.

This function returns EFI_UNSUPPORTED if the firmware image is not updatable.

If the firmware image is updatable, the function should perform the following minimal validations before proceeding to do the firmware image update.

- Validate the image authentication if image has attribute IMAGE_ATTRIBUTE_AUTHENTICATION_REQUIRED. The function returns EFI_SECURITY_VIOLATION if the validation fails.
- Validate the image is a supported image for this device. The function returns EFI_ABORTED if the image is unsupported. The function can optionally provide more detailed information on why the image is not a supported image.
- Validate the data from VendorCode if not null. Image validation must be performed before VendorCode data validation. VendorCode data is ignored or considered invalid if image validation failed. The function returns EFI_ABORTED if the data is invalid.
**VendorCode** enables vendor to implement vendor-specific firmware image update policy. Null if the caller did not specify the policy or use the default policy. As an example, vendor can implement a policy to allow an option to force a firmware image update when the abort reason is due to the new firmware image version is older than the current firmware image version or bad image checksum. Sensitive operations such as those wiping the entire firmware image and render the device to be non-functional should be encoded in the image itself rather than passed with the **VendorCode**.

**AbortReason** enables vendor to have the option to provide a more detailed description of the abort reason to the caller.

#### EFI_FIRMWARE_MANAGEMENT_PROTOCOL.CheckImage()

**Summary**

Checks if the firmware image is valid for the device.

**Protocol**

```c
typedef EFI_STATUS
  (EFIAPI *EFI_FIRMWARE_MANAGEMENT_PROTOCOL_CHECK_IMAGE) (  
    IN EFI_FIRMWARE_MANAGEMENT_PROTOCOL *This,
    IN UINT8 ImageIndex,
    IN CONST VOID *Image,
    IN UINTN ImageSize,
    OUT UINT32 *ImageUpdatable
  ) ;
```

**Parameters**

- **This**
  A pointer to the **EFI_FIRMWARE_MANAGEMENT_PROTOCOL** instance.

- **ImageIndex**
  A unique number identifying the firmware image(s) within the device. The number is between 1 and **DescriptorCount**.

- **Image**
  Points to the new image.

- **ImageSize**
  Size of the new image in bytes.
ImageUpdatable

Indicates if the new image is valid for update. It also provides, if available, additional information if the image is invalid. See “Related Definitions”.

Related Definitions

//***************************************************************
// ImageUpdatable Definitions
//***************************************************************
#define IMAGE_UPDATABLE_VALID 0x0000000000000001
#define IMAGE_UPDATABLE_INVALID 0x0000000000000002
#define IMAGE_UPDATABLE_INVALID_TYPE 0x0000000000000004
#define IMAGE_UPDATABLE_INVALID_OLD 0x0000000000000008
#define IMAGE_UPDATABLE_VALID_WITH_VENDOR_CODE \ 0x0000000000000010

**IMAGE_UPDATABLE_VALID** indicates **setImage()** will accept the new image and update the device with the new image. The version of the new image could be higher or lower than the current image. **SetImage** VendorCode is optional but can be used for vendor specific action.

**IMAGE_UPDATABLE_INVALID** indicates **setImage()** will reject the new image. No additional information is provided for the rejection.

**IMAGE_UPDATABLE_INVALID_TYPE** indicates **setImage()** will reject the new image. The rejection is due to the new image is not a firmware image recognized for this device.

**IMAGE_UPDATABLE_INVALID_OLD** indicates **setImage()** will reject the new image. The rejection is due to the new image version is older than the current firmware image version in the device. The device firmware update policy does not support firmware version downgrade.

**IMAGE_UPDATABLE_VALID_WITH_VENDOR_CODE** indicates **setImage()** will accept and update the new image only if a correct VendorCode is provided or else image would be rejected and **SetImage** will return appropriate error.

**Description**

This function allows firmware update application to validate the firmware image without invoking the **SetImage()** first. Please see **SetImage()** for the type of image validations performed.

#### EFI_FIRMWARE_MANAGEMENT_PROTOCOL.GetPackageInfo()

**Summary**

Returns information about the firmware package.

**Protocol**

```c
typedef EFI_STATUS (EFIAPI *EFI_FIRMWARE_MANAGEMENT_PROTOCOL_GET_PACKAGE_INFO) (
    IN EFI_FIRMWARE_MANAGEMENT_PROTOCOL *This,
    OUT UINT32              *PackageVersion,
    OUT CHAR16 **PackageVersionName,
    OUT UINT32              PackageVersionNameMaxLen,
    OUT UINT64              *AttributesSupported,
    OUT UINT64              *AttributesSetting
);
```

**Parameters**

- **This**
  A pointer to the `EFI_FIRMWARE_MANAGEMENT_PROTOCOL` instance.

- **PackageVersion**
  A version number that represents all the firmware images in the device. The format is vendor specific and new version must have a greater value than the old version. If `PackageVersion` is not supported, the value is 0xFFFFFFFF. A value of 0xFFFFFFFF indicates that package version comparison is to be performed using `PackageVersionName`. A value of 0xFFFFFFFD indicates that package version update is in progress.

- **PackageVersionName**
  A pointer to a pointer to a null-terminated string representing the package version name. The buffer is allocated by this function with `AllocatePool()`, and it is the caller’s responsibility to free it with a call to `FreePool()`. 

- **PackageVersionNameMaxLen**
  The maximum length of package version name if device supports update of package version name. A value of 0 indicates the device does not support update of package version name.
version name. Length is the number of Unicode characters, including the terminating null character.

**AttributesSupported**

Package attributes that are supported by this device. See “Package Attribute Definitions” for possible returned values of this parameter. A value of 1 indicates the attribute is supported and the current setting value is indicated in **AttributesSetting**. A value of 0 indicates the attribute is not supported and the current setting value in **AttributesSetting** is meaningless.

**AttributesSetting**

Package attributes. See “Package Attribute Definitions” for possible returned values of this parameter.

**Related Definitions**

```c
//**************************************************************
// Package Attribute Definitions
//**************************************************************
#define PACKAGE_ATTRIBUTE_VERSION_UPDATABLE 0x0000000000000001
#define PACKAGE_ATTRIBUTE_RESET_REQUIRED   0x0000000000000002
#define PACKAGE_ATTRIBUTE_AUTHENTICATION_REQUIRED 0x0000000000000004
```

The attribute **PACKAGE_ATTRIBUTE_VERSION_UPDATABLE** indicates this device supports the update of the firmware package version.

The attribute **PACKAGE_ATTRIBUTE_RESET_REQUIRED** indicates a reset of the device is required for the new package info to take effect after an update.

The attribute **PACKAGE_ATTRIBUTE_AUTHENTICATION_REQUIRED** indicates authentication is required to update the package info.

**Description**

This function returns package information.

**Status Codes Returned**

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The package information was successfully returned.</td>
</tr>
<tr>
<td>EFI_UNSUPPORTED</td>
<td>The operation is not supported.</td>
</tr>
</tbody>
</table>
**Summary**

Updates information about the firmware package.

**Protocol**

```c
typedef EFI_STATUS (EFIAPI *EFI_FIRMWARE_MANAGEMENT_PROTOCOL_SET_PACKAGE_INFO) (
    IN EFI_FIRMWARE_MANAGEMENT_PROTOCOL  *This, 
    IN CONST VOID             *Image, 
    IN UINTN                   ImageSize, 
    IN CONST VOID             *VendorCode, 
    IN UINT32                  PackageVersion, 
    IN CONST CHAR16            *PackageVersionName 
) ;
```

**Parameters**

**This**

A pointer to the `EFI_FIRMWARE_MANAGEMENT_PROTOCOL` instance.

**Image**

Points to the authentication image. Null if authentication is not required.

**ImageSize**

Size of the authentication image in bytes. 0 if authentication is not required.

**VendorCode**

This enables vendor to implement vendor-specific firmware image update policy. Null indicates the caller did not specify this policy or use the default policy.

**PackageVersion**

The new package version.

**PackageVersionName**

A pointer to the new null-terminated Unicode string representing the package version name. The string length is equal to or less than the value returned in `PackageVersionNameMaxLen`.

**Description**

This function updates package information.

This function returns `EFI_UNSUPPORTED` if the package information is not updatable.

**VendorCode** enables vendor to implement vendor-specific package information update policy. Null if the caller did not specify this policy or use the default policy.

23.2 Dependency Expression Instruction Set

The following topics describe each of the firmware management protocol dependency expression (depex) opcodes in detail. Information includes a description of the instruction functionality, binary encoding, and any limitations or unique behaviors of the instruction.

Several of the opcodes require a GUID operand. The GUID operand is a 16-byte value that matches the type `EFI_GUID` that is described in Chapter 2 of the UEFI 2.0 specification. These GUIDs represent the `EFI_FIRMWARE_IMAGE_DESCRIPTOR` `ImageTypeId` that are exposed by an `EFI_FIRMWARE_MANAGE_PROTOCOL` instance. A dependency expression is a packed byte stream of opcodes and operands. As a result, some of the GUID operands will not be aligned on natural boundaries. Care must be taken on processor architectures that do allow unaligned accesses.

The dependency expression is stored in a packed byte stream using postfix notation. As a dependency expression is evaluated, the operands are pushed onto a stack. Operands are popped off the stack to perform an operation. After the last operation is performed, the value on the top of the stack represents the evaluation of the entire dependency expression. If a push operation causes a stack overflow, then the entire dependency expression evaluates to `FALSE`. If a pop operation causes a stack underflow, then the entire dependency expression evaluates to `FALSE`. Reasonable implementations of a dependency expression evaluator should not make arbitrary assumptions about the maximum stack size it will support. Instead, it should be designed to grow the dependency expression stack as required. In addition, FMP images that contain dependency expressions should make an effort to keep their dependency expressions as small as possible to help reduce the size of the FMP image.

All opcodes are 8-bit values, and if an invalid opcode is encountered, then the entire dependency expression evaluates to `FALSE`.

When the dependency expression is being evaluated and a GUID specified cannot be found, then the result of the conditional operation evaluates to `FALSE`.

If, when evaluating two popped values from the stack, it is determined that they are of different types (e.g. BOOLEAN value and 32-bit value), then the entire dependency expression evaluates to `FALSE`.

If an END opcode is not present in a dependency expression, then the entire dependency expression evaluates to `FALSE`.

The final evaluation of the dependency expression results in either a `TRUE` or `FALSE` result.

</tr>
</tbody>
</table>
PUSH_GUID

Syntax

PUSH_GUID <FMP GUID>

Description

Pushes the GUID value onto the stack. This GUID should be exposed by an EFI_FIRMWARE_MANAGEMENT_PROTOCOL instance. The GUID should match one of the EFI_FIRMWARE_IMAGE_DESCRIPTOR ImageTypeId values exposed through the GetImageInfo() function.

Operation

1) Search through all instances of the EFI_FIRMWARE_MANAGEMENT_PROTOCOL.

   a. In each instance, use the GetImageInfo() function to retrieve the ImageInfo->ImageTypeId value and ensure it matches the GUID specified in the op-code.

   b. If it doesn't match the GUID and no other instances match either, POP all values from the stack and PUSH FALSE onto the stack when evaluating a conditional operation involving the missing GUID.

2) Having found the matching EFI_FIRMWARE_MANAGEMENT_PROTOCOL instance, use the GetImageInfo() function and push the ImageInfo->Version value onto the stack.

</table>
Behaviors and Restrictions
None.

**PUSH_VERSION**

**Syntax**

```
PUSH_VERSION <32-bit Version>
```

**Description**

Pushes the 32-bit version value to compare against onto the stack. This value will be used to compare against Version values exposed through the `GetImageInfo()` function.

**Table 23-2 PUSH_VERSION Instruction Encoding**

<table>
<thead>
<tr>

**DECLARE_VERSION_NAME**

**Syntax**

```
DECLARE_VERSION_NAME <NULL-terminated string>
```

**Description**

Declares an optional null-terminated version string that is the equivalent of the VersionName in the `EFI_FIRMWARE_MANAGEMENT_DESCRIPTOR`. Due to the OEM/IHV-specific format of version strings, this null-terminated string will not be used for purposes of comparison. Only the 32-bit integer values will be used for comparisons.

**EQ**

Syntax

```
EQ
```

Description
Pops two 32-bit operands off the stack, performs a Boolean equals comparison operation between the two operands, and pushes the result back onto the stack.

Operation

```
Operand1 ? POP 32-bit stack element
Operand2 ? POP 32-bit stack element
Result ? Operand1 EQ Operand2
PUSH Result
```

</tbody>
</table>

Behaviors and Restrictions
This opcode must be the first one in a dependency expression.
23.3 Delivering Capsules Containing Updates to Firmware Management Protocol

Summary
This section defines a method for delivery of a Firmware Management Protocol defined update using the UpdateCapsule runtime API.

23.3.1 EFI_FIRMWARE_MANAGEMENT_CAPSULE_ID_GUID

GUID

```
// {6DCBD5ED-E82D-4C44-BDA1-7194199AD92A}
#define EFI_FIRMWARE_MANAGEMENT_CAPSULE_ID_GUID
{0x6dcbd5ed, 0xe82d, 0x4c44, 
 {0xbd, 0xa1, 0x71, 0x94, 0x19, 0x9a, 0xd9, 0x2a }}
```

Description
This GUID is used in the CapsuleGuid field of EFI_Capsule_Header struct within a capsule constructed according to the definitions of section Section 8.5.3.1. Use of this GUID indicates a capsule with body conforming to the additional structure defined in Section 23.3.2.

When delivered to platform firmware QueryCapsuleCapabilities() the capsule will be examined according to the structure defined in Section 23.3.2 and if it is possible for the platform to process EFI_SUCCESS will be returned.

When delivered to platform firmware UpdateCapsule() the capsule will be examined according to the structure defined in Section 23.3.2 and if it is possible for the platform to process the update will be processed.

By definition Firmware Management protocol services are not available in EFI runtime and depending upon platform capabilities, EFI runtime delivery of this capsule may not be supported and may return an error when delivered in EFI runtime with CAPSULE_FLAGS_PERSIST_ACROSS_RESET bit defined. However any platform supporting this capability is required to accept this form of capsule in Boot Services, including optional use of CAPSULE_FLAGS_PERSIST_ACROSS_RESET bit.

23.3.2 DEFINED FIRMWARE MANAGEMENT PROTOCOL DATA CAPSULE STRUCTURE

Structure of the Capsule Body
Generic EFI Capsule Body is defined in Section 8.5.3.1. When an EFI Capsule is identified by EFI_FIRMWARE_MANAGEMENT_CAPSULE_ID_GUID, the internal structure of the capsule _FIRMWARE_MANAGEMENT_CAPSULE_HEADER followed by optional EFI drivers to be loaded by the platform and optional binary payload items to be processed and passed to Firmware Management Protocol image update function. Each binary payload item is preceded by EFI_FIRMWARE_MANAGEMENT_CAPSULE_IMAGE_HEADER. Internal capsule structure diagram follows.
Figure 23-4 Optional Scatter-Gather Construction of Capsule Submitted to UpdateCapsule()
Figure 23-5 Capsule Header and Firmware Management Capsule Header
Related Definitions

```c
#pragma pack(1)
typedef struct {
    UINT32 Version;
    UINT16 EmbeddedDriverCount;
    UINT16 PayloadItemCount;
    // UINT64 ItemOffsetList[];
} EFI_FIRMWARE_MANAGEMENT_CAPSULE_HEADER;
```

**Version**
Version of the structure, initially 0x00000001.

**EmbeddedDriverCount**
The number of drivers included in the capsule and the number of corresponding offsets stored in `ItemOffsetList` array. This field may be zero in the case where no driver is required.

**PayloadItemCount**
The number of payload items included in the capsule and the number of corresponding offsets stored in the `ItemOffsetList` array. This field may be zero in the case where no binary payload object is required to accomplish the update.
ItemOffsetList
Variable length array of dimension \([\text{EmbeddedDriverCount} + \text{PayloadItemCount}]\) containing offsets of each of the drivers and payload items contained within the capsule. The offsets of the items are calculated relative to the base address of the `EFI_FIRMWARE_MANAGEMENT_CAPSULE_HEADER` struct. Offset may indicate structure begins on any byte boundary. Offsets in the array must be sorted in ascending order with all drivers preceding all binary payload elements.

```c
#pragma pack(1)
typedef struct {
  UINT32   Version;
  EFI_GUID UpdateImageTypeId;
  UINT8    UpdateImageIndex;
  UINT8    reserved_bytes[3];
  UINT32   UpdateImageSize;
  UINT32   UpdateVendorCodeSize;
  UINT64   UpdateHardwareInstance;  //Introduced in v2
  UINT64   ImageCapsuleSupport;     //Introduced in v3
} EFI_FIRMWARE_MANAGEMENT_CAPSULE_IMAGE_HEADER;
```

Version
Version of the structure, initially \(0x00000003\).

UpdateImageTypeId
Used to identify device firmware targeted by this update. This guid is matched by system firmware against `ImageTypeId` field within a `EFI_FIRMWARE_IMAGE_DESCRIPTOR` returned by an instance of `EFI_FIRMWARE_MANAGEMENT_PROTOCOL.GetImageInfo()` in the system.

UpdateImageIndex
Passed as `ImageIndex` in call to `EFI_FIRMWARE_MANAGEMENT_PROTOCOL.SetImage()`.

UpdateImageSize
Size of the binary update image which immediately follows this structure. Passed as `ImageSize` to `EFI_FIRMWARE_MANAGEMENT_PROTOCOL.SetImage()`. This size may or may not include Firmware Image Authentication information.

UpdateVendorCodeSize
Size of the `VendorCode` bytes which optionally immediately follow binary update image in the capsule. Pointer to these bytes passed in `VendorCode` to `EFI_FIRMWARE_MANAGEMENT_PROTOCOL.SetImage()`. If `UpdateVendorCodeSize` is zero, then `VendorCode` is null in `SetImage()` call.
UpdateHardwareInstance
The HardwareInstance to target with this update. If value is zero it means match all HardwareInstances. This field allows update software to target only a single device in cases where there are more than one device with the same ImageTypeId GUID. This header is outside the signed data of the Authentication Info structure and therefore can be modified without changing the Auth data.

ImageCapsuleSupport
A 64-bit bitmask that determines what sections are added to the payload.
#define CAPSULE_SUPPORT_AUTHENTICATION 0x0000000000000001
#define CAPSULE_SUPPORT_DEPENDENCY 0x0000000000000002

Description
The EFI_FIRMWARE_MANAGEMENT_CAPSULE_HEADER structure is located at the lowest offset within the body of the capsule identified by EFI_FIRMWARE_MANAGEMENT_CAPSULE_ID_GUID. The structure is variable length with the number of element offsets within of the ItemOffsetList array determined by the count of drivers within the capsule plus the count of binary payload elements. It is expected that drivers whose presence is indicated by non-zero EmbeddedDriverCount will be used to supply an implementation of EFI_FIRMWARE_MANAGEMENT_PROTOCOL for devices that lack said protocol within the image to be updated.

Each payload item contained within the capsule body is preceded by a EFI_FIRMWARE_MANAGEMENT_CAPSULE_IMAGE_HEADER struct used to provide information required to prepare the payload item as an image for delivery to a instance of EFI_FIRMWARE_MANAGEMENT_PROTOCOL.SetImage() function.

Note: [Caution] The capsule identified by EFI_FIRMWARE_MANAGEMENT_CAPSULE_ID_GUID uses packed structures and structure fields may not be naturally aligned within the capsule buffer as delivered. Drivers and binary payload elements may start on byte boundary with no padding. Processing firmware may need to copy content elements during capsule unpacking in order to achieve any required natural alignment.

23.3.3 Firmware Processing of the Capsule Identified by EFI_FIRMWARE_MANAGEMENT_CAPSULE_ID_GUID
1. Capsule is presented to system firmware via call to UpdateCapsule() or using mass storage delivery procedure of Section 8.5.5. The capsule must be constructed to consist of a single EFI_FIRMWARE_MANAGEMENT_CAPSULE_HEADER structure with the 0 or more drivers and 0 or more binary payload items. However a capsule in which driver count and payload count are both zero is not processed.
2. Capsule is recognized by EFI_CAPSULE_HEADER member CapsuleGuid equal to EFI_FIRMWARE_MANAGEMENT_CAPSULE_ID_GUID. CAPSULE_FLAGS_POPULATE_SYSTEM_TABLE flag must be 0.
3. If system is not in boot services and platform does not support persistence of capsule across reset when initiated within EFI Runtime, EFI_OUT_OF_RESOURCES error is returned.
4. If device requires hardware reset to unlock flash write protection, CAPSULE_FLAGS_PERSIST ACROSS_RESET and optionally CAPSULE_FLAGS_INITIATE_RESET should be set to 1 in the EFI_CAPSULE_HEADER.
5. When reset is requested using `CAPSULE_FLAGS_PERSIST_ACROSS_RESET`, the capsule is processed in Boot Services, before the `EFI_EVENT_GROUP_READY_TO_BOOT` event.

6. All scatter-gather fragmentation is removed by the platform firmware and the capsule is processed as a contiguous buffer.

7. Examining `EFI_FIRMWARE_MANAGEMENT_CAPSULE_HEADER`, if `EmbeddedDriverCount` is non-zero, for each of the included drivers up to indicated count, the portion of the capsule body starting at the offset indicated by `ItemOffsetList[n]` and continuing for a size encompassing all bytes up to the next element’s offset stored in `ItemOffsetList[n+1]` or the end of the capsule, will be copied to a buffer. The driver contained within the capsule body may not be naturally aligned and the exact driver size in bytes should be respected to ensure successful security validation. In the case where a driver is last element in the `ItemOffsetList` array, the driver size may be calculated by reference to body size as calculated from `CapsuleImageSize` in `EFI_CAPSULE_HEADER`.

8. Each extracted driver is placed into a buffer and passed to `LoadImage()`. The driver image passed to `LoadImage()` must successfully pass all image format, platform type, and security checks including those related to UEFI secure boot, if enabled on the platform. After `LoadImage()` returns the processing of the capsule is continued with next driver if present until all drivers have been passed to `LoadImage()`. The driver being installed must check for matching hardware and instantiate any required protocols during call to `EFI_IMAGE_ENTRY_POINT`. In case where matching hardware is not found the driver should exit with error. In case where capsule creator has preference as to which of several included drivers to be made resident, later drivers in the capsule should confirm earlier driver successfully loaded and then exit with load error.

9. After driver processing is complete the platform firmware examines `PayloadItemCount`, and if zero the capsule processing is complete. Otherwise platform firmware sequentially locates each `EFI_FIRMWARE_MANAGEMENT_CAPSULE_IMAGE_HEADER` found within the capsule and processes according to steps 10-14.

10. For all instances of `EFI_FIRMWARE_MANAGEMENT_PROTOCOL` in the system, `GetImageInfo()` is called to return arrays of `EFI_FIRMWARE_IMAGE_DESCRIPTOR` structures.

11. Find the matching FMP instance(s):

   a. If the `EFI_FIRMWARE_MANAGEMENT_CAPSULE_IMAGE_HEADER` is version 1 or it is version 2 with `UpdateHardwareInstance` set to 0, then system firmware will use only the `ImageTypeId` to determine a match. For each instance of `EFI_FIRMWARE_MANAGEMENT_PROTOCOL` that returns a `EFI_FIRMWARE_IMAGE_DESCRIPTOR` containing an `ImageTypeId` GUID that matches the `UpdateImageTypeId` GUID within `EFI_FIRMWARE_MANAGEMENT_CAPSULE_IMAGE_HEADER`, the system firmware will call `SetImage()` function within that instance. In some cases there may be more than one instance of matching `EFI_FIRMWARE_MANAGEMENT_PROTOCOL` when multiple matching devices are installed in the system and all instances will be checked for GUID match and `SetImage()` call if match is successful.

   b. If the `EFI_FIRMWARE_MANAGEMENT_CAPSULE_IMAGE_HEADER` is version 2 and contains a non-zero value in the `UpdateHardwareInstance` field, then system firmware will use both `ImageTypeId` and `HardwareInstance` to determine a match. For the instance of `EFI_FIRMWARE_MANAGEMENT_PROTOCOL` that returns a `EFI_FIRMWARE_IMAGE_DESCRIPTOR` containing an `ImageTypeId` GUID that
matches the `UpdateImageTypeId` GUID and a `HardwareInstanceId` matching the `UpdateHardwareInstanceId` within `EFI_FIRMWARE.Management.Capsule.Image.Header`, the system firmware will call the `SetImage()` function within that instance. There will never be more than one instance since the `ImageId` must be unique.

12. In the situation where platform configuration or policy prohibits the processing of a capsule or individual FMP payload, the error `EFI_NOT_READY` will be returned in capsule result variable `CapsuleStatus` field. Otherwise `SetImage()` parameters are constructed using the `UpdateImageIndex`, `UpdateImageSize` and `UpdateVendorCodeSize` fields within `EFI_FIRMWARE.Management.Capsule.Image.Header`. In the case of capsule containing multiple payloads, or a payload matching multiple FMP instances, a separate Capsule Result Variable will be created with the results of each call to `SetImage()`. If any call to `SetImage()` selected per above matching algorithm returns an error, the processing of additional FMP instances or payload items in that capsule will be skipped and `EFI_ABORTED` returned in Capsule Result Variable for each potential call to `SetImage()` that was skipped.

13. `SetImage()` performs any required image authentication as described in that functions definition within this chapter.

14. Note: if multiple separate component updates including multiple `ImageIndex` values are required then additional `EFI_FIRMWARE.Management.Capsule.Image.Header` structures and image binaries are included within the capsule.

15. After all items in the capsule are processed the system is restarted by the platform firmware.

23.4 EFI System Resource Table

**EFI_SYSTEM_RESOURCE_TABLE**

**Summary**

The EFI System Resource Table (ESRT) provides an optional mechanism for identifying device and system firmware resources for the purposes of targeting firmware updates to those resources. Each entry in the ESRT describes a device or system firmware resource that can be targeted by a firmware capsule update. Each entry in the ESRT will also be used to report status of the last attempted update. See Section 4.6 for description of how to publish ESRT using `EFI_CONFIGURATION_TABLE`. The ESRT shall be stored in memory of type `EfiBootServicesData`. See Section 8.5.3 and Section 8.5.5 for details on delivery of updates to devices listed in ESRT.

**GUID**

```c
#define EFI_SYSTEMRESOURCE_TABLE_GUID
{ 0xb122a263, 0x3661, 0x4f68,
{ 0x99, 0x29, 0x78, 0xf8, 0xb0, 0xd6, 0x21, 0x80 }}
```

**Table Structure**

```c
typedef struct {
    UINT32       FwResourceCount;
    UINT32       FwResourceCountMax;
    UINT64       FwResourceVersion;
    //EFI_SYSTEMRESOURCEENTRY Entries[];
};
```
 Members

FwResourceCount  The number of firmware resources in the table, must not be zero.
FwResourceCountMax The maximum number of resource array entries that can be within the table without reallocating the table, must not be zero.
FwResourceVersion The version of the EFI_SYSTEM_RESOURCE_ENTRY entities used in this table. This field should be set to 1. See EFI_SYSTEM_RESOURCE_TABLE_FIRMWARE_RESOURCE_VERSION.

Entries  Array of EFI_SYSTEM_RESOURCE_ENTRY

Related Definitions

// Current Entry Version
#define EFI_SYSTEM_RESOURCE_TABLE_FIRMWARE_RESOURCE_VERSION 1

typedef struct {
    EFI_GUID  FwClass;
    UINT32    FwType;
    UINT32    FwVersion;
    UINT32    LowestSupportedFwVersion;
    UINT32    CapsuleFlags;
    UINT32    LastAttemptVersion;
    UINT32    LastAttemptStatus;
} EFI_SYSTEM_RESOURCE_ENTRY;

FwClass  The firmware class field contains a GUID that identifies a firmware component that can be updated via UpdateCapsule(). This GUID must be unique within all entries of the ESRT.
FwType  Identifies the type of firmware resource. See “Firmware Type Definitions” below for possible values.
FwVersion  The firmware version field represents the current version of the firmware resource, value must always increase as a larger number represents a newer version.
LowestSupportedFwVersion  The lowest firmware resource version to which a firmware resource can be rolled back for the given system/device. Generally this is used to protect against known and fixed security issues.
CapsuleFlags  The capsule flags field contains the CapsuleGuid flags (bits 0-15) as defined in the EFI_CAPSULE_HEADER that will be set in the capsule header.
LastAttemptVersion  The last attempt version field describes the last firmware version for which an update was attempted (uses the same format as Firmware Version).
Last Attempt Version is updated each time an `UpdateCapsule()` is attempted for an ESRT entry and is preserved across reboots (non-volatile). However, in cases where the attempt version is not recorded due to limitations in the update process, the field shall set to zero after a failed update. Similarly, in the case of a removable device, this value is set to 0 in cases where the device has not been updated since being added to the system.

### LastAttemptStatus

The last attempt status field describes the result of the last firmware update attempt for the firmware resource entry. `LastAttemptStatus` is updated each time an `UpdateCapsule()` is attempted for an ESRT entry and is preserved across reboots (non-volatile).

If a firmware update has never been attempted or is unknown, for example after fresh insertion of a removable device, `LastAttemptStatus` must be set to Success.

```c
// Firmware Type Definitions

#define ESRT_FW_TYPE_UNKNOWN         0x00000000
#define ESRT_FW_TYPE_SYSTEMFIRMWARE  0x00000001
#define ESRT_FW_TYPE_DEVICEFIRMWARE  0x00000002
#define ESRT_FW_TYPE_UEFIDRIVER      0x00000003

// Last Attempt Status Values

#define LAST_ATTEMPT_STATUS_SUCCESS                      0x00000000
#define LAST_ATTEMPT_STATUS_ERROR_UNSUCCESSFUL           0x00000001
#define LAST_ATTEMPT_STATUS_ERROR_INSUFFICIENT_RESOURCES 0x00000002
#define LAST_ATTEMPT_STATUS_ERROR_INCORRECT_VERSION      0x00000003
#define LAST_ATTEMPT_STATUS_ERROR_INVALID_FORMAT         0x00000004
#define LAST_ATTEMPT_STATUS_ERROR_AUTH_ERROR             0x00000005
#define LAST_ATTEMPT_STATUS_ERROR_PWR_EVT_AC             0x00000006
#define LAST_ATTEMPT_STATUS_ERROR_PWR_EVT_BATT           0x00000007
#define LAST_ATTEMPT_STATUS_ERROR_UNSATISFIED_DEPENDENCIES 0x00000008

// The LastAttemptStatus values of 0x1000 - 0x4000 are reserved for vendor usage.
#define LAST_ATTEMPT_STATUS_ERROR_UNSUCCESSFUL_VENDOR_RANGE_MIN 0x00001000
#define LAST_ATTEMPT_STATUS_ERROR_UNSUCCESSFUL_VENDOR_RANGE_MAX 0x00004000
```

### 23.4.1 Adding and Removing Devices from the ESRT

ESRT entries must be updated by System Firmware before handoff to the Operating System under the following conditions. Devices and systems that support hot swapping (once the OS has been loaded) will
not get their ESRT entries updated until the next reboot and execution of ESRT updating logic in the UEFI space.

**Required:** System firmware is responsible for updating the FirmwareVersion, LowestSupportedFirmwareVersion, LastAttemptVersion and LastAttemptStatus values in the ESRT any time UpdateCapsule is called and a firmware update attempt is made for the corresponding ESRT entry.

**Required:** the ESRT must be updated each time a configuration change is detected by system firmware, such as when a device is added or removed from the system.

**Optional:** all devices in the ESRT should be polled for any configuration changes any time UpdateCapsule is called.

### 23.4.2 ESRT and Firmware Management Protocol

Although the ESRT does not require firmware to use Firmware Management Protocol for updates it is designed to work with and extend the capabilities of FMP. The ESRT can be used to represent system and device firmware serviced by capsules that have an implementation specific format as well as devices that support Firmware Management Protocol and that are serviced by capsules formatted as described in Section 23.2, Delivering Capsules Containing Updates to Firmware Management Protocol. For system expansion devices, the task of building ESRT table entries is to be performed by the system firmware based upon FMP data published by the device.

### 23.4.3 Mapping Firmware Management Protocol Descriptors to ESRT Entries

Firmware Management Protocol descriptors define most of the information needed for an ESRT entry. The table below helps identify which members map to which fields. Some members are dependent on certain versions of FMP and it is left to system firmware to resolve any mappings when information is not present in the FMP instance. FMP descriptors should only be mapped to ESRT entries if the following are true:

- An entry with the same ImageTypeId is not already in the ESRT.
- AttributesSupported and AttributesSetting have the IMAGE_ATTRIBUTE_IN_USE bit set.
- In the case where DescriptorCount returned by GetImageInfo() is greater than one, firmware shall populate the ESRT according to system policy, noting however that multiple ESRT entries with identical FwClass values are not permitted.

23.5 Delivering Capsule Containing JSON payload

Summary
This section defines a method for delivery of JSON payload to perform firmware configuration or firmware update using the UpdateCapsule runtime API or using mass storage delivery.

23.5.1 EFI_JSON_CAPSULE_ID_GUID

GUID

```
// {67D6F4CD-D6B8-4573-BF4A-DE5E252D61AE}
#define EFI_JSON_CAPSULE_ID_GUID
  {0x67d6f4cd, 0xd6b8, 0x4573, 
  {0xbf, 0x4a, 0xde, 0x5e, 0x25, 0x2d, 0x61, 0xae }}
```

Description
This GUID is used in the CapsuleGuid field of EFI_CAPSULE_HEADER struct within a capsule constructed according to the definitions of Section 8.5.3. Use of this GUID indicates a capsule with body conforming to the additional structure defined in Section 23.5.2.

When delivered to platform firmware QueryCapsuleCapabilities() the capsule will be examined according to the structure defined in Section 23.5.2, and if it is possible for the platform to process that then EFI_SUCCESS will be returned.

When delivered to platform firmware UpdateCapsule() the capsule will be examined according to the structure defined in Section 23.5.2, and if it is possible for the platform to process that the update will be processed.

By definition, firmware configuration and firmware update are not available in EFI runtime. Depending on platform capabilities, EFI runtime delivery of the capsule may not be supported, and may return an error when delivered in EFI runtime with CAPSULE_FLAGS_PERSIST_ACROSS_RESET bit defined. However, any platform supporting this capability is required to accept this form of capsule in Boot Services, including optional use of the CAPSULE_FLAGS_PERSIST_ACROSS_RESET bit.

23.5.2 Defined JSON Capsule Data Structure

Structure of the Capsule Body
A generic EFI Capsule Body is defined in Section 8.5.3. When an EFI Capsule is identified by EFI_JSON_CAPSULE_ID_GUID, the internal structure of the capsule header is defined in this section, see EFI_JSON_CAPSULE_HEADER. Note that if multiple JSON capsules are delivered together, each JSON capsule should contain one EFI_CAPSULE_HEADER and one EFI_JSON_CAPSULE_HEADER separately.

Related Definitions

```c
#pragma pack(1)
typedef struct {
    UINT32 Version;
    UINT32 CapsuleId;
    UINT32 PayloadLength;
    UINT8 Payload[];
} EFI_JSON_CAPSULE_HEADER;
#pragma pack ()
```

Version
Version of the structure, initially 0x00000001.

CapsuleId
The unique identifier of this capsule.

PayloadLength
The length of the JSON payload immediately following this header, in bytes.

Payload
Variable length buffer containing the JSON payload that should be parsed and applied to the system. The definition of the JSON schema used in the payload is beyond the scope of this specification.

Description
The EFI_JSON_CAPSULE_HEADER structure is located at the lowest offset within the body of the capsule identified by EFI_JSON_CAPSULE_ID_GUID. It is expected that drivers which process the JSON payload have the specific knowledge of the JSON schema used in the payload. The drivers should parse the JSON payload firstly to understand whether the capsule wants to perform firmware configure or firmware update then route the JSON payload to corresponding modules. For instance, the capsule may be delivered to EFI_FIRMWARE_MANAGEMENT_PROTOCOL instance to update the firmware image.

Structure of the Configuration Data
During the system boot, current configuration data or cached configuration data is reported to the EFI System Configuration Table with EFI_JSON_CONFIG_DATA_TABLE_GUID according to the value of EFI_OS_INDICATIONS_JSON_CONFIG_DATA_REFRESH bit in OsIndications. The structure to record the configuration data is defined in this section, see EFI_JSON_CAPSULE_CONFIG_DATA.
Related Definitions

```c
#pragma pack(1)
typedef struct {
    UINT32 Version;
    UINT32 TotalLength;
    EFI_JSON_CONFIG_DATA_ITEM ConfigDataList[];
} EFI_JSON_CAPSULE_CONFIG_DATA;
#pragma pack ()
```

**Version**
Version of the structure, initially 0x00000001.

**TotalLength**
The total length of `EFI_JSON_CAPSULE_CONFIG_DATA`, in bytes.

**ConfigDataList**
Array of configuration data groups. Type `EFI_JSON_CONFIG_DATA_ITEM` is defined below.

```c
typedef struct {
    UINT32 ConfigDataLength;
    UINT8 ConfigData[];
} EFI_JSON_CONFIG_DATA_ITEM;
```

**ConfigDataLength**
The length of the following `ConfigData`, in bytes.

**ConfigData**
Variable length buffer containing the JSON payload that describes one group of configuration data within current system. The definition of the JSON schema used in this payload is beyond the scope of this specification.

**Description**
For supporting multiple groups of configuration data, a list of `EFI_JSON_CONFIG_DATA_ITEM` are included in `EFI_JSON_CAPSULE_CONFIG_DATA` and each item indicates one group of configuration data. It is expected that particular drivers have the specific knowledge of the JSON schema used in the payload so that they can describe system configuration data in JSON then install to the EFI System Configuration Table. The drivers should check `EFI_OS_INDICATIONS_JSON_CONFIG_DATA_REFRESH` bit in `OsIndications` to understand whether they need collect current configuration firstly.

### 23.5.3 Firmware Processing of the Capsule Identified by `EFI_JSON_CAPSULE_ID_GUID`

1. Capsule is presented to system firmware via call to `UpdateCapsule()` or using mass storage delivery procedure of Section 8.5.5. The capsule must be constructed to consist of a single `EFI_JSON_CAPSULE_HEADER` structure with JSON payload follows. A capsule in which `PayloadLength` is zero will not be processed.
2. Capsule is recognized by `EFI_CAPSULE_HEADER` member `CapsuleGuid` equal to `EFI_JSON_CAPSULE_ID_GUID`. `CAPSULE_FLAGS_POPULATE_SYSTEM_TABLE` flag must be 0.

3. If system is not in boot services and platform does not support persistence of capsule across reset when initiated within EFI Runtime, `EFI_OUT_OF_RESOURCES` error is returned.

4. If device requires hardware reset to unlock flash write protection, `CAPSULE_FLAGS_PERSIST_ACROSS_RESET` and optionally `CAPSULE_FLAGS_INITIATE_RESET` should be set to 1 in the `EFI_CAPSULE_HEADER`.

5. When reset is requested using `CAPSULE_FLAGS_PERSIST_ACROSS_RESET`, the capsule is processed in Boot Services, before the `EFI_EVENT_GROUP_READY_TO_BOOT` event.

6. All scatter-gather fragmentation is removed by the platform firmware and the capsule is processed as a contiguous buffer.

7. When a capsule identified by `EFI_JSON_CAPSULE_ID_GUID` is received, the system firmware shall place a pointer to the coalesced capsule in the EFI System Configuration Table with `EFI_JSON_CAPSULE_DATA_TABLE_GUID` before loading any third party modules such as option ROM. If multiple capsules identified by `EFI_JSON_CAPSULE_ID_GUID` are received, the system firmware shall place a list of pointers to the capsules, preceded by a UINTN that represents the number of pointers, in the EFI System Configuration Table with `EFI_JSON_CAPSULE_DATA_TABLE_GUID` before loading any third party modules such as option ROM. The UINTN and each pointer must be naturally aligned.

8. The system configuration driver should check EFI System Configuration Table and parse the JSON payload, to identify the configuration data type of JSON payload, and route the JSON payload to corresponding modules. The corresponding capsule pointer shall be removed from the EFI System Configuration Table and also be cleared after it is processed.

9. The processing result shall be installed to EFI System Configuration Table using the format of `EFI_CAPSULE_RESULT_VARIABLE_HEADER` and `EFI_CAPSULE_RESULT_VARIABLE_JSON` defined in Section 8.5.6 with `EFI_JSON_CAPSULE_RESULT_TABLE_GUID`. If the capsule is delivered via mass storage device, the process result shall be recorded by using UEFI variables as described in Section 8.5.6.
24.1 Simple Network Protocol

This section defines the Simple Network Protocol. This protocol provides a packet level interface to a network adapter.

**EFI_SIMPLE_NETWORK_PROTOCOL**

**Summary**

The **EFI_SIMPLE_NETWORK_PROTOCOL** provides services to initialize a network interface, transmit packets, receive packets, and close a network interface.

**GUID**

```
#define EFI_SIMPLE_NETWORK_PROTOCOL_GUID \
{0xA19832B9,0xAC25,0x11D3,\ 
 {0x9A,0x2D,0x00,0x90,0x27,0x3f,0xc1,0x4d}}
```

**Revision Number**

```
#define EFI_SIMPLE_NETWORK_PROTOCOL_REVISION 0x00010000
```

**Protocol Interface Structure**

```
typedef struct _EFI_SIMPLE_NETWORK_PROTOCOL_ {
    UINT64 Revision;
    EFI_SIMPLE_NETWORK_START Start;
    EFI_SIMPLE_NETWORK_STOP Stop;
    EFI_SIMPLE_NETWORK_INITIALIZE Initialize;
    EFI_SIMPLE_NETWORK_RESET Reset;
    EFI_SIMPLE_NETWORK_SHUTDOWN Shutdown;
    EFI_SIMPLE_NETWORK.ReceiveFilters ReceiveFilters;
    EFI_SIMPLE_NETWORK_STATION_ADDRESS StationAddress;
    EFI_SIMPLE_NETWORK_STATISTICS Statistics;
    EFI_SIMPLE_NETWORK_MCAST_IP_TO_MAC MCastIpToMac;
    EFI_SIMPLE_NETWORK_NVDATA NvData;
    EFI_SIMPLE_NETWORK_GET_STATUS GetStatus;
    EFI_SIMPLE_NETWORK_TRANSMIT Transmit;
    EFI_SIMPLE_NETWORK_RECEIVE Receive;
    EFI_EVENT WaitForPacket;
    *Mode;
} EFI_SIMPLE_NETWORK_PROTOCOL;
```

**Parameters**

- **Revision**
  
  Revision of the **EFI_SIMPLE_NETWORK_PROTOCOL**. All future revisions must be backwards compatible. If a future version is not backwards compatible it is not the same GUID.
<table>

// EFI_DRIVER_BINDING_PROTOCOL.Start().
//**************************************************************
typedef struct {
    UINT32 State;
    UINT32 HwAddressSize;
    UINT32 MediaHeaderSize;
    UINT32 MaxPacketSize;
    UINT32 NvRamSize;
    UINT32 NvRamAccessSize;
    UINT32 ReceiveFilterMask;
    UINT32 ReceiveFilterSetting;
    UINT32 MaxMCastFilterCount;
    UINT32 MCastFilterCount;
    EFI_MAC_ADDRESS MCastFilter[MAX_MCAST_FILTER_CNT];
    EFI_MAC_ADDRESS CurrentAddress;
    EFI_MAC_ADDRESS BroadcastAddress;
    EFI_MAC_ADDRESS PermanentAddress;
    UINT8 IfType;
    BOOLEAN MacAddressChangeable;
    BOOLEAN MultipleTxSupported;
    BOOLEAN MediaPresentSupported;
    BOOLEAN MediaPresent;
} EFI_SIMPLE_NETWORK_MODE;

State          Reports the current state of the network interface (see
                EFI_SIMPLE_NETWORK_STATE below). When an
                EFI_SIMPLE_NETWORK_PROTOCOL driver initializes a network
                interface, the network interface is left in the
                EfiSimpleNetworkStopped state.
HwAddressSize  The size, in bytes, of the network interface’s HW address.
MediaHeaderSize The size, in bytes, of the network interface’s media header.
MaxPacketSize  The maximum size, in bytes, of the packets supported by the
                network interface.
NvRamSize      The size, in bytes, of the NVRAM device attached to the network
                interface. If an NVRAM device is not attached to the network
                interface, then this field will be zero. This value must be a multiple of
                NvramAccessSize.
NvRamAccessSize

The size that must be used for all NVRAM reads and writes. The start address for NVRAM read and write operations and the total length of those operations, must be a multiple of this value. The legal values for this field are 0, 1, 2, 4, and 8. If the value is zero, then no NVRAM devices are attached to the network interface.

ReceiveFilterMask

The multicast receive filter settings supported by the network interface.

ReceiveFilterSetting

The current multicast receive filter settings. See “Bit Mask Values for ReceiveFilterSetting” below.

MaxMCastFilterCount

The maximum number of multicast address receive filters supported by the driver. If this value is zero, then ReceiveFilters() cannot modify the multicast address receive filters. This field may be less than MAX_MCAST_FILTER_CNT (see below).

MCastFilterCount

The current number of multicast address receive filters.

MCastFilter

Array containing the addresses of the current multicast address receive filters.

CurrentAddress

The current HW MAC address for the network interface.

BroadcastAddress

The current HW MAC address for broadcast packets.

PermanentAddress

The permanent HW MAC address for the network interface.

IfType

The interface type of the network interface. See RFC 3232, section “Number Hardware Type.”

MacAddressChangeable

TRUE if the HW MAC address can be changed.

MultipleTxSupported

TRUE if the network interface can transmit more than one packet at a time.

MediaPresentSupported

TRUE if the presence of media can be determined; otherwise FALSE. If FALSE, MediaPresent cannot be used.

MediaPresent

TRUE if media are connected to the network interface; otherwise FALSE. This field shows the media present status as of the most recent GetStatus() call.
typedef enum {
    EfiSimpleNetworkStopped,
    EfiSimpleNetworkStarted,  
    EfiSimpleNetworkInitialized,
    EfiSimpleNetworkMaxState
} EFI_SIMPLE_NETWORK_STATE;

#define MAX_MCAST_FILTER_CNT 16

#define EFI_SIMPLE_NETWORK_RECEIVE_UNICAST 0x01
#define EFI_SIMPLE_NETWORK_RECEIVE_MULTICAST 0x02
#define EFI_SIMPLE_NETWORK_RECEIVE_BROADCAST 0x04
#define EFI_SIMPLE_NETWORK_RECEIVE_PROMISCUOUS 0x08
#define EFI_SIMPLE_NETWORK_RECEIVE_PROMISCUOUS_MULTICAST 0x10

Description
The EFI_SIMPLE_NETWORK_PROTOCOL protocol is used to initialize access to a network adapter. Once the network adapter initializes, the EFI_SIMPLE_NETWORK_PROTOCOL protocol provides services that allow packets to be transmitted and received. This provides a packet level interface that can then be used by higher level drivers to produce boot services like DHCP, TFTP, and MTFTP. In addition, this protocol can be used as a building block in a full UDP and TCP/IP implementation that can produce a wide variety of application level network interfaces. See the Preboot Execution Environment (PXE) Specification for more information.

Note: The underlying network hardware may only be able to access 4 GiB (32-bits) of system memory. Any requests to transfer data to/from memory above 4 GiB with 32-bit network hardware will be double-buffered (using intermediate buffers below 4 GiB) and will reduce performance.

Note: The same handle can have an instance of the EFI_ADAPTER_INFORMATION_PROTOCOL with a EFI_ADAPTER_INFO_MEDIA_STATE type structure.

EFI_SIMPLE_NETWORK.Start()

Summary
Changes the state of a network interface from “stopped” to “started.”
Prototype

```c
typedef
EFI_STATUS
(EIFIAPI *EFI_SIMPLE_NETWORK_START) (
    IN EFI_SIMPLE_NETWORK_PROTOCOL *This
);
```

Parameters
- `This` A pointer to the EFI_SIMPLE_NETWORK_PROTOCOL instance.

Description
This function starts a network interface. If the network interface successfully starts, then EFI_SUCCESS will be returned.

Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The network interface was started.</td>
</tr>
<tr>
<td>EFI_ALREADY_STARTED</td>
<td>The network interface is already in the started state.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>This parameter was NULL or did not point to a valid EFI_SIMPLE_NETWORK_PROTOCOL structure.</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>The command could not be sent to the network interface.</td>
</tr>
<tr>
<td>EFI_UNSUPPORTED</td>
<td>This function is not supported by the network interface.</td>
</tr>
</tbody>
</table>

EFI_SIMPLE_NETWORK.Stop()

Summary
Changes the state of a network interface from “started” to “stopped.”

Prototype

```c
typedef
EFI_STATUS
(EIFIAPI *EFI_SIMPLE_NETWORK_STOP) (
    IN EFI_SIMPLE_NETWORK_PROTOCOL *This
);
```

Parameters
- `This` A pointer to the EFI_SIMPLE_NETWORK_PROTOCOL instance.

Description
This function stops a network interface. This call is only valid if the network interface is in the started state. If the network interface was successfully stopped, then EFI_SUCCESS will be returned.
Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The network interface was stopped.</td>
</tr>
<tr>
<td>EFI_NOT_STARTED</td>
<td>The network interface has not been started.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>This parameter was NULL or did not point to a valid EFI_SIMPLE_NETWORK_PROTOCOL structure.</td>

<td>The command could not be sent to the network interface.</td>
</tr>
<tr>
<td>EFI_UNSUPPORTED</td>
<td>This function is not supported by the network interface.</td>
</tr>
</tbody>
</table>

EFI_SIMPLE_NETWORK.Initialize()

Summary
Resets a network adapter and allocates the transmit and receive buffers required by the network interface; optionally, also requests allocation of additional transmit and receive buffers.

Prototype
```c
typedef EFI_STATUS (EFIAPI *EFI_SIMPLE_NETWORK_INITIALIZE) (  
    IN EFI_SIMPLE_NETWORK_PROTOCOL *This,
    IN UINTN ExtraRxBufferSize OPTIONAL,
    IN UINTN ExtraTxBufferSize OPTIONAL
);
```

Parameters
- **This**
  A pointer to the EFI_SIMPLE_NETWORK_PROTOCOL instance.
- **ExtraRxBufferSize**
  The size, in bytes, of the extra receive buffer space that the driver should allocate for the network interface. Some network interfaces will not be able to use the extra buffer, and the caller will not know if it is actually being used.
- **ExtraTxBufferSize**
  The size, in bytes, of the extra transmit buffer space that the driver should allocate for the network interface. Some network interfaces will not be able to use the extra buffer, and the caller will not know if it is actually being used.

Description
This function allocates the transmit and receive buffers required by the network interface. If this allocation fails, then EFI_OUT_OF_RESOURCES is returned. If the allocation succeeds and the network interface is successfully initialized, then EFI_SUCCESS will be returned.
Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The network interface was initialized.</td>
</tr>
<tr>
<td>EFI_NOT_STARTED</td>
<td>The network interface has not been started.</td>
</tr>
<tr>

<td>There was not enough memory for the transmit and receive buffers.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>This parameter was NULL or did not point to a valid EFI_SIMPLE_NETWORK_PROTOCOL structure.</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>The command could not be sent to the network interface.</td>
</tr>
<tr>
<td>EFI_UNSUPPORTED</td>
<td>The increased buffer size feature is not supported.</td>
</tr>
</tbody>
</table>

EFI_SIMPLE_NETWORK.Reset()

Summary
Resets a network adapter and reinitializes it with the parameters that were provided in the previous call to Initialize().

Prototype
```c
typedef EFI_STATUS (EFIAPI *EFI_SIMPLE_NETWORK_RESET) (  
    IN EFI_SIMPLE_NETWORK_PROTOCOL  *This,  
    IN BOOLEAN          ExtendedVerification)
```

Parameters
- **This**: A pointer to the EFI_SIMPLE_NETWORK_PROTOCOL instance.
- **ExtendedVerification**: Indicates that the driver may perform a more exhaustive verification operation of the device during reset.

Description
This function resets a network adapter and reinitializes it with the parameters that were provided in the previous call to Initialize(). The transmit and receive queues are emptied and all pending interrupts are cleared. Receive filters, the station address, the statistics, and the multicast-IP-to-HW MAC addresses are not reset by this call. If the network interface was successfully reset, then EFI_SUCCESS will be returned. If the driver has not been initialized, EFI_DEVICE_ERROR will be returned.
Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The network interface was reset.</td>
</tr>
<tr>
<td>EFI_NOT_STARTED</td>
<td>The network interface has not been started.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>One or more of the parameters has an unsupported value.</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>The command could not be sent to the network interface.</td>
</tr>
<tr>
<td>EFI_UNSUPPORTED</td>
<td>This function is not supported by the network interface.</td>
</tr>
</tbody>
</table>

EFI_SIMPLE_NETWORK.Shutdown()

Summary
Resets a network adapter and leaves it in a state that is safe for another driver to initialize.

Prototype

typedef

EFI_STATUS

(EIFIAPI *EFI_SIMPLE_NETWORK_SHUTDOWN) ( |

IN EFI_SIMPLE_NETWORK_PROTOCOL *This |

);

Parameters

This A pointer to the EFI_SIMPLE_NETWORK_PROTOCOL instance.

Description
This function releases the memory buffers assigned in the Initialize() call. Pending transmits and receives are lost, and interrupts are cleared and disabled. After this call, only the Initialize() and Stop() calls may be used. If the network interface was successfully shutdown, then EFI_SUCCESS will be returned. If the driver has not been initialized, EFI_DEVICE_ERROR will be returned.

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The network interface was shutdown.</td>
</tr>
<tr>
<td>EFI_NOT_STARTED</td>
<td>The network interface has not been started.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>This parameter was NULL or did not point to a valid EFI_SIMPLE_NETWORK_PROTOCOL structure.</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>The command could not be sent to the network interface.</td>
</tr>
</tbody>
</table>

EFI_SIMPLE_NETWORK.ReceiveFilters()

Summary
Manages the multicast receive filters of a network interface.
Prototype

```c
typedef
EFI_STATUS
(EFI_API *EFI_SIMPLE_NETWORK_RECEIVE_FILTERS) (
    IN EFI_SIMPLE_NETWORK_PROTOCOL  *This,
    IN UINT32           Enable,
    IN UINT32           Disable,
    IN BOOLEAN          ResetMCastFilter,
    IN UINTN            MCastFilterCnt OPTIONAL,
    IN EFI_MAC_ADDRESS  *MCastFilter OPTIONAL,
);```

Parameters

- **This**: A pointer to the `EFI_SIMPLE_NETWORK_PROTOCOL` instance.
- **Enable**: A bit mask of receive filters to enable on the network interface.
- **Disable**: A bit mask of receive filters to disable on the network interface. For backward compatibility with EFI 1.1 platforms, the `EFI_SIMPLE_NETWORK_RECEIVE_MULTICAST` bit must be set when the `ResetMCastFilter` parameter is `TRUE`.
- **MCastFilterCnt**: Number of multicast HW MAC addresses in the new MCastFilter list. This value must be less than or equal to the `MCastFilterCnt` field of `EFI_SIMPLE_NETWORK_MODE`. This field is optional if `ResetMCastFilter` is `TRUE`.
- **MCastFilter**: A pointer to a list of new multicast receive filter HW MAC addresses. This list will replace any existing multicast HW MAC address list. This field is optional if `ResetMCastFilter` is `TRUE`.

Description

This function is used to enable and disable the hardware and software receive filters for the underlying network device.

The receive filter change is broken down into three steps:

- The filter mask bits that are set (ON) in the Enable parameter are added to the current receive filter settings.
- The filter mask bits that are set (ON) in the Disable parameter are subtracted from the updated receive filter settings.
- If the resulting receive filter setting is not supported by the hardware a more liberal setting is selected.

If the same bits are set in the Enable and Disable parameters, then the bits in the Disable parameter takes precedence.
If the `ResetMCastFilter` parameter is TRUE, then the multicast address list filter is disabled (irregardless of what other multicast bits are set in the Enable and Disable parameters). The `SNP->Mode->MCastFilterCount` field is set to zero. The `Snp->Mode->MCastFilter` contents are undefined.

After enabling or disabling receive filter settings, software should verify the new settings by checking the `Snp->Mode->ReceiveFilterSettings`, `Snp->Mode->MCastFilterCount` and `Snp->Mode->MCastFilter` fields.

**Note:** Some network drivers and/or devices will automatically promote receive filter settings if the requested setting can not be honored. For example, if a request for four multicast addresses is made and the underlying hardware only supports two multicast addresses the driver might set the promiscuous or promiscuous multicast receive filters instead. The receiving software is responsible for discarding any extra packets that get through the hardware receive filters.

**Note:** To disable all receive filter hardware, the network driver must be `Shutdown()` and `Stopped()`. Calling `ReceiveFilters()` with `Disable` set to `Snp->Mode->ReceiveFilterSettings` will make it so no more packets are returned by the `Receive()` function, but the receive hardware may still be moving packets into system memory before inspecting and discarding them. Unexpected system errors, reboots and hangs can occur if an OS is loaded and the network devices are not `Shutdown()` and `Stopped()`.

If `ResetMCastFilter` is TRUE, then the multicast receive filter list on the network interface will be reset to the default multicast receive filter list. If `ResetMCastFilter` is FALSE, and this network interface allows the multicast receive filter list to be modified, then the `MCastFilterCnt` and `MCastFilter` are used to update the current multicast receive filter list. The modified receive filter list settings can be found in the `MCastFilter` field of `EFI_SIMPLE_NETWORK_MODE`. If the network interface does not allow the multicast receive filter list to be modified, then `EFI_INVALID_PARAMETER` will be returned. If the driver has not been initialized, `EFI_DEVICE_ERROR` will be returned.

If the receive filter mask and multicast receive filter list have been successfully updated on the network interface, `EFI_SUCCESS` will be returned.
Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The multicast receive filter list was updated.</td>
</tr>
<tr>
<td>EFI_NOT_STARTED</td>

<td>This function is not supported by the network interface.</td>
</tr>
</tbody>
</table>

**EFI_SIMPLE_NETWORK.StationAddress()**

**Summary**

Modifies or resets the current station address, if supported.

**Prototype**

```c
typedef
EFI_STATUS
(EFIAPI *EFI_SIMPLE_NETWORK_STATION_ADDRESS) (  
  IN EFI_SIMPLE_NETWORK_PROTOCOL *This,  
  IN BOOLEAN Reset,  
  IN EFI_MAC_ADDRESS *New OPTIONAL  
);
```

**Parameters**

- **This**  
  A pointer to the EFI_SIMPLE_NETWORK_PROTOCOL instance.

- **Reset**  
  Flag used to reset the station address to the network interface’s permanent address.

- **New**  
  New station address to be used for the network interface.
Description
This function modifies or resets the current station address of a network interface, if supported. If `Reset` is `TRUE`, then the current station address is set to the network interface’s permanent address. If `Reset` is `FALSE`, and the network interface allows its station address to be modified, then the current station address is changed to the address specified by `New`. If the network interface does not allow its station address to be modified, then `EFI_INVALID_PARAMETER` will be returned. If the station address is successfully updated on the network interface, `EFI_SUCCESS` will be returned. If the driver has not been initialized, `EFI_DEVICE_ERROR` will be returned.

Status Codes Returned

<td>The Simple Network Protocol interface has not been initialized by calling <code>Initialize()</code>.</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>An error occurred attempting to set the new station address.</td>
</tr>
<tr>
<td>EFI_UNSUPPORTED</td>
<td>The NIC does not support changing the network interface’s station address.</td>
</tr>
</tbody>
</table>

`EFI_SIMPLE_NETWORK.Statistics()`

Summary
Resets or collects the statistics on a network interface.

Prototype

```c
typedef
EFI_STATUS
(EFIAPI *EFI_SIMPLE_NETWORK_STATISTICS) (
  IN EFI_SIMPLE_NETWORK_PROTOCOL *This,
  IN BOOLEAN             Reset,
  IN OUT UINTN           *StatisticsSize OPTIONAL,
  OUT EFI_NETWORK_STATISTICS *StatisticsTable OPTIONAL
);
```

Parameters

- **This**
  A pointer to the `EFI_SIMPLE_NETWORK_PROTOCOL` instance.
- **Reset**
  Set to `TRUE` to reset the statistics for the network interface.
- **StatisticsSize**
  On input the size, in bytes, of `StatisticsTable`. On output the size, in bytes, of the resulting table of statistics.
- **StatisticsTable**
  A pointer to the `EFI_NETWORK_STATISTICS` structure that contains the statistics. Type `EFI_NETWORK_STATISTICS` is defined in “Related Definitions” below.
Related Definitions

// *******************************************************************************
// EFI_NETWORK_STATISTICS
//
// Any statistic value that is –1 is not available
// on the device and is to be ignored.
// *******************************************************************************
typedef struct {
    UINT64 RxTotalFrames;

    UINT64 TxErrorFrames;
    UINT64 TxRetryFrames;
} EFI_NETWORK_STATISTICS;

RxTotalFrames     Total number of frames received. Includes frames with errors and dropped frames.
RxGoodFrames      Number of valid frames received and copied into receive buffers.
RxUndersizeFrames Number of frames below the minimum length for the communications device.
RxOversizeFrames  Number of frames longer than the maximum length for the communications device.
RxDroppedFrames   Valid frames that were dropped because receive buffers were full.
RxUnicastFrames  Number of valid unicast frames received and not dropped.
RxBroadcastFrames Number of valid broadcast frames received and not dropped.
RxMulticastFrames Number of valid multicast frames received and not dropped.
RxCrcErrorFrames  Number of frames with CRC or alignment errors.
RxTotalBytes Total number of bytes received. Includes frames with errors and dropped frames.
TxTotalFrames Total number of frames transmitted. Includes frames with errors and dropped frames.
TxGoodFrames Number of valid frames transmitted and copied into receive buffers.
TxUndersizeFrames Number of frames below the minimum length for the media. This would be less than 64 for Ethernet.
TxOversizeFrames Number of frames longer than the maximum length for the media. This would be greater than 1500 for Ethernet.
TxDroppedFrames Valid frames that were dropped because receive buffers were full.
TxUnicastFrames Number of valid unicast frames transmitted and not dropped.
TxBroadcastFrames Number of valid broadcast frames transmitted and not dropped.
TxMulticastFrames Number of valid multicast frames transmitted and not dropped.
TxCrcErrorFrames Number of frames with CRC or alignment errors.
TxTotalBytes Total number of bytes transmitted. Includes frames with errors and dropped frames.
Collisions Number of collisions detected on this subnet.
UnsupportedProtocol Number of frames destined for unsupported protocol.
RxDuplicatedFrames Number of valid frames received that were duplicated.
RxDecryptErrorFrames Number of encrypted frames received that failed to decrypt.
TxErrorFrames Number of frames that failed to transmit after exceeding the retry limit.
TxRetryFrames Number of frames transmitted successfully after more than one attempt.

**Description**

This function resets or collects the statistics on a network interface. If the size of the statistics table specified by `StatisticsSize` is not big enough for all the statistics that are collected by the network interface, then a partial buffer of statistics is returned in `StatisticsTable`, `StatisticsSize` is set to the size required to collect all the available statistics, and `EFI_BUFFER_TOO_SMALL` is returned.

If `StatisticsSize` is big enough for all the statistics, then `StatisticsTable` will be filled, `StatisticsSize` will be set to the size of the returned `StatisticsTable` structure, and `EFI_SUCCESS` is returned. If the driver has not been initialized, `EFI_DEVICE_ERROR` will be returned.

If `Reset` is `FALSE`, and both `StatisticsSize` and `StatisticsTable` are `NULL`, then no operations will be performed, and `EFI_SUCCESS` will be returned.

If `Reset` is `TRUE`, then all of the supported statistics counters on this network interface will be reset to zero.

EFI_SIMPLE_NETWORK.MCastIPtoMAC()

Summary
Converts a multicast IP address to a multicast HW MAC address.

Prototype
```c
typedef EFI_STATUS
    (EFIAPI *EFI_SIMPLE_NETWORK_MCAST_IP_TO_MAC) (    
    IN EFI_SIMPLE_NETWORK_PROTOCOL *This,  
    IN BOOLEAN IPv6,  
    IN EFI_IP_ADDRESS *IP,    
    OUT EFI_MAC_ADDRESS *MAC  
    );
```

Parameters
- `This` A pointer to the EFI_SIMPLE_NETWORK_PROTOCOL instance.
- `IPv6` Set to `TRUE` if the multicast IP address is IPv6 [RFC 2460]. Set to `FALSE` if the multicast IP address is IPv4 [RFC 791].
- `IP` The multicast IP address that is to be converted to a multicast HW MAC address.
- `MAC` The multicast HW MAC address that is to be generated from `IP`.

Description
This function converts a multicast IP address to a multicast HW MAC address for all packet transactions. If the mapping is accepted, then `EFI_SUCCESS` will be returned.

EFI\_SIMPLE\_NETWORK.NvData()

Summary
Performs read and write operations on the NVRAM device attached to a network interface.

Prototype

```c
typedef
EFI_STATUS
(EFIAPIT *EFI\_SIMPLE\_NETWORK\_NVDATA) (  
  IN EFI\_SIMPLE\_NETWORK\_PROTOCOL *This
  IN BOOLEAN ReadWrite,
  IN UINTN Offset,
  IN UINTN BufferSize,
  IN OUT VOID *Buffer
);
```

Parameters

- **This**: A pointer to the EFI\_SIMPLE\_NETWORK\_PROTOCOL instance.
- **ReadWrite**: \texttt{TRUE} for read operations, \texttt{FALSE} for write operations.
- **Offset**: Byte offset in the NVRAM device at which to start the read or write operation. This must be a multiple of NvRamAccessSize and less than NvRamSize. (See EFI\_SIMPLE\_NETWORK\_MODE)
- **BufferSize**: The number of bytes to read or write from the NVRAM device. This must also be a multiple of 2.
- **Buffer**: A pointer to the data buffer.

Description
This function performs read and write operations on the NVRAM device attached to a network interface. If **ReadWrite** is \texttt{TRUE}, a read operation is performed. If **ReadWrite** is \texttt{FALSE}, a write operation is performed.
Offset specifies the byte offset at which to start either operation. Offset must be a multiple of NvRamAccessSize, and it must have a value between zero and NvRamSize.

BufferSize specifies the length of the read or write operation. BufferSize must also be a multiple of NvRamAccessSize, and Offset + BufferSize must not exceed NvRamSize.

If any of the above conditions is not met, then EFI_INVALID_PARAMETER will be returned.

If all the conditions are met and the operation is “read,” the NVRAM device attached to the network interface will be read into Buffer and EFI_SUCCESS will be returned. If this is a write operation, the contents of Buffer will be used to update the contents of the NVRAM device attached to the network interface and EFI_SUCCESS will be returned.

| EFI_UNSUPPORTED      | This function is not supported by the network interface. |

**EFI_SIMPLE_NETWORK.GetStatus()**

**Summary**

Reads the current interrupt status and recycled transmit buffer status from a network interface.

**Prototype**

```c
typedef EFI_STATUS  
(EIFIAPI *EFI_SIMPLE_NETWORK_GET_STATUS) ( 
  IN EFI_SIMPLE_NETWORK_PROTOCOL  *This, 
  OUT UINT32  *InterruptStatus  OPTIONAL, 
  OUT VOID  **TxBuf  OPTIONAL
 );
```

**Parameters**

This A pointer to the EFI_SIMPLE_NETWORK_PROTOCOL instance.
InterruptStatus  A pointer to the bit mask of the currently active interrupts (see “Related Definitions”). If this is NULL, the interrupt status will not be read from the device. If this is not NULL, the interrupt status will be read from the device. When the interrupt status is read, it will also be cleared. Clearing the transmit interrupt does not empty the recycled transmit buffer array.

TxBuf  Recycled transmit buffer address. The network interface will not transmit if its internal recycled transmit buffer array is full. Reading the transmit buffer does not clear the transmit interrupt. If this is NULL, then the transmit buffer status will not be read. If there are no transmit buffers to recycle and TxBuf is not NULL, *TxBuf will be set to NULL.

Related Definitions

//**********************************************************************
// Interrupt Bit Mask Settings for InterruptStatus.
// Note that all other bit values are reserved.
//**********************************************************************
#define EFI_SIMPLE_NETWORK_RECEIVE_INTERRUPT     0x01
#define EFI_SIMPLE_NETWORK_TRANSMIT_INTERRUPT    0x02
#define EFI_SIMPLE_NETWORK_COMMAND_INTERRUPT     0x04
#define EFI_SIMPLE_NETWORK_SOFTWARE_INTERRUPT    0x08

Description

This function gets the current interrupt and recycled transmit buffer status from the network interface. The interrupt status is returned as a bit mask in InterruptStatus. If InterruptStatus is NULL, the interrupt status will not be read. Upon successful return of the media status, the MediaPresent field of EFI_SIMPLE_NETWORK_MODE will be updated to reflect any change of media status. Upon successful return of the media status, the MediaPresent field of EFI_SIMPLE_NETWORK_MODE will be updated to reflect any change of media status. If TxBuf is not NULL, a recycled transmit buffer address will be retrieved. If a recycled transmit buffer address is returned in TxBuf, then the buffer has been successfully transmitted, and the status for that buffer is cleared. If the status of the network interface is successfully collected, EFI_SUCCESS will be returned. If the driver has not been initialized, EFIDEVICE_ERROR will be returned.

EFI_SIMPLE_NETWORK.Transmit()

Summary

Places a packet in the transmit queue of a network interface.
Prototype

```c
typedef EFI_STATUS
(EIFIAPI *EFI_SIMPLE_NETWORK_TRANSMIT) (
    IN EFI_SIMPLE_NETWORK_PROTOCOL *This,
    IN UINTN HeaderSize,
    IN UINTN BufferSize,
    IN VOID *Buffer,
    IN EFI_MAC_ADDRESS *SrcAddr OPTIONAL,
    IN EFI_MAC_ADDRESS *DestAddr OPTIONAL,
    IN UINT16 *Protocol OPTIONAL,
);
```

Parameters

- **This**: A pointer to the EFI_SIMPLE_NETWORK_PROTOCOL instance.
- **HeaderSize**: The size, in bytes, of the media header to be filled in by the Transmit() function. If HeaderSize is nonzero, then it must be equal to This->Mode->MediaHeaderSize and the DestAddr and Protocol parameters must not be NULL.
- **BufferSize**: The size, in bytes, of the entire packet (media header and data) to be transmitted through the network interface.
- **Buffer**: A pointer to the packet (media header followed by data) to be transmitted. This parameter cannot be NULL. If HeaderSize is zero, then the media header in Buffer must already be filled in by the caller. If HeaderSize is nonzero, then the media header will be filled in by the Transmit() function.
- **SrcAddr**: The source HW MAC address. If HeaderSize is zero, then this parameter is ignored. If HeaderSize is nonzero and SrcAddr is NULL, then This->Mode->CurrentAddress is used for the source HW MAC address.
- **DestAddr**: The destination HW MAC address. If HeaderSize is zero, then this parameter is ignored.
- **Protocol**: The type of header to build. If HeaderSize is zero, then this parameter is ignored. See RFC 3232, section “Ether Types,” for examples.

Description

This function places the packet specified by **Header** and **Buffer** on the transmit queue. If **HeaderSize** is nonzero and **HeaderSize** is not equal to This->Mode->MediaHeaderSize, then **EFI_INVALID_PARAMETER** will be returned. If **BufferSize** is less than This->Mode->MediaHeaderSize, then **EFI_BUFFER_TOO_SMALL** will be returned. If Buffer is NULL, then **EFI_INVALID_PARAMETER** will be returned. If **HeaderSize** is nonzero and DestAddr or **Protocol** is NULL, then **EFI_INVALID_PARAMETER** will be returned. If the transmit engine of the network interface is busy, then **EFI_NOT_READY** will be returned. If this packet can be accepted by the transmit engine of the network interface, the packet contents specified by **Buffer** will be placed on the transmit queue of the network interface, and **EFI_SUCCESS** will be returned. **GetStatus()** can be
used to determine when the packet has actually been transmitted. The contents of the Buffer must not be modified until the packet has actually been transmitted.

The Transmit() function performs nonblocking I/O. A caller who wants to perform blocking I/O, should call Transmit(), and then GetStatus() until the transmitted buffer shows up in the recycled transmit buffer.

If the driver has not been initialized, EFI_DEVICE_ERROR will be returned.

**Status Codes Returned**

<table>

</tbody>
</table>

**EFI_SIMPLE_NETWORK.Receive()**

**Summary**
Receives a packet from a network interface.

**Prototype**

```c
typedef EFI_STATUS (EFIAPIC *EFI_SIMPLE_NETWORK_RECEIVE) (  
    IN EFI_SIMPLE_NETWORK_PROTOCOL *This,  
    OUT UINTN *HeaderSize OPTIONAL,  
    IN OUT UINTN *BufferSize,  
    OUT VOID *Buffer,  
    OUT EFI_MAC_ADDRESS *SrcAddr OPTIONAL,  
    OUT EFI_MAC_ADDRESS *DestAddr OPTIONAL,  
    OUT UINT16 *Protocol OPTIONAL  
);  
```

**Parameters**

- **This** A pointer to the EFI_SIMPLE_NETWORK_PROTOCOL instance.
- **HeaderSize** The size, in bytes, of the media header received on the network interface. If this parameter is NULL, then the media header size will not be returned.
- **BufferSize** On entry, the size, in bytes, of Buffer. On exit, the size, in bytes, of the packet that was received on the network interface.
- **Buffer** A pointer to the data buffer to receive both the media header and the data.
The source HW MAC address. If this parameter is NULL, the HW MAC source address will not be extracted from the media header.

DestAddr

The destination HW MAC address. If this parameter is NULL, the HW MAC destination address will not be extracted from the media header.

Protocol

The media header type. If this parameter is NULL, then the protocol will not be extracted from the media header. See RFC 1700 section “Ether Types” for examples.

Description

This function retrieves one packet from the receive queue of a network interface. If there are no packets on the receive queue, then EFI_NOT_READY will be returned. If there is a packet on the receive queue, and the size of the packet is smaller than BufferSize, then the contents of the packet will be placed in Buffer, and BufferSize will be updated with the actual size of the packet. In addition, if SrcAddr, DestAddr, and Protocol are not NULL, then these values will be extracted from the media header and returned. EFI_SUCCESS will be returned if a packet was successfully received. If BufferSize is smaller than the received packet, then the size of the receive packet will be placed in BufferSize and EFI_BUFFER_TOO_SMALL will be returned. If the driver has not been initialized, EFI_DEVICE_ERROR will be returned.

Status Codes Returned

24.2 Network Interface Identifier Protocol

This is an optional protocol that is used to describe details about the software layer that is used to produce the Simple Network Protocol. This protocol is only required if the underlying network interface is 16-bit UNDI, 32/64-bit S/W UNDI, or H/W UNDI. It is used to obtain type and revision information about the underlying network interface.

An instance of the Network Interface Identifier protocol must be created for each physical external network interface that is controlled by the iPXE structure. The iPXE structure is defined in the 32/64-bit UNDI Specification in Appendix E.
**EFI_NETWORK_INTERFACE_IDENTIFIER_PROTOCOL**

**Summary**
An optional protocol that is used to describe details about the software layer that is used to produce the Simple Network Protocol.

**GUID**
```
#define EFI_NETWORK_INTERFACE_IDENTIFIER_PROTOCOL_GUID_31 \ 
{0x1ACED566, 0x76ED, 0x4218, \ 
{0xBC, 0x81, 0x76, 0x7F, 0x1F, 0x97, 0x7A, 0x89}}
```

**Revision Number**
```
#define EFI_NETWORK_INTERFACE_IDENTIFIER_PROTOCOL_REVISION \ 
0x00020000
```

**Protocol Interface Structure**
```
typedef struct {
    UINT64  Revision;
    UINT64  Id;
    UINT64  ImageAddr;
    UINT32  ImageSize;
    CHAR8   StringId[4];
    UINT8   Type;
    UINT8   MajorVer;
    UINT8   MinorVer;
    BOOLEAN Ipv6Supported;
    UINT16  IfNum;
} EFI_NETWORK_INTERFACE_IDENTIFIER_PROTOCOL;
```

**Parameters**
- **Revision**
The revision of the **EFI_NETWORK_INTERFACE_IDENTIFIER** protocol.
- **Id**
Address of the first byte of the identifying structure for this network interface. This is only valid when the network interface is started (see **Start()**). When the network interface is not started, this field is set to zero.
  - **16-bit UNDI and 32/64-bit S/W UNDI:**
    - `Id` contains the address of the first byte of the copy of the `!PXE` structure in the relocated UNDI code segment. See the **Preboot Execution Environment (PXE) Specification** and Appendix E.
  - **H/W UNDI:**
    - `Id` contains the address of the **!PXE** structure.
- **ImageAddr**
Address of the unrelocated network interface image.
  - **16-bit UNDI:**
    - `ImageAddr` is the address of the PXE option ROM image in upper memory.
32/64-bit S/W UNDI:

- **ImageAddr** is the address of the unrelocated S/W UNDI image.

H/W UNDI:

- **ImageAddr** contains zero.

- **ImageSize** is the size of the network interface image.

16-bit UNDI:

- **ImageSize** is the size of the PXE option ROM image in upper memory.

32/64-bit S/W UNDI:

- **ImageSize** is the size of the unrelocated S/W UNDI image.

H/W UNDI:

- **ImageSize** contains zero.

- **StringId** is a four-character ASCII string that is sent in the class identifier field of option 60 in DHCP. For a **Type** of **EfiNetworkInterfaceUndi**, this field is “UNDI.”

- **Type** is the network interface type. This will be set to one of the values in **EFI_NETWORK_INTERFACE_TYPE** (see “Related Definitions” below).

- **MajorVer** is the major version number.

16-bit UNDI:

- **MajorVer** comes from the third byte of the **UNDIRev** field in the **UNDI ROM ID** structure. Refer to the **Preboot Execution Environment (PXE) Specification**.

32/64-bit S/W UNDI and H/W UNDI:

- **MajorVer** comes from the **Major** field in the **!PXE** structure. See Appendix E.

- **MinorVer** is the minor version number.

16-bit UNDI:

- **MinorVer** comes from the second byte of the **UNDIRev** field in the **UNDI ROM ID** structure. Refer to the **Preboot Execution Environment (PXE) Specification**.

32/64-bit S/W UNDI and H/W UNDI:

- **MinorVer** comes from the **Minor** field in the **!PXE** structure. See Appendix E.

- **Ipv6Supported** is **TRUE** if the network interface supports IPv6; otherwise **FALSE**.

- **IfNum** is the network interface number that is being identified by this Network Interface Identifier Protocol. This field must be less than or equal to the (IFcnt | IFcntExt << 8) field in the **!PXE** structure.
Related Definitions

```c
typedef enum {
    EfiNetworkInterfaceUndi = 1
} EFI_NETWORK_INTERFACE_TYPE;
```

Description

The `EFI_NETWORK_INTERFACE_IDENTIFIER_PROTOCOL` is used by `EFI_PXE_BASE_CODE_PROTOCOL` and OS loaders to identify the type of the underlying network interface and to locate its initial entry point.

24.3 PXE Base Code Protocol

This section defines the Preboot Execution Environment (PXE) Base Code protocol, which is used to access PXE-compatible devices for network access and network booting. For more information about PXE, see “Links to UEFI-Related Documents” ([http://uefi.org/uefi](http://uefi.org/uefi)) under the heading “Preboot Execution Environment (PXE) Specification”.

**EFI_PXE_BASE_CODE_PROTOCOL**

**Summary**

The `EFI_PXE_BASE_CODE_PROTOCOL` is used to control PXE-compatible devices. The features of these devices are defined in the *Preboot Execution Environment (PXE) Specification*. An `EFI_PXE_BASE_CODE_PROTOCOL` will be layered on top of an `EFI_MANAGED_NETWORK_PROTOCOL` protocol in order to perform packet level transactions. The `EFI_PXE_BASE_CODE_PROTOCOL` handle also supports the `EFI_LOAD_FILE_PROTOCOL` protocol. This provides a clean way to obtain control from the boot manager if the boot path is from the remote device.

**GUID**

```c
#define EFI_PXE_BASE_CODE_PROTOCOL_GUID \\
{0x03C4E603,0xAC28,0x11d3,\\
{0x9A,0x2D,0x00,0x90,0x27,0x3F,0xC1,0x4D}}
```

**Revision Number**

```c
#define EFI_PXE_BASE_CODE_PROTOCOL_REVISION 0x00010000
```

  EFI_PXE_BASE_CODE_SET_PACKETS SetPackets;
  EFI_PXE_BASE_CODE_MODE *Mode;
} EFI_PXE_BASE_CODE_PROTOCOL;

Parameters

Revision The revision of the EFI_PXE_BASE_CODE_PROTOCOL. All future revisions must be backwards compatible. If a future version is not backwards compatible it is not the same GUID.

Start Starts the PXE Base Code Protocol. Mode structure information is not valid and no other Base Code Protocol functions will operate until the Base Code is started. See the Start() function description.

Stop Stops the PXE Base Code Protocol. Mode structure information is unchanged by this function. No Base Code Protocol functions will operate until the Base Code is restarted. See the Stop() function description.

Dhcp Attempts to complete a DHCPv4 D.O.R.A. (discover / offer / request / acknowledge) or DHCPv6 S.A.R.R (solicit / advertise / request / reply) sequence. See the Dhcp() function description.

Discover Attempts to complete the PXE Boot Server and/or boot image discovery sequence. See the Discover() function description.

Mtftp Performs TFTP and MTFTP services. See the Mtftp() function description.

UdpWrite Writes a UDP packet to the network interface. See the UdpWrite() function description.

UdpRead Reads a UDP packet from the network interface. See the UdpRead() function description.

SetIpFilter Updates the IP receive filters of the network device. See the SetIpFilter() function description.

Arp Uses the ARP protocol to resolve a MAC address. See the Arp() function description.
SetParameters  Updates the parameters that affect the operation of the PXE Base Code Protocol. See the SetParameters() function description.

SetStationIp  Updates the station IP address and subnet mask values. See the SetStationIp() function description.

SetPackets  Updates the contents of the cached DHCP and Discover packets. See the SetPackets() function description.

Mode  Pointer to the EFI_PXE_BASE_CODE_MODE data for this device. The EFI_PXE_BASE_CODE_MODE structure is defined in “Related Definitions” below.

**Started**  
`TRUE` if this device has been started by calling `Start()`. This field is set to `TRUE` by the `Start()` function and to `FALSE` by the `Stop()` function.

**Ipv6Available**  
`TRUE` if the UNDI protocol supports IPv6.

**Ipv6Supported**  
`TRUE` if this PXE Base Code Protocol implementation supports IPv6.

**UsingIpv6**  
`TRUE` if this device is currently using IPv6. This field is set by the `Start()` function.

**BisSupported**  
`TRUE` if this PXE Base Code implementation supports Boot Integrity Services (BIS). This field is set by the `Start()` function.

**BisDetected**  
`TRUE` if this device and the platform support Boot Integrity Services (BIS). This field is set by the `Start()` function.

**AutoArp**  
`TRUE` for automatic ARP packet generation; `FALSE` otherwise. This field is initialized to `TRUE` by `Start()` and can be modified with the `SetParameters()` function.

**SendGUID**  
This field is used to change the Client Hardware Address (chaddr) field in the DHCP and Discovery packets. Set to `TRUE` to send the SystemGuid (if one is available). Set to `FALSE` to send the client NIC MAC address. This field is initialized to `FALSE` by `Start()` and can be modified with the `SetParameters()` function.

**DhcpDiscoverValid**  
This field is initialized to `FALSE` by the `Start()` function and set to `TRUE` when the `Dhcp()` function completes successfully. When `TRUE`, the `DhcpDiscover` field is valid. This field can also be changed by the `SetPackets()` function.

**DhcpAckReceived**  
This field is initialized to `FALSE` by the `Start()` function and set to `TRUE` when the `Dhcp()` function completes successfully. When `TRUE`, the `DhcpAck` field is valid. This field can also be changed by the `SetPackets()` function.

**ProxyOfferReceived**  
This field is initialized to `FALSE` by the `Start()` function and set to `TRUE` when the `Dhcp()` function completes successfully and a proxy DHCP offer packet was received. When `TRUE`, the `ProxyOffer`
packet field is valid. This field can also be changed by the SetPackets() function.

**PxeDiscoverValid**

When TRUE, the PxeDiscover packet field is valid. This field is set to FALSE by the Start() and Dhcp() functions, and can be set to TRUE or FALSE by the Discover() and SetPackets() functions.

**PxeReplyReceived**

When TRUE, the PxeReply packet field is valid. This field is set to FALSE by the Start() and Dhcp() functions, and can be set to TRUE or FALSE by the Discover() and SetPackets() functions.

**PxeBisReplyReceived**

When TRUE, the PxeBisReply packet field is valid. This field is set to FALSE by the Start() and Dhcp() functions, and can be set to TRUE or FALSE by the Discover() and SetPackets() functions.

**IcmpErrorReceived**

Indicates whether the IcmpError field has been updated. This field is reset to FALSE by the Start(), Dhcp(), Discover(), Mtftp(), UdpRead(), UdpWrite(), and Arp() functions. If an ICMP error is received, this field will be set to TRUE after the IcmpError field is updated.

**TftpErrorReceived**

Indicates whether the TftpError field has been updated. This field is reset to FALSE by the Start() and Mtftp() functions. If a TFTP error is received, this field will be set to TRUE after the TftpError field is updated.

**MakeCallbacks**

When FALSE, callbacks will not be made. When TRUE, make callbacks to the PXE Base Code Callback Protocol. This field is reset to FALSE by the Start() function if the PXE Base Code Callback Protocol is not available. It is reset to TRUE by the Start() function if the PXE Base Code Callback Protocol is available.

**TTL**

The “time to live” field of the IP header. This field is initialized to DEFAULT_TTL (See “Related Definitions”) by the Start() function and can be modified by the SetParameters() function.

**ToS**

The type of service field of the IP header. This field is initialized to DEFAULT_ToS (See “Related Definitions”) by Start(), and can be modified with the SetParameters() function.

**StationIp**

The device’s current IP address. This field is initialized to a zero address by Start(). This field is set when the Dhcp() function completes successfully. This field can also be set by the SetStationIp() function. This field must be set to a valid IP address by either Dhcp() or SetStationIp() before the Discover(), Mtftp(), UdpRead(), UdpWrite(), and Arp() functions are called.

**SubnetMask**

The device’s current subnet mask. This field is initialized to a zero address by the Start() function. This field is set when the Dhcp() function completes successfully. This field can also be set by the SetStationIp() function. This field must be set to a valid subnet mask by either Dhcp() or SetStationIp() before the Discover(), Mtftp(), UdpRead(), UdpWrite(), or Arp() functions are called.

**DhcpDiscover**

Cached DHCP Discover packet. This field is zero-filled by the Start() function, and is set when the Dhcp() function completes
successfully. The contents of this field can replaced by the SetPackets() function.

**DhcpAck**  
Cached DHCP Ack packet. This field is zero-filled by the Start() function, and is set when the Dhcp() function completes successfully. The contents of this field can be replaced by the SetPackets() function.

**ProxyOffer**  
Cached Proxy Offer packet. This field is zero-filled by the Start() function, and is set when the Dhcp() function completes successfully. The contents of this field can be replaced by the SetPackets() function.

**PxeDiscover**  
Cached PXE Discover packet. This field is zero-filled by the Start() function, and is set when the Discover() function completes successfully. The contents of this field can be replaced by the SetPackets() function.

**PxeReply**  
Cached PXE Reply packet. This field is zero-filled by the Start() function, and is set when the Discover() function completes successfully. The contents of this field can be replaced by the SetPackets() function.

**PxeBisReply**  
Cached PXE BIS Reply packet. This field is zero-filled by the Start() function, and is set when the Discover() function completes successfully. This field can be replaced by the SetPackets() function.

**IpFilter**  
The current IP receive filter settings. The receive filter is disabled and the number of IP receive filters is set to zero by the Start() function, and is set by the SetIpFilter() function.

**ArpCacheEntries**  
The number of valid entries in the ARP cache. This field is reset to zero by the Start() function.

**ArpCache**  
Array of cached ARP entries.

**RouteTableEntries**  
The number of valid entries in the current route table. This field is reset to zero by the Start() function.

**RouteTable**  
Array of route table entries.

**IcmpError**  
ICMP error packet. This field is updated when an ICMP error is received and is undefined until the first ICMP error is received. This field is zero-filled by the Start() function.

**TftpError**  
TFTP error packet. This field is updated when a TFTP error is received and is undefined until the first TFTP error is received. This field is zero-filled by the Start() function.
//EFI_PXE_BASE_CODE_UDP_PORT
//******************************************************************************
typedef UINT16 EFI_PXE_BASE_CODE_UDP_PORT;

//EFI_IPv4_ADDRESS and EFI_IPv6_ADDRESS
//******************************************************************************
typedef struct {
    UINT8 Addr[4];
} EFI_IPv4_ADDRESS;

typedef struct {
    UINT8 Addr[16];
} EFI_IPv6_ADDRESS;

//EFI_IP_ADDRESS
//******************************************************************************
typedef union {
    UINT32 Addr[4];
    EFI_IPv4_ADDRESS v4;
    EFI_IPv6_ADDRESS v6;
} EFI_IP_ADDRESS;

//EFI_MAC_ADDRESS
//******************************************************************************
typedef struct {
    UINT8 Addr[32];
} EFI_MAC_ADDRESS;

**DHCP Packet Data Types**
This section defines the data types for DHCP packets, ICMP error packets, and TFTP error packets. All of these are byte-packed data structures.

**Note:** *All the multibyte fields in these structures are stored in network order.*
typedef struct {
    UINT8    BootpOpcode;
    UINT8    BootpHwType;
    UINT8    BootpHwAddrLen;
    UINT8    BootpGateHops;
    UINT32   BootpIdent;
    UINT16   BootpSeconds;
    UINT16   BootpFlags;
    UINT8    BootpCiAddr[4];
    UINT8    BootpYiAddr[4];
    UINT8    BootpSiAddr[4];
    UINT8    BootpGiAddr[4];
    UINT8    BootpHwAddr[16];
    UINT8    BootpSrvName[64];
    UINT8    BootpBootFile[128];
    UINT32   DhcpMagik;
    UINT8    DhcpOptions[56];
} EFI_PXE_BASE_CODE_DHCPV4_PACKET;

typedef struct {
    UINT32   MessageType:8;
    UINT32   TransactionId:24;
    UINT8    DhcpOptions[1024];
} EFI_PXE_BASE_CODE_DHCPV6_PACKET;

typedef union {
    UINT8    Raw[1472];
    EFI_PXE_BASE_CODE_DHCPV4_PACKET Dhcpv4;
    EFI_PXE_BASE_CODE_DHCPV6_PACKET Dhcpv6;
} EFI_PXE_BASE_CODE_PACKET;

typedef struct {
    UINT8    Type;
    UINT8    Code;
} EFI_PXE_BASE_CODE_ICMP_ERROR;
IP Receive Filter Settings
This section defines the data types for IP receive filter settings.

```c
#define EFI_PXE_BASE_CODE_MAX_IPCNT

//*******************************************************
// EFI_PXE_BASE_CODE_IP_FILTER
//*******************************************************
typedef struct {
    UINT8     Filters;
    UINT8     IpCnt;
    UINT16    reserved;
    EFI_IP_ADDRESS IpList[EFI_PXE_BASE_CODE_MAX_IPCNT];
} EFI_PXE_BASE_CODE_IP_FILTER;

#define EFI_PXE_BASE_CODE_IP_FILTER_STATION_IP            0x0001
#define EFI_PXE_BASE_CODE_IP_FILTER_BROADCAST             0x0002
#define EFI_PXE_BASE_CODE_IP_FILTER_PROMISCUOUS           0x0004
#define EFI_PXE_BASE_CODE_IP_FILTER_PROMISCUOUS_MULTICAST 0x0008
```

ARP Cache Entries
This section defines the data types for ARP cache entries, and route table entries.
typedef struct {
  EFI_IP_ADDRESS  IpAddr;
  EFI_MAC_ADDRESS MacAddr;
} EFI_PXE_BASE_CODE_ARP_ENTRY;

typedef struct {
  EFI_IP_ADDRESS  IpAddr;
  EFI_IP_ADDRESS  SubnetMask;
  EFI_IP_ADDRESS  GwAddr;
} EFI_PXE_BASE_CODE_ROUTE_ENTRY;

Filter Operations for UDP Read/Write Functions
This section defines the types of filter operations that can be used with the UdpRead() and UdpWrite() functions.

#define EFI_PXE_BASE_CODE_UDP_OPFLAGS_ANY_SRC_IP    0x0001
#define EFI_PXE_BASE_CODE_UDP_OPFLAGS_ANY_SRC_PORT  0x0002
#define EFI_PXE_BASE_CODE_UDP_OPFLAGS_ANY_DEST_IP   0x0004
#define EFI_PXE_BASE_CODE_UDP_OPFLAGS_ANY_DEST_PORT 0x0008
#define EFI_PXE_BASE_CODE_UDP_OPFLAGS_USE_FILTER    0x0010
#define EFI_PXE_BASE_CODE_UDP_OPFLAGS_MAY_FRAGMENT  0x0020
#define DEFAULT_TTL                                 16
#define DEFAULT_ToS                                 0

The following table defines values for the PXE DHCP and Bootserver Discover packet tags that are specific to the UEFI environment.  Complete definitions of all PXE tags are defined in Table 24-1 “PXE DHCP Options (Full List),” in the PXE Specification.

Table 24-1 PXE Tag Definitions for EFI

</tr>
</tbody>
</table>
Description

The basic mechanisms and flow for remote booting in UEFI are identical to the remote boot functionality described in detail in the PXE Specification. However, the actual execution environment, linkage, and calling conventions are replaced and enhanced for the UEFI environment.

The DHCP Option for the Client System Architecture is used to inform the DHCP server if the client is a UEFI environment in supported systems. The server may use this information to provide default images if it does not have a specific boot profile for the client.

The DHCP Option for Client Network Interface Identifier is used to inform the DHCP server of the client underlying network interface information. If the NII protocol is present, such information will be acquired by this protocol. Otherwise, Type = 0x01, MajorVer=0x03, MinorVer=0x00 will be the default value.

A handle that supports EFI_PXE_BASE_CODE_PROTOCOL is required to support EFI_LOAD_FILE_PROTOCOL. The EFI_LOAD_FILE_PROTOCOL function LoadFile() is used by the firmware to load files from devices that do not support file system type accesses. Specifically, the firmware’s boot manager invokes LoadFile() with BootPolicy being TRUE when attempting to boot from the device. The firmware then loads and transfers control to the downloaded PXE boot image. Once the remote image is successfully loaded, it may utilize the EFI_PXE_BASE_CODE_PROTOCOL interfaces, or even the EFI_SIMPLE_NETWORK_PROTOCOL interfaces, to continue the remote process.

EFI_PXE_BASE_CODE_PROTOCOL.Start()

Summary

Enables the use of the PXE Base Code Protocol functions.
Prototype

typedef
EFI_STATUS
(EIFIAPI *EFI_PXE_BASE_CODE_START) (  
  IN EFI_PXE_BASE_CODE_PROTOCOL *This,
  IN BOOLEAN UseIpv6
);

Parameters

This Pointer to the EFI_PXE_BASE_CODE_PROTOCOL instance.

UseIpv6 Specifies the type of IP addresses that are to be used during the session that is being started. Set to TRUE for IPv6 addresses, and FALSE for IPv4 addresses.

Description

This function enables the use of the PXE Base Code Protocol functions. If the Started field of the EFI_PXE_BASE_CODE_MODE structure is already TRUE, then EFI_ALREADY_STARTED will be returned. If UseIpv6 is TRUE, then IPv6 formatted addresses will be used in this session. If UseIpv6 is FALSE, then IPv4 formatted addresses will be used in this session. If UseIpv6 is TRUE, and theIpv6Supported field of the EFI_PXE_BASE_CODE_MODE structure is FALSE, then EFI_UNSUPPORTED will be returned. If there is not enough memory or other resources to start the PXE Base Code Protocol, then EFI_OUT_OF_RESOURCES will be returned. Otherwise, the PXE Base Code Protocol will be started, and all of the fields of the EFI_PXE_BASE_CODE_MODE structure will be initialized as follows:

- Started Set to TRUE.
- Ipv6Supported Unchanged.
- Ipv6Available Unchanged.
- UsingIpv6 Set to UseIpv6.
- BisSupported Unchanged.
- BisDetected Unchanged.
- AutoArp Set to TRUE.
- SendGUID Set to FALSE.
- TTL Set to DEFAULT_TTL.
- ToS Set to DEFAULT_ToS.
- DhcpCompleted Set to FALSE.
- ProxyOfferReceived Set to FALSE.
- StationIp Set to an address of all zeros.
- SubnetMask Set to a subnet mask of all zeros.
- DhcpDiscover Zero-filled.
- DhcpAck Zero-filled.
- ProxyOffer Zero-filled.
- PxeDiscoverValid Set to FALSE.
- PxeDiscover Zero-filled.
PxeReplyValid Set to FALSE.
PxeReply Zero-filled.
PxeBisReplyValid Set to FALSE.
PxeBisReply Zero-filled.
IpFilter Set the Filters field to 0 and the IpCnt field to 0.
ArpCacheEntries Set to 0.
ArpCache Zero-filled.
RouteTableEntries Set to 0.
RouteTable Zero-filled.
IcmpErrorReceived Set to FALSE.
IcmpError Zero-filled.
TftpErroReceived Set to FALSE.
TftpError Zero-filled.
MakeCallbacks Set to TRUE if the PXE Base Code Callback Protocol is available. Set to FALSE if the PXE Base Code Callback Protocol is not available.

EFI_PXE_BASE_CODE_PROTOCOL.Stop()

Summary
Disables the use of the PXE Base Code Protocol functions.

Prototype
typedef
   EFI_STATUS
   (EFIAPI *EFI_PXE_BASE_CODE_STOP)(
       IN EFI_PXE_BASE_CODE_PROTOCOL  *This
   );

Parameters
This Pointer to the EFI_PXE_BASE_CODE_PROTOCOL instance.
Description
This function stops all activity on the network device. All the resources allocated in `Start()` are released, the `Started` field of the `EFI_PXE_BASE_CODE_MODE` structure is set to `FALSE` and `EFI_SUCCESS` is returned. If the `Started` field of the `EFI_PXE_BASE_CODE_MODE` structure is already `FALSE`, then `EFI_NOT_STARTED` will be returned.

Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The PXE Base Code Protocol was stopped.</td>
</tr>
<tr>
<td>EFI_NOT_STARTED</td>
<td>The PXE Base Code Protocol is already in the stopped state.</td>

</tr>
</tbody>
</table>

**EFI_PXE_BASE_CODE_PROTOCOL.Dhcp()**

Summary
Attempts to complete a DHCPv4 D.O.R.A. (discover / offer / request / acknowledge) or DHCPv6 S.A.R.R (solicit / advertise / request / reply) sequence.

Prototype
```c
typedef EFI_STATUS
    (EFIAPI *EFI_PXE_BASE_CODE_DHCP) ( IN EFI_PXE_BASE_CODE_PROTOCOL  *This,
                                            IN BOOLEAN SortOffers           );
```

Parameters
- **This** Pointer to the `EFI_PXE_BASE_CODE_PROTOCOL` instance.
- **SortOffers** `TRUE` if the offers received should be sorted. Set to `FALSE` to try the offers in the order that they are received.

Description
This function attempts to complete the DHCP sequence. If this sequence is completed, then `EFI_SUCCESS` is returned, and the `DhcpCompleted, ProxyOfferReceived, StationIp, SubnetMask, DhcpDiscover, DhcpAck,` and `ProxyOffer` fields of the `EFI_PXE_BASE_CODE_MODE` structure are filled in.

If `SortOffers` is `TRUE`, then the cached DHCP offer packets will be sorted before they are tried. If `SortOffers` is `FALSE`, then the cached DHCP offer packets will be tried in the order in which they are received. Please see the Preboot Execution Environment (PXE) Specification for additional details on the implementation of DHCP.

This function can take at least 31 seconds to timeout and return control to the caller. If the DHCP sequence does not complete, then `EFI_TIMEOUT` will be returned.
If the Callback Protocol does not return `EFI_PXE_BASE_CODE_CALLBACK_STATUS_CONTINUE`, then the DHCP sequence will be stopped and `EFI_ABORTED` will be returned.

### `EFI_PXE_BASE_CODE_PROTOCOL.Discover()`

#### Summary

Attempts to complete the PXE Boot Server and/or boot image discovery sequence.

#### Prototype

```c
typedef EFI_STATUS
(EFIAPI *EFI_PXE_BASE_CODE_DISCOVER) (  
    IN EFI_PXE_BASE_CODE_PROTOCOL This,  
    IN UINT16 Type,  
    IN UINT16 *Layer,  
    IN BOOLEAN UseBis,  
    IN EFI_PXE_BASE_CODE_DISCOVER_INFO *Info OPTIONAL  
);  
```

#### Parameters

- **This**
  - Pointer to the `EFI_PXE_BASE_CODE_PROTOCOL` instance.
- **Type**
  - The type of bootstrap to perform. See “Related Definitions” below.
- **Layer**
  - Pointer to the boot server layer number to discover, which must be `PXE_BOOT_LAYER_INITIAL` when a new server type is being discovered. This is the only layer type that will perform multicast and broadcast discovery. All other layer types will only perform unicast discovery. If the boot server changes `Layer`, then the new `Layer` will be returned.
- **UseBis**
  - `TRUE` if Boot Integrity Services are to be used. `FALSE` otherwise.
Info

Pointer to a data structure that contains additional information on the type of discovery operation that is to be performed. If this field is NULL, then the contents of the cached DhcpAck and ProxyOffer packets will be used.

// Values 65280 through 65534 are reserved.
//
#define EFI_PXE_BASE_CODE_BOOT_TYPE_PXETEST 65535

#define EFI_PXE_BASE_CODE_BOOT_LAYER_MASK    0x7FFF
#define EFI_PXE_BASE_CODE_BOOT_LAYER_INITIAL 0x0000

//*******************************************************
// EFI_PXE_BASE_CODE_DISCOVER_INFO
//*******************************************************
typedef struct {
    BOOLEAN UseMCast;
    BOOLEAN UseBCast;
    BOOLEAN UseUCast;
    BOOLEAN MustUseList;
    EFI_IP_ADDRESS ServerMCastIp;
    UINT16 IpCnt;
} DiscoverInfo;
typedef struct {
    UINT16 Type;
    BOOLEAN AcceptAnyResponse;
    UINT8 reserved;
    EFI_IP_ADDRESS IpAddr;
} EFI_PXE_BASE_CODE_SRVLIST;

Description

This function attempts to complete the PXE Boot Server and/or boot image discovery sequence. If this sequence is completed, then EFI_SUCCESS is returned, and the PxeDiscoverValid, PxeDiscover, PxeReplyReceived, and PxeReply fields of the EFI_PXE_BASE_CODE_MODE structure are filled in. If UseBis is TRUE, then the PxeBisReplyReceived and PxeBisReply fields of the EFI_PXE_BASE_CODE_MODE structure will also be filled in. If UseBis is FALSE, then PxeBisReplyValid will be set to FALSE.

In the structure referenced by parameter Info, the PXE Boot Server list, SrvList[], has two uses: It is the Boot Server IP address list used for unicast discovery (if the UseUCast field is TRUE), and it is the list used for Boot Server verification (if the MustUseList field is TRUE). Also, if the MustUseList field in that structure is TRUE and the AcceptAnyResponse field in the SrvList[] array is TRUE, any Boot Server reply of that type will be accepted. If the AcceptAnyResponse field is FALSE, only responses from Boot Servers with matching IP addresses will be accepted.

This function can take at least 10 seconds to timeout and return control to the caller. If the Discovery sequence does not complete, then EFI_TIMEOUT will be returned. Please see the Preboot Execution Environment (PXE) Specification for additional details on the implementation of the Discovery sequence.

If the Callback Protocol does not return EFI_PXE_BASE_CODE_CALLBACK_STATUS_CONTINUE, then the Discovery sequence is stopped and EFI_ABORTED will be returned.

### EFI_PXE_BASE_CODE_PROTOCOL.Mtftp() Summary

Used to perform TFTP and MTFTP services.

### Prototype

```c
typedef
  EFI_STATUS
  (EFIAPI *EFI_PXE_BASE_CODE_MTFTP) (
    IN EFI_PXE_BASE_CODE_PROTOCOL *This,
    IN EFI_PXE_BASE_CODE_TFTP_OPCODE Operation,
    IN OUT VOID *BufferPtr, OPTIONAL
    IN BOOLEAN Overwrite,
    IN OUT UINT64 *BufferSize,
    IN UINTN *BlockSize, OPTIONAL
    IN EFI_IP_ADDRESS *ServerIp,
    IN CHAR8 *Filename, OPTIONAL
    IN EFI_PXE_BASE_CODE_MTFTP_INFO *Info, OPTIONAL
    IN BOOLEAN DontUseBuffer
  );
```
Parameters

This
- Pointer to the **EFI_PXE_BASE_CODE_PROTOCOL** instance.

Operation
- The type of operation to perform. See “Related Definitions” below for the list of operation types.

BufferPtr
- A pointer to the data buffer. Ignored for read file if **DontUseBuffer** is **TRUE**.

Overwrite
- Only used on write file operations. **TRUE** if a file on a remote server can be overwritten.

BufferSize
- For get-file-size operations, **BufferSize** returns the size of the requested file. For read-file and write-file operations, this parameter is set to the size of the buffer specified by the **BufferPtr** parameter. For read-file operations, if **EFI_BUFFER_TOO_SMALL** is returned, **BufferSize** returns the size of the requested file.

BlockSize
- The requested block size to be used during a TFTP transfer. This must be at least 512. If this field is **NULL**, then the largest block size supported by the implementation will be used.

ServerIp
- The TFTP / MTFTP server IP address.

Filename
- A Null-terminated ASCII string that specifies a directory name or a file name. This is ignored by MTFTP read directory.

Info
- Pointer to the MTFTP information. This information is required to start or join a multicast TFTP session. It is also required to perform the “get file size” and “read directory” operations of MTFTP. See “Related Definitions” below for the description of this data structure.

DontUseBuffer
- Set to **FALSE** for normal TFTP and MTFTP read file operation. Setting this to **TRUE** will cause TFTP and MTFTP read file operations to function without a receive buffer, and all of the received packets are passed to the Callback Protocol which is responsible for storing them. This field is only used by TFTP and MTFTP read file.
Related Definitions

```c
//***********************************************************************
// EFI_PXE_BASE_CODE_TFTP_OPCODE
//***********************************************************************
typedef enum {
  EFI_PXE_BASE_CODE_TFTP_FIRST,
  EFI_PXE_BASE_CODE_TFTP_GET_FILE_SIZE,
  EFI_PXE_BASE_CODE_TFTP_READ_FILE,
  EFI_PXE_BASE_CODE_TFTP_WRITE_FILE,

  EFI_PXE_BASE_CODE_MTFTP_READ_FILE,
  EFI_PXE_BASE_CODE_MTFTP_READ_DIRECTORY,
  EFI_PXE_BASE_CODE_MTFTP_LAST
} EFI_PXE_BASE_CODE_TFTP_OPCODE;
```

```c
//***********************************************************************
// EFI_PXE_BASE_CODE_MTFTP_INFO
//***********************************************************************
typedef struct {
  EFI_IP_ADDRESS MCastIp;
  EFI_PXE_BASE_CODE_UDP_PORT CPort;
  EFI_PXE_BASE_CODE_UDP_PORT SPort;
  UINT16 ListenTimeout;
  UINT16 TransmitTimeout;
} EFI_PXE_BASE_CODE_MTFTP_INFO;
```

**MCastIp**  
File multicast IP address. This is the IP address to which the server will send the requested file.

**CPort**  
Client multicast listening port. This is the UDP port to which the server will send the requested file.

**SPort**  
Server multicast listening port. This is the UDP port on which the server listens for multicast open requests and data acks.

**ListenTimeout**  
The number of seconds a client should listen for an active multicast session before requesting a new multicast session.

**TransmitTimeout**  
The number of seconds a client should wait for a packet from the server before retransmitting the previous open request or data ack packet.

**Description**

This function is used to perform TFTP and MTFTP services. This includes the TFTP operations to get the size of a file, read a directory, read a file, and write a file. It also includes the MTFTP operations to get the size of a file, read a directory, and read a file. The type of operation is specified by **Operation**. If the callback function that is invoked during the TFTP/MTFTP operation does not return **EFI_PXE_BASE_CODE_CALLBACK_STATUS_CONTINUE**, then **EFI_ABORTED** will be returned.
For read operations, the return data will be placed in the buffer specified by `BufferPtr`. If `BufferSize` is too small to contain the entire downloaded file, then `EFI_BUFFER_TOO_SMALL` will be returned and `BufferSize` will be set to zero or the size of the requested file (the size of the requested file is only returned if the TFTP server supports TFTP options). If `BufferSize` is large enough for the read operation, then `BufferSize` will be set to the size of the downloaded file, and `EFI_SUCCESS` will be returned. Applications using the `PxeBc.Mtftp()` services should use the get-file-size operations to determine the size of the downloaded file prior to using the read-file operations—especially when downloading large (greater than 64 MiB) files—instead of making two calls to the read-file operation. Following this recommendation will save time if the file is larger than expected and the TFTP server does not support TFTP option extensions. Without TFTP option extension support, the client has to download the entire file, counting and discarding the received packets, to determine the file size.

For write operations, the data to be sent is in the buffer specified by `BufferPtr`. `BufferSize` specifies the number of bytes to send. If the write operation completes successfully, then `EFI_SUCCESS` will be returned.

For TFTP “get file size” operations, the size of the requested file or directory is returned in `BufferSize`, and `EFI_SUCCESS` will be returned. If the TFTP server does not support options, the file will be downloaded into a bit bucket and the length of the downloaded file will be returned. For MTFTP “get file size” operations, if the MTFTP server does not support the “get file size” option, `EFI_UNSUPPORTED` will be returned.

This function can take up to 10 seconds to timeout and return control to the caller. If the TFTP sequence does not complete, `EFI_TIMEOUT` will be returned.

If the Callback Protocol does not return `EFI_PXE_BASE_CODE_CALLBACK_STATUS_CONTINUE`, then the TFTP sequence is stopped and `EFI_ABORTED` will be returned.

The format of the data returned from a TFTP read directory operation is a null-terminated filename followed by a null-terminated information string, of the form “size year-month-day hour:minute:second” (i.e., %d %d-%d-%d %d:%d:%f - note that the seconds field can be a decimal number), where the date and time are UTC. For an MTFTP read directory command, there is additionally a null-terminated multicast IP address preceding the filename of the form %d.%d.%d.%d for IP v4. The final entry is itself null-terminated, so that the final information string is terminated with two null octets.
## Status Codes Returned

</tr>
</tbody>
</table>
| EFI_INVALID_PARAMETER | One or more of the following conditions was **TRUE:**  
- The `This` parameter was **NULL**  
- The `This` parameter did not point to a valid `EFI_PXE_BASE_CODE_PROTOCOL` structure  
- The Operation parameter was not one of the listed `EFI_PXE_BASE_CODE_TFTP_OPCODE` constants  
- The `BufferPtr` parameter was **NULL** and the `DontUseBuffer` parameter was **FALSE**  
- The `BufferSize` parameter was **NULL**  
- The `BlockSize` parameter was not **NULL** and `*BlockSize` was less than 512  
- The ServerIp parameter was **NULL** or did not contain a valid unicast IP address  
- The Filename parameter was **NULL** for a file transfer or information request  
- The `Info` parameter was **NULL** for a multicast request  
- The `Info->MCastIp` parameter is not a valid multicast IP address |
| EFI_DEVICE_ERROR | The network device encountered an error during this operation. |
| EFI_BUFFER_TOO_SMALL | The buffer is not large enough to complete the read operation. |
| EFI_ABORTED      | The callback function aborted the TFTP/MTFTP operation. |
| EFI_TIMEOUT      | The TFTP/MTFTP operation timed out. |
| EFI_TFTP_ERROR   | A TFTP error packet was received during the MTFTP session. The TFTP error packet has been cached in the `EFI_PXE_BASE_CODE_MODE.TftpError` packet structure. Information about TFTP error packet contents can be found in RFC 1350. |
| EFI_ICMP_ERROR   | An ICMP error packet was received during the MTFTP session. The ICMP error packet has been cached in the `EFI_PXE_BASE_CODE_MODE.IcmpError` packet structure. Information about ICMP packet contents can be found in RFC 792. |

### EFI_PXE_BASE_CODE_PROTOCOL.UdpWrite()

**Summary**

 Writes a UDP packet to the network interface.
Prototype

typedef
EFI_STATUS
(EIFIAPIC*EFI_PXE_BASE_CODE_UDP_WRITE)
(
    IN EFI_PXE_BASE_CODE_PROTOCOL *This,
    IN UINT16 OpFlags,
    IN EFI_IP_ADDRESS *DestIp,
    IN EFI_PXE_BASE_CODE_UDP_PORT *DestPort,
    IN EFI_IP_ADDRESS *GatewayIp,
    OPTIONAL IN EFI_IP_ADDRESS *SrcIp,
    OPTIONAL IN OUT EFI_PXE_BASE_CODE_UDP_PORT *SrcPort,
    OPTIONAL IN UINTN *HeaderSize,
    OPTIONAL IN VOID *HeaderPtr,
    OPTIONAL IN UINTN *BufferSize,
    IN VOID *BufferPtr
);

Parameters

This Pointer to the EFI_PXE_BASE_CODE_PROTOCOL instance.
OpFlags The UDP operation flags. If MAY_FRAGMENT is set, then if required, this UDP write operation may be broken up across multiple packets.
DestIp The destination IP address.
DestPort The destination UDP port number.
GatewayIp The gateway IP address. If DestIp is not in the same subnet as StationIp, then this gateway IP address will be used. If this field is NULL, and the DestIp is not in the same subnet as StationIp, then the RouteTable will be used.
SrcIp The source IP address. If this field is NULL, then StationIp will be used as the source IP address.
SrcPort The source UDP port number. If OpFlags has ANY_SRC_PORT set or SrcPort is NULL, then a source UDP port will be automatically selected. If a source UDP port was automatically selected, and SrcPort is not NULL, then it will be returned in SrcPort.
HeaderSize An optional field which may be set to the length of a header at HeaderPtr to be prefixed to the data at BufferPtr.
HeaderPtr If HeaderSize is not NULL, a pointer to a header to be prefixed to the data at BufferPtr.
BufferSize A pointer to the size of the data at BufferPtr.
BufferPtr A pointer to the data to be written.

Description

This function writes a UDP packet specified by the (optional HeaderPtr and) BufferPtr parameters to the network interface. The UDP header is automatically built by this routine. It uses the parameters OpFlags, DestIp, DestPort, GatewayIp, SrcIp, and SrcPort to build this header. If the packet is successfully built and transmitted through the network interface, then EFI_SUCCESS will be returned. If a
timeout occurs during the transmission of the packet, then \texttt{EFI_TIMEOUT} will be returned. If an ICMP
error occurs during the transmission of the packet, then the \texttt{IcmpErrorReceived} field is set to \texttt{TRUE},
the \texttt{IcmpError} field is filled in and \texttt{EFI_ICMP_ERROR} will be returned. If the Callback Protocol does not
return \texttt{EFI_PXE_BASE_CODE_CALLBACK_STATUS_CONTINUE}, then \texttt{EFI_ABORTED} will be returned.

</tbody>
</table>

**

\texttt{EFI_PXE_BASE_CODE_PROTOCOL.UdpRead()}**

**Summary**

Reads a UDP packet from the network interface.
Prototype

```c
typedef
EFI_STATUS
(EFIAPI *EFI_PXE_BASE_CODE_UDP_READ) (  
    IN EFI_PXE_BASE_CODE_PROTOCOL *This,  
    IN UINT16 OpFlags,  
    IN OUT EFI_IP_ADDRESS *DestIp,  
    IN OUT EFI_IP_ADDRESS *SrcIp,  
    OPTIONAL IN OUT EFI_PXE_BASE_CODE_UDP_PORT *DestPort,  
    OPTIONAL IN OUT EFI_PXE_BASE_CODE_UDP_PORT *SrcPort,  
    OPTIONAL IN UINTN *HeaderSize,  
    OPTIONAL IN VOID *HeaderPtr,  
    OPTIONAL IN VOID *BufferPtr,  
    IN OUT UINTN *BufferSize,  
    IN VOID *BufferPtr  
);
```

Parameters

- **This**: Pointer to the `EFI_PXE_BASE_CODE_PROTOCOL` instance.
- **OpFlags**: The UDP operation flags.
- **DestIp**: The destination IP address.
- **DestPort**: The destination UDP port number.
- **SrcIp**: The source IP address.
- **SrcPort**: The source UDP port number.
- **HeaderSize**: An optional field which may be set to the length of a header to be put in `HeaderPtr`.
- **HeaderPtr**: If `HeaderSize` is not `NULL`, a pointer to a buffer to hold the `HeaderSize` bytes which follow the UDP header.
- **BufferSize**: On input, a pointer to the size of the buffer at `BufferPtr`. On output, the size of the data written to `BufferPtr`.
- **BufferPtr**: A pointer to the data to be read.

Description

This function reads a UDP packet from a network interface. The data contents are returned in (the optional `HeaderPtr` and) `BufferPtr`, and the size of the buffer received is returned in `BufferSize`. If the input `BufferSize` is smaller than the UDP packet received (less optional `HeaderSize`), it will be set to the required size, and `EFI_BUFFER_TOO_SMALL` will be returned. In this case, the contents of `BufferPtr` are undefined, and the packet is lost. If a UDP packet is successfully received, then `EFI_SUCCESS` will be returned, and the information from the UDP header will be returned in `DestIp`, `DestPort`, `SrcIp`, and `SrcPort` if they are not `NULL`. Depending on the values of `OpFlags` and the `DestIp`, `DestPort`, `SrcIp`, and `SrcPort` input values, different types of UDP packet receive filtering will be performed. The following tables summarize these receive filter operations.
### Table 24-2 Destination IP Filter Operation

<table>
<thead>
<tr>
<th>OpFlags</th>
<th>OpFlags</th>
<th>DestIp</th>
<th>Action</th>

### EFI_PXE_BASE_CODE_PROTOCOL.SetIpFilter()

**Summary**

Updates the IP receive filters of a network device and enables software filtering.

**Prototype**

```c
typedef EFI_STATUS (EFIAPI *EFI_PXE_BASE_CODE_SET_IP_FILTER) (    
    IN EFI_PXE_BASE_CODE_PROTOCOL *This,                        
    IN EFI_PXE_BASE_CODE_IP_FILTER *NewFilter                  
);
```

**Parameters**

- **This**: Pointer to the **EFI_PXE_BASE_CODE_PROTOCOL** instance.
NewFilter

Pointer to the new set of IP receive filters.

Description
The **NewFilter** field is used to modify the network device’s current IP receive filter settings and to enable a software filter. This function updates the **IpFilter** field of the **EFI_PXE_BASE_CODE_MODE** structure with the contents of **NewIpFilter**. The software filter is used when the **USE_FILTER** in **OpFlags** is set to **UdpRead()**. The current hardware filter remains in effect no matter what the settings of **OpFlags** are, so that the meaning of **ANY_DEST_IP** set in **OpFlags** to **UdpRead()** is from those packets whose reception is enabled in hardware – physical NIC address (unicast), broadcast address, logical address or addresses (multicast), or all (promiscuous). **UdpRead()** does not modify the IP filter settings. **Dhcp()**, **Discover()**, and **Mtftp()** set the IP filter, and return with the IP receive filter list emptied and the filter set to **EFI_PXE_BASE_CODE_IP_FILTER_STATION_IP**. If an application or driver wishes to preserve the IP receive filter settings before these calls, and use **SetIpFilter()** to restore them after the calls. If incompatible filtering is requested (for example, **PROMISCUOUS** with anything else) or if the device does not support a requested filter setting and it cannot be accommodated in software (for example, **PROMISCUOUS** not supported), **EFI_INVALID_PARAMETER** will be returned. The **IPlist** field is used to enable IPs other than the **StationIP**. They may be multicast or unicast. If **IPcnt** is set as well as **EFI_PXE_BASE_CODE_IP_FILTER_STATION_IP**, then both the **StationIP** and the IPs from the **IPlist** will be used.

Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>EFI_SUCCESS</strong></td>
<td>The IP receive filter settings were updated.</td>
</tr>
</tbody>
</table>
| **EFI_INVALID_PARAMETER** | - One or more of the following conditions was **TRUE**:  
    - The **This** parameter was **NULL**  
    - The **This** parameter did not point to a valid **EFI_PXE_BASE_CODE_PROTOCOL** structure  
    - The **NewFilter** parameter was **NULL**  
    - The **NewFilter**-> **IPlist** [] array contains one or more broadcast IP addresses |
| **EFI_NOT_STARTED** | The PXE Base Code Protocol is not in the started state. |

**EFI_PXE_BASE_CODE_PROTOCOL.Arp()**

Summary
Uses the ARP protocol to resolve a MAC address.
Prototype

```c
Prototype

typedef
EFI_STATUS
(EIFIAPI *EFI_PXE_BASE_CODE_ARP) (
    IN EFI_PXE_BASE_CODE_PROTOCOL *This,
    IN EFI_IP_ADDRESS *IpAddr,
    IN EFI_MAC_ADDRESS *MacAddr
);
```

Parameters

- **This**: Pointer to the EFI_PXE_BASE_CODE_PROTOCOL instance.
- **IpAddr**: Pointer to the IP address that is used to resolve a MAC address. When the MAC address is resolved, the ArpCacheEntries and ArpCache fields of the EFI_PXE_BASE_CODE_MODE structure are updated.
- **MacAddr**: If not NULL, a pointer to the MAC address that was resolved with the ARP protocol.

Description

This function uses the ARP protocol to resolve a MAC address. The UsingIpv6 field of the EFI_PXE_BASE_CODE_MODE structure is used to determine if IPv4 or IPv6 addresses are being used. The IP address specified by IpAddr is used to resolve a MAC address in the case of IPv4; the concept of Arp is not supported in IPv6, though.

If the ARP protocol succeeds in resolving the specified address, then the ArpCacheEntries and ArpCache fields of the EFI_PXE_BASE_CODE_MODE structure are updated, and EFI_SUCCESS is returned. If MacAddr is not NULL, the resolved MAC address is placed there as well.

If the PXE Base Code protocol is in the stopped state, then EFI_NOT_STARTED is returned. If the ARP protocol encounters a timeout condition while attempting to resolve an address, then EFI_TIMEOUT is returned. If the Callback Protocol does not return EFI_PXE_BASE_CODE_CALLBACK_STATUS_CONTINUE, then EFI_ABORTED is returned.

Status Codes Returned

</tbody>
</table>
**EFI_PXE_BASE_CODE_PROTOCOL.SetParameters()**

**Summary**
Updates the parameters that affect the operation of the PXE Base Code Protocol.

**Prototype**
```c
typedef EFI_STATUS
  (EFIAPIC void EFI_PXE_BASE_CODE_SET_PARAMETERS)
  (IN EFI_PXE_BASE_CODE_PROTOCOL *This,
   IN BOOLEAN *NewAutoArp,  OPTIONAL
   IN BOOLEAN *NewSendGUID,  OPTIONAL
   IN UINT8 *NewTTL,  OPTIONAL
   IN UINT8 *NewToS,  OPTIONAL
   IN BOOLEAN *NewMakeCallback OPTIONAL);
```

**Parameters**
- **This**
  Pointer to the EFI_PXE_BASE_CODE_PROTOCOL instance.
- **NewAutoArp**
  If not NULL, a pointer to a value that specifies whether to replace the current value of AutoARP. If TRUE, ARP packets will be generated as required by the PXE Base Code Protocol. If FALSE, no ARP packets will be generated. In this case, the only mappings that are available are those stored in the ArpCache of the EFI_PXE_BASE_CODE_MODE structure. If there are not enough mappings in the ArpCache to perform a PXE Base Code Protocol service, then the

**Description**
This function sets parameters that affect the operation of the PXE Base Code Protocol. The parameter specified by NewAutoArp is used to control the generation of ARP protocol packets. If NewAutoArp is TRUE, ARP Protocol packets will be generated as required by the PXE Base Code Protocol. If NewAutoArp is FALSE, no ARP Protocol packets will be generated. In this case, the only mappings that are available are those stored in the ArpCache of the EFI_PXE_BASE_CODE_MODE structure. If there are not enough mappings in the ArpCache to perform a PXE Base Code Protocol service, then the
service will fail. This function updates the `AutoArp` field of the `EFI_PXE_BASE_CODE_MODE` structure to `NewAutoArp`.

The `SetParameters()` call must be invoked after a Callback Protocol is installed to enable the use of callbacks.

### Status Codes Returned

### `EFI_PXE_BASE_CODE_PROTOCOL.SetStationIp()`

**Summary**

Updates the station IP address and/or subnet mask values of a network device.

**Prototype**

```c
typedef EFI_STATUS
    (EFIAPI *EFI_PXE_BASE_CODE_SET_STATION_IP) (    
        IN EFI_PXE_BASE_CODE_PROTOCOL *This,
        IN EFI_IP_ADDRESS *NewStationIp,   OPTIONAL
        IN EFI_IP_ADDRESS *NewSubnetMask OPTIONAL
    );
```

**Parameters**

- **This**
  - Pointer to the `EFI_PXE_BASE_CODE_PROTOCOL` instance.
- **NewStationIp**
  - Pointer to the new IP address to be used by the network device. If this field is `NULL`, then the `StationIp` address will not be modified.
- **NewSubnetMask**
  - Pointer to the new subnet mask to be used by the network device. If this field is `NULL`, then the `SubnetMask` will not be modified.

**Description**

This function updates the station IP address and/or subnet mask values of a network device.
The `NewStationIp` field is used to modify the network device’s current IP address. If `NewStationIp` is `NULL`, then the current IP address will not be modified. Otherwise, this function updates the `StationIp` field of the `EFI_PXE_BASE_CODE_MODE` structure with `NewStationIp`.

The `NewSubnetMask` field is used to modify the network device’s current subnet mask. If `NewSubnetMask` is `NULL`, then the current subnet mask will not be modified. Otherwise, this function updates the `SubnetMask` field of the `EFI_PXE_BASE_CODE_MODE` structure with `NewSubnetMask`.

### EFI_PXE_BASE_CODE_PROTOCOL.SetPackets()

#### Summary

Updates the contents of the cached DHCP and Discover packets.

#### Prototype

```c
typedef
EFI_STATUS
(EFIAPI *EFI_PXE_BASE_CODE_SET_PACKETS) (
    IN EFI_PXE_BASE_CODE_PROTOCOL *This,
    IN BOOLEAN *NewDhcpDiscoverValid, OPTIONAL
    IN BOOLEAN *NewDhcpAckReceived, OPTIONAL
    IN BOOLEAN *NewProxyOfferReceived, OPTIONAL
    IN BOOLEAN *NewPxeDiscoverValid, OPTIONAL
    IN BOOLEAN *NewPxeReplyReceived, OPTIONAL
    IN BOOLEAN *NewPxeBisReplyReceived, OPTIONAL
    IN EFI_PXE_BASE_CODE_PACKET *NewDhcpDiscover, OPTIONAL
    IN EFI_PXE_BASE_CODE_PACKET *NewDhcpAck, OPTIONAL
    IN EFI_PXE_BASE_CODE_PACKET *NewProxyOffer, OPTIONAL
    IN EFI_PXE_BASE_CODE_PACKET *NewPxeDiscover, OPTIONAL
    IN EFI_PXE_BASE_CODE_PACKET *NewPxeReply, OPTIONAL
    IN EFI_PXE_BASE_CODE_PACKET *NewPxeBisReply OPTIONAL
);
```

#### Parameters

- **This**: Pointer to the `EFI_PXE_BASE_CODE_PROTOCOL` instance.
NewDhcpDiscoverValid: Pointer to a value that will replace the current DhcpDiscoverValid field. If NULL, this parameter is ignored.

NewDhcpAckReceived: Pointer to a value that will replace the current DhcpAckReceived field. If NULL, this parameter is ignored.

NewProxyOfferReceived: Pointer to a value that will replace the current ProxyOfferReceived field. If NULL, this parameter is ignored.

NewPxeDiscoverValid: Pointer to a value that will replace the current PxeDiscoverValid field. If NULL, this parameter is ignored.

NewPxeReplyReceived: Pointer to a value that will replace the current PxeReplyReceived field. If NULL, this parameter is ignored.

NewPxeBisReplyReceived: Pointer to a value that will replace the current PxeBisReplyReceived field. If NULL, this parameter is ignored.

NewDhcpDiscover: Pointer to the new cached DHCP Discover packet contents. If NULL, this parameter is ignored.

NewDhcpAck: Pointer to the new cached DHCP Ack packet contents. If NULL, this parameter is ignored.

NewProxyOffer: Pointer to the new cached Proxy Offer packet contents. If NULL, this parameter is ignored.

NewPxeDiscover: Pointer to the new cached PXE Discover packet contents. If NULL, this parameter is ignored.

NewPxeReply: Pointer to the new cached PXE Reply packet contents. If NULL, this parameter is ignored.

NewPxeBisReply: Pointer to the new cached PXE BIS Reply packet contents. If NULL, this parameter is ignored.

Description

The pointers to the new packets are used to update the contents of the cached packets in the EFI_PXE_BASE_CODE_MODE structure.

24.3.1 Netboot6

For IPv4, PXE drivers typically install a LoadFile protocol on the NIC handle. In the case of supporting both IPv4 and IPv6 where two PXE Base Code and LoadFile protocol instances need be produced, the PXE driver will have to create two child handles and install EFI_LOAD_FILE_PROTOCOL, EFI_SIMPLE_NETWORK_PROTOCOL and PXE_BASE_CODE_PROTOCOL on each child handle. To
distinguish these two child handles, an IP device path node can be appended to the parent device path, for example:

\[
PciRoot(0x0)/Pci(0x19,0x0)/MAC(001320F4B4FF,0x0)/IPv4(...) \ 
\]
\[
PciRoot(0x0)/Pci(0x19,0x0)/MAC(001320F4B4FF,0x0)/IPv6(...) \ 
\]

These two instances allow for the boot manager to decide a preference of IPv6 versus IPv4 since the IETF and other bodies do not speak to this policy choice.

### 24.3.1.1 DHCP6 options for PXE

In IPv4-based PXE, as defined by the rfc2131, rfc2132 and rfc4578, and described by the PXE2.1 specification and the UEFI specification, there are the following PXE related options/fields in DHCPv4 packet:

- siaddr field/ServerAddress option (54) – next server address.
- BootFileName option (67)
- ) – NBP file name.
- BootFileSize option (13)
- – NBP file size.
- ClassIdentifier (60)
- – PXE client tag.
- ClientSystemArchitectureType option (93)
- – client architecture type.
- ClientNetworkInterface Identifier option (94)
- – client network interface identifier.

In IPv6-based PXE, or ‘netboot6’, there are the following PXE related options in the DHCPv6 packet:

- BootFileURL option - OPT_BOOTFILE_URL (59) – next server address and NBP (Network Bootable Program) file name.
- BootFileParameters option
- - OPT_BOOTFILE_PARAM (60) – NBP file size.
- VendorClass option (16)
- – PXE client tag.
- ClientSystemArchitectureType option - OPTION_CLIENT_ARCH_TYPE (61) – client architecture type.
- ClientNetworkInterfaceIdentifier option (62) – client network interface identifier.

The BootFileURL option is used to deliver the next server address or the next server address with NBP file name.

As an example where the next server address delivered only:

As an example where the next server address and BOOTFILE_NAME delivered both:

The BootFileParameters option is used to deliver the NBP file size with the unit of 512-octet blocks. The maximum of the NBP file size is 65535 * 512 bytes.

As an example where the NBP file size is 1600 * 512 bytes:

\[
\begin{align*}
\text{para-len 1} & = 4 \\
\text{parameter 1} & = "1600"
\end{align*}
\]

The VendorClass option is used to deliver the PXE client tag.

As an example where the client architecture is EFI-X64 and the client network interface identifier is UNDI:

\[
\begin{align*}
\text{Enterprise-number} & = (343) \\
\text{Vendor-class-data} & = "\text{PXEClient:Arch:00006:UNDI:003016}"
\end{align*}
\]

#define DUID-UUID 4

The Netboot6 client will use the DUID-UUID to report the platform identifier as part of the netboot6 DHCP options.

**24.3.1.2 IPv6-based PXE boot**

As PXE 2.1 specification describes step-by-step synopsis of the IPv4-based PXE process, Figure 1 describes the corresponding synopsis for netboot6.
24.3.1.2.1 Step 1.

The client multicasts a SOLICIT message to the standard DHCP6 port (547). It contains the following:

- A tag for client UNDI version.
- A tag for the client system architecture.
- A tag for PXE client, Vendor Class data set to “PXEClient:Arch:xxxxx:UNDI:yyyyzzz”.

Figure 24-1  IPv6-based PXE boot
24.3.1.2.2 Step 2.
The DHCP6 or Proxy DHCP6 service responds by sending a ADVERTISE message to the client on the standard DHCP6 reply port (546). If this is a Proxy DHCP6 service, the next server (Boot Server) address is delivered by Boot File URL option. If this is a DHCP6 service, the new assigned client address is delivered by IA option. The extension tags information will be conveyed via the VENDOR OPTS field.

24.3.1.2.3 Steps 3 and 4.
If the client selects an address from a DHCP6 service, then it must complete the standard DHCP6 process by sending a REQUEST for the address back to the service and then waiting for an REPLY from the service.

24.3.1.2.4 Step 5.
The client multicasts a REQUEST message to the Boot Server port 4011, it contains the following:
- A tag for client UNDI version.
- A tag for the client system architecture.
- A tag for PXE client, Vendor Class option, set to "PXEClient:Arch:xxxxx:UNDI:yyyzzz".

24.3.1.2.5 Step 6.
The Boot Server unicasts a REPLY message back to the client on the client port. It contains the following:
- A tag for NBP file name.
- A tag for NBP file size if needed.

24.3.1.2.6 Step 7.
The client requests the NBP file using TFTP (port 69).

24.3.1.2.7 Step 8.
The NBP file, dependent on the client’s CPU architecture, is downloaded into client’s memory.

24.3.1.3 Proxy DHCP6
The netboot6 DHCP6 options may be supplied by the DHCP6 service or a Proxy DHCP6 service. This Proxy DHCP6 service may reside on the same server as the DHCP6 service, or it may be located on a separate server. A Proxy DHCP6 service on the same server as the DHCP6 service is illustrated in Figure 2. In this case, the Proxy DHCP6 service is listening to UDP port (4011), and communication with the Proxy DHCP6 service occurs after completing the standard DHCP6 process. Proxy DHCP6 uses port (4011) because it cannot share port (547) with the DHCP6 service. The netboot6 client knows how to interrogate the Proxy DHCP6 service because the ADVERTISE from the DHCP6 service contains a VendorClass option “PXEClient” tag without a BootFileURL option (including NBP file name). The client will not request option 16 (OPTION_VENDOR_CLASS) in ORO, but server must still reply with "PXEClient" in order to inform the client to start the Proxy DHCPv6 mode. The client will accept just the string "PXEClient" as sufficient, the server need not echo back the entire
Figure 24-2 netboot6 (DHCP6 and ProxyDHCP6 reside on the same server)

Figure 24-3 illustrates the case of a Proxy DHCP6 service and the DHCP6 service on different servers. In this case, the Proxy DHCP6 service listens to UDP port (547) and responds in parallel with DHCP6 service.
24.4 PXE Base Code Callback Protocol

This protocol is a specific instance of the PXE Base Code Callback Protocol that is invoked when the PXE Base Code Protocol is about to transmit, has received, or is waiting to receive a packet. The PXE Base Code Callback Protocol must be on the same handle as the PXE Base Code Protocol.
EFI_PXE_BASE_CODE_CALLBACK_PROTOCOL

Summary
Protocol that is invoked when the PXE Base Code Protocol is about to transmit, has received, or is waiting to receive a packet.

GUID
#define EFI_PXE_BASE_CODE_CALLBACK_PROTOCOL_GUID \
{0x245DCA21,0xFB7B,0x11d3,\ 
{0x8F,0x01,0x00,0xA0, 0xC9,0x69,0x72,0x3B}"

Revision Number
#define EFI_PXE_BASE_CODE_CALLBACK_PROTOCOL_REVISION \
0x00010000

Protocol Interface Structure
typedef struct {
  UINT64                     Revision;
  EFI_PXE_CALLBACK          Callback;
} EFI_PXE_BASE_CODE_CALLBACK_PROTOCOL;

Parameters
Revision          The revision of the EFI_PXE_BASE_CODE_CALLBACK_PROTOCOL. All future revisions must be backwards compatible. If a future revision is not backwards compatible, it is not the same GUID.

Callback          Callback routine used by the PXE Base Code Dhcp(), Discover(), Mtftp(), UdpWrite(), and Arp() functions.

Summary
Callback function that is invoked when the PXE Base Code Protocol is about to transmit, has received, or is waiting to receive a packet.

Prototype
typedef
EFI_PXE_BASE_CODE_CALLBACK_STATUS
(*EFI_PXE_CALLBACK) ( 
  IN EFI_PXE_BASE_CODE_CALLBACK_PROTOCOL  *This, 
  IN EFI_PXE_BASE_CODE_FUNCTION            Function, 
  IN BOOLEAN                                Received, 
  IN UINT32                                  PacketLen, 
  IN EFI_PXE_BASE_CODE_PACKET               *Packet OPTIONAL 
);
Parameters

- **This**: Pointer to the `EFI_PXE_BASE_CODE_PROTOCOL` instance.
- **Function**: The PXE Base Code Protocol function that is waiting for an event.
- **Received**: `TRUE` if the callback is being invoked due to a receive event. `FALSE` if the callback is being invoked due to a transmit event.
- **PacketLen**: The length, in bytes, of `Packet`. This field will have a value of zero if this is a wait for receive event.
- **Packet**: If **Received** is **TRUE**, a pointer to the packet that was just received; otherwise a pointer to the packet that is about to be transmitted. This field will be **NULL** if this is not a packet event.

Related Definitions

```c
typedef enum {
  EFI_PXE_BASE_CODE_CALLBACK_STATUS_FIRST,
  EFI_PXE_BASE_CODE_CALLBACK_STATUS_CONTINUE,
  EFI_PXE_BASE_CODE_CALLBACK_STATUS_ABORT,
  EFI_PXE_BASE_CODE_CALLBACK_STATUS_LAST
} EFI_PXE_BASE_CODE_CALLBACK_STATUS;
```

```c
typedef enum {
  EFI_PXE_BASE_CODE_FUNCTION_FIRST,
  EFI_PXE_BASE_CODE_FUNCTION_DHCP,
  EFI_PXE_BASE_CODE_FUNCTION_DISCOVER,
  EFI_PXE_BASE_CODE_FUNCTION_MTFTP,
  EFI_PXE_BASE_CODE_FUNCTION_UDP_WRITE,
  EFI_PXE_BASE_CODE_FUNCTION_UDP_READ,
  EFI_PXE_BASE_CODE_FUNCTION_ARP,
  EFI_PXE_BASE_CODE_FUNCTION_IGMP,
  EFI_PXE_BASE_CODE_PXE_FUNCTION_LAST
} EFI_PXE_BASE_CODE_FUNCTION;
```

Description

This function is invoked when the PXE Base Code Protocol is about to transmit, has received, or is waiting to receive a packet. Parameters **Function** and **Received** specify the type of event. Parameters **PacketLen** and **Packet** specify the packet that generated the event. If these fields are zero and **NULL** respectively, then this is a status update callback. If the operation specified by **Function** is to continue, then `CALLBACK_STATUS_CONTINUE` should be returned. If the operation specified by **Function** should be aborted, then `CALLBACK_STATUS_ABORT` should be returned. Due to the polling nature of UEFI device drivers, a callback function should not execute for more than 5 ms.
The `SetParameters()` function must be called after a Callback Protocol is installed to enable the use of callbacks.

### 24.5 Boot Integrity Services Protocol

This section defines the Boot Integrity Services (BIS) protocol, which is used to check a digital signature of a data block against a digital certificate for the purpose of an integrity and authorization check. BIS is primarily used by the Preboot Execution Environment (PXE) Base Code protocol `EFI_PXE_BASE_CODE_PROTOCOL` to check downloaded network boot images before executing them. BIS is a UEFI Boot Service Driver, so its services are also available to applications written to this specification until the time of `EFI_BOOT_SERVICES.ExitBootServices()`. More information about BIS can be found in the *Boot Integrity Services Application Programming Interface Version 1.0*.

This section defines the Boot Integrity Services Protocol. This protocol is used to check a digital signature of a data block against a digital certificate for the purpose of an integrity and authorization check.

**EFI_BIS_PROTOCOL**

Summary

The **EFI_BIS_PROTOCOL** is used to check a digital signature of a data block against a digital certificate for the purpose of an integrity and authorization check.

GUID

```c
#define EFI_BIS_PROTOCOL_GUID   \
{0x0b64aab0,0x5429,0x11d4,\ 
 {0x98,0x16,0xa0,0xc9,0x1f,0xad,0xcf}}
```

Protocol Interface Structure

```c
typedef struct _EFI_BIS_PROTOCOL {
  EFI_BIS_INITIALIZE   Initialize;
  EFI_BIS_SHUTDOWN     Shutdown;
  EFI_BIS_FREE         Free;
  EFI_BIS_GET_BOOT_OBJECT_AUTHORIZATION_CERTIFICATE   
    GetBootObjectAuthorizationCertificate;
  EFI_BIS_GET_BOOT_OBJECT_AUTHORIZATION_CHECKFLAG    
    GetBootObjectAuthorizationCheckFlag;
  EFI_BIS_GET_BOOT_OBJECT_AUTHORIZATION_UPDATE_TOKEN 
    GetBootObjectAuthorizationUpdateToken;
  EFI_BIS_GET_SIGNATURE_INFO                         
    GetSignatureInfo;
  EFI_BIS_UPDATE_BOOT_OBJECT_AUTHORIZATION          
    UpdateBootObjectAuthorization;
  EFI_BIS_VERIFY_BOOT_OBJECT                         
    VerifyBootObject;
  EFI_BIS_VERIFY_OBJECT_WITH_CREDENTIAL              
    VerifyObjectWithCredential;
} EFI_BIS_PROTOCOL;
```
Parameters

**Initialize**
Initializes an application instance of the **EFI_BIS** protocol, returning a handle for the application instance. Other functions in the **EFI_BIS** protocol require a valid application instance handle obtained from this function. See the **Initialize()** function description.

**Shutdown**
Ends the lifetime of an application instance of the **EFI_BIS** protocol, invalidating its application instance handle. The application instance handle may no longer be used in other functions in the **EFI_BIS** protocol. See the **Shutdown()** function description.

**Free**
Frees memory structures allocated and returned by other functions in the **EFI_BIS** protocol. See the **Free()** function description.

**GetBootObjectAuthorizationCertificate**
Retrieves the current digital certificate (if any) used by the **EFI_BIS** protocol as the source of authorization for verifying boot objects and altering configuration parameters. See the **GetBootObjectAuthorizationCertificate()** function description.

**GetBootObjectAuthorizationCheckFlag**
Retrieves the current setting of the authorization check flag that indicates whether or not authorization checks are required for boot objects. See the **GetBootObjectAuthorizationCheckFlag()** function description.

**GetBootObjectAuthorizationUpdateToken**
Retrieves an uninterpreted token whose value gets included and signed in a subsequent request to alter the configuration parameters, to protect against attempts to “replay” such a request. See the **GetBootObjectAuthorizationUpdateToken()** function description.

**GetSignatureInfo**
Retrieves information about the digital signature algorithms supported and the identity of the installed authorization certificate, if any. See the **GetSignatureInfo()** function description.

**UpdateBootObjectAuthorization**
Requests that the configuration parameters be altered by installing or removing an authorization certificate or changing the setting of the check flag. See the **UpdateBootObjectAuthorization()** function description.

**VerifyBootObject**
Verifies a boot object according to the supplied digital signature and the current authorization certificate and check flag setting. See the **VerifyBootObject()** function description.

**VerifyObjectWithCredential**
Verifies a data object according to a supplied digital signature and a supplied digital certificate. See the **VerifyObjectWithCredential()** function description.
Description
The EFI_BIS_PROTOCOL provides a set of functions as defined in this section. There is no physical device associated with these functions, however, in the context of UEFI every protocol operates on a device. Accordingly, BIS installs and operates on a single abstract device that has only a software representation.

EFI_BIS_PROTOCOL.Initialize()

Summary
Initializes the BIS service, checking that it is compatible with the version requested by the caller. After this call, other BIS functions may be invoked.

Prototype

```c
typedef EFI_STATUS
  (EFIAPI *EFI_BIS_INITIALIZE)(
   IN   EFI_BIS_PROTOCOL    *This,
   OUT  BIS_APPLICATION_HANDLE *AppHandle,
   IN OUT EFI_BIS_VERSION    *InterfaceVersion,
   IN   EFI_BIS_DATA        *TargetAddress
  );
```

Parameters

This
A pointer to the EFI_BIS_PROTOCOL object. The protocol implementation may rely on the actual pointer value and object location, so the caller must not copy the object to a new location.

AppHandle
The function writes the new BIS_APPLICATION_HANDLE if successful, otherwise it writes NULL. The caller must eventually destroy this handle by calling Shutdown(). Type BIS_APPLICATION_HANDLE is defined in “Related Definitions” below.

InterfaceVersion
On input, the caller supplies the major version number of the interface version desired. The minor version number supplied on input is ignored since interface compatibility is determined solely by the major version number. On output, both the major and minor version numbers are updated with the major and minor version numbers of the interface (and underlying implementation). This update is done whether or not the initialization was successful. Type EFI_BIS_VERSION is defined in “Related Definitions” below.

TargetAddress
Indicates a network or device address of the BIS platform to connect to. Local-platform BIS implementations require that the caller sets TargetAddress.Data to NULL, but otherwise ignores this parameter. BIS implementations that redirect calls to an agent at a remote address must define their own format and interpretation of this parameter outside the scope of this document. For all implementations, if the TargetAddress is an unsupported value,
the function fails with the error **EFI_UNSUPPORTED**. Type **EFI_BIS_DATA** is defined in “Related Definitions” below.

**Related Definitions**

```c
//*******************************************************************************
//  BIS_APPLICATION_HANDLE
//*******************************************************************************
typedef VOID *BIS_APPLICATION_HANDLE;
```

This type is an opaque handle representing an initialized instance of the BIS interface. A **BIS_APPLICATION_HANDLE** value is returned by the **Initialize()** function as an “out” parameter. Other BIS functions take a **BIS_APPLICATION_HANDLE** as an “in” parameter to identify the BIS instance.

```c
//*******************************************************************************
//  EFI_BIS_VERSION
//*******************************************************************************
typedef struct _EFI_BIS_VERSION {
  UINT32 Major;
  UINT32 Minor;
} EFI_BIS_VERSION;
```

**Major**

This describes the major BIS version number. The major version number defines version compatibility. That is, when a new version of the BIS interface is created with new capabilities that are not available in the previous interface version, the major version number is increased.

**Minor**

This describes a minor BIS version number. This version number is increased whenever a new BIS implementation is built that is fully interface compatible with the previous BIS implementation. This number may be reset when the major version number is increased.

This type represents a version number of the BIS interface. This is used as an “in out” parameter of the **Initialize()** function for a simple form of negotiation of the BIS interface version between the caller and the BIS implementation.

```c
//*******************************************************************************
//  EFI_BIS_VERSION predefined values
//  Use these values to initialize EFI_BIS_VERSION.Major and to interpret results of Initialize.
//*******************************************************************************
#define BIS_CURRENT_VERSION_MAJOR   BIS_VERSION_1
#define BIS_VERSION_1               1
```

These C preprocessor macros supply values for the major version number of an **EFI_BIS_VERSION**. At the time of initialization, a caller supplies a value to request a BIS interface version. On return, the (IN OUT) parameter is over-written with the actual version of the interface.
typedef struct _EFI_BIS_DATA {
    UINT32   Length;
    UINT8    *Data;
} EFI_BIS_DATA;

The length of the data buffer in bytes.
A pointer to the raw data buffer.

This type defines a structure that describes a buffer. BIS uses this type to pass back and forth most large objects such as digital certificates, strings, etc. Several of the BIS functions allocate a EFI_BIS_DATA* and return it as an “out” parameter. The caller must eventually free any allocated EFI_BIS_DATA* using the Free() function.

Description
This function must be the first BIS function invoked by an application. It passes back a BIS_APPLICATION_HANDLE value that must be used in subsequent BIS functions. The handle must be eventually destroyed by a call to the Shutdown() function, thus ending that handle’s lifetime. After the handle is destroyed, BIS functions may no longer be called with that handle value. Thus all other BIS functions may only be called between a pair of Initialize() and Shutdown() functions.

There is no penalty for calling Initialize() multiple times. Each call passes back a distinct handle value. Each distinct handle must be destroyed by a distinct call to Shutdown(). The lifetimes of handles created and destroyed with these functions may be overlapped in any way.

**EFI_BIS_PROTOCOL.Shutdown()**

**Summary**

Shuts down an application’s instance of the BIS service, invalidating the application handle. After this call, other BIS functions may no longer be invoked using the application handle value.

**Prototype**

```c
typedef
EFI_STATUS
(EFIAPI *EFI_BIS_SHUTDOWN)(
    IN BIS_APPLICATION_HANDLE AppHandle
);
```

**Parameters**

- **AppHandle** An opaque handle that identifies the caller’s instance of initialization of the BIS service. Type BIS_APPLICATION_HANDLE is defined in the Initialize() function description.
Description
This function shuts down an application’s instance of the BIS service, invalidating the application handle. After this call, other BIS functions may no longer be invoked using the application handle value.

This function must be paired with a preceding successful call to the Initialize() function. The lifetime of an application handle extends from the time the handle was returned from Initialize() until the time the handle is passed to Shutdown(). If there are other remaining handles whose lifetime is still active, they may still be used in calling BIS functions.

The caller must free all memory resources associated with this AppHandle that were allocated and returned from other BIS functions before calling Shutdown(). Memory resources are freed using the Free() function. Failure to free such memory resources is a caller error, however, this function does not return an error code under this circumstance. Further attempts to access the outstanding memory resources cause unspecified results.

EFI_BIS_PROTOCOL.Free()

Summary
Frees memory structures allocated and returned by other functions in the EFI_BIS protocol.

Prototype
define

typedef

EFI_STATUS

(EIFIAPI *EFI_BIS_FREE)(
    IN BIS_APPLICATION_HANDLE AppHandle,
    IN EFI_BIS_DATA      *ToF

); Parameters

AppHandle An opaque handle that identifies the caller’s instance of initialization of the BIS service. Type BIS_APPLICATION_HANDLE is defined in the Initialize() function description.

ToFree An EFI_BIS_DATA* and associated memory block to be freed. This EFI_BIS_DATA* must have been allocated by one of the other BIS functions. Type EFI_BIS_DATA is defined in the Initialize() function description.
Description
This function deallocates an `EFI_BIS_DATA*` and associated memory allocated by one of the other BIS functions.

Callers of other BIS functions that allocate memory in the form of an `EFI_BIS_DATA*` must eventually call this function to deallocate the memory before calling the `Shutdown()` function for the application handle under which the memory was allocated. Failure to do so causes unspecified results, and the continued correct operation of the BIS service cannot be guaranteed.

`EFI_BIS_PROTOCOL.GetBootObjectAuthorizationCertificate()`

Summary
Retrieves the certificate that has been configured as the identity of the organization designated as the source of authorization for signatures of boot objects.

Prototype

```c
typedef
EFI_STATUS
(EFIAPI *EFI_BIS_GET_BOOT_OBJECT_AUTHORIZATION_CERTIFICATE)(
    IN BIS_APPLICATION_Handle AppHandle,
    OUT EFI_BIS_DATA **Certificate
);
```

Parameters

- **AppHandle**
  An opaque handle that identifies the caller’s instance of initialization of the BIS service. Type `BIS_APPLICATION_HANDLE` is defined in the `Initialize()` function description.

- **Certificate**
  The function writes an allocated `EFI_BIS_DATA*` containing the Boot Object Authorization Certificate object. The caller must eventually free the memory allocated by this function using the function `Free()`. Type `EFI_BIS_DATA` is defined in the `Initialize()` function description.

Description
This function retrieves the certificate that has been configured as the identity of the organization designated as the source of authorization for signatures of boot objects.

**EFI_BIS_PROTOCOL.GetBootObjectAuthorizationCheckFlag()**

**Summary**
Retrieves the current status of the Boot Authorization Check Flag.

**Prototype**
```c
typedef EFI_STATUS (EFIAPIS *EFI_BIS_GET_BOOT_OBJECT_AUTHORIZATION_CHECKFLAG)(
    IN BIS_APPLICATION_HANDLE AppHandle,
    OUT BOOLEAN *CheckIsRequired
);
```

**Parameters**
- **AppHandle**
  - An opaque handle that identifies the caller’s instance of initialization of the BIS service. Type `BIS_APPLICATION_HANDLE` is defined in the Initialize() function description.
- **CheckIsRequired**
  - The function writes the value **TRUE** if a Boot Authorization Check is currently required on this platform, otherwise the function writes **FALSE**.

**Description**
This function retrieves the current status of the Boot Authorization Check Flag (in other words, whether or not a Boot Authorization Check is currently required on this platform).
Status Codes Returned

**EFI_BIS_PROTOCOL.GetBootObjectAuthorizationUpdateToken()**

**Summary**
Retrieves a unique token value to be included in the request credential for the next update of any parameter in the Boot Object Authorization set (Boot Object Authorization Certificate and Boot Authorization Check Flag).

**Prototype**
```c
typedef EFI_STATUS (EFIAPI *EFI_BIS_GET_BOOT_OBJECT_AUTHORIZATION_UPDATE_TOKEN)(
    IN BIS_APPLICATION_HANDLE AppHandle,
    OUT EFI_BIS_DATA **UpdateToken
);
```

**Parameters**
- **AppHandle**
  An opaque handle that identifies the caller’s instance of initialization of the BIS service. Type BIS_APPLICATION_HANDLE is defined in the Initialize() function description.
- **UpdateToken**
  The function writes an allocated EFI_BIS_DATA* containing the new unique update token value. The caller must eventually free the memory allocated by this function using the function Free(). Type EFI_BIS_DATA is defined in the Initialize() function description.

**Description**
This function retrieves a unique token value to be included in the request credential for the next update of any parameter in the Boot Object Authorization set (Boot Object Authorization Certificate and Boot Authorization Check Flag). The token value is unique to this platform, parameter set, and instance of parameter values. In particular, the token changes to a new unique value whenever any parameter in this set is changed.

**EFI_BIS_PROTOCOL.GetSignatureInfo()**

**Summary**

Retrieves a list of digital certificate identifier, digital signature algorithm, hash algorithm, and key-length combinations that the platform supports.

**Prototype**

```c
typedef
EFI_STATUS
(EFI_API *EFI_BIS_GET_SIGNATURE_INFO)(
    IN BIS_APPLICATION_HANDLE AppHandle,
    OUT EFI_BIS_DATA **SignatureInfo
);
```

**Parameters**

- **AppHandle**
  - An opaque handle that identifies the caller’s instance of initialization of the BIS service. Type `BIS_APPLICATION_HANDLE` is defined in the [Initialize()] function description.

- **SignatureInfo**
  - The function writes an allocated `EFI_BIS_DATA*` containing the array of `EFI_BIS_SIGNATURE_INFO` structures representing the supported digital certificate identifier, algorithm, and key length combinations. The caller must eventually free the memory allocated by this function using the function `Free()`. Type `EFI_BIS_DATA` is defined in the [Initialize()] function description. Type `EFI_BIS_SIGNATURE_INFO` is defined in “Related Definitions” below.
Related Definitions

typedef struct _EFI_BIS_SIGNATURE_INFO {
    BIS_CERT_ID   CertificateID;
    BIS_ALG_ID    AlgorithmID;
    UINT16        KeyLength;
} EFI_BIS_SIGNATURE_INFO;

CertificateID
A shortened value identifying the platform’s currently configured Boot Object Authorization Certificate, if one is currently configured. The shortened value is derived from the certificate as defined in the Related Definition for BIS_CERT_ID below. If there is no certificate currently configured, the value is one of the reserved BIS_CERT_ID XXX values defined below. Type BIS_CERT_ID and its predefined reserved values are defined in “Related Definitions” below.

AlgorithmID
A predefined constant representing a particular digital signature algorithm. Often this represents a combination of hash algorithm and encryption algorithm, however, it may also represent a standalone digital signature algorithm. Type BIS_ALG_ID and its permitted values are defined in “Related Definitions” below.

KeyLength
The length of the public key, in bits, supported by this digital signature algorithm.

This type defines a digital certificate, digital signature algorithm, and key-length combination that may be supported by the BIS implementation. This type is returned by GetSignatureInfo() to describe the combination(s) supported by the implementation.

#define BIS_GET_SIGINFO_COUNT(BisDataPtr) \
    ((BisDataPtr)->Length/sizeof(EFI_BIS_SIGNATURE_INFO))

BisDataPtr Supplies the pointer to the target EFI_BIS_DATA structure.
(return value) The number of EFI_BIS_SIGNATURE_INFO elements contained in the array.

This macro computes how many EFI_BIS_SIGNATURE_INFO elements are contained in an EFI_BIS_DATA structure returned from GetSignatureInfo(). The number returned is the count of items in the list of supported digital certificate, digital signature algorithm, and key-length combinations.
//******************************************************************************************
// BIS_GET_SIGINFO_ARRAY macro
// Produces a EFI_BIS_SIGNATURE_INFO* from a given
// EFI_BIS_DATA*.
//******************************************************************************************
#define BIS_GET_SIGINFO_ARRAY(BisDataPtr) 
  ((EFI_BIS_SIGNATURE_INFO*)(BisDataPtr)->Data)

BisDataPtr Supplies the pointer to the target EFI_BIS_DATA structure.

(return value) The pointer to the EFI_BIS_SIGNATURE_INFO array, cast as an
  EFI_BIS_SIGNATURE_INFO*.

This macro returns a pointer to the EFI_BIS_SIGNATURE_INFO array contained in an EFI_BIS_DATA
structure returned from GetSignatureInfo() representing the list of supported digital certificate,
digital signature algorithm, and key-length combinations.

//******************************************************************************************
// BIS_CERT_ID
//******************************************************************************************
typedef UINT32 BIS_CERT_ID;

This type represents a shortened value that identifies the platform’s currently configured Boot Object
Authorization Certificate. The value is the first four bytes, in “little-endian” order, of the SHA-1 hash of
the certificate, except that the most-significant bits of the second and third bytes are reserved, and must
be set to zero regardless of the outcome of the hash function. This type is included in the array of values
returned from the GetSignatureInfo() function to indicate the required source of a signature for a
boot object or a configuration update request. There are a few predefined reserved values with special
meanings as described below.

//******************************************************************************************
// BIS_CERT_ID predefined values
// Currently defined values for EFI_BIS_SIGNATURE_INFO.
// CertificateId.
//******************************************************************************************
#define BIS_CERT_ID_DSA   BIS_ALG_DSA   //CSSM_ALGID_DSA
#define BIS_CERT_ID_RSA_MD5 BIS_ALG_RSA_MD5 //CSSM_ALGID_MD5_WITH_RSA

These C preprocessor symbols provide values for the BIS_CERT_ID type. These values are used when
the platform has no configured Boot Object Authorization Certificate. They indicate the signature
algorithm that is supported by the platform. Users must be careful to avoid constructing Boot Object
Authorization Certificates that transform to BIS_CERT_ID values that collide with these predefined
values or with the BIS_CERT_ID values of other Boot Object Authorization Certificates they use.
//*******************************************************
// BIS_CERT_ID_MASK
// The following is a mask value that gets applied to the
// truncated hash of a platform Boot Object Authorization
// Certificate to create the CertificateId. A CertificateId
// must not have any bits set to the value 1 other than bits in
// this mask.
//*******************************************************
#define BIS_CERT_ID_MASK (0xFF7F7FFF)

This C preprocessor symbol may be used as a bit-wise “AND” value to transform the first four bytes (in
little-endian order) of a SHA-1 hash of a certificate into a certificate ID with the “reserved” bits properly
set to zero.

//*******************************************************
// BIS_ALG_ID
//*******************************************************
typedef UINT16         BIS_ALG_ID;

This type represents a digital signature algorithm. A digital signature algorithm is often composed of a
particular combination of secure hash algorithm and encryption algorithm. This type also allows for
digital signature algorithms that cannot be decomposed. Predefined values for this type are as defined
below.

//*******************************************************
// BIS_ALG_ID predefined values
// Currently defined values for EFI_BIS_SIGNATURE_INFO.
// AlgorithmId. The exact numeric values come from “Common
// Data Security Architecture (CDSA) Specification.”
//*******************************************************
#define BIS_ALG_DSA   (41)  //CSSM_ALGID_DSA
#define BIS_ALG_RSA_MD5 (42)  //CSSM_ALGID_MD5_WITH_RSA

These values represent the two digital signature algorithms predefined for BIS. Each implementation of
BIS must support at least one of these digital signature algorithms. Values for the digital signature
algorithms are chosen by an industry group known as The Open Group. Developers planning to support
additional digital signature algorithms or define new digital signature algorithms should refer to The
Open Group for interoperable values to use.

Description
This function retrieves a list of digital certificate identifier, digital signature algorithm, hash algorithm,
and key-length combinations that the platform supports. The list is an array of (certificate id, algorithm
id, key length) triples, where the certificate id is derived from the platform’s Boot Object Authorization
Certificate as described in the Related Definition for BIS_CERT_ID above, the algorithm id represents
the combination of signature algorithm and hash algorithm, and the key length is expressed in bits. The
number of array elements can be computed using the Length field of the retrieved EFI_BIS_DATA*. 
The retrieved list is in order of preference. A digital signature algorithm for which the platform has a currently configured Boot Object Authorization Certificate is preferred over any digital signature algorithm for which there is not a currently configured Boot Object Authorization Certificate. Thus the first element in the list has a `CertificateID` representing a Boot Object Authorization Certificate if the platform has one configured. Otherwise the `CertificateID` of the first element in the list is one of the reserved values representing a digital signature algorithm.

### EFI_BIS_PROTOCOL.UpdateBootObjectAuthorization()

**Summary**

Updates one of the configurable parameters of the Boot Object Authorization set (Boot Object Authorization Certificate or Boot Authorization Check Flag).

**Prototype**

```c
typedef EFI_STATUS
(EFIAPI *EFI_BIS_UPDATE_BOOT_OBJECT_AUTHORIZATION)(
    IN BIS_APPLICATION_HANDLE AppHandle,
    IN EFI_BIS_DATA *RequestCredential,
    OUT EFI_BIS_DATA **NewUpdateToken
);
```

**Parameters**

- **AppHandle**
  
  An opaque handle that identifies the caller’s instance of initialization of the BIS service. Type `BIS_APPLICATION_HANDLE` is defined in the `Initialize()` function description.

- **RequestCredential**
  
  This is a Signed Manifest with embedded attributes that carry the details of the requested update. The required syntax of the Signed Manifest is described in the Related Definition for Manifest Syntax below. The key used to sign the request credential must be the private key corresponding to the public key in the platform’s configured Boot Object Authorization Certificate. Authority to
update parameters in the Boot Object Authorization set cannot be delegated.

If there is no Boot Object Authorization Certificate, the request credential may be signed with any private key. In this case, this function interacts with the user in a platform-specific way to determine whether the operation should succeed. Type EFI_BIS_DATA is defined in the Initialize() function description.

NewUpdateToken

The function writes an allocated EFI_BIS_DATA* containing the new unique update token value. The caller must eventually free the memory allocated by this function using the function Free(). Type EFI_BIS_DATA is defined in the Initialize() function description.

Related Definitions

//**********************************************************
// Manifest Syntax
//**********************************************************

The Signed Manifest consists of three parts grouped together into an Electronic Shrink Wrap archive as described in [SM spec]: a manifest file, a signer’s information file, and a signature block file. These three parts, along with examples are described in the following sections. In these examples, text in parentheses is a description of the text that would appear in the signed manifest. Text outside of parentheses must appear exactly as shown. Also note that manifest files and signer’s information files must conform to a 72-byte line-length limit. Continuation lines (lines beginning with a single “space” character) are used for lines longer than 72 bytes. The examples given here follow this rule for continuation lines.

Note that the manifest file and signer’s information file parts of a Signed Manifest are ASCII text files. In cases where these files contain a base-64 encoded string, the string is an ASCII string before base-64 encoding.

//**********************************************************
// Manifest File Example
//**********************************************************

The manifest file must include a section referring to a memory-type data object with the reserved name as shown in the example below. This data object is a zero-length object whose sole purpose in the manifest is to serve as a named collection point for the attributes that carry the details of the requested update. The attributes are also contained in the manifest file. An example manifest file is shown below.

Manifest-Version: 2.0
ManifestPersistentId: (base-64 representation of a unique GUID)

Name: memory:UpdateRequestParameters
Digest-Algorithms: SHA-1
SHA-1-Digest: (base-64 representation of a SHA-1 digest of zero-length buffer)
X-Intel-BIS-ParameterSet: (base-64 representation of
A line-by-line description of this manifest file is as follows.

**Manifest-Version: 2.0**

This is a standard header line that all signed manifests have. It must appear exactly as shown.

**ManifestPersistentId: (base-64 representation of a unique GUID)**

The left-hand string must appear exactly as shown. The right-hand string must be a unique GUID for every manifest file created. The Win32 function UuidCreate() can be used for this on Win32 systems. The GUID is a binary value that must be base-64 encoded. Base-64 is a simple encoding scheme for representing binary values that uses only printing characters. Base-64 encoding is described in [BASE-64].

**Name: memory:UpdateRequestParameters**

This identifies the manifest section that carries a dummy zero-length data object serving as the collection point for the attribute values appearing later in this manifest section (lines prefixed with “X-Intel-BIS-”). The string “memory:UpdateRequestParameters” must appear exactly as shown.

**Digest-Algorithms: SHA-1**

This enumerates the digest algorithms for which integrity data is included for the data object. These are required even though the data object is zero-length. For systems with DSA signing, SHA-1 hash, and 1024-bit key length, the digest algorithm must be “SHA-1.” For systems with RSA signing, MD5 hash, and 512-bit key length, the digest algorithm must be “MD5.” Multiple algorithms can be specified as a whitespace-separated list. For every digest algorithm XXX listed, there must also be a corresponding XXX-Digest line.

**SHA-1-Digest: (base-64 representation of a SHA-1 digest of zero-length buffer)**

Gives the corresponding digest value for the dummy zero-length data object. The value is base-64 encoded. Note that for both MD5 and SHA-1, the digest value for a zero-length data object is not zero.

**X-Intel-BIS-ParameterSet: (base-64 representation of BootObjectAuthorizationSetGUID)**

A named attribute value that distinguishes updates of BIS parameters from updates of other parameters. The left-hand attribute-name keyword must appear exactly as shown. The GUID value for the right-hand side is always the same, and can be found under the preprocessor symbol `BOOT_OBJECT_AUTHORIZATION_PARAMSET_GUIDVALUE`. The representation inserted into the manifest is base-64 encoded.

Note the “X-Intel-BIS-” prefix on this and the following attributes. The “X-” part of the prefix was chosen to avoid collisions with future reserved keywords defined by future versions of the signed
manifest specification. The “Intel-BIS-” part of the prefix was chosen to avoid collisions with other user-defined attribute names within the user-defined attribute name space.

X-Intel-BIS-ParameterSetToken: (base-64 representation of the current update token)

A named attribute value that makes this update of BIS parameters different from any other on the same target platform. The left-hand attribute-name keyword must appear exactly as shown. The value for the right-hand side is generally different for each update-request manifest generated. The value to be base-64 encoded is retrieved through the functions GetBootObjectAuthorizationUpdateToken() or UpdateBootObjectAuthorization().

X-Intel-BIS-ParameterId: (base-64 representation of “BootObjectAuthorizationCertificate” or “BootAuthorizationCheckFlag”)

A named attribute value that indicates which BIS parameter is to be updated. The left-hand attribute-name keyword must appear exactly as shown. The value for the right-hand side is the base-64 encoded representation of one of the two strings shown.

X-Intel-BIS-ParameterValue: (base-64 representation of certificate or single-byte boolean flag)

A named attribute value that indicates the new value to be set for the indicated parameter. The left-hand attribute-name keyword must appear exactly as shown. The value for the right-hand side is the appropriate base-64 encoded new value to be set. In the case of the Boot Object Authorization Certificate, the value is the new digital certificate raw data. A zero-length value removes the certificate altogether. In the case of the Boot Authorization Check Flag, the value is a single-byte Boolean value, where a nonzero value “turns on” the check and a zero value “turns off” the check.

//**********************************************************
// Signer’s Information File Example
//**********************************************************

The signer’s information file must include a section whose name matches the reserved data object section name of the section in the Manifest file. This section in the signer’s information file carries the integrity data for the attributes in the corresponding section in the manifest file. An example signer’s information file is shown below.

Signature-Version: 2.0
SignerInformationPersistentId: (base-64 representation of a unique GUID)
SignerInformationName: BIS_UpdateManifestSignerInfoName

Name: memory:UpdateRequestParameters
Digest-Algorithms: SHA-1
SHA-1-Digest: (base-64 representation of a SHA-1 digest of the corresponding manifest section)

A line-by-line description of this signer’s information file is as follows.

Signature-Version: 2.0
This is a standard header line that all signed manifests have. It must appear exactly as shown.

**SignerInformationPersistentId:** (base-64 representation of a unique GUID)

The left-hand string must appear exactly as shown. The right-hand string must be a unique GUID for every signer’s information file created. The Win32 function UuidCreate() can be used for this on Win32 systems. The GUID is a binary value that must be base-64 encoded. Base-64 is a simple encoding scheme for representing binary values that uses only printing characters. Base-64 encoding is described in [BASE-64].

**SignerInformationName:** BIS_UpdateManifestSignerInfoName

The left-hand string must appear exactly as shown. The right-hand string must appear exactly as shown.

**Name:** memory:UpdateRequestParameters

This identifies the section in the signer’s information file corresponding to the section with the same name in the manifest file described earlier. The string “memory:UpdateRequestParameters” must appear exactly as shown.

**Digest-Algorithms:** SHA-1

This enumerates the digest algorithms for which integrity data is included for the corresponding manifest section. Strings identifying digest algorithms are the same as in the manifest file. The digest algorithms specified here must match those specified in the manifest file. For every digest algorithm XXX listed, there must also be a corresponding **XXX-Digest** line.

**SHA-1-Digest:** (base-64 representation of a SHA-1 digest of the corresponding manifest section)

Gives the corresponding digest value for the corresponding manifest section. The value is base-64 encoded. Note that for the purpose of computing the hash of the manifest section, the manifest section starts at the beginning of the opening “Name:” keyword and continues up to, but not including, the next section’s “Name:” keyword or the end-of-file. Thus the hash includes the blank line(s) at the end of a section and any newline(s) preceding the next “Name:” keyword or end-of-file.

```
//**********************************************************
// Signature Block File Example
//**********************************************************
```

A signature block file is a raw binary file (not base-64 encoded) that is a PKCS#7 defined format signature block. The signature block covers exactly the contents of the signer’s information file. There must be a correspondence between the name of the signer’s information file and the signature block file. The base name matches, and the three-character extension is modified to reflect the signature algorithm used according to the following rules:

- DSA signature algorithm (which uses SHA-1 hash): extension is DSA.
- RSA signature algorithm with MD5 hash: extension is RSA.

So for example with a signer’s information file name of “myinfo.SF,” the corresponding DSA signature block file name would be “myinfo.DSA.”

The format of a signature block file is defined in [PKCS].
This preprocessor symbol gives the value for an attribute inserted in signed manifests to distinguish updates of BIS parameters from updates of other parameters. The representation inserted into the manifest is base-64 encoded.

**Description**

This function updates one of the configurable parameters of the Boot Object Authorization set (Boot Object Authorization Certificate or Boot Authorization Check Flag). It passes back a new unique update token that must be included in the request credential for the next update of any parameter in the Boot Object Authorization set. The token value is unique to this platform, parameter set, and instance of parameter values. In particular, the token changes to a new unique value whenever any parameter in this set is changed.

There were no signers associated with the identified signer’s information file, or
There was more than one signer associated with the identified signer’s information file, or
Any other unspecified security violation occurred.
### EFI_BIS_PROTOCOL.VerifyBootObject()

#### Summary
Verifies the integrity and authorization of the indicated data object according to the indicated credentials.

#### Prototype
```c
typedef EFI_STATUS (EFIAPI *EFI_BIS_VERIFY_BOOT_OBJECT)(
    IN BIS_APPLICATION_HANDLE AppHandle,
    IN EFI_BIS_DATA *Credentials,
    IN EFI_BIS_DATA *DataObject,
    OUT BOOLEAN *IsVerified
);
```

#### Parameters
- **AppHandle**: An opaque handle that identifies the caller’s instance of initialization of the BIS service. Type `BIS_APPLICATION_HANDLE` is defined in the `Initialize()` function description.
- **Credentials**: A Signed Manifest containing verification information for the indicated data object. The Manifest signature itself must meet the requirements described below. This parameter is optional if a Boot Authorization Check is currently not required on this platform (`Credentials.Data` may be `NULL`), otherwise this parameter is required. The required syntax of the Signed Manifest is described in the Related Definition for Manifest Syntax below. Type `EFI_BIS_DATA` is defined in the `Initialize()` function description.
**DataObject**
An in-memory copy of the raw data object to be verified. Type `EFI_BIS_DATA` is defined in the `Initialize()` function description.

**IsVerified**
The function writes `TRUE` if the verification succeeded, otherwise `FALSE`.

**Related Definitions**
```c
//**********************************************************
// Manifest Syntax
//**********************************************************
```

The Signed Manifest consists of three parts grouped together into an Electronic Shrink Wrap archive as described in [SM spec]: a manifest file, a signer’s information file, and a signature block file. These three parts along with examples are described in the following sections. In these examples, text in parentheses is a description of the text that would appear in the signed manifest. Text outside of parentheses must appear exactly as shown. Also note that manifest files and signer’s information files must conform to a 72-byte line-length limit. Continuation lines (lines beginning with a single “space” character) are used for lines longer than 72 bytes. The examples given here follow this rule for continuation lines.

Note that the manifest file and signer’s information file parts of a Signed Manifest are ASCII text files. In cases where these files contain a base-64 encoded string, the string is an ASCII string before base-64 encoding.

```c
//**********************************************************
// Manifest File Example
//**********************************************************
```

The manifest file must include a section referring to a memory-type data object with the reserved name as shown in the example below. This data object is the Boot Object to be verified. An example manifest file is shown below.

```
Manifest-Version: 2.0
ManifestPersistentId: (base-64 representation of a unique GUID)
Name: memory:BootObject
Digest-Algorithms: SHA-1
SHA-1-Digest: (base-64 representation of a SHA-1 digest of the boot object)
```

A line-by-line description of this manifest file is as follows.

- **Manifest-Version: 2.0**
  This is a standard header line that all signed manifests have. It must appear exactly as shown.

- **ManifestPersistentId: (base-64 representation of a unique GUID)**
  The left-hand string must appear exactly as shown. The right-hand string must be a unique GUID for every manifest file created. The Win32 function `UuidCreate()` can be used for this on Win32 systems. The GUID is a binary value that must be base-64 encoded. Base-64 is a simple encoding scheme for representing binary values that uses only printing characters. Base-64 encoding is described in [BASE-64].
**Name: memory:BootObject**

This identifies the section that carries the integrity data for the Boot Object. The string “memory:BootObject” must appear exactly as shown. Note that the Boot Object cannot be found directly from this manifest. A caller verifying the Boot Object integrity must load the Boot Object into memory and specify its memory location explicitly to this verification function through the DataObject parameter.

**Digest-Algorithms: SHA-1**

This enumerates the digest algorithms for which integrity data is included for the data object. For systems with DSA signing, SHA-1 hash, and 1024-bit key length, the digest algorithm must be “SHA-1.” For systems with RSA signing, MD5 hash, and 512-bit key length, the digest algorithm must be “MD5.” Multiple algorithms can be specified as a whitespace-separated list. For every digest algorithm listed, there must also be a corresponding XXX-Digest line.

**SHA-1-Digest: (base-64 representation of a SHA-1 digest of the boot object)**

Gives the corresponding digest value for the data object. The value is base-64 encoded.

```plaintext
//**********************************************************
// Signer’s Information File Example
//**********************************************************
```

The signer’s information file must include a section whose name matches the reserved data object section name of the section in the Manifest file. This section in the signer’s information file carries the integrity data for the corresponding section in the manifest file. An example signer’s information file is shown below.

```plaintext
Signature-Version: 2.0
SignerInformationPersistentId: (base-64 representation of a unique GUID)
SignerInformationName: BIS_VerifiableObjectSignerInfoName

Name: memory:BootObject
Digest-Algorithms: SHA-1
SHA-1-Digest: (base-64 representation of a SHA-1 digest of the corresponding manifest section)
```

A line-by-line description of this signer’s information file is as follows.

**Signature-Version: 2.0**

This is a standard header line that all signed manifests have. It must appear exactly as shown.

**SignerInformationPersistentId: (base-64 representation of a unique GUID)**

The left-hand string must appear exactly as shown. The right-hand string must be a unique GUID for every signer’s information file created. The Win32 function UuidCreate() can be used for this on Win32 systems. The GUID is a binary value that must be base-64 encoded. Base-64 is a simple encoding scheme for representing binary values that uses only printing characters. Base-64 encoding is described in [BASE-64].

**SignerInformationName: BIS_VerifiableObjectSignerInfoName**
The left-hand string must appear exactly as shown. The right-hand string must appear exactly as shown.

Name: memory:BootObject

This identifies the section in the signer's information file corresponding to the section with the same name in the manifest file described earlier. The string "memory:BootObject" must appear exactly as shown.

Digest-Algorithms: SHA-1

This enumerates the digest algorithms for which integrity data is included for the corresponding manifest section. Strings identifying digest algorithms are the same as in the manifest file. The digest algorithms specified here must match those specified in the manifest file. For every digest algorithm XXX listed, there must also be a corresponding XXX-Digest line.

SHA-1-Digest: (base-64 representation of a SHA-1 digest of the corresponding manifest section)

Gives the corresponding digest value for the corresponding manifest section. The value is base-64 encoded. Note that for the purpose of computing the hash of the manifest section, the manifest section starts at the beginning of the opening “Name:” keyword and continues up to, but not including, the next section's “Name:” keyword or the end-of-file. Thus the hash includes the blank line(s) at the end of a section and any newline(s) preceding the next “Name:” keyword or end-of-file.

//**********************************************************
// Signature Block File Example
//**********************************************************

A signature block file is a raw binary file (not base-64 encoded) that is a PKCS#7 defined format signature block. The signature block covers exactly the contents of the signer's information file. There must be a correspondence between the name of the signer's information file and the signature block file. The base name matches, and the three-character extension is modified to reflect the signature algorithm used according to the following rules:

- DSA signature algorithm (which uses SHA-1 hash): extension is DSA.
- RSA signature algorithm with MD5 hash: extension is RSA.

So for example with a signer's information file name of “myinfo.SF,” the corresponding DSA signature block file name would be “myinfo.DSA.”

The format of a signature block file is defined in [PKCS].

Description

This function verifies the integrity and authorization of the indicated data object according to the indicated credentials. The rules for successful verification depend on whether or not a Boot Authorization Check is currently required on this platform.

If a Boot Authorization Check is not currently required on this platform, no authorization check is performed. However, the following rules are applied for an integrity check:

- In this case, the credentials are optional. If they are not supplied (Credentials.Data is NULL), no integrity check is performed, and the function returns immediately with a “success” indication and IsVerified is TRUE.
If the credentials are supplied (Credentials.Data is other than NULL), integrity checks are performed as follows:

- Verify the credentials – The credentials parameter is a valid signed Manifest, with a single signer. The signer’s identity is included in the credential as a certificate.
- Verify the data object – The Manifest must contain a section named “memory:BootObject,” with associated verification information (in other words, hash value). The hash value from this Manifest section must match the hash value computed over the specified DataObject data.
- If these checks succeed, the function returns with a “success” indication and IsVerified is TRUE. Otherwise, IsVerified is FALSE and the function returns with a “security violation” indication.

If a Boot Authorization Check is currently required on this platform, authorization and integrity checks are performed. The integrity check is the same as in the case above, except that it is required. The following rules are applied:

- Verify the credentials – The credentials parameter is required in this case (Credentials.Data must be other than NULL). The credentials parameter is a valid Signed Manifest, with a single signer. The signer’s identity is included in the credential as a certificate.
- Verify the data object – The Manifest must contain a section named “memory:BootObject,” with associated verification information (in other words, hash value). The hash value from this Manifest section must match the hash value computed over the specified DataObject data.
- Do Authorization check – This happens one of two ways depending on whether or not the platform currently has a Boot Object Authorization Certificate configured.
  - If a Boot Object Authorization Certificate is not currently configured, this function interacts with the user in a platform-specific way to determine whether the operation should succeed.
  - If a Boot Object Authorization Certificate is currently configured, this function uses the Boot Object Authorization Certificate to determine whether the operation should succeed. The public key certified by the signer’s certificate must match the public key in the Boot Object Authorization Certificate configured for this platform. The match must be direct, that is, the signature authority cannot be delegated along a certificate chain.
- If these checks succeed, the function returns with a “success” indication and IsVerified is TRUE. Otherwise, IsVerified is FALSE and the function returns with a “security violation” indication.

Note that if a Boot Authorization Check is currently required on this platform this function always performs an authorization check, either through platform-specific user interaction or through a signature generated with the private key corresponding to the public key in the platform’s Boot Object Authorization Certificate.

EFI_BIS_PROTOCOL.VerifyObjectWithCredential()

Summary
Verifies the integrity and authorization of the indicated data object according to the indicated credentials and authority certificate.
Prototype

typedef
EFI_STATUS
(EFIAPI *EFI_BIS_VERIFY_OBJECT_WITH_CREDENTIAL)(
    IN BIS_APPLICATION_HANDLE AppHandle,
    IN EFI_BIS_DATA *Credentials,
    IN EFI_BIS_DATA *DataObject,
    IN EFI_BIS_DATA *SectionName,
    IN EFI_BIS_DATA *AuthorityCertificate,
    OUT BOOLEAN *IsVerified
);

Parameters

AppHandle An opaque handle that identifies the caller’s instance of initialization of the BIS service. Type BIS_APPLICATION_HANDLE is defined in the Initialize() function description.

Credentials A Signed Manifest containing verification information for the indicated data object. The Manifest signature itself must meet the requirements described below. The required syntax of the Signed Manifest is described in the Related Definition of Manifest Syntax below. Type EFI_BIS_DATA is defined in the Initialize() function description.

DataObject An in-memory copy of the raw data object to be verified. Type EFI_BIS_DATA is defined in the Initialize() function description.

SectionName An ASCII string giving the section name in the manifest holding the verification information (in other words, hash value) that corresponds to DataObject. Type EFI_BIS_DATA is defined in the Initialize() function description.

AuthorityCertificate A digital certificate whose public key must match the signer’s public key which is found in the credentials. This parameter is optional (AuthorityCertificate.Data may be NULL). Type EFI_BIS_DATA is defined in the Initialize() function description.

IsVerified The function writes TRUE if the verification was successful. Otherwise, the function writes FALSE.

Related Definitions

//**********************************************************
// Manifest Syntax
//**********************************************************

The Signed Manifest consists of three parts grouped together into an Electronic Shrink Wrap archive as described in [SM spec]: a manifest file, a signer’s information file, and a signature block file. These three parts along with examples are described in the following sections. In these examples, text in parentheses
is a description of the text that would appear in the signed manifest. Text outside of parentheses must appear exactly as shown. Also note that manifest files and signer’s information files must conform to a 72-byte line-length limit. Continuation lines (lines beginning with a single “space” character) are used for lines longer than 72 bytes. The examples given here follow this rule for continuation lines.

Note that the manifest file and signer’s information file parts of a Signed Manifest are ASCII text files. In cases where these files contain a base-64 encoded string, the string is an ASCII string before base-64 encoding.

//**********************************************************
// Manifest File Example
//**********************************************************

The manifest file must include a section referring to a memory-type data object with the caller-chosen name as shown in the example below. This data object is the Data Object to be verified. An example manifest file is shown below.

**Manifest-Version**: 2.0  
**ManifestPersistentId**: (base-64 representation of a unique GUID)

**Name**: (a memory-type data object name)  
**Digest-Algorithms**: SHA-1  
**SHA-1-Digest**: (base-64 representation of a SHA-1 digest of the data object)

A line-by-line description of this manifest file is as follows.

**Manifest-Version**: 2.0  
This is a standard header line that all signed manifests have. It must appear exactly as shown.

**ManifestPersistentId**: (base-64 representation of a unique GUID)

The left-hand string must appear exactly as shown. The right-hand string must be a unique GUID for every manifest file created. The Win32 function UuidCreate() can be used for this on Win32 systems. The GUID is a binary value that must be base-64 encoded. Base-64 is a simple encoding scheme for representing binary values that uses only printing characters. Base-64 encoding is described in [BASE-64].

**Name**: (a memory-type data object name)

This identifies the section that carries the integrity data for the target Data Object. The right-hand string must obey the syntax for memory-type references, that is, it is of the form “memory:SomeUniqueName.” The “memory:” part of this string must appear exactly. The “SomeUniqueName” part is chosen by the caller. It must be unique within the section names in this manifest file. The entire “memory:SomeUniqueName” string must match exactly the corresponding string in the signer’s information file described below. Furthermore, this entire string must match the value given for the SectionName parameter to this function. Note that the target Data Object cannot be found directly from this manifest. A caller verifying the Data Object integrity must load the Data Object into memory and specify its memory location explicitly to this verification function through the DataObject parameter.

**Digest-Algorithms**: SHA-1
This enumerates the digest algorithms for which integrity data is included for the data object. For systems with DSA signing, SHA-1 hash, and 1024-bit key length, the digest algorithm must be “SHA-1.” For systems with RSA signing, MD5 hash, and 512-bit key length, the digest algorithm must be “MD5.” Multiple algorithms can be specified as a whitespace-separated list. For every digest algorithm listed, there must also be a corresponding `XXX-Digest` line.

**SHA-1-Digest:** (base-64 representation of a SHA-1 digest of the data object)

Gives the corresponding digest value for the data object. The value is base-64 encoded.

```plaintext
//**********************************************************
// Signer's Information File Example
//**********************************************************
```

The signer’s information file must include a section whose name matches the reserved data object section name of the section in the Manifest file. This section in the signer’s information file carries the integrity data for the corresponding section in the manifest file. An example signer’s information file is shown below.

```plaintext
Signature-Version: 2.0
SignerInformationPersistentId: (base-64 representation of a unique GUID)
SignerInformationName: BIS_VerifiableObjectSignerInfoName
Name: (a memory-type data object name)
Digest-Algorithms: SHA-1
SHA-1-Digest: (base-64 representation of a SHA-1 digest of the corresponding manifest section)
```

A line-by-line description of this signer’s information file is as follows.

**Signature-Version: 2.0**

This is a standard header line that all signed manifests have. It must appear exactly as shown.

**SignerInformationPersistentId:** (base-64 representation of a unique GUID)

The left-hand string must appear exactly as shown. The right-hand string must be a unique GUID for every signer’s information file created. The Win32 function `UuidCreate()` can be used for this on Win32 systems. The GUID is a binary value that must be base-64 encoded. Base-64 is a simple encoding scheme for representing binary values that uses only printing characters. Base-64 encoding is described in [BASE-64].

**SignerInformationName:** BIS_VerifiableObjectSignerInfoName

The left-hand string must appear exactly as shown. The right-hand string must appear exactly as shown.

**Name:** (a memory-type data object name)

This identifies the section in the signer’s information file corresponding to the section with the same name in the manifest file described earlier. The right-hand string must match exactly the corresponding string in the manifest file described above.

**Digest-Algorithms:** SHA-1
This enumerates the digest algorithms for which integrity data is included for the corresponding manifest section. Strings identifying digest algorithms are the same as in the manifest file. The digest algorithms specified here must match those specified in the manifest file. For every digest algorithm XXX listed, there must also be a corresponding XXX-Digest line.

SHA-1-Digest: (base-64 representation of a SHA-1 digest of the corresponding manifest section)

Gives the corresponding digest value for the corresponding manifest section. The value is base-64 encoded. Note that for the purpose of computing the hash of the manifest section, the manifest section starts at the beginning of the opening “Name:” keyword and continues up to, but not including, the next section’s “Name:” keyword or the end-of-file. Thus the hash includes the blank line(s) at the end of a section and any newline(s) preceding the next “Name:” keyword or end-of-file.

//**********************************************************
// Signature Block File Example
//**********************************************************

A signature block file is a raw binary file (not base-64 encoded) that is a PKCS#7 defined format signature block. The signature block covers exactly the contents of the signer’s information file. There must be a correspondence between the name of the signer’s information file and the signature block file. The base name matches, and the three-character extension is modified to reflect the signature algorithm used according to the following rules:

- DSA signature algorithm (which uses SHA-1 hash): extension is DSA.
- RSA signature algorithm with MD5 hash: extension is RSA.

So for example with a signer’s information file name of “myinfo.SF,” the corresponding DSA signature block file name would be “myinfo.DSA.”

The format of a signature block file is defined in [PKCS].

Description

This function verifies the integrity and authorization of the indicated data object according to the indicated credentials and authority certificate.

Both an integrity check and an authorization check are performed. The rules for a successful integrity check are:

- Verify the credentials – The credentials parameter is a valid Signed Manifest, with a single signer. The signer’s identity is included in the credential as a certificate.
- Verify the data object – The Manifest must contain a section with the name as specified by the SectionName parameter, with associated verification information (in other words, hash value). The hash value from this Manifest section must match the hash value computed over the data specified by the DataObject parameter of this function.

The authorization check is optional. It is performed only if the AuthorityCertificate.Data parameter is other than NULL. If it is other than NULL, the rules for a successful authorization check are:

- The AuthorityCertificate parameter is a valid digital certificate. There is no requirement regarding the signer (issuer) of this certificate.
- The public key certified by the signer’s certificate must match the public key in the AuthorityCertificate. The match must be direct, that is, the signature authority cannot be delegated along a certificate chain.

If all of the integrity and authorization check rules are met, the function returns with a “success” indication and IsVerified is TRUE. Otherwise, it returns with a nonzero specific error code and IsVerified is FALSE.

24.6 DHCP options for ISCSI on IPV6

Option 59 is the iSCSI Root path
The format of the root path is

"iscsi:"<servername>":"<protocol>":"<port>":"<LUN>":"<targetname>

This is per the description in IETF RFC 4173. See https://uefi.org/uefi#RFC4173 for a link to this document.

Option 60 is the DHCP Server address.

This is formatted the same as parameter 1 in OPT_BOOTFILE_PARAM (60) of the IPv6 address of the DHCP server (IETF RFC 5970). See https://uefi.org/uefi#RFC5970 for a link to this document.

24.7 HTTP Boot

24.7.1 Boot from URL

Elsewhere in this specification there is defined a discoverable network boot using DHCP as a control channel allowing a firmware client machine export its architecture type, and then have the boot server response with a binary image. For the UEFI architecture types defined in “Links to UEFI-Related Documents” (http://uefi.org/uefi) under the heading “IANA DHCPv6 parameters”, the binary image on the boot service is a UEFI-formatted executable with a machine subsystem type that corresponds to the UEFI firmware on the client machine, or it could be mounted as a RAM disk which contains a UEFI-compliant file system (see Section 13.3). This binary image is often referred to as a “Network Boot Program” (NBP). The UEFI client machine that downloads the NBP uses the IPV4 or IPV6 TFTP protocol to address the indicated server, depending upon if DHCP4 or DHCP6 was used initially, in order to download images such as 64-bit UEFI (type 0x07).

This section defines a related method indicated by other codes in the DHCP options, in which the name and path of the NBP are specified as a URI string in one of several formats specifying protocol and unique name identifying the NBP for the specified protocol. In this method the NBP will be downloaded via IPV4 or IPV6 HTTP protocol if the tag indicates x64 UEFI HTTP Boot (type code 0x0f for x86 and 0x10 for x64).

In the future other protocols such as FTP or NFS could be encoded with both new tag types and corresponding URIs (e.g., ‘ftp:///nbp.efi or nfs:///nbp.efi, respectively). However, assignment of these type codes has not yet occurred.

The rest of this section will describe ‘HTTP Boot’ as one example of ‘boot from URI’. It is expected that the procedure can be extended as additional protocol type codes are defined.

Please reference the definitions of EFI_DNS4_PROTOCOL and EFI_DNS6_PROTOCOL elsewhere in this document. In systems that also support one of both of these protocols, the target URI can be specified using Internet domain name format understood by DNS servers supporting the appropriate RFC specifications.

Also, elsewhere in this document, the PXE2.1 and UEFI2.4 netboot6 sections talk about the ‘boot from TFTP’ method of ‘boot from URI.’

The following RFC documents should be consulted for network message details related to the processes described in this chapter:

1. RFC1034 - "Domain Names - Concepts and Facilities",
2. RFC 1035 - "Domain Names - Implementation and Specification",
24.7.2 Concept configuration for a typical HTTP Boot scenario

HTTP Boot is client-server communication based application. It combines the DHCP, DNS, and HTTP protocols to provide the capability for system deployment and configuration over the network. This new capability can be utilized as a higher-performance replacement for tftp-based PXE boot methods of network deployment.

24.7.2.1 Use in Corporate environment

A typical network configuration which supports UEFI HTTP Boot may involve one or more UEFI client systems, and several server systems. Figure 24-4 show a typical HTTP Boot network topology for a corporate environment.

- **UEFI HTTP Boot Client** initiates the communication between the client and different server system.
- **DHCP server with HTTPBoot extension** for boot service discovery. Besides the standard host configuration information (such as address/subnet/gateway/name-server, etc...), the DHCP
server with the extensions can also provide the discovery of URI locations for boot images on the HTTP server.

- **HTTP server** could be located either inside the corporate environment or across networks, such as on the Internet. The boot resource itself is deployed on the HTTP server. In this example, “http://webserver/boot/boot.efi” is used as the boot resource. Such an application is also called a Network Boot Program (NBP). NBPs are used to setup the client system, which may include installation of an operating system, or running a service OS for maintenance and recovery tasks.

- **DNS server** is optional; and provides standard domain name resolution service.

### 24.7.2.2 Use case in Home environment

In a corporate environment, a standard DHCP server can be enhanced to support the HTTPBoot extension. In a home network, generally only an optional standard DHCP server may be available for host configuration information assignment. Figure 24-5 shows the concept network topology for a typical home PC environment.

![Figure 24-5 HTTP Boot Network Topology Concept2 – Home environments](image)

**UEFI HTTP Boot Client** initiates the communication between the client and different servers. In the home configuration however, the client will expect the boot resource information to be available from a source other than the standard DHCP server, and that source does not typically have HTTPBoot extensions. Instead of DHCP, the boot URI could be created by a UEFI application or extracted from text entered by a user.

**DHCP server** is optional, and if available in the network, provides the standard service to assign host configuration information to the UEFI Client (e.g. address/subnet/gateway/name-server/etc.). In case the standard DHCP server is not available, the same host configuration information should be provided by a UEFI application or extracted from text entered by a user prior to the client initiating the communication.

**DNS Server** is optional, and provides standard domain name resolution service.
24.7.3 Protocol Layout for UEFI HTTP Boot Client concept configuration for a typical HTTP Boot scenario

This figure illustrates the UEFI network layers related to how the HTTP Boot works.

The HTTP Boot driver is layered on top of a UEFI Network stack implementation. It consumes DHCP service to do the Boot service discovery, and DNS service to do domain name resolution if needed. It also consumes HTTP serviced to retrieve images from the HTTP server. The functionality needed in the HTTP Boot scenario is limited to client initiated requests to download the boot image.

TLS is consumed if HTTPS functionality is needed. The TLS design is covered in Section 28.10.2.

The HTTP Boot driver produces **LoadFile** protocol and device path protocol. BDS will provide the boot options for the HTTP Boot. Once a boot option for HTTP boot is executed, a particular network interface is selected. HTTP Boot driver will perform all steps on that interface and it is not required to use other interfaces.
24.7.3.1 Device Path

If both IPv4 and IPv6 are supported, the HTTP Boot driver should create two child handles, with LoadFile and DevicePath installed on each child handle. For the device path, an IP device path node and a BootURI device path are appended to the parent device path, for example:

PciRoot(0x0)/Pci(0x19, 0x0)/MAC(001230F4B4FF, 0x0)/IPv4(0.0.0.0, 0, DHCP, 0.0.0.0, 0.0.0.0, 0.0.0.0)/Uri()
PciRoot(0x0)/Pci(0x19, 0x0)/MAC(001230F4B4FF, 0x0)/IPv6(::/128, 0, Static, ::/128, ::/128, 0)/Uri()

Also, after retrieving the boot resource information and IP address, the BootURI device path node will be updated to include the BootURI information. For example, if the NBP is a UEFI-formatted executable, the device patch will be updated to

PciRoot(0x0)/Pci(0x19, 0x0)/MAC(001230F4B4FF, 0x0)/IPv4(192.168.1.100, TCP, DHCP, 192.168.1.5, 192.168.1.1, 255.255.255.0)/Uri(http://192.168.1.100/shell.efi)
PciRoot(0x0)/Pci(0x19, 0x0)/MAC(001230F4B4FF, 0x0)/IPv6(2015::100, TCP, StatefulAutoConfigure, 2015::5, 2015::10, 64)/Uri(http://2015::100/shell.efi)

These two instances allow for the boot manager to decide a preference of IPv6 versus IPv4.

If the NBP is a binary image which could be mounted as a RAM disk, the device path will be updated to

PciRoot(0x0)/Pci(0x19, 0x0)/MAC(001230F4B4FF, 0x0)/IPv4(192.168.1.100, TCP, DHCP, 192.168.1.5, 192.168.1.1, 255.255.255.0)/Uri(http://192.168.1.100/boot.iso [%])
PciRoot(0x0)/Pci(0x19, 0x0)/MAC(001230F4B4FF, 0x0)/IPv6(2015::100, TCP, StatefulAutoConfigure, 2015::5, 2015::10, 64)/Uri(http://2015::100/boot.iso)

In this case, the HTTP Boot driver will register RAM disk with the downloaded NBP, by appending a RamDisk device node to the device path above, like

PciRoot(0x0)/Pci(0x19, 0x0)/MAC(001230F4B4FF, 0x0)/IPv4(192.168.1.100, TCP, DHCP, 192.168.1.5, 192.168.1.1, 255.255.255.0)/Uri(http://192.168.1.100/boot.iso)/RamDisk(0x049EA000, 0x5DEA000, 0, 3D5ABD30-4175-87CE-6D64-D2ADE523C4BB)
PciRoot(0x0)/Pci(0x19, 0x0)/MAC(001230F4B4FF, 0x0)/IPv6(2015::100, TCP, StatefulAutoConfigure, 2015::5, 2015::10, 64)/Uri(http://2015::100/boot.iso)/RamDisk(0x049EA000, 0x5DEA000, 0, 3D5ABD30-4175-87CE-6D64-D2ADE523C4BB)
In some cases, Uri includes a host name and DNS become mandatory for translating the name to the IP address of the host. The HTTP Boot driver may append DNS device path node immediately before Uri device path node, for example:

```
PciRoot(0x0)/Pci(0x19, 0x0)/MAC(001230F4B4FF, 0x0)/IPv4(192.168.1.100, TCP, DHCP, 192.168.1.5, 192.168.1.1, 255.255.255.0)/Dns(192.168.22.100, 192.168.22.101)/Uri(http://www.bootserver.com/boot.iso)/RamDisk(0x049EA000, 0x5DEA000, 0, 3D5ABD30-4175-87CE-6D64-D2ADE523C4BB)
PciRoot(0x0)/Pci(0x19, 0x0)/MAC(001230F4B4FF, 0x0)/IPv6(2015::100, TCP, StatefulAutoConfigure, 2015::5, 2015::10, 64)/Dns(2016::100, 2016::101)/Uri(http://www.bootserver.com/boot.iso)/ RamDisk(0x049EA000, 0x5DEA000, 0, 3D5ABD30-4175-87CE-6D64-D2ADE523C4BB)
```

If HTTP Boot driver cannot obtain the DNS server addresses, it should not append an empty DNS device path node.

The boot manager could use the example device paths to match the device which produces a device path protocol including a URI device path node in the system, without matching the Specific Device Path data in IP device path node and URI device path node, because the IP device path node and URI device path node might be updated by HTTP Boot driver in different scenarios.

The BootURI information could be retrieved from a DHCP server with HTTPBoot extension, or from a boot option which includes a short-form URI device path, or from a boot option which includes a URI device path node, or created by a UEFI application or extracted from text entered by a user.

Once the HTTP Boot driver retrieves the BootURI information from the short-form URI device path, it will perform all other steps for HTTP boot except retrieving the BootURI from DHCP server. Also, when the short-form URI device path is inputted to HTTP Boot driver via LoadFile protocol, the HTTP Boot driver should expand the short-form URI device path to above example device path after retrieving IP address configuration (address, subnet, gateway, and optionally the name-server) from the DHCP server. In case of the home environment with no DHCP server, the same information may be provisioned by OEM or input by the end user through Setup Options. The IP and optional DNS device path nodes, constructed with this information and prefixed to the short-form URI device path, can be inputted to the HTTP Boot driver via LoadFile protocol. The name server information in the form of DNS device path node is optional, and is used only when the BootURI contains the server name or FQDN. The HTTP Boot driver will then consume the information in the device path and initiate the necessary communication.

Once the HTTP Boot driver retrieves the BootURI information from a boot option which includes a URI device path node, it should retrieve the IP address configuration from the IP device path node of the same boot option. If the IP address configuration or BootURI information is empty, the HTTP Boot driver could retrieve the required information from DHCP server. If the IP address configuration or BootURI information is not empty but invalid, the HTTP boot process will fail.

The HTTP Boot block diagram (Figure 24-6) describes a suggested implementation for HTTP Boot. Other implementation can create their own HTTP Netboot Driver which meets the requirements for their netboot methodology.

### 24.7.4 Concept of Message Exchange in a typical HTTP Boot scenario (IPv4 in Corporate Environment)

In summary, the newly installed networked client machine (UEFI HTTP Boot Client) should be able to enter a heterogeneous network, acquire a network address from a DHCP server, and then download an NBP to set itself up.
The concept of HTTP Boot message exchange sequence is as follows. The client initiates the DHCPv4 D.O.R.A process by broadcasting a DHCPDISCOVER containing the extension that identifies the request as coming from a client that implements the HTTP Boot functionality. Assuming that a DHCP server or a Proxy DHCP server implementing this extension is available, after several intermediate steps, besides the standard configuration such as address/subnet/router/dns-server, boot resource location will be provided to the client system in the format of a URI. The URI points to the NBP which is appropriate for this client hardware configuration. A boot option is created, and if selected by the system logic the client then uses HTTP to download the NBP from the HTTP server into memory. Finally, the client executes the downloaded NBP image from memory. This image can then consume other UEFI interfaces for further system setup.
24.7.4.1 Message exchange between EFI Client and DHCP server using DHCP Client Extensions

24.7.4.1.1 Client broadcast
The client broadcasts a DHCP Discover message to the standard DHCP port (67).
An option field in this packet contains the following:

- Fill DHCP option 55 – Parameter Requested List option
  - Address configuration, Server information, Name server, Vendor class identifier
- A DHCP option 97: UUID/GUID-based Client Identifier
- A DHCP option 94: Client Network Identifier Option
  - If support UNDI, fill this option (Refer RFC5970)
- A DHCP option 93: the client system architecture (Refer [Arch-Type])
  - 0x0F - x86 UEFI HTTP Boot
  - 0x10 - x64 UEFI HTTP Boot
- A DHCP option 60, Vendor Class ID, set to “HTTPClient:Arch:XXXX:UNDI:YYYYZZZ”

24.7.4.1.2 DHCP server response
The DHCP server responds by sending DHCPOFFER message on standard DHCP reply port (68).
The HTTP Boot Client may possibly receive multiple DHCPOFFER packets from different sources of DHCP Services, possibly from DHCP Services which recognize the HTTP extensions or from Standard DHCP Services.

A service recognizing HTTP extensions must respond with an offer that has Option 60 (Vendor class identifier) parameter set to “HTTPClient”, in response to the Vendor class identifier requested in option 55 in the DHCP Discover message.

Each message contains standard DHCP parameters: an IP address for the client and any other parameters that the administrator might have configured on the DHCP or Proxy DHCP Service. The DHCP service or Proxy DHCP which recognizes the HTTPBoot extension will provide DHCPOFFER with HTTPClient extensions. If this is a Proxy DHCP service, then the client IP address field is (0.0.0.0). If this is from a DHCP service, then the returned client IP address field is valid.

From the received DHCPOFFER(s), the client records the information as follows:

- Client IP address (and other parameters) offered by a standard DHCP/BOOTP services.
- If Boot URI information is provided thru ‘file’ field in DHCP Header or option 67, then the client will record the information as well.
- Optional Name-server information if URI is displayed using domain-name

**Timeout**: After Client sent out the DHCP Discover packet, the Client will wait for a timeout to collect enough DHCP Offers. If failed to retrieve all the required information, the DHCP Discover will be retried, at most four times. The four timeout mechanisms is 4, 8, 16 and 32 seconds respectively,

**Priority**: Among all the received DHCPOFFERs, the Priority is considered as follows:
Priority 1
Choose the DHCPOFFER that provides all required information:

<IP address configuration, Boot URI configuration, Name-server configuration (if domain-name used in Boot URI)>

If Boot URI and IP address configuration provided in different DHCPOFFER, Using 5 DHCPOFFER as example for priority description

- Packet1 – DHCPOFFER, provide <IP address configuration, Name server>
- Packet2 – DHCPOFFER, provide <IP address configuration>
- Packet3 – DHCPOFFER, provide <domain-name expressed URI>
- Packet4 – DHCPOFFER, provide <IP address expressed URI>
- Packet5 – DHCPOFFER, provide <IP address, domain-name expressed URI>

Then,

Priority 2
Choose the DHCPOFFER from different packet, firstly find out URI info represented in IP address mode, then choose DHCPOFFER which provide IP address configuration

In this example, the chosen DHCPOFFER packet is packet4 + packet1 / packet2 (packet 1/2 take same priority, implementation can make its own implementation choice)

Priority 3
Choose the DHCPOFFER from different packet, firstly find out URI info represented in domain-name mode, then choose DHCPOFFER which provide <IP address configuration, domain-name expressed URI>

In this example, the chosen DHCPOFFER packet is packet3 / packet5 + packet1

Note: If packet5, then client IP address assigned by Packet5 will be override by IP address in packet1.

Priority 4
If failed to retrieve <Boot URI / IP address / (on-demand) Name-server> information through all received DHCPOFFERs, this is deemed as FAILED-CONFIGURATION

Assuming the boot image is in the boot subdirectory of the web server root, the supported URI could be one of below formats. [RFC3986] where ‘/boot/’ is replaced by administrator-created directory, and ‘image’ is the file name of the NBP.

http://reg-name:port/boot/image
http://ipv4address:port/boot/image
http://ipv6address:port/boot/image

In the URL example, Port is optional if web service is provided through port 80 for the HTTP data transfer. Commonly, the reg-name use DNS as name registry mechanism.

After retrieving the boot URI through Section 24.7.3.1, if IP address (either IPv4 or IPv6 address) is provided, the HTTP Boot Client can directly use that address for next step HTTP transfer. If a reg-name is
provided in the URI, the HTTP Boot Client driver need initiate DNS process (Section 24.7.4.3) to resolve its IP address.

24.7.4.1.3 DHCP Request

The HTTP Boot Client selects an IP address offered by a DHCP Service, and then it completes the standard DHCP protocol by sending a DHCP Request packet for the address to the DHCP Server and waiting for acknowledgement from the DHCP server.

24.7.4.1.4 DHCP ACK

The server acknowledges the IP address by sending DHCP ACK packet to the client.

24.7.4.2 Message exchange between UEFI Client and DHCP server not using DHCP Client Extensions

In a home environment, because the Boot URI Information will not be provided by the DHCP Offers, we need other channels to provide this information. The implementation suggestion is provisioning this information by OEM or input by end user through Setup Options, henceforth, the UEFI Boot Client already know the Boot URI before contacting the DHCP server.

The message exchange between the EFI Client and DHCP server will be standard DHCP D.O.R.A to obtain <IP address, Name-server>.

In the case of a home environment without a DHCP server, the above message exchange is not needed, and the UEFI HTTP Boot Client will have the <IP address, Name-server> provisioned by OEM or input by the end user through Setup Options.

24.7.4.3 Message in DNS Query/Reply

The DNS Query/Reply is a standard process defined in DNS Protocol [RFC 1034, RFC 1035]. Multiple IP address might be retrieved from the DNS process. It’s the HTTP Boot Client driver’s responsibility to select proper IP address automatically or expose user interface for customer to decide proper IP address.

24.7.4.4 Message in HTTP Download

In the HTTP Boot scenario, HTTP GET message is used to get image from the Web server.

24.7.5 Concept of Message Exchange in HTTP Boot scenario (IPv6)

24.7.5.1 Message exchange between EFI Client and DHCPv6 server with DHCP Client extensions

24.7.5.1.1 Client multicast a DHCPv6 Solicit message to the standard DHCPv6 port (547).

Besides the options required for address auto-configuration, option field in this packet also contains the following:

- Fill DHCPv6 Option 6 – Option Request Option
  - Request server to supply option 59 (OPT_BOOTFILE_URL), option 60 (OPT_BOOTFILE_PARAM), option 23 (OPT_DNS_SERVERS), option 16 (OPTION_VENDOR_CLASS).
• A DHCPv6 option 1, Client identifier
• A DHCPv6 option 16, Vendor Class ID, set to “HTTPClient:Arch:XXXX:UNDI:YYYYZZZ”
• A DHCPv6 option 61: the client system architecture (Refer [Arch-Type])
  — 0x0F - x86 UEFI HTTP Boot
  — 0x10 - x64 UEFI HTTP Boot
• A DHCPv6 option 62: Client Network Identifier Option
  — If support UNDI, fill this option (Refer RFC5970)

24.7.5.1.2 Server unicast DHCPv6 Advertisement to the Client to the DHCPv6 port (546).

The HTTP Boot Client will receive multiple advertisements from different sources of DHCPv6 Services, possibly from DHCPv6 Services which recognize the HTTP extensions or from Standard DHCPv6 Services. A DHCPv6 service recognizing HTTP extensions must respond with an Advertisement that has Option 16 (OPTION_VENDOR_CLASS) parameter set to “HTTPClient”, in response to the OPTION_VENDOR_CLASS requested in Option 6 in the DHCPv6 Solicit message.

Each message contains standard DHCP parameters: Identify Association (IA) option which conveys information including <IP address, lifetime, etc...>. Name server option conveys the DNS server address. The DHCP service or Proxy DHCP which recognizes the HTTPBoot extension will provide DHCPv6 Advertisement with HTTPClient extensions, including Boot URI and Optional Boot Parameters.

From the received DHCPOFFER(s), the client records the information as follows:
• Client IP address (and other parameters) provide through IA option
• Boot URI provided thru option 59
• Optional BootFile Parameter provided through option 60 (if no other parameter needed for this boot URI, this option can be eliminated)
• Optional Name-server information provided through option 23, if URI is displayed using domain-name.

24.7.5.1.3 Client multicast DHCPv6 Request to the selected DHCP Advertisement to confirm the IP address assigned by that server

This packet is the same with the DHCPv6 Solicit packet except for the message type is Request.

24.7.5.1.4 Server unicast the DHCPv6 Reply to acknowledge the Client IP address for the UEFI HTTP Client.

24.7.5.2 Message exchange between UEFI Client and DHCPv6 server not using DHCP Client Extensions

In a home environment, the Boot URI Information will not be provided by the DHCPv6 Offers, we need other channels to provide this information. Like what is described in Section 24.7.4.2, the implementation suggestion is provisioning this information by OEM or input by end user through Setup Options, henceforth, the UEFI Boot Client already know the Boot URI before contacting the DHCP server.

The message exchange between the EFI Client and DHCP server will be standard DHCP S.A.R.R. to obtain <IP address, Name-server>.
In the case of a home environment without a DHCPv6 server, the above message exchange is not needed, and the UEFI HTTP Boot Client will have the <IP address, Name-server> provisioned by OEM or input by the end user through Setup Options.

24.7.5.3 Message exchange between UEFI Client and DNS6 server
The DNS Query/Reply for domain name resolution is the same process as described in Section 24.7.4.3.

24.7.5.4 Message in HTTP Download
HTTP Download process is the same process as described in Section 24.7.4.4.

24.7.6 EFI HTTP Boot Callback Protocol
This section defines the EFI HTTP Boot Callback Protocol that is invoked when the HTTP Boot driver is about to transmit or has received a packet. The EFI HTTP Boot Callback Protocol must be installed on the same handle as the Load File Protocol for the HTTP Boot.

EFI_HTTP_BOOT_CALLBACK_PROTOCOL

Summary
Protocol that is invoked when the HTTP Boot driver is about to transmit or has received a packet.

GUID
#define EFI_HTTP_BOOT_CALLBACK_PROTOCOL_GUID
{0xba23b311, 0x343d, 0x11e6, {0x91, 0x85, 0x58, 0x20, 0xb1, 0xd6, 0x52, 0x99}}

Protocol Interface Structure
typedef struct _EFI_HTTP_BOOT_CALLBACK_PROTOCOL {
    EFI_HTTP_BOOT_CALLBACK       Callback;
} EFI_HTTP_BOOT_CALLBACK_PROTOCOL;

Parameters
Callback                Callback routine used by the HTTP Boot driver.

EFI_HTTP_BOOT_CALLBACK_PROTOCOL.Callback()

Summary
Callback function that is invoked when the HTTP Boot driver is about to transmit or has received a packet.

Prototype
typedef
EFI_STATUS
(EIFIAPI *EFI_HTTP_BOOT_CALLBACK) (
    IN EFI_HTTP_BOOT_CALLBACK_PROTOCOL*This,
IN EFI_HTTP_BOOT_CALLBACK_DATA_TYPE DataType,
IN BOOLEAN Received,
IN UINT32 DataLength,
IN VOID *Data OPTIONAL
);

Parameters
This Pointer to the EFI_HTTP_BOOT_CALLBACK_PROTOCOL instance.
DataType The event that occurs in the current state. Type EFI_HTTP_BOOT_CALLBACK_DATA_TYPE is defined below.
Received TRUE if the callback is being invoked due to a receive event. FALSE if the callback is being invoked due to a transmit event.
DataLength The length in bytes of the buffer pointed to by Data.
Data A pointer to the buffer of data, the data type is specified by DataType.

Related Definitions
//**********************************************
// EFI_HTTP_BOOT_CALLBACK_DATA_TYPE
//**********************************************
typedef enum {
    HttpBootDhcp4,
    HttpBootDhcp6,
    HttpBootHttpRequest,
    HttpBootHttpResponse,
    HttpBootHttpEntityBody,
    HttpBootTypeMax
} EFI_HTTP_BOOT_CALLBACK_DATA_TYPE;

HttpBootDhcp4 Data points to a DHCP4 packet which is about to transmit or has received.
HttpBootDhcp6 Data points to a DHCP6 packet which is about to be transmit or has received.
HttpBootHttpRequestData points to an EFI_HTTP_MESSAGE structure, which contains a HTTP request message to be transmitted.
HttpBootHttpResponseData points to an EFI_HTTP_MESSAGE structure, which contains a received HTTP response message.
HttpBootHttpEntityBody Part of the entity body has been received from the HTTP server. Data points to the buffer of the entity body data.

Description
This function is invoked when the HTTP Boot driver is about to transmit or has received packet. Parameters DataType and Received specify the type of event and the format of the buffer pointed to by Data. Due to the polling nature of UEFI device drivers, this callback function should not execute for more than 5 ms.
The returned status code determines the behavior of the HTTP Boot driver.

25 - Network Protocols — Managed Network

25.1 EFI Managed Network Protocol

This chapter defines the EFI Managed Network Protocol. It is split into the following two main sections:

- Managed Network Service Binding Protocol (MNSBP)
- Managed Network Protocol (MNP)

The MNP provides raw (unformatted) asynchronous network packet I/O services. These services make it possible for multiple-event-driven drivers and applications to access and use the system network interfaces at the same time.

EFI_MANAGED_NETWORK_SERVICE_BINDING_PROTOCOL

Summary

The MNSBP is used to locate communication devices that are supported by an MNP driver and to create and destroy instances of the MNP child protocol driver that can use the underlying communications device.

The EFI Service Binding Protocol in Section 2.5.8 defines the generic Service Binding Protocol functions. This section discusses the details that are specific to the MNP.

GUID

```
#define EFI_MANAGED_NETWORK_SERVICE_BINDING_PROTOCOL_GUID \
{0xf36ff770,0xa7e1,0x42cf,\ 
 {0x9e,0xd2,0x56,0xf0,0xf2,0x71,0xf4,0x4c}}
```

Description

A network application (or driver) that requires shared network access can use one of the protocol handler services, such as `BS->LocateHandleBuffer()`, to search for devices that publish an MNSBP GUID. Each device with a published MNSBP GUID supports MNP and may be available for use.

After a successful call to the `EFI_MANAGED_NETWORK_SERVICE_BINDING_PROTOCOL.CreateChild()` function, the child MNP driver instance is in an unconfigured state; it is not ready to send and receive data packets.

Before a network application terminates execution, every successful call to the `EFI_MANAGED_NETWORK_SERVICE_BINDING_PROTOCOL.CreateChild()` function must be matched with a call to the `EFI_MANAGED_NETWORK_SERVICE_BINDING_PROTOCOL.DestroyChild()` function.

EFI_MANAGED_NETWORK_PROTOCOL

Summary

The MNP is used by network applications (and drivers) to perform raw (unformatted) asynchronous network packet I/O.
GUID

```c
#define EFI_MANAGED_NETWORK_PROTOCOL_GUID
    {0x7ab33a91, 0xace5, 0x4326,
     {0xb5, 0x72, 0xe7, 0xee, 0x33, 0xd3, 0x9f, 0x16}}
```

Protocol Interface Structure

```c
typedef struct _EFI_MANAGED_NETWORK_PROTOCOL {
    EFI_MANAGED_NETWORK_GET_MODE_DATA GetModeData;
    EFI_MANAGED_NETWORK_CONFIGURE Configure;
    EFI_MANAGED_NETWORK_MCAST_IP_TO_MAC McastIpToMac;
    EFI_MANAGED_NETWORK_GROUPS Groups;
    EFI_MANAGED_NETWORK_TRANSMIT Transmit;
    EFI_MANAGED_NETWORK_RECEIVE Receive;
    EFI_MANAGED_NETWORK_CANCEL Cancel;
    EFI_MANAGED_NETWORK_POLL Poll;
} EFI_MANAGED_NETWORK_PROTOCOL;
```

Parameters

- **GetModeData**: Returns the current MNP child driver operational parameters. May also support returning underlying Simple Network Protocol (SNP) driver mode data. See the `GetModeData()` function description.
- **Configure**: Sets and clears operational parameters for an MNP child driver. See the `Configure()` function description.
- **McastIpToMac**: Translates a software (IP) multicast address to a hardware (MAC) multicast address. This function may be unsupported in some MNP implementations. See the `McastIpToMac()` function description.
- **Groups**: Enables and disables receive filters for multicast addresses. This function may be unsupported in some MNP implementations. See the `Groups()` function description.
- **Transmit**: Places asynchronous outgoing data packets into the transmit queue. See the `Transmit()` function description.
- **Receive**: Places an asynchronous receiving request into the receiving queue. See the `Receive()` function description.
- **Cancel**: Aborts a pending transmit or receive request. See the `Cancel()` function description.
- **Poll**: Polls for incoming data packets and processes outgoing data packets. See the `Poll()` function description.

Description

The services that are provided by MNP child drivers make it possible for multiple drivers and applications to send and receive network traffic using the same network device.
Before any network traffic can be sent or received, the
`EFI_MANAGED_NETWORK_PROTOCOL.Configure()` function must initialize the operational
parameters for the MNP child driver instance. Once configured, data packets can be received and sent
using the following functions:

- `EFI_MANAGED_NETWORK_PROTOCOL.Transmit()`
- `EFI_MANAGED_NETWORK_PROTOCOL.Receive()`
- `EFI_MANAGED_NETWORK_PROTOCOL.Poll()`

**EFI_MANAGED_NETWORK_PROTOCOL.GetModeData()**

**Summary**
Returns the operational parameters for the current MNP child driver. May also support returning the
underlying SNP driver mode data.

**Prototype**

```c
typedef
EFI_STATUS
(EIFIAPI *EFI_MANAGED_NETWORK_GET_MODE_DATA) (  
    IN EFI_MANAGED_NETWORK_PROTOCOL *This,
    OUT EFI_MANAGED_NETWORK_CONFIG_DATA *MnpConfigData OPTIONAL,
    OUT EFI_SIMPLE_NETWORK_MODE *SnpModeData OPTIONAL
  )
;
```

**Parameters**

- **This**
  Pointer to the `EFI_MANAGED_NETWORK_PROTOCOL` instance.
- **MnpConfigData**
  Pointer to storage for MNP operational parameters. Type
  `EFI_MANAGED_NETWORK_CONFIG_DATA` is defined in “Related
  Definitions” below.
- **SnpModeData**
  Pointer to storage for SNP operational parameters. This
  feature may be unsupported. Type
  `EFI_SIMPLE_NETWORK_MODE` is defined in the
  `EFI_SIMPLE_NETWORK_PROTOCOL`.

**Description**
The `GetModeData()` function is used to read the current mode data (operational parameters) from the
MNP or the underlying SNP.
ReceivedQueueTimeoutValue
Timeout value for a UEFI one-shot timer event. A packet that has not been removed from the MNP receive queue by a call to `EFI_MANAGED_NETWORK_PROTOCOL.Poll()` will be dropped if its receive timeout expires. If this value is zero, then there is no receive queue timeout. If the receive queue fills up, then the device receive filters are disabled until there is room in the receive queue for more packets. The startup default value is 10,000,000 (10 seconds).

TransmitQueueTimeoutValue
Timeout value for a UEFI one-shot timer event. A packet that has not been removed from the MNP transmit queue by a call to `EFI_MANAGED_NETWORK_PROTOCOL.Poll()` will be dropped if its transmit timeout expires. If this value is zero, then there is no transmit queue timeout. If the transmit queue fills up, then the `EFI_MANAGED_NETWORK_PROTOCOL.Transmit()` function will return `EFI_NOT_READY` until there is room in the transmit queue for more packets. The startup default value is 10,000,000 (10 seconds).

ProtocolTypeFilter
Ethernet type II 16-bit protocol type in host byte order. Valid values are zero and 1,500 to 65,535. Set to zero to receive packets with any protocol type. The startup default value is zero.

EnableUnicastReceive
Set to `TRUE` to receive packets that are sent to the network device MAC address. The startup default value is `FALSE`. 
EnableMulticastReceive  
Set to TRUE to receive packets that are sent to any of the active multicast groups. The startup default value is FALSE.

EnableBroadcastReceive  
Set to TRUE to receive packets that are sent to the network device broadcast address. The startup default value is FALSE.

EnablePromiscuousReceive  
Set to TRUE to receive packets that are sent to any MAC address. Note that setting this field to TRUE may cause packet loss and degrade system performance on busy networks. The startup default value is FALSE.

FlushQueuesOnReset  
Set to TRUE to drop queued packets when the configuration is changed. The startup default value is FALSE.

EnableReceiveTimestamps  
Set to TRUE to timestamp all packets when they are received by the MNP. Note that timestamps may be unsupported in some MNP implementations. The startup default value is FALSE.

DisableBackgroundPolling  
Set to TRUE to disable background polling in this MNP instance. Note that background polling may not be supported in all MNP implementations. The startup default value is FALSE, unless background polling is not supported.

**EFI_MANAGED_NETWORK_PROTOCOL.Configure()**

**Summary**

Sets or clears the operational parameters for the MNP child driver.
Prototype

typedef

EFI_STATUS

(EIFIAPI *EFI_MANAGED_NETWORK_CONFIGURE) (

IN EFI_MANAGED_NETWORK_PROTOCOL *This,

IN EFI_MANAGED_NETWORK_CONFIG_DATA *MnpConfigData OPTIONAL

);

Parameters

This Pointer to the EFI_MANAGED_NETWORK_PROTOCOL instance.

MnpConfigData Pointer to configuration data that will be assigned to the MNP child driver instance. If NULL, the MNP child driver instance is reset to startup defaults and all pending transmit and receive requests are flushed. Type EFI_MANAGED_NETWORK_CONFIG_DATA is defined in EFI_MANAGED_NETWORK_PROTOCOL.GetModeData().

Description

The Configure() function is used to set, change, or reset the operational parameters for the MNP child driver instance. Until the operational parameters have been set, no network traffic can be sent or received by this MNP child driver instance. Once the operational parameters have been reset, no more traffic can be sent or received until the operational parameters have been set again.

Each MNP child driver instance can be started and stopped independently of each other by setting or resetting their receive filter settings with the Configure() function.

After any successful call to Configure(), the MNP child driver instance is started. The internal periodic timer (if supported) is enabled. Data can be transmitted and may be received if the receive filters have also been enabled.

Note: If multiple MNP child driver instances will receive the same packet because of overlapping receive filter settings, then the first MNP child driver instance will receive the original packet and additional instances will receive copies of the original packet.

Note: Warning: Receive filter settings that overlap will consume extra processor and/or DMA resources and degrade system and network performance.

### EFI_MANAGED_NETWORK_PROTOCOL.McastIpToMac()

#### Summary
Translates an IP multicast address to a hardware (MAC) multicast address. This function may be unsupported in some MNP implementations.

#### Prototype

```c
typedef EFI_STATUS (EFIAPI *EFI_MANAGED_NETWORK_MCAST_IP_TO_MAC) (  
    IN EFI_MANAGED_NETWORK_PROTOCOL *This,  
    IN BOOLEAN Ipv6Flag,  
    IN EFI_IP_ADDRESS *IpAddress,  
    OUT EFI_MAC_ADDRESS *MacAddress  
);
```

#### Parameters

- **This** Pointer to the **EFI_MANAGED_NETWORK_PROTOCOL** instance.
- **Ipv6Flag** Set to **TRUE** if **IpAddress** is an IPv6 multicast address. Set to **FALSE** if **IpAddress** is an IPv4 multicast address.
- **IpAddress** Pointer to the multicast IP address (in network byte order) to convert.
- **MacAddress** Pointer to the resulting multicast MAC address.

#### Description
The **McastIpToMac()** function translates an IP multicast address to a hardware (MAC) multicast address.

This function may be implemented by calling the underlying **EFI_SIMPLE_NETWORK.MCastIpToMac()** function, which may also be unsupported in some MNP implementations.

**EFI_MANAGED_NETWORK_PROTOCOL.Groups()**

**Summary**
Enables and disables receive filters for multicast address. This function may be unsupported in some MNP implementations.

**Prototype**

```c
typedef EFI_STATUS
(EFIAPI *EFI_MANAGED_NETWORK_GROUPS) (  
    IN EFI_MANAGED_NETWORK_PROTOCOL  *This,  
    IN BOOLEAN            JoinFlag,  
    IN EFI_MAC_ADDRESS    *MacAddress OPTIONAL  
);
```

**Parameters**

- **This**
  Pointer to the EFI_MANAGED_NETWORK_PROTOCOL instance.
- **JoinFlag**
  Set to TRUE to join this multicast group.
  Set to FALSE to leave this multicast group.
- **MacAddress**
  Pointer to the multicast MAC group (address) to join or leave.

**Description**
The Groups() function only adds and removes multicast MAC addresses from the filter list. The MNP driver does not transmit or process Internet Group Management Protocol (IGMP) packets.
If JoinFlag is FALSE and MacAddress is NULL, then all joined groups are left.

**EFI_MANAGED_NETWORK_PROTOCOL.Transmit()**

**Summary**
Places asynchronous outgoing data packets into the transmit queue.

**Prototype**

```c
typedef
EFI_STATUS
(EIFIAPI *EFI_MANAGED_NETWORK_TRANSMIT) (  
    IN EFI_MANAGED_NETWORK_PROTOCOL  *This,
    IN EFI_MANAGED_NETWORK_COMPLETION_TOKEN  *Token
);
```

**Parameters**

- **This**  
  Pointer to the **EFI_MANAGED_NETWORK_PROTOCOL** instance.

- **Token**  
  Pointer to a token associated with the transmit data descriptor. Type **EFI_MANAGED_NETWORK_COMPLETION_TOKEN** is defined in “Related Definitions” below.

**Description**

The **Transmit()** function places a completion token into the transmit packet queue. This function is always asynchronous.

The caller must fill in the **Token.Event** and **Token.TxData** fields in the completion token, and these fields cannot be **NULL**. When the transmit operation completes, the MNP updates the **Token.Status** field and the **Token.Event** is signaled.
**Note:** There may be a performance penalty if the packet needs to be defragmented before it can be transmitted by the network device. Systems in which performance is critical should review the requirements and features of the underlying communications device and drivers.

**Related Definitions**

```c
// *******************************************************
// EFI_MANAGED_NETWORK_COMPLETION_TOKEN
// *******************************************************
typedef struct {
    EFI_EVENT Event;
    EFI_STATUS Status;
    union {
        EFI_MANAGED_NETWORK_RECEIVE_DATA *RxData;
        EFI_MANAGED_NETWORK_TRANSMIT_DATA *TxData;
    }
    Packet;
} EFI_MANAGED_NETWORK_COMPLETION_TOKEN;
```

- **Event**: This *Event* will be signaled after the *Status* field is updated by the MNP. The type of *Event* must be *EVT_NOTIFY_SIGNAL*. The Task Priority Level (TPL) of *Event* must be lower than or equal to *TPL_CALLBACK*.

- **Status**: This field will be set to one of the following values:
  - *EFI_SUCCESS*: The receive or transmit completed successfully.
  - *EFI_ABORTED*: The receive or transmit was aborted.
  - *EFI_TIMEOUT*: The transmit timeout expired.
  - *EFI_DEVICE_ERROR*: There was an unexpected system or network error.
  - *EFI_NO_MEDIA*: There was a media error

- **RxData**: When this token is used for receiving, *RxData* is a pointer to the *EFI_MANAGED_NETWORK_RECEIVE_DATA*.

- **TxData**: When this token is used for transmitting, *TxData* is a pointer to the *EFI_MANAGED_NETWORK_TRANSMIT_DATA*.

The *EFI_MANAGED_NETWORK_COMPLETION_TOKEN* structure is used for both transmit and receive operations.

When it is used for transmitting, the *Event* and *TxData* fields must be filled in by the MNP client. After the transmit operation completes, the MNP updates the *Status* field and the *Event* is signaled.

When it is used for receiving, only the *Event* field must be filled in by the MNP client. After a packet is received, the MNP fills in the *RxData* and *Status* fields and the *Event* is signaled.
typedef struct {
  EFI_TIME   Timestamp;
  EFI_EVENT  RecycleEvent;
  UINT32     PacketLength;
  UINT32     HeaderLength;
  UINT32     AddressLength;
  UINT32     DataLength;
  BOOLEAN    BroadcastFlag;
  BOOLEAN    MulticastFlag;
  BOOLEAN    PromiscuousFlag;
  UINT16     ProtocolType;
  VOID       *DestinationAddress;
  VOID       *SourceAddress;
  VOID       *MediaHeader;
  VOID       *PacketData;
} EFI_MANAGED_NETWORK_RECEIVE_DATA;

Timestamp       System time when the MNP received the packet. Timestamp is zero filled if receive timestamps are disabled or unsupported.
RecycleEvent    MNP clients must signal this event after the received data has been processed so that the receive queue storage can be reclaimed. Once RecycleEvent is signaled, this structure and the received data that is pointed to by this structure must not be accessed by the client.
PacketLength    Length of the entire received packet (media header plus the data).
HeaderLength    Length of the media header in this packet.
AddressLength   Length of a MAC address in this packet.
DataLength      Length of the data in this packet.
BroadcastFlag   Set to TRUE if this packet was received through the broadcast filter. (The destination MAC address is the broadcast MAC address.)
MulticastFlag   Set to TRUE if this packet was received through the multicast filter. (The destination MAC address is in the multicast filter list.)
PromiscuousFlag Set to TRUE if this packet was received through the promiscuous filter. (The destination address does not match any of the other hardware or software filter lists.)
ProtocolType    16-bit protocol type in host byte order. Zero if there is no protocol type field in the packet header.
DestinationAddress Pointer to the destination address in the media header.
SourceAddress  Pointer to the source address in the media header.
MediaHeader    Pointer to the first byte of the media header.
PacketData     Pointer to the first byte of the packet data (immediately following media header).

An EFI_MANAGED_NETWORK_RECEIVE_DATA structure is filled in for each packet that is received by the MNP.

If multiple instances of this MNP driver can receive a packet, then the receive data structure and the received packet are duplicated for each instance of the MNP driver that can receive the packet.

```c
// EFI_MANAGED_NETWORK_TRANSMIT_DATA
typedef struct {
  EFI_MAC_ADDRESS *DestinationAddress OPTIONAL;
  EFI_MAC_ADDRESS *SourceAddress OPTIONAL;
  UINT16 ProtocolType OPTIONAL;
  UINT32 DataLength;
  UINT16 HeaderLength OPTIONAL;
  UINT16 FragmentCount;
  EFI_MANAGED_NETWORK_FRAGMENT_DATA FragmentTable[1];
} EFI_MANAGED_NETWORK_TRANSMIT_DATA;
```

DestinationAddress Pointer to the destination MAC address if the media header is not included in FragmentTable[]. If NULL, then the media header is already filled in FragmentTable[].
SourceAddress Pointer to the source MAC address if the media header is not included in FragmentTable[]. Ignored if DestinationAddress is NULL.
ProtocolType The protocol type of the media header in host byte order. Ignored if DestinationAddress is NULL.
DataLength Sum of all FragmentLength fields in FragmentTable[] minus the media header length.
HeaderLength Length of the media header if it is included in the FragmentTable. Must be zero if DestinationAddress is not NULL.
FragmentCount Number of data fragments in FragmentTable[]. This field cannot be zero.
FragmentTable Table of data fragments to be transmitted. The first byte of the first entry in FragmentTable[] is also the first byte of the media header or, if there is no media header, the first byte of payload. Type EFI_MANAGED_NETWORK_FRAGMENT_DATA is defined below.
The **EFI_MANAGED_NETWORK_TRANSMIT_DATA** structure describes a (possibly fragmented) packet to be transmitted.

The `DataLength` field plus the `HeaderLength` field must be equal to the sum of all of the `FragmentLength` fields in the `FragmentTable`.

If the media header is included in `FragmentTable[]`, then it cannot be split between fragments.

```c
typedef struct {
    UINT32    FragmentLength;
    VOID      *FragmentBuffer;
} EFI_MANAGED_NETWORK_FRAGMENT_DATA;
```

**FragmentLength**  Number of bytes in the `FragmentBuffer`. This field may not be set to zero.

**FragmentBuffer**  Pointer to the fragment data. This field may not be set to NULL.

The **EFI_MANAGED_NETWORK_FRAGMENT_DATA** structure describes the location and length of a packet fragment to be transmitted.

EFI_MANAGED_NETWORK_PROTOCOL.Receive()

Summary
Places an asynchronous receiving request into the receiving queue.

Prototype
```c
typedef
EFI_STATUS
(EIFIAPI *EFI_MANAGED_NETWORK_RECEIVE) (  
  IN EFI_MANAGED_NETWORK_PROTOCOL *This,
  IN EFI_MANAGED_NETWORK_COMPLETION_TOKEN *Token
);
```

Parameters
- **This**: Pointer to the EFI_MANAGED_NETWORK_PROTOCOL instance.
- **Token**: Pointer to a token associated with the receive data descriptor. Type EFI_MANAGED_NETWORK_COMPLETION_TOKEN is defined in EFI_MANAGED_NETWORK_PROTOCOL.Transmit().

Description
The Receive() function places a completion token into the receive packet queue. This function is always asynchronous.

The caller must fill in the Token.Event field in the completion token, and this field cannot be NULL. When the receive operation completes, the MNP updates the Token.Status and Token.RxData fields and the Token.Event is signaled.

**EFI_MANAGED_NETWORK_PROTOCOL.Cancel()**

**Summary**

Aborts an asynchronous transmit or receive request.

**Prototype**

```c
typedef
  EFI_STATUS
  (EFIAPI *EFI_MANAGED_NETWORK_CANCEL)(
    IN EFI_MANAGED_NETWORK_PROTOCOL *This,
    IN EFI_MANAGED_NETWORK_COMPLETION_TOKEN *Token OPTIONAL
  );
```

**Parameters**

- **This**
  Pointer to the **EFI_MANAGED_NETWORK_PROTOCOL** instance.
- **Token**
  Pointer to a token that has been issued by
  **EFI_MANAGED_NETWORK_PROTOCOL.Transmit()** or
  **EFI_MANAGED_NETWORK_PROTOCOL.Receive()**. If **NULL**, all pending tokens are aborted. Type
  **EFI_MANAGED_NETWORK_COMPLETION_TOKEN** is defined in
  **EFI_MANAGED_NETWORK_PROTOCOL.Transmit()**.

**Description**

The **Cancel()** function is used to abort a pending transmit or receive request. If the token is in the transmit or receive request queues, after calling this function, **Token.Status** will be set to **EFI_ABORTED** and then **Token.Event** will be signaled. If the token is not in one of the queues, which usually means that the asynchronous operation has completed, this function will not signal the token and **EFI_NOT_FOUND** is returned.

</tbody>
</table>

EFI_MANAGED_NETWORK_PROTOCOL.Poll()

Summary
Polls for incoming data packets and processes outgoing data packets.

Prototype
```c
typedef EFI_STATUS (EFIAPI *EFI_MANAGED_NETWORK_POLL) (
    IN EFI_MANAGED_NETWORK_PROTOCOL  *This
);
```

Parameters
This Pointer to the EFI_MANAGED_NETWORK_PROTOCOL instance.

Description
The Poll() function can be used by network drivers and applications to increase the rate that data packets are moved between the communications device and the transmit and receive queues.

Normally, a periodic timer event internally calls the Poll() function. But, in some systems, the periodic timer event may not call Poll() fast enough to transmit and/or receive all data packets without missing packets. Drivers and applications that are experiencing packet loss should try calling the Poll() function more often.

26 - Network Protocols — Bluetooth

26.1 EFI Bluetooth Host Controller Protocol

**EFI_BLUETOOTH_HC_PROTOCOL**

**Summary**

This protocol abstracts the Bluetooth host controller layer message transmit and receive.

**GUID**

```c
#define EFI_BLUETOOTH_HC_PROTOCOL_GUID \
{ 0xb3930571, 0xbeba, 0x4fc5, \
{ 0x92, 0x3, 0x94, 0x27, 0x24, 0x2e, 0x6a, 0x43 }}
```

**Protocol Interface Structure**

```c
typedef struct _EFI_BLUETOOTH_HC_PROTOCOL {
  EFI_BLUETOOTH_HC_SEND_COMMAND    SendCommand;
  EFI_BLUETOOTH_HC_RECEIVE_EVENT   ReceiveEvent;
  EFI_BLUETOOTH_HC_ASYNC_RECEIVE_EVENT  AsyncReceiveEvent;
  EFI_BLUETOOTH_HC_SEND_ACL_DATA   SendACLData;
  EFI_BLUETOOTH_HC_RECEIVE_ACL_DATA ReceiveACLData;
  EFI_BLUETOOTH_HC_ASYNC_RECEIVE_ACL_DATA AsyncReceiveACLData;
  EFI_BLUETOOTH_HC_SEND_SCO_DATA   SendSCOData;
  EFI_BLUETOOTH_HC_RECEIVE_SCO_DATA ReceiveSCOData;
  EFI_BLUETOOTH_HC_ASYNC_RECEIVE_SCO_DATA AsyncReceiveSCOData;
} EFI_BLUETOOTH_HC_PROTOCOL;
```

**Parameters**

- **SendCommand** Send HCI command packet. See the `SendCommand()` function description.
- **ReceiveEvent** Receive HCI event packets. See the `ReceiveEvent()` function description.
- **AsyncReceiveEvent** Non-blocking receive HCI event packets. See the `AsyncReceiveEvent()` function description.
- **SendACLData** Send HCI ACL (asynchronous connection-oriented) data packets. See the `SendACLData()` function description.
- **ReceiveACLData** Receive HCI ACL data packets. See the `ReceiveACLData()` function description.
- **AsyncReceiveACLData** Non-blocking receive HCI ACL data packets. See the `AsyncReceiveACLData()` function description.
- **SendSCOData** Send HCI synchronous (SCO and eSCO) data packets. See the `SendSCOData()` function description.
- **ReceiveSCOData** Receive HCI synchronous data packets. See the `ReceiveSCOData()` function description.
AsyncReceiveSCOData: Non-blocking receive HCI synchronous data packets. See the AsyncReceiveSCOData() function description.

Description
The EFI_BLUETOOTH_HC_PROTOCOL is used to transmit or receive HCI layer data packets. For detail of different HCI packet (command, event, ACL, SCO), please refer to Bluetooth specification.

BLUETOOTH_HC_PROTOCOL.SendCommand()

Summary
Send HCI command packet.

Prototype
typedef EFI_STATUS (EFIAPI *EFI_BLUETOOTH_HC_SEND_COMMAND)(
    IN EFI_BLUETOOTH_HC_PROTOCOL   *This,
    IN OUT UINTN           *BufferSize,
    IN VOID              *Buffer,
    IN UINTN            Timeout
);

Parameters
This Pointer to the EFI_BLUETOOTH_HC_PROTOCOL instance.
BufferSize On input, indicates the size, in bytes, of the data buffer specified by Buffer. On output, indicates the amount of data actually transferred.
Buffer A pointer to the buffer of data that will be transmitted to Bluetooth host controller.
Timeout Indicating the transfer should be completed within this time frame. The units are in milliseconds. If Timeout is 0, then the caller must wait for the function to be completed until EFI_SUCCESS or EFI_DEVICE_ERROR is returned.

Description
The SendCommand() function sends HCI command packet. Buffer holds the whole HCI command packet, including OpCode, OCF, OGF, parameter length, and parameters. When this function is returned, it just means the HCI command packet is sent, it does not mean the command is success or complete. Caller might need to wait a command status event to know the command status, or wait a command complete event to know if the command is completed. (see in Bluetooth specification, HCI Command Packet for more detail)

**BLUETOOTH_HC_PROTOCOL.ReceiveEvent()**

**Summary**

Receive HCI event packet.

**Prototype**

```c
typedef EFI_STATUS
  (EFIAPI *EFI_BLUETOOTH_HC_RECEIVE_EVENT)(
   IN EFI_BLUETOOTH_HC_PROTOCOL *This,
   IN OUT UINTN *BufferSize,
   OUT VOID *Buffer,
   IN UINTN Timeout)
);
```

**Parameters**

- **This**
  - Pointer to the `EFI_BLUETOOTH_HC_PROTOCOL` instance.
- **BufferSize**
  - On input, indicates the size, in bytes, of the data buffer specified by `Buffer`. On output, indicates the amount of data actually transferred.
- **Buffer**
  - A pointer to the buffer of data that will be received from Bluetooth host controller.
- **Timeout**
  - Indicating the transfer should be completed within this time frame. The units are in milliseconds. If `Timeout` is 0, then the caller must wait for the function to be completed until `EFI_SUCCESS` or `EFI_DEVICE_ERROR` is returned.

**Description**

The `ReceiveEvent()` function receives HCI event packet. `Buffer` holds the whole HCI event packet, including `EventCode`, parameter length, and parameters. (See in Bluetooth specification, HCI Event Packet for more detail.)
Status Codes Returned

<table>
<thead>
<tr>

BLUETOOTH_HC_PROTOCOL.AsyncReceiveEvent()

Summary
Receive HCI event packet in non-blocking way.

Prototype
```c
typedef EFI_STATUS (EFIAPI *EFI_BLUETOOTH_HC_ASYNC_RECEIVE_EVENT) (  
  IN EFI_BLUETOOTH_HC_PROTOCOL       *This,  
  IN BOOLEAN                        IsNewTransfer,  
  IN UINTN                          PollingInterval,  
  IN UINTN                          DataLength,  
  IN EFI_BLUETOOTH_HC_ASYNC_FUNC_CALLBACK  Callback,  
  IN VOID                          *Context
);
```

Parameters
- **This**: Pointer to the `EFI_BLUETOOTH_HC_PROTOCOL` instance.
- **IsNewTransfer**: If `TRUE`, a new transfer will be submitted. If `FALSE`, the request is deleted.
- **PollingInterval**: Indicates the periodic rate, in milliseconds, that the transfer is to be executed.
- **DataLength**: Specifies the length, in bytes, of the data to be received.
- **Callback**: The callback function. This function is called if the asynchronous transfer is completed.
- **Context**: Data passed into `Callback` function. This is optional parameter and may be `NULL`.

Description
The `AsyncReceiveEvent()` function receives HCI event packet in non-blocking way. `Data` in `Callback` function holds the whole HCI event packet, including `EventCode`, parameter length, and parameters. (See in Bluetooth specification, HCI Event Packet for more detail.)
Related Definitions

typedef EFI_STATUS (EFIAPI *EFI_BLUETOOTH_HC_ASYNC_FUNC_CALLBACK) (
    IN VOID              *Data,
    IN UINTN             DataLength,
    IN VOID              *Context
);

Data    Data received via asynchronous transfer.
DataLength The length of Data in bytes, received via asynchronous transfer.
Context  Context passed from asynchronous transfer request.

Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The HCI asynchronous receive request is submitted successfully.</td>
</tr>
<tr>

</tbody>
</table>

BLUETOOTH_HC_PROTOCOL.SendACLData()

Summary
Send HCI ACL data packet.

Prototype

typedef EFI_STATUS (EFIAPI *EFI_BLUETOOTH_HC_SEND_ACL_DATA)(
    IN EFI_BLUETOOTH_HC_PROTOCOL   *This,
    IN OUT UINTN           *BufferSize,
    IN VOID              *Buffer,
    IN UINTN             Timeout
);

Parameters

This Pointer to the EFI_BLUETOOTH_HC_PROTOCOL instance.
BufferSize On input, indicates the size, in bytes, of the data buffer specified by Buffer. On output, indicates the amount of data actually transferred.
Buffer A pointer to the buffer of data that will be transmitted to Bluetooth host controller.
Timeout Indicating the transfer should be completed within this time frame. The units are in milliseconds. If Timeout is 0, then the caller must
wait for the function to be completed until \texttt{EFI\_SUCCESS} or \texttt{EFI\_DEVICE\_ERROR} is returned.

**Description**

The \texttt{SendACLData()} function sends HCI ACL data packet. \texttt{Buffer} holds the whole HCI ACL data packet, including Handle, PB flag, BC flag, data length, and data. (see in Bluetooth specification, HCI ACL Data Packet for more detail)

The \texttt{SendACLData()} function and \texttt{ReceiveACLData()} function just send and receive data payload from application layer. In order to protect the payload data, the Bluetooth bus is required to call \texttt{HCI\_Set\_Connection\_Encryption} command to enable hardware based encryption after authentication completed, according to pairing mode and host capability.

**Status Codes Returned**

<table>
<thead>
<tr>

**BLUETOOTH\_HC\_PROTOCOL.ReceiveACLData()**

**Summary**

Receive HCI ACL data packet.

**Prototype**

```c
typedef
EFI\_STATUS
(\texttt{EFIAPI *EFI\_BLUETOOTH\_HC\_RECEIVE\_ACL\_DATA)}(
  \texttt{IN EFI\_BLUETOOTH\_HC\_PROTOCOL} *This,
  \texttt{IN OUT UINTN} *BufferSize,
  \texttt{OUT VOID} *Buffer,
  \texttt{IN UINTN} Timeout
);
```

**Parameters**

- **This**
  - Pointer to the \texttt{EFI\_BLUETOOTH\_HC\_PROTOCOL} instance.

- **BufferSize**
  - On input, indicates the size, in bytes, of the data buffer specified by \texttt{Buffer}. On output, indicates the amount of data actually transferred.

- **Buffer**
  - A pointer to the buffer of data that will be received from Bluetooth host controller.
Timeout

Indicating the transfer should be completed within this time frame. The units are in milliseconds. If Timeout is 0, then the caller must wait for the function to be completed until EFI_SUCCESS or EFI_DEVICE_ERROR is returned.

Description

The ReceiveACLData() function receives HCI ACL data packet. Buffer holds the whole HCI ACL data packet, including Handle, PB flag, BC flag, data length, and data. (See in Bluetooth specification, HCI ACL Data Packet for more detail.)

BLUETOOTH_HC_PROTOCOL.AsyncReceiveACLData()

Summary

Receive HCI ACL data packet in non-blocking way.

Prototype

typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_HC_ASYNC_RECEIVE_ACL_DATA) (
   IN EFI_BLUETOOTH_HC_PROTOCOL       *This,
   IN BOOLEAN                     IsNewTransfer,
   IN UINTN                       PollingInterval,
   IN UINTN                       DataLength,
   IN EFI_BLUETOOTH_HC_ASYNC_FUNC_CALLBACK  Callback,
   IN VOID                        *Context
);

Parameters

This Pointer to the EFI_BLUETOOTH_HC_PROTOCOL instance.
IsNewTransfer If TRUE, a new transfer will be submitted. If FALSE, the request is deleted.
PollingInterval Indicates the periodic rate, in milliseconds, that the transfer is to be executed.
DataLength Specifies the length, in bytes, of the data to be received.
Callback
The callback function. This function is called if the asynchronous transfer is completed.

Context
Data passed into Callback function. This is optional parameter and may be NULL.

Description
The AsyncReceiveACLData() function receives HCI ACL data packet in non-blocking way. Data in Callback holds the whole HCI ACL data packet, including Handle, PB flag, BC flag, data length, and data. (See in Bluetooth specification, HCI ACL Data Packet for more detail.)

Status Codes Returned

BLUETOOTH_HC_PROTOCOL.SendSCOData()

Summary
Send HCI SCO data packet.

Prototype

typedef
EFI_STATUS
(EIFIAPI *EFI_BLUETOOTH_HC_SEND_SCO_DATA)(
    IN EFI_BLUETOOTH_HC_PROTOCOL   *This,
    IN OUT UINTN           *BufferSize,
    IN VOID              *Buffer,
    IN UINTN            Timeout
);

Parameters

This
Pointer to the EFI_BLUETOOTH_HC_PROTOCOL instance.

BufferSize
On input, indicates the size, in bytes, of the data buffer specified by Buffer. On output, indicates the amount of data actually transferred.

Buffer
A pointer to the buffer of data that will be transmitted to Bluetooth host controller.

Timeout
Indicating the transfer should be completed within this time frame. The units are in milliseconds. If Timeout is 0, then the caller must wait for the function to be completed until EFI_SUCCESS or EFI_DEVICE_ERROR is returned.
Description
The `SendSCOData()` function sends HCI SCO data packet. `Buffer` holds the whole HCI SCO data packet, including `ConnectionHandle`, `PacketStatus` flag, data length, and data. (See in Bluetooth specification, HCI Synchronous Data Packet for more detail.)

**BLUETOOTH_HC_PROTOCOL.ReceiveSCOData()**

Summary
Receive HCI SCO data packet.

Prototype
```c
typedef EFI_STATUS (EFIAPI *EFI_BLUETOOTH_HC_RECEIVE_SCO_DATA)(
    IN EFI_BLUETOOTH_HC_PROTOCOL   *This,
    IN OUT UINTN           *BufferSize,
    OUT VOID             *Buffer,
    IN UINTN                     Timeout
);
```

Parameters
- **This**
  Pointer to the `EFI_BLUETOOTH_HC_PROTOCOL` instance.
- **BufferSize**
  On input, indicates the size, in bytes, of the data buffer specified by `Buffer`. On output, indicates the amount of data actually transferred.
- **Buffer**
  A pointer to the buffer of data that will be received from Bluetooth host controller.
- **Timeout**
  Indicating the transfer should be completed within this time frame. The units are in milliseconds. If `Timeout` is 0, then the caller must wait for the function to be completed until `EFI_SUCCESS` or `EFI_DEVICE_ERROR` is returned.
Description

The `ReceiveSCOData()` function receives HCI SCO data packet. `Buffer` holds the whole HCI SCO data packet, including ConnectionHandle, PacketStatus flag, data length, and data. (see in Bluetooth specification, HCI Synchronous Data Packet for more detail)

**BLUETOOTH_HC_PROTOCOL.AsyncReceiveSCOData()**

Summary

Receive HCI SCO data packet in non-blocking way.

Prototype

```c
typedef EFI_STATUS
  (EFIAPI *EFI_BLUETOOTH_HC_ASYNC_RECEIVE_SCO_DATA) (
  IN EFI_BLUETOOTH_HC_PROTOCOL       *This,
  IN BOOLEAN                        IsNewTransfer,
  IN UINTN                          PollingInterval,
  IN UINTN                          DataLength,
  IN EFI_BLUETOOTH_HC_ASYNC_FUNC_CALLBACK Callback,
  IN VOID                           *Context
);
```

Parameters

- **This**
  Pointer to the `EFI_BLUETOOTH_HC_PROTOCOL` instance.
- **IsNewTransfer**
  If `TRUE`, a new transfer will be submitted. If `FALSE`, the request is deleted.
- **PollingInterval**
  Indicates the periodic rate, in milliseconds, that the transfer is to be executed.
- **DataLength**
  Specifies the length, in bytes, of the data to be received.
- **Callback**
  The callback function. This function is called if the asynchronous transfer is completed.
- **Context**
  Data passed into `Callback` function. This is optional parameter and may be `NULL`. 
Description

The `AsyncReceiveSCOData()` function receives HCI SCO data packet in non-blocking way. Data in `Callback` holds the whole HCI SCO data packet, including `ConnectionHandle`, `PacketStatus` flag, data length, and data. (See in Bluetooth specification, HCI SCO Data Packet for more detail.)

### 26.2 EFI Bluetooth Bus Protocol

**EFI_BLUETOOTH_IO_SERVICE_BINDING_PROTOCOL**

**Summary**

The EFI Bluetooth IO Service Binding Protocol is used to locate EFI Bluetooth IO Protocol drivers to create and destroy child of the driver to communicate with other Bluetooth device by using Bluetooth IO protocol.

**GUID**

```c
#define EFI_BLUETOOTH_IO_SERVICE_BINDING_PROTOCOL_GUID \\  { 0x388278d3, 0x7b85, 0x42f0, \\  { 0xab, 0xa9, 0xfb, 0x4b, 0xfd, 0x69, 0xf5, 0xab }
```

**Description**

The Bluetooth IO consumer need locate `EFI_BLUETOOTH_IO_SERVICE_BINDING_PROTOCOL` and call `CreateChild()` to create a new child of `EFI_BLUETOOTH_IO_PROTOCOL` instance. Then use `EFI_BLUETOOTH_IO_PROTOCOL` for Bluetooth communication. After use, the Bluetooth IO consumer need call `DestroyChild()` to destroy it.

**EFI_BLUETOOTH_IO_PROTOCOL**

**Summary**

This protocol provides service for Bluetooth L2CAP (Logical Link Control and Adaptation Protocol) and SDP (Service Discovery Protocol).

**GUID**

```c
#define EFI_BLUETOOTH_IO_PROTOCOL_GUID \\  { 0x467313de, 0x4e30, 0x43f1, \\  { 0x94, 0x3e, 0x32, 0x3f, 0x89, 0x84, 0x5d, 0xb5 }}
```
Protocol Interface Structure

typedef struct _EFI_BLUETOOTH_IO_PROTOCOL {
    EFI_BLUETOOTH_IO_GET_DEVICE_INFO    GetDeviceInfo;
    EFI_BLUETOOTH_IO_GET_SDP_INFO      GetSdpInfo;
    EFI_BLUETOOTH_IO_L2CAP_RAW_SEND    L2CapRawSend;
    EFI_BLUETOOTH_IO_L2CAP_RAW_RECEIVE L2CapRawReceive;
    EFI_BLUETOOTH_IO_L2CAP_RAW_ASYNC_RECEIVE
        L2CapRawAsyncReceive;
    EFI_BLUETOOTH_IO_L2CAP_SEND        L2CapSend;
    EFI_BLUETOOTH_IO_L2CAP_RECEIVE     L2CapReceive;
    EFI_BLUETOOTH_IO_L2CAP_ASYNC_RECEIVE L2CapAsyncReceive;
    EFI_BLUETOOTH_IO_L2CAP_CONNECT     L2CapConnect;
    EFI_BLUETOOTH_IO_L2CAP_DISCONNECT  L2CapDisconnect;
    EFI_BLUETOOTH_IO_L2CAP_REGISTER_SERVICE
        L2CapRegisterService;
} EFI_BLUETOOTH_IO_PROTOCOL;

Parameters

GetDeviceInfo Get Bluetooth device Information. See the GetDeviceInfo() function description.

GetSdpInfo Get Bluetooth device SDP information. See the GetSdpInfo() function description.

L2CapRawSend Send L2CAP message (including L2CAP header). See the L2CapRawSend() function description.

L2CapSend Send L2CAP message (excluding L2CAP header) to a specific channel. See the L2CapSend() function description.

L2CapReceive Receive L2CAP message (excluding L2CAP header) from a specific channel. See the L2CapReceive() function description.

L2CapAsyncReceive Non-blocking receive L2CAP message (excluding L2CAP header) from a specific channel. See the L2CapAsyncReceive() function description.

L2CapConnect Do L2CAP connection. See the L2CapConnect() function description.

L2CapDisconnect Do L2CAP disconnection. See the L2CapDisconnect() function description.

L2CapRegisterService Register L2CAP callback function for special channel. See the L2CapRegisterService() function description.
Description
The **EFI_BLUETOOTH_IO_PROTOCOL** provides services in L2CAP protocol and SDP protocol. For detail of L2CAP packet format, and SDP service, please refer to Bluetooth specification.

**BLUETOOTH_IO_PROTOCOL.GetDeviceInfo**

**Summary**
Get Bluetooth device information.

**Prototype**
```c
typedef EFI_STATUS
                (EFIAPI *EFI_BLUETOOTH_IO_GET_DEVICE_INFO)(
                    IN EFI_BLUETOOTH_IO_PROTOCOL   *This,
                    OUT UINTN             *DeviceInfoSize,
                    OUT VOID             **DeviceInfo
                );
```

**Parameters**
- **This** Pointer to the **EFI_BLUETOOTH_IO_PROTOCOL** instance.
- **DeviceInfoSize** A pointer to the size, in bytes, of the **DeviceInfo** buffer.
- **DeviceInfo** A pointer to a callee allocated buffer that returns Bluetooth device information. Callee allocates this buffer by using EFI Boot Service **AllocatePool()**.

**Description**
The **GetDeviceInfo()** function returns Bluetooth device information. The size of **DeviceInfo** structure should never be assumed and the value of **DeviceInfoSize** is the only valid way to know the size of **DeviceInfo**.

**Related Definitions**
```c
typedef struct {
    UINT32        Version;
    BLUETOOTH_ADDRESS   BD_ADDR;
    UINT8          PageScanRepetitionMode;
    BLUETOOTH_CLASS_OF_DEVICE    ClassOfDevice;
    UINT16         ClockOffset;
    UINT8          RSSI;
    UINT8         ExtendedInquiryResponse[240];
} EFI_BLUETOOTH_DEVICE_INFO;
```

- **Version** The version of the structure. A value of zero represents the **EFI_BLUETOOTH_DEVICE_INFO** structure as defined here. Future version of this specification may extend this data structure in a backward compatible way and increase the value of **Version**.
- **BD_ADDR** 48bit Bluetooth device address.
PageScanRepetitionMode  
Bluetooth PageScanRepetitionMode. See Bluetooth specification for detail.

ClassOfDevice  
Bluetooth ClassOfDevice. See Bluetooth specification for detail.

ClockOffset  
Bluetooth ClockOffset. See Bluetooth specification for detail.

RSSI  
Bluetooth RSSI. See Bluetooth specification for detail.

ExtendedInquiryResponse  
Bluetooth ExtendedInquiryResponse. See Bluetooth specification for detail.

typedef struct {
    UINT8   Address[6];
} BLUETOOTH_ADDRESS;

typedef struct {
    UINT8   FormatType:2;
    UINT8   MinorDeviceClass: 6;
    UINT16  MajorDeviceClass: 5;
    UINT16  MajorServiceClass:11;
} BLUETOOTH_CLASS_OF_DEVICE;

**BLUETOOTH_IO_PROTOCOL.GetSdpInfo**

Summary
Get Bluetooth SDP information.

Prototype

typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_IO_GET_SDP_INFO)(
    IN EFI_BLUETOOTH_IO_PROTOCOL   *This,
    OUT UINTN             *SdpInfoSize,
    OUT VOID             **SdpInfo
    );

Parameters

This  
Pointer to the EFI_BLUETOOTH_IO_PROTOCOL instance.

SdpInfoSize  
A pointer to the size, in bytes, of the SdpInfo buffer.
**SdpInfo**

A pointer to a callee allocated buffer that returns Bluetooth SDP information. Callee allocates this buffer by using EFI Boot Service `AllocatePool()`.

**Description**

The `GetSdpInfo()` function returns Bluetooth SDP information. The size of `SdpInfo` structure should never be assumed and the value of `SdpInfoSize` is the only valid way to know the size of `SdpInfo`.

**Status Codes Returned**

<table>
<thead>
<tr>

**BLUETOOTH_IO_PROTOCOL.L2CapRawSend**

**Summary**

Send L2CAP message (including L2CAP header).

**Prototype**

```c
typedef EFI_STATUS (EFIAPI *EFI_BLUETOOTH_IO_L2CAP_RAW_SEND)(
    IN EFI_BLUETOOTH_IO_PROTOCOL   *This,
    IN OUT UINTN           *BufferSize,
    IN VOID              *Buffer,
    IN UINTN            Timeout
);
```

**Parameters**

- **This**
  Pointer to the `EFI_BLUETOOTH_IO_PROTOCOL` instance.
- **BufferSize**
  On input, indicates the size, in bytes, of the data buffer specified by `Buffer`. On output, indicates the amount of data actually transferred.
- **Buffer**
  A pointer to the buffer of data that will be transmitted to Bluetooth L2CAP layer.
- **Timeout**
  Indicating the transfer should be completed within this time frame. The units are in milliseconds. If `Timeout` is 0, then the caller must wait for the function to be completed until `EFI_SUCCESS` or `EFI_DEVICE_ERROR` is returned.

**Description**

The `L2CapRawSend()` function sends L2CAP layer message (including L2CAP header). `Buffer` holds the whole L2CAP message, including Length, ChannelID, and information payload. (see in Bluetooth specification, L2CAP Data Packet Format for more detail)

</tbody>
</table>

BLUETOOTH_IO_PROTOCOL.L2CapRawReceive

Summary
Receive L2CAP message (including L2CAP header).

Prototype
```c
typedef EFI_STATUS
  (EFIAPIC *EFI_BLUE TOOTH_IO_L2CAP_RAW_RECEIVE)(
    IN EFI_BLUE TOOTH_IO_PROTOCOL   *This,
    IN OUT UINTN           *BufferSize,
    OUT VOID             *Buffer,
    IN UINTN            Timeout
  );
```

Parameters
- **This**: Pointer to the EFI_BLUE TOOTH_IO_PROTOCOL instance.
- **BufferSize**: On input, indicates the size, in bytes, of the data buffer specified by Buffer. On output, indicates the amount of data actually transferred.
- **Buffer**: A pointer to the buffer of data that will be received from Bluetooth L2CAP layer.
- **Timeout**: Indicating the transfer should be completed within this time frame. The units are in milliseconds. If Timeout is 0, then the caller must wait for the function to be completed until EFI_SUCCESS or EFI_DEVICE_ERROR is returned.

Description
The L2CapRawReceive() function receives L2CAP layer message (including L2CAP header). Buffer holds the whole L2CAP message, including Length, ChannelID, and information payload. (see in Bluetooth specification, L2CAP Data Packet Format for more detail)
**Status Codes Returned**

**BLUETOOTH_IO_PROTOCOL.L2CapRawAsyncReceive**

**Summary**

Receive L2CAP message (including L2CAP header) in non-blocking way.

**Prototype**

```c
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_IO_L2CAP_RAW_ASYNC_RECEIVE)(
    IN EFI_BLUETOOTH_IO_PROTOCOL       *This,
    IN BOOLEAN                        IsNewTransfer,
    IN UINTN                          PollingInterval,
    IN UINTN                          DataLength,
    IN EFI_BLUETOOTH_IO_ASYNC_FUNC_CALLBACK  Callback,
    IN VOID                           *Context);
```

**Parameters**

- **This**
  Pointer to the `EFI_BLUETOOTH_IO_PROTOCOL` instance.

- **IsNewTransfer**
  If `TRUE`, a new transfer will be submitted. If `FALSE`, the request is deleted.

- **PollingInterval**
  Indicates the periodic rate, in milliseconds, that the transfer is to be executed.

- **DataLength**
  Specifies the length, in bytes, of the data to be received.

- **Callback**
  The callback function. This function is called if the asynchronous transfer is completed.

- **Context**
  Data passed into `Callback` function. This is optional parameter and may be `NULL`.

**Description**

The `L2CapRawAsyncReceive()` function receives L2CAP layer message (including L2CAP header) in non-blocking way. Data in `Callback` function holds the whole L2CAP message, including Length, ChannelID, and information payload. (see in Bluetooth specification, L2CAP Data Packet Format for more detail)
Related Definitions

typedef
   EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_IO_ASYNC_FUNC_CALLBACK) (  
   IN UINT16 ChannelID,
   IN VOID *Data,
   IN UINTN DataLength,

BLUETOOTH_IO_PROTOCOL.L2CapSend

Summary
Send L2CAP message (excluding L2CAP header) to a specific channel.

Prototype

typedef
   EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_IO_L2CAP_SEND) (  
   IN EFI_BLUETOOTH_IO_PROTOCOL *This,
   IN EFI_HANDLE Handle,
   IN OUT UINTN *BufferSize,
   IN VOID *Buffer,
   IN UINTN Timeout
);

Parameters
This Pointer to the EFI_BLUETOOTH_IO_PROTOCOL instance.
Handle A handle created by EFI_BLUETOOTH_IO_PROTOCOL.L2CapConnect indicates which channel to send.
BufferSize
On input, indicates the size, in bytes, of the data buffer specified by Buffer. On output, indicates the amount of data actually transferred.

Buffer
A pointer to the buffer of data that will be transmitted to Bluetooth L2CAP layer.

Timeout
Indicating the transfer should be completed within this time frame. The units are in milliseconds. If Timeout is 0, then the caller must wait for the function to be completed until EFI_SUCCESS or EFI_DEVICE_ERROR is returned.

Description
The L2CapSend() function sends L2CAP layer message (excluding L2CAP header) to Bluetooth channel indicated by Handle. Buffer only holds information payload. (see in Bluetooth specification, L2CAP Data Packet Format for more detail). Handle

BLUETOOTH_IO_PROTOCOL.L2CapReceive

Summary
Receive L2CAP message (excluding L2CAP header) from a specific channel.

Prototype

typedef

EFI_STATUS

(EIFIAPI *EFI_BLUETOOTH_IO_L2CAP_RECEIVE)(

  IN EFI_BLUETOOTH_IO_PROTOCOL  *This,

  IN EFI_HANDLE                 Handle,

  OUT UINTN                     *BufferSize,

  OUT VOID                      **Buffer,

  IN UINTN                      Timeout

);

Parameters

This Pointer to the EFI_BLUETOOTH_IO_PROTOCOL instance.
Handle

A handle created by EFI_BLUETOOTH_IO_PROTOCOL.L2CapConnect indicates which channel to receive.

BufferSize

Indicates the size, in bytes, of the data buffer specified by Buffer.

Buffer

A pointer to the buffer of data that will be received from Bluetooth L2CAP layer. Callee allocates this buffer by using EFI Boot Service AllocatePool().

Timeout

Indicating the transfer should be completed within this time frame. The units are in milliseconds. If Timeout is 0, then the caller must wait for the function to be completed until EFI_SUCCESS or EFI_DEVICE_ERROR is returned.

Description

The L2CapReceive() function receives L2CAP layer message (excluding L2CAP header) from Bluetooth channel indicated by Handle. Buffer only holds information payload. (see in Bluetooth specification, L2CAP Data Packet Format for more detail)

BLUETOOTH_IO_PROTOCOL.L2CapAsyncReceive

Summary

Receive L2CAP message (including L2CAP header) in non-blocking way from a specific channel.

Prototype

typedef

EFI_STATUS

(EIFIAPI *EFI_BLUETOOTH_IO_L2CAP_ASYNC_RECEIVE)(

  IN EFI_BLUETOOTH_IO_PROTOCOL *This,
  IN EFI_HANDLE Handle,
  IN EFI_BLUETOOTH_IO_CHANNEL_SERVICE_CALLBACK Callback,
  IN VOID *Context

Parameters

This Pointer to the EFI_BLUETOOTH_IO_PROTOCOL instance.
Handle
A handle created by
`EFI_BLUETOOTH_IO_PROTOCOL.L2CapConnect` indicates which channel to receive.

Callback
The callback function. This function is called if the asynchronous transfer is completed.

Context
Data passed into `Callback` function. This is optional parameter and may be `NULL`.

Description
The `L2CapAsyncReceive()` function receives L2CAP layer message (excluding L2CAP header) in non-blocking way from Bluetooth channel indicated by `Handle`. Data in `Callback` function only holds information payload. (see in Bluetooth specification, L2CAP Data Packet Format for more detail)

Related Definitions

```c
typedef EFI_STATUS (*EFI_BLUETOOTH_IO_CHANNEL_SERVICE_CALLBACK) (
    IN VOID *Data,
    IN UINTN DataLength,
    IN VOID *Context
);
```

- Data
  Data received via asynchronous transfer.
- DataLength
  The length of `Data` in bytes, received via asynchronous transfer.
- Context
  Context passed from asynchronous transfer request.

**BLUETOOTH_IO_PROTOCOL.L2CapConnect**

Summary
Do L2CAP connection.
Prototype

```c
typedef EFI_STATUS
(EIFIAPI *EFI_BLUETOOTH_IO_L2CAP_CONNECT)(
  IN EFI_BLUETOOTH_IO_PROTOCOL          *This,
  OUT EFI_HANDLE                 *Handle,
  IN UINT16                     Psm,
  IN UINT16                     Mtu,
  IN EFI_BLUETOOTH_IO_CHANNEL_SERVICE_CALLBACK  Callback,
  IN VOID                        *Context
);
```

Parameters

- **This**: Pointer to the `EFI_BLUETOOTH_IO_PROTOCOL` instance.
- **Handle**: A handle to indicate this L2CAP connection.
- **Psm**: Bluetooth PSM. See Bluetooth specification for detail.
- **Mtu**: Bluetooth MTU. See Bluetooth specification for detail.
- **Callback**: The callback function. This function is called whenever there is message received in this channel.
- **Context**: Data passed into `Callback` function. This is optional parameter and may be `NULL`.

Description

The `L2CapConnect()` function does all necessary steps for Bluetooth L2CAP layer connection in blocking way. It might take long time. Once this function is returned `Handle` is created to indicate the connection.

Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>

**BLUETOOTH_IO_PROTOCOL.L2CapDisconnect**

Summary

Do L2CAP disconnection.
Prototype

typedef

EFI_STATUS

(EFIAPI *EFI_BLUETOOTH_IO_L2CAP_DISCONNECT)(
  IN EFI_BLUETOOTH_IO_PROTOCOL          *This,
  IN EFI_HANDLE                        Handle
);  

Parameters

This Pointer to the EFI_BLUETOOTH_IO_PROTOCOL instance.
Handle A handle to indicate this L2CAP connection.

Description

The L2CapDisconnect() function does all necessary steps for Bluetooth L2CAP layer disconnection in blocking way. It might take long time. Once this function is returned Handle is no longer valid.

Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>

BLUETOOTH_IO_PROTOCOL.L2CapRegisterService

Summary

Register L2CAP callback function for special channel.

Prototype

typedef

EFI_STATUS

(EFIAPI *EFI_BLUETOOTH_IO_L2CAP_REGISTER_SERVICE)(
  IN EFI_BLUETOOTH_IO_PROTOCOL          *This,
  OUT EFI_HANDLE                      *Handle,
  IN UINT16                           Psm,
  IN UINT16                           Mtu,
  IN EFI_BLUETOOTH_IO_CHANNEL_SERVICE_CALLBACK Callback,
  IN VOID                            *Context
);  

Parameters

This Pointer to the EFI_BLUETOOTH_IO_PROTOCOL instance.
Handle A handle to indicate this L2CAP connection.
Psm Bluetooth PSM. See Bluetooth specification for detail.
Mtut Bluetooth MTU. See Bluetooth specification for detail.
Callback

The callback function. This function is called whenever there is message received in this channel. **NULL** means unregister.

Context

Data passed into **Callback** function. This is optional parameter and may be **NULL**.

Description

The **L2CapRegisterService()** function registers L2CAP callback function for a special channel. Once this function is returned **Handle** is created to indicate the connection.

Status Codes Returned

</tbody>
</table>

26.3 EFI Bluetooth Configuration Protocol

**EFI_BLUETOOTH_CONFIG_PROTOCOL**

Summary

This protocol abstracts user interface configuration for Bluetooth device.

GUID

```c
#define EFI_BLUETOOTH_CONFIG_PROTOCOL_GUID \
{ 0x62960cf3, 0x40ff, 0x4263,\ 
{ 0xa7, 0x7c, 0xdf, 0xde, 0xbd, 0x19, 0x1b, 0x4b }}
```

Protocol Interface Structure

```c
typedef struct _EFI_BLUETOOTH_CONFIG_PROTOCOL {
    EFI_BLUETOOTH_CONFIG_INIT Init;
    EFI_BLUETOOTH_CONFIG_SCAN Scan;
    EFI_BLUETOOTH_CONFIG_CONNECT Connect;
    EFI_BLUETOOTH_CONFIG_DISCONNECT Disconnect;
    EFI_BLUETOOTH_CONFIG_GET_DATA GetData;
    EFI_BLUETOOTH_CONFIG_SET_DATA GetData;
    EFI_BLUETOOTH_CONFIG_GET_REMOTE_DATA GetRemoteData;
    EFI_BLUETOOTH_CONFIG_REGISTER_PIN_CALLBACK RegisterPinCallback;
    EFI_BLUETOOTH_CONFIG_REGISTER_GET_LINK_KEY_CALLBACK RegisterGetLinkKeyCallback;
    EFI_BLUETOOTH_CONFIG_REGISTER_SET_LINK_KEY_CALLBACK RegisterSetLinkKeyCallback;
    EFI_BLUETOOTH_CONFIG_REGISTER_CONNECT_COMPLETE_CALLBACK RegisterLinkConnectCompleteCallback;
} EFI_BLUETOOTH_CONFIG_PROTOCOL;
```
Parameters

**Init**
Initialize Bluetooth host controller and local device. See the **Init()** function description.

**Scan**
Scan Bluetooth device. See the **Scan()** function description.

**Connect**
Connect one Bluetooth device. See the **Connect()** function description.

**Disconnect**
Disconnect one Bluetooth device. See the **Disconnect()** function description.

**GetData**
Get Bluetooth configuration data. See the **GetData()** function description.

**SetData**
Set Bluetooth configuration data. See the **SetData()** function description.

**GetRemoteData**
Get remote Bluetooth device data. See the **GetRemoteData()** function description.

**RegisterPinCallback**
Register PIN callback function. See the **RegisterPinCallback()** function description.

**RegisterGetLinkKeyCallback**
Register get link key callback function. See the **RegisterGetLinkKeyCallback()** function description.

**RegisterSetLinkKeyCallback**
Register set link key callback function. See the **RegisterSetLinkKeyCallback()** function description.

**RegisterLinkConnectCompleteCallback**
Register link connect complete callback function. See the **RegisterLinkConnectCompleteCallback()** function description.

Description

The **EFI_BLUETOOTH_CONFIG_PROTOCOL** abstracts the Bluetooth configuration. User can use Bluetooth configuration to interactive with Bluetooth bus driver.

**BLUETOOTH_CONFIG_PROTOCOL.Init**

Summary

Initialize Bluetooth host controller and local device.
Prototype

typedef

typedef

(EFI_STATUS)

EFI_SUCCESS

EFI_DEVICE_ERROR

The Bluetooth host controller and local device is initialized successfully.

A hardware error occurred trying to initialize the Bluetooth host controller and local device.

BLUETOOTH_CONFIG_PROTOCOL.Scan

Summary

Scan Bluetooth device.

Prototype

typedef

(EFI_STATUS)

IN EFI_BLUETOOTH_CONFIG_PROTOCOL *This,

IN BOOLEAN ReScan,

IN UINT8 ScanType,

IN EFI_BLUETOOTH_CONFIG_SCAN_CALLBACK_FUNCTION Callback

IN VOID *Context

);
Description

The `Scan()` function scans Bluetooth device. When this function is returned, it just means scan request is submitted. It does not mean scan process is started or finished. Whenever there is a Bluetooth device is found, the `Callback` function will be called. `Callback` function might be called before this function returns or after this function returns.

Related Definitions

```c
typedef EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_CONFIG.ScanCallbackFunction)
(
    IN EFI_BLUETOOTH_CONFIG_PROTOCOL        *This,
    IN VOID                     *Context,
    IN EFI_BLUETOOTH_SCAN_CALLBACK_INFORMATION   *CallbackInfo
);
```

- **This** Pointer to the `EFI_BLUETOOTH_CONFIG_PROTOCOL` instance.
- **Context** Context passed from scan request.
- **CallbackInfo** Data related to scan result. `NULL CallbackInfo` means scan complete.

```c
typedef typedef struct{
    BLUETOOTH_ADDRESS BDAddr;
    UINT8 RemoteDeviceState;
    BLUETOOTH_CLASS_OF_DEVICE ClassOfDevice;
    UINT8 RemoteDeviceName[BLUETOOTH_HCI_COMMAND_LOCAL_READABLE_NAME_MAX_SIZE];
}EFI_BLUETOOTH_SCAN_CALLBACK_INFORMATION;
```

#define BLUETOOTH_HCI_COMMAND_LOCAL_READABLE_NAME_MAX_SIZE 248

Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The Bluetooth scan request is submitted.</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>A hardware error occurred trying to scan the Bluetooth device.</td>
</tr>
</tbody>
</table>

**BLUETOOTH_CONFIG_PROTOCOL.Connect**

Summary

Connect a Bluetooth device.
Prototype

typedef
    EFI_STATUS
    (EFIAPI *EFI_BLUETOOTH_CONFIG_CONNECT)(
        IN EFI_BLUETOOTH_CONFIG_PROTOCOL *This,
        IN BLUETOOTH_ADDRESS *BD_ADDR
    );

Parameters

This                  Pointer to the EFI_BLUETOOTH_CONFIG_PROTOCOL instance.
BD_ADDR                The address of Bluetooth device to be connected.

Description

The Connect() function connects a Bluetooth device. When this function is returned successfully, a new EFI_BLUETOOTH_IO_PROTOCOL is created.

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The Bluetooth device is connected successfully.</td>
</tr>
<tr>
<td>EFI_ALREADY_STARTED</td>

</tr>
</tbody>
</table>

BLUETOOTH_CONFIG_PROTOCOL.Disconnect

Summary

Disconnect a Bluetooth device.

Prototype

typedef
    EFI_STATUS
    (EFIAPI *EFI_BLUETOOTH_CONFIG_DISCONNECT)(
        IN EFI_BLUETOOTH_CONFIG_PROTOCOL *This,
        IN BLUETOOTH_ADDRESS *BD_ADDR,
        IN UINT8 Reason
    );

Parameters

This                  Pointer to the EFI_BLUETOOTH_CONFIG_PROTOCOL instance.
BD_ADDR                The address of Bluetooth device to be connected.
Reason                 Bluetooth disconnect reason. See Bluetooth specification for detail.
Description
The `Disconnect()` function disconnects a Bluetooth device. When this function is returned successfully, the `EFI_BLUETOOTH_IO_PROTOCOL` associated with this device is destroyed and all services associated are stopped.

Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>

<td>The Bluetooth device is not found.</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>A hardware error occurred trying to disconnect the Bluetooth device.</td>
</tr>
</tbody>
</table>

BLUETOOTH_CONFIG_PROTOCOL.GetData

Summary
Get Bluetooth configuration data.

Prototype
```c
typedef EFI_STATUS (EFIAPI *EFI_BLUETOOTH_CONFIG_GET_DATA) (
    IN EFI_BLUETOOTH_CONFIG_PROTOCOL    *This,
    IN EFI_BLUETOOTH_CONFIG_DATA_TYPE Data_Type,
    IN OUT UINTN              *DataSize,
    IN OUT VOID              *Data
);
```

Parameters
- **This**: Pointer to the `EFI_BLUETOOTH_CONFIG_PROTOCOL` instance.
- **DataType**: Configuration data type.
- **DataSize**: On input, indicates the size, in bytes, of the data buffer specified by `Data`. On output, indicates the amount of data actually returned.
- **Data**: A pointer to the buffer of data that will be returned.

Description
The `GetData()` function returns Bluetooth configuration data. For remote Bluetooth device configuration data, please use `GetRemoteData()` function with valid BD_ADDR.

BLUETOOTH_CONFIG_PROTOCOL.RegisterPinCallback

Summary
Register PIN callback function.

Prototype
```c
typedef EFI_STATUS
  (EFIAPI *EFI_BLUETOOTH_CONFIG_REGISTER_PIN_CALLBACK) (
   IN EFI_BLUETOOTH_CONFIG_PROTOCOL            *This,
   IN EFI_BLUETOOTH_CONFIG_REGISTER_PIN_CALLBACK_FUNCTION Callback,
   IN VOID                         *Context
);
```

Parameters
- This: Pointer to the EFI_BLUETOOTH_CONFIG_PROTOCOL instance.
- Callback: The callback function. NULL means unregister.
- Context: Data passed into Callback function. This is optional parameter and may be NULL.

Description
The RegisterPinCallback() function registers Bluetooth PIN callback function. The Bluetooth configuration driver must call RegisterPinCallback() to register a callback function. During pairing, Bluetooth bus driver must trigger this callback function, and Bluetooth configuration driver must handle callback function according to CallbackType during pairing. Both Legacy pairing and SSP (secure simple pairing) are required to be supported. See EFI_BLUETOOTH_PIN_CALLBACK_TYPE below for detail of each pairing mode.

  IN EFI_BLUETOOTH_PIN_CALLBACK_TYPE   CallbackType,  
  IN VOID                *InputBuffer,  
  IN UINTN                  InputBufferSize,  
  OUT VOID                **OutputBuffer,  
  OUT UINTN               *OutputBufferSize
);

This Pointer to the EFI_BLUETOOTH_CONFIG_PROTOCOL instance.
Context Context passed from registration.
CallbackType Callback type in EFI_BLUETOOTH_PIN_CALLBACK_TYPE.
InBuffer A pointer to the buffer of data that is input from callback caller.
InputBufferSize Indicates the size, in bytes, of the data buffer specified by InBuffer.
OutputBuffer A pointer to the buffer of data that will be output from callback callee. Callee allocates this buffer by using EFI Boot Service AllocatePool().
OutputBufferSize Indicates the size, in bytes, of the data buffer specified by OutputBuffer.

typedef enum {
  EfiBluetoothCallbackTypeUserPasskeyNotification,  
  EfiBluetoothCallbackTypeUserConfirmationRequest,  
  EfiBluetoothCallbackTypeOOBDataRequest,  
  EfiBluetoothCallbackTypePinCodeRequest,  
  EfiBluetoothCallbackTypeMax,  
  EFI_BLUETOOTH_PIN_CALLBACK_TYPE;

  EfiBluetoothCallbackTypeUserPasskeyNotification
    For SSP – passkey entry. Input buffer is Passkey (4 bytes). No output buffer. See Bluetooth HCI command for detail.

  EfiBluetoothCallbackTypeUserConfirmationRequest
    For SSP – just work and numeric comparison. Input buffer is numeric value (4 bytes). Output buffer is BOOLEAN (1 byte). See Bluetooth HCI command for detail.

  EfiBluetoothCallbackTypeOOBDataRequest
    For SSP – OOB. See Bluetooth HCI command for detail.

  EfiBluetoothCallbackTypePinCodeRequest
    For legacy paring. No input buffer. Output buffer is PIN code (<= 16 bytes). See Bluetooth HCI command for detail.

**BLUETOOTH_CONFIG_PROTOCOL.RegisterGetLinkKeyCallback**

**Summary**

Register get link key callback function.

**Prototype**

```c
typedef EFI_STATUS (EFIAPI *EFI_BLUETOOTH_CONFIG_REGISTER_GET_LINK_KEY_CALLBACK) (
    IN EFI_BLUETOOTH_CONFIG_PROTOCOL *This,
    IN EFI_BLUETOOTH_CONFIG_REGISTER_GET_LINK_KEY_CALLBACK_FUNCTION Callback,
    IN VOID *Context)
```

**Parameters**

- **This**: Pointer to the `EFI_BLUETOOTH_CONFIG_PROTOCOL` instance.
- **Callback**: The callback function. **NULL** means unregister.
- **Context**: Data passed into `Callback` function. This is optional parameter and may be **NULL**.

**Description**

The `RegisterGetLinkKeyCallback()` function registers Bluetooth get link key callback function. The Bluetooth configuration driver may call `RegisterGetLinkKeyCallback()` to register a callback function. When Bluetooth bus driver get Link_Key_Request_Event, Bluetooth bus driver must trigger this callback function if it is registered. Then the callback function in Bluetooth configuration driver must pass link key to Bluetooth bus driver. When the callback function is returned Bluetooth bus driver gets link key and must send HCI_Link_Key_Request_Reply to remote device. If this `GetLinkKey` callback function is not registered or Bluetooth configuration driver fails to return a valid link key, the Bluetooth bus driver must send HCI_Link_Key_Request_Negative_Reply to remote device. The original link key is passed by Bluetooth bus driver to Bluetooth configuration driver by using `EFI_BLUETOOTH_CONFIG_REGISTER_SET_LINK_KEY_CALLBACK_FUNCTION`. The Bluetooth configuration driver need save link key to a non-volatile safe place. (See Bluetooth specification, HCI_Link_Key_Request_Reply)

    OUT UINT8               LinkKey[BLUETOOTH_HCI_LINK_KEY_SIZE]
);
```
This Pointer to the `EFI_BLUETOOTH_CONFIG_PROTOCOL` instance.
Context Context passed from registration.
CallbackType Callback type in `EFI_BLUETOOTH_PIN_CALLBACK_TYPE`.
BDAddr A pointer to Bluetooth device address.
LinkKey A pointer to the buffer of link key.

**BLUETOOTH_CONFIG_PROTOCOL/RegisterSetLinkKeyCallback**

**Summary**
Register set link key callback function.

**Prototype**

```c
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_CONFIG_REGISTER_SET_LINK_KEY_CALLBACK) (
    IN EFI_BLUETOOTH_CONFIG_PROTOCOL                 *This,
    IN EFI_BLUETOOTH_CONFIG_REGISTER_SET_LINK_KEY_CALLBACK_FUNCTION
    Callback,
    IN VOID                              *Context
);
```

**Parameters**

- **This** Pointer to the `EFI_BLUETOOTH_CONFIG_PROTOCOL` instance.
- **Callback** The callback function. `NULL` means unregister.
- **Context** Data passed into `Callback` function. This is optional parameter and may be `NULL`.

**Description**
The `RegisterSetLinkKeyCallback()` function registers Bluetooth link key callback function. The Bluetooth configuration driver may call `RegisterSetLinkKeyCallback()` to register a callback function to get link key from Bluetooth bus driver. When Bluetooth bus driver gets Link_Key_Notification_Event, Bluetooth bus driver must call this callback function if it is registered. Then
the callback function in Bluetooth configuration driver must save link key to a safe place. This link key will be used by `EFI_BLUETOOTH_CONFIG_REGISTER_GET_LINK_KEY_CALLBACK_FUNCTION` later. (See Bluetooth specification, Link_Key_Notification_Event)

**Related Definitions**

typedef

```c
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_CONFIG_REGISTER_SET_LINK_KEY_CALLBACK_FUNCTION) ( 
    IN EFI_BLUETOOTH_CONFIG_PROTOCOL   *This,
    IN VOID                *Context,
    IN BLUETOOTH_ADDRESS         *BDAddr,
    IN UINT8               LinkKey[BLUETOOTH_HCI_LINK_KEY_SIZE]
);
```

- **This**: Pointer to the `EFI_BLUETOOTH_CONFIG_PROTOCOL` instance.
- **Context**: Context passed from registration.
- **CallbackType**: Callback type in `EFI_BLUETOOTH_PIN_CALLBACK_TYPE`.
- **BDAddr**: A pointer to Bluetooth device address.
- **LinkKey**: A pointer to the buffer of link key.

**Status Codes Returned**

**BLUETOOTH_CONFIG_PROTOCOL.RegisterLinkConnectCompleteCallback**

**Summary**

Register link connect complete callback function.

**Prototype**

typedef

```c
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_CONFIG_REGISTER_CONNECT_COMPLETE_CALLBACK) ( 
    IN EFI_BLUETOOTH_CONFIG_PROTOCOL                    *This,
    IN EFI_BLUETOOTH_CONFIG_REGISTER_CONNECT_COMPLETE_CALLBACK_FUNCTION
    Callback,
    IN VOID                                 *Context
);
```

- **This**: Pointer to the `EFI_BLUETOOTH_CONFIG_PROTOCOL` instance.
- **Callback**: The callback function. **NULL** means unregister.
- **Context**: Data passed into `Callback` function. This is optional parameter and may be **NULL**.
**Description**

The `RegisterLinkConnectCompleteCallback()` function registers Bluetooth link connect complete callback function. The Bluetooth Configuration driver may call `RegisterLinkConnectCompleteCallback()` to register a callback function. During pairing, Bluetooth bus driver must trigger this callback function to report device state, if it is registered. Then Bluetooth Configuration driver will get information on device connection, according to `CallbackType` defined by `EFI_BLUETOOTH_CONNECT_COMPLETE_CALLBACK_TYPE`.

**Related Definitions**

```c
typedef EFI_STATUS (EFIAPI *EFI_BLUETOOTH_CONFIG_REGISTER_CONNECT_COMPLETE_CALLBACK_FUNCTION) (  
    IN EFI_BLUETOOTH_CONFIG_PROTOCOL *This,  
    IN VOID *Context,  
    IN EFI_BLUETOOTH_CONNECT_COMPLETE_CALLBACK_TYPE CallbackType,  
    IN BLUETOOTH_ADDRESS *BDAddr,  
    IN VOID *InputBuffer,  
    IN UINTN InputBufferSize);  
```

- **This** Pointer to the `EFI_BLUETOOTH_CONFIG_PROTOCOL` instance.
- **Context** Context passed from registration.
- **CallbackType** Callback type in `EFI_BLUETOOTH_CONNECT_COMPLETE_CALLBACK_TYPE`.
- **BDAddr** A pointer to Bluetooth device address.
- **InputBuffer** A pointer to the buffer of data that is input from callback caller.
- **InputBufferSize** Indicates the size, in bytes, of the data buffer specified by `InputBuffer`.

```c
typedef enum {  
    EfiBluetoothConnCallbackTypeDisconnected,  
    EfiBluetoothConnCallbackTypeConnected,  
    EfiBluetoothConnCallbackTypeAuthenticated,  
    EfiBluetoothConnCallbackTypeEncrypted,  
} EFI_BLUETOOTH_CONNECT_COMPLETE_CALLBACK_TYPE;
```

- **EfiBluetoothConnCallbackTypeDisconnected** This callback is called when Bluetooth receive Disconnection_Complete event. Input buffer is Event Parameters of Disconnection_Complete Event defined in Bluetooth specification.

- **EfiBluetoothConnCallbackTypeConnected** This callback is called when Bluetooth receive Connection_Complete event. Input buffer is Event Parameters of Connection_Complete Event defined in Bluetooth specification.

- **EfiBluetoothConnCallbackTypeAuthenticated**
This callback is called when Bluetooth receive Authentication_Complete event. Input buffer is Event Parameters of Authentication_Complete Event defined in Bluetooth specification.

EfiBluetoothConnCallbackTypeEncrypted

This callback is called when Bluetooth receive Encryption_Change event. Input buffer is Event Parameters of Encryption_Change Event defined in Bluetooth specification.

26.4 EFI Bluetooth Attribute Protocol

EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL

Summary
This protocol provides service for Bluetooth ATT (Attribute Protocol) and GATT (Generic Attribute Profile) based protocol interfaces.

GUID
#define EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL_GUID \  
  { 0x898890e9, 0x84b2, 0x4f3a, \{ 0x8c, 0x58, 0xd8, 0x57, 0x78, 0x13, 0xe0, \} 0xac }

Protocol Interface Structure
typedef struct _EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL {  
  EFI_BLUETOOTH_ATTRIBUTE_SEND_REQUEST SendRequest; \  
  EFI_BLUETOOTH_ATTRIBUTE_REGISTER_FOR_SERVER_NOTIFICATION RegisterForServerNotification; \  
  EFI_BLUETOOTH_ATTRIBUTE_GET_SERVICE_INFO GetServiceInfo; \  
  EFI_BLUETOOTH_ATTRIBUTE_GET_DEVICE_INFO GetDeviceInfo; \  
} EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL;

Parameters

SendRequest  Send a “REQUEST” or “COMMAND” message to remote server and receive a “RESPONSE” message for “REQUEST” from remote server according to Bluetooth attribute protocol data unit (PDU). See the SendRequest() function description.

RegisterForServerNotification  Register or unregister a server initiated PDU, such as “NOTIFICATION” or “INDICATION” on a characteristic value on remote server. See the RegisterForServerInitiatedMessage() function description.

GetServiceInfo  Get discovered service data information from connected remote device. See GetServiceInfo() function description.
GetDeviceInfo

Get the device information. See \texttt{GetDeviceInfo()} function description.

\textbf{Description}

The \texttt{EFI\_BLUETOOTH\_ATTRIBUTE\_PROTOCOL} provides services in ATT protocol and GATT profile. For detail of ATT protocol, and GATT profile, please refer to Bluetooth specification.

\textbf{BLUETOOTH\_ATTRIBUTE\_PROTOCOL.SendRequest}

\textbf{Summary}

Send a “REQUEST” or “COMMAND” message to remote server and receive a “RESPONSE” message for “REQUEST” from remote server according to Bluetooth attribute protocol data unit (PDU).

\textbf{Prototype}

\begin{verbatim}
typedef EFI_STATUS
  (EFIAPI *EFI_BLUETOOTH_ATTRIBUTE_SEND_REQUEST)(
    IN EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL  *This,
    IN VOID  Data,
    IN UINTN  DataLength,
    IN EFI_BLUETOOTH_ATTRIBUTE_CALLBACK_FUNCTION  Callback,
    IN VOID  Context
  );
\end{verbatim}

\textbf{Parameters}

\begin{itemize}
  \item \texttt{This} Pointer to the EFI\_BLUETOOTH\_ATTRIBUTE\_PROTOCOL instance.
  \item \texttt{Data} Data of a REQUEST or COMMAND message. The first byte is the attribute PDU related opcode, followed by opcode specific fields. See Bluetooth specification, Vol 3, Part F, Attribute Protocol.
  \item \texttt{DataLength} The length of \texttt{Data} in bytes.
  \item \texttt{Callback} Callback function to notify the RESPONSE is received to the caller, with the response buffer. Caller must check the response buffer content to know if the request action is success or fail. It may be NULL if the data is a COMMAND.
  \item \texttt{Context} Data passed into \texttt{Callback} function. It is optional parameter and may be NULL.
\end{itemize}
Description

The `SendRequest()` function sends a “REQUEST” or “COMMAND” message to remote server and receive a “RESPONSE” message for “REQUEST” from remote server according to Bluetooth attribute protocol data unit (PDU). In most cases, this interface is used to read attributes from remote device, or write attributes to remote device.

Related Definitions

typedef

```c

    IN EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL *This,
    IN VOID *Data,
    IN UINTN DataLength,
    IN VOID *Context
);
```

- **This**: Pointer to the EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL instance.
- **Data**: Data received. The first byte is the attribute opcode, followed by opcode specific fields. See Bluetooth specification, Vol 3, Part F, Attribute Protocol. It might be a normal RESPONSE message, or ERROR RESPONSE message.
- **DataLength**: The length of `Data` in bytes.
- **Context**: The context passed from the callback registration request.

**BLUETOOTH_ATTRIBUTE_PROTOCOL.RegisterForServerNotification**

Summary

Register or unregister a server initiated message, such as NOTIFICATION or INDICATION, on a characteristic value on remote server.

Prototype
typedef

EFI_STATUS

(EIFI_API *EFI_BLUETOOTH_ATTRIBUTE_REGISTER_FOR_SERVER_NOTIFICATION)(
    IN EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL *This,
    IN EFI_BLUETOOTH_ATTRIBUTE_CALLBACK_PARAMETER *CallbackParameter,
    IN EFI_BLUETOOTH_ATTRIBUTE_CALLBACK_FUNCTION Callback,
    IN VOID *Context
);

Parameters

This              Pointer to the EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL instance.

CallbackParameterThe parameter of the callback.

Callback         Callback function for server initiated attribute protocol. NULL callback function means unregister the server initiated callback.

Context          Data passed into Callback function. It is optional parameter and may be NULL.

Description

The RegisterForServerNotification() function can be issued to request Bluetooth to register or unregister a server initiated message, such as notification or indication, on a characteristic value on remote server. It can only be done if the characteristic supports that operation.

Related Definitions

typedef struct {
    UINT16   AttributeHandle;
} EFI_BLUETOOTH_ATTRIBUTE_CALLBACK_PARAMETER_NOTIFICATION;
typedef struct {
    UINT16   AttributeHandle;
} EFI_BLUETOOTH_ATTRIBUTE_CALLBACK_PARAMETER_INDICATION;
typedef struct {
    UINT32   Version;
    UINT8    AttributeOpCode;

    union {

</table>

**BLUETOOTH_ATTRIBUTE_PROTOCOL.GetServiceInfo**

**Summary**

Get Bluetooth discovered service information.

**Prototype**

```c
typedef EFI_STATUS
  (EFIAPI *EFI_BLUETOOTH_ATTRIBUTE_GET_SERVICE_INFO)(
   IN EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL *This,
   OUT UINTN *ServiceInfoSize,
   OUT VOID **ServiceInfo
  );
```

**Parameters**

- **This**
  
  Pointer to the `EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL` instance.

- **ServiceInfoSize**
  
  A pointer to the size, in bytes, of the `ServiceInfo` buffer.

- **ServiceInfo**
  
  A pointer to a callee allocated buffer that returns Bluetooth discovered service information. Callee allocates this buffer by using EFI Boot Service `AllocatePool()`.

**Description**

The `GetServiceInfo()` function returns Bluetooth discovered service information. The size of `ServiceInfo` structure should never be assumed and the value of `ServiceInfoSize` is the only valid way to know the size of `ServiceInfo`. The
ServiceInfo buffer is a list Bluetooth service information structures defined below.

Related Definitions

```c
typedef struct {
    UINT8         Length;
    union {
        UINT16       Uuid16;
        UINT32       Uuid32;
        UINT8        Uuid128[16];
    } Data;
} EFI_BLUETOOTH_UUID;
```

- **Length**: The length of Bluetooth UUID data. The valid value is 2, 4, or 16.
- **Uuid16**: The 16-bit Bluetooth UUID data.
- **Uuid32**: The 32-bit Bluetooth UUID data.
- **Uuid128**: The 128-bit Bluetooth UUID data.

```c
typedef struct {
    EFI_BLUETOOTH_UUID         Type;
    UINT16               Length;
    UINT16               AttributeHandle;
    EFI_BLUETOOTH_ATTRIBUTE_PERMISSION AttributePermission;
} EFI_BLUETOOTH_ATTRIBUTE_HEADER;
```

- **Type**: The type of this structure. It must be EFI_BLUETOOTH_UUID. See Bluetooth GATT definition. Primary Service is 0x2800. Secondary Service is 0x2801. Include Service is 0x2802. Characteristic is 0x2803. Characteristic Descriptor is 0x2900.
- **Length**: The length of this structure.
- **AttributeHandle**: The handle of the service declaration. See Bluetooth specification.
AttributePermission

The permission of the attribute. This field is only valid for the attribute of the local device. This field should be ignored for the attribute of the remote device.

//
// Bluetooth Attribute Permission
//
typedef union {
    struct {
        UINT16 Readable      : 1;
        UINT16 ReadEncryption   : 1;
        UINT16 ReadAuthentication : 1;

        UINT16 Reserved2      : 7;
    } Permission;
    UINT32 Data32;
} EFI_BLUETOOTH_ATTRIBUTE_PERMISSION;

Readable    The attribute is readable.
ReadEncryption      The encryption is required on read.
ReadAuthentication  The authentication is required on read.
ReadAuthorization   The authorization is required on read.
ReadKeySize       The size of key in bytes on read.
Writeable    The attribute is writeable.
WriteEncryption   The encryption is required on write.
WriteAuthentication  The authentication is required on write.
WriteAuthorization   The authorization is required on write.
WriteKeySize       The size of key in bytes on write.

typedef struct {
    EFI_BLUETOOTH_ATTRIBUTE_HEADER Header;
    UINT16 EndGroupHandle;
    EFI_BLUETOOTH_UUID ServiceUuid;
} EFI_BLUETOOTH_GATT_PRIMARY_SERVICE_INFO;

EndGroupHandle    The handle of the last attribute within the service definition. See Bluetooth specification.
Header            The header of this structure.
typedef struct {
  EFI_BLUETOOTH_ATTRIBUTE_HEADER Header;
  UINT16 StartGroupHandle;
  UINT16 EndGroupHandle;
  EFI_BLUETOOTH_UUID ServiceUuid;
} EFI_BLUETOOTH_GATT_INCLUDE_SERVICE_INFO;

Header
  The header of this structure.

typedef struct {
  EFI_BLUETOOTH_ATTRIBUTE_HEADER Header;
  UINT8 CharacteristicProperties;
  UINT16 CharacteristicValueHandle;
  EFI_BLUETOOTH_UUID CharacteristicUuid;
} EFI_BLUETOOTH_GATT_CHARACTERISTIC_INFO;

Header
  The header of this structure.

typedef struct {
  EFI_BLUETOOTH_ATTRIBUTE_HEADER Header;
  EFI_BLUETOOTH_UUID CharacteristicDescriptorUuid;
} EFI_BLUETOOTH_GATT_CHARACTERISTIC_DESCRIPTOR_INFO;

Header
  The header of this structure.

BLUETOOTH_ATTRIBUTE_PROTOCOL::GetDeviceInfo

Summary
Get Bluetooth device information.

Prototype
```c
typedef EFI_STATUS (EFIAPI *EFI_BLUETOOTH_ATTRIBUTE_GET_DEVICE_INFO)(
    IN EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL *This,
    OUT UINTN *DeviceInfoSize,
    OUT VOID **DeviceInfo
);
```

Parameters

- **This**: Pointer to the `EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL` instance.
- **DeviceInfoSize**: A pointer to the size, in bytes, of the `DeviceInfo` buffer.
- **DeviceInfo**: A pointer to a callee allocated buffer that returns Bluetooth device information. Calllee allocates this buffer by using EFI Boot Service `AllocatePool()`. If this device is Bluetooth classic device, `EFI_BLUETOOTH_DEVICE_INFO` should be used. If this device is Bluetooth LE device, `EFI_BLUETOOTH_LE_DEVICE_INFO` should be used.

Description
The `GetDeviceInfo()` function returns Bluetooth device information. The size of `DeviceInfo` structure should never be assumed and the value of `DeviceInfoSize` is the only valid way to know the size of `DeviceInfo`.

Related Definitions
```c
typedef struct {
    UINT8           Address[6];
    UINT8           Type;
} BLUETOOTH_LE_ADDRESS;

typedef struct {
    UINT32          Version;
    BLUETOOTH_LE_ADDRESS   BD_ADDR;
    BLUETOOTH_LE_ADDRESS   DirectAddress;
    UINT8           RSSI;
    UINTN           AdvertismentDataSize;
    VOID           *AdvertismentData;
} EFI_BLUETOOTH_LE_DEVICE_INFO;
```

- **Version**: The version of the structure. A value of zero represents the `EFI_BLUETOOTH_LE_DEVICE_INFO` structure as defined here. Future
version of this specification may extend this data structure in a backward compatible way and increase the value of Version.

**BD_ADDR**
48bit Bluetooth device address and 1byte address type.

**DirectAddress**
48bit random device address and 1byte address type.

**RSSI**
Bluetooth RSSI. See Bluetooth specification for detail.

**AdvertisementDataSize**
The size of AdvertisementData in bytes.

**AdvertisementData**
Bluetooth LE advertisement data. See Bluetooth specification for detail.

### EFI_BLUETOOTH_ATTRIBUTE_SERVICE_BINDING_PROTOCOL

#### Summary
The EFI Bluetooth ATTRIBUTE Service Binding Protocol is used to locate EFI Bluetooth ATTRIBUTE Protocol drivers to create and destroy child of the driver to communicate with other Bluetooth device by using Bluetooth ATTRIBUTE protocol.

#### GUID
```c
#define EFI_BLUETOOTH_ATTRIBUTE_SERVICE_BINDING_PROTOCOL_GUID { \
    0x5639867a, 0x8c8e, 0x408d, 0xac, 0x2f, 0x61, 0xbd, 0xc0, 0xbb, 0xbb \
}
```

#### Description
The Bluetooth ATTRIBUTE consumer need locate EFI_BLUETOOTH_ATTRIBUTE_SERVICE_BINDING_PROTOCOL and call CreateChild() to create a new child of EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL instance. Then use EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL for Bluetooth communication. After use, the Bluetooth ATTRIBUTE consumer need call DestroyChild() to destroy it.

### 26.5 EFI Bluetooth LE Configuration Protocol

#### EFI_BLUETOOTH_LE_CONFIG_PROTOCOL

#### Summary
This protocol abstracts user interface configuration for BluetoothLe device.

#### GUID
#define EFI_BLUETOOTH_LE_CONFIG_PROTOCOL_GUID \
{ 0x8f76da58, 0x1f99, 0x4275, { 0xa4, 0xec, 0x47, 0x56, 0x51, 0x5b, 0x1c, 0xe8 }}

Protocol Interface Structure

typedef struct _EFI_BLUETOOTH_LE_CONFIG_PROTOCOL {

  EFI_BLUETOOTH_LE_CONFIG_REGISTER_SMP_SEND_SMP_AUTH_DATA SendSmpAuthData;
  EFI_BLUETOOTH_LE_CONFIG_REGISTER_SMP_SEND_SMP_DATA_CALLBACK SendSmpDataCallback;
  EFI_BLUETOOTH_LE_CONFIG_REGISTER_SMP_SET_DATA_CALLBACK SendSmpSetDataCallback;
} EFI_BLUETOOTH_LE_CONFIG_PROTOCOL;

Parameters

Init

  Initialize BluetoothLE host controller and local device. See the Init() function description.

Scan

  Scan BluetoothLE device. See the Scan() function description.

Connect

  Connect one BluetoothLE device. See the Connect() function description.

Disconnect

  Disconnect one BluetoothLE device. See the Disconnect() function description.

GetData

  Get BluetoothLE configuration data. See the GetData() function description.

SetData

  Set BluetoothLE configuration data. See the SetData() function description.

GetRemoteData

  Get remote BluetoothLE device data. See the GetRemoteData() function description.

RegisterSmpAuthCallback

  Register Security Manager Callback function. This function will be called from Bluetooth BUS driver whenever user interaction is required for security protocol authorization/authentication. See the RegisterSmpAuthCallback() function description.

SendSmpAuthData

  Send user input (Authentication/Authorization) such as passkey, confirmation (yes/no) in response to pairing request. See the SendSmpAuthData() function description.
RegisterSmpGetDataCallback
Register a callback function to get SMP related data. See the RegisterSmpGetDataCallback() function description.

RegisterSmpSetDataCallback
Register a callback function to set SMP related data. See the RegisterSmpGetDataCallback() function description.

RegisterLinkConnectCompleteCallback
Register link connect complete callback function. See the RegisterLinkConnectCompleteCallback() function description.

Description
The EFI_BLUETOOTH_LE_CONFIG_PROTOCOL abstracts the BluetoothLE configuration. User can use BluetoothLE configuration to interactive with BluetoothLE bus driver.

BLUETOOTH_LE_CONFIG_PROTOCOL.Init
Summary
Initialize BluetoothLE host controller and local device.

Prototype
typedef
EFI_STATUS
(EIFIAPI *EFI_BLUETOOTH_LE_CONFIG_INIT)(
    IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL *This
);

Parameters
This Pointer to the EFI_BLUETOOTH_LE_CONFIG_PROTOCOL instance.

Description
The Init() function initializes BluetoothLE host controller and local device.

EFI_STATUS
(EFI_API *EFI_BLUETOOTH_LE_CONFIG_SCAN)(
    IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL *This,
    IN BOOLEAN  ReScan,
    IN UINT32   Timeout;
    IN EFI_BLUETOOTH_LE_CONFIG_SCAN_PARAMETER *ScanParameter, OPTIONAL
    IN EFI_BLUETOOTH_LE_CONFIG_SCAN_CALLBACK_FUNCTION Callback,
    IN VOID *Context
);

Parameters

This       Pointer to the EFI_BLUETOOTH_LE_CONFIG_PROTOCOL instance.
ReScan     If TRUE, a new scan request is submitted no matter there is scan result before. If FALSE and there is scan result, the previous scan result is returned and no scan request is submitted.
Timeout    Duration in milliseconds for which to scan.
ScanParameter     If it is not NULL, the ScanParameter is used to perform a scan by the BluetoothLE bus driver. If it is NULL, the default parameter is used.
Callback    The callback function. This function is called if a BluetoothLE device is found during scan process.
Context     Data passed into Callback function. This is optional parameter and may be NULL.

Description

The Scan() function scans BluetoothLE device. When this function is returned, it just means scan request is submitted. It does not mean scan process is started or finished. Whenever there is a BluetoothLE device is found, the Callback function will be called. Callback function might be called before this function returns or after this function returns.

Related Definitions

    UINT8  ScanType;
    UINT16 ScanInterval;
    UINT16 ScanWindow;
    UINT8  ScanningFilterPolicy;
    // Scan result filter
    UINT8 AdvertisementFlagFilter;
} EFI_BLUETOOTH_LE_CONFIG_SCAN_PARAMETER;
Version

The version of the structure. A value of zero represents the EFI_BLUETOOTH_LE_CONFIG_SCAN_PARAMETER structure as defined here. Future version of this specification may extend this data structure in a backward compatible way and increase the value of Version.

ScanType

Passive scanning or active scanning. See Bluetooth specification.

ScanInterval

Recommended scan interval to be used while performing scan.

ScanWindow

Recommended scan window to be used while performing a scan.

ScanningFilterPolicy

Recommended scanning filter policy to be used while performing a scan.

AdvertisementFlagFilter

This is one byte flag to serve as a filter to remove unneeded scan result. For example, set BIT0 means scan in LE Limited Discoverable Mode. Set BIT1 means scan in LE General Discoverable Mode. See Supplement to Bluetooth Core Specification.

typedef

EFI_STATUS

(EIFIAPI *EFI_BLUETOOTH_LE_CONFIG_SCAN_CALLBACK_FUNCTION) (IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL *This,
IN VOID *Context,
IN EFI_BLUETOOTH_LE_SCAN_CALLBACK_INFORMATION *CallbackInfo);

This

Pointer to the EFI_BLUETOOTH_LE_CONFIG_PROTOCOL instance.

Context

Context passed from scan request.

CallbackInfo

Data related to scan result. NULL CallbackInfo means scan complete.

typedef struct{
BLUETOOTH_LE_ADDRESS BDA;address;
BLUETOOTH_LE_ADDRESS DirectAddress;
UINT8 RemoteDeviceState;

**BLUETOOTH_LE_CONFIG_PROTOCOL.Connect**

**Summary**

Connect a BluetoothLE device.
Prototype

typedef
EFI_STATUS
(EIFIAPI *EFI_BLUETOOTH_LE_CONFIG_CONNECT)(
IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL *This,
IN BOOLEAN AutoReconnect,
IN BOOLEAN DoBonding;
IN EFI_BLUETOOTH_LE_CONFIG_CONNECT_PARAMETER *ConnectParameter,
OPTIONAL
IN BLUETOOTH_LE_ADDRESS *BD_ADDR
);

Parameters

This Pointer to the EFI_BLUETOOTH_LE_CONFIG_PROTOCOL instance.
AutoReconnect If TRUE, the BluetoothLE host controller needs to do an auto reconnect. If FALSE, the BluetoothLE host controller does not do an auto reconnect.
DoBonding If TRUE, the BluetoothLE host controller needs to do a bonding. If FALSE, the BluetoothLE host controller does not do a bonding.
ConnectParameter If it is not NULL, the ConnectParameter is used to perform a scan by the BluetoothLE bus driver. If it is NULL, the default parameter is used.
BD_ADDR The address of the BluetoothLE device to be connected.

Description

The Connect() function connects a Bluetooth device. When this function is returned successfully, a new EFI_BLUETOOTH_IO_PROTOCOL is created.

Related Definitions

    } EFI_BLUETOOTH_LE_CONFIG_CONNECT_PARAMETER;

Version The version of the structure. A value of zero represents the EFI_BLUETOOTH_LE_CONFIG_CONNECT_PARAMETER structure as defined here. Future version of this specification may extend this data structure in a backward compatible way and increase the value of Version.

ScanInterval Recommended scan interval to be used while performing scan before connect.
**ScanWindow**
Recommended scan window to be used while performing a connection.

**ConnIntervalMin**
Minimum allowed connection interval. Shall be less than or equal to **ConnIntervalMax**.

**ConnIntervalMax**
Maximum allowed connection interval. Shall be greater than or equal to **ConnIntervalMin**.

**ConnLatency**
Slave latency for the connection in number of connection events.

**SupervisionTimeout**
Link supervision timeout for the connection.

**BLUETOOTH_LE_CONFIG_PROTOCOL.Disconnect**

**Summary**
Disconnect a BluetoothLE device.

**Prototype**

```c
typedef
    EFI_STATUS
    (EFIAPI *EFI_BLUETOOTH_LE_CONFIG_DISCONNECT)(
    IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL *This,
    IN BLUETOOTH_LE_ADDRESS       *BD_ADDR,
    IN UINT8               Reason
    );
```

**Parameters**

- **This**
  Pointer to the **EFI_BLUETOOTH_LE_CONFIG_PROTOCOL** instance.
- **BD_ADDR**
  The address of BluetoothLE device to be connected.
- **Reason**
  BluetoothLE disconnect reason. See Bluetooth specification for detail.

**Description**

The **Disconnect()** function disconnects a BluetoothLE device. When this function is returned successfully, the **EFI_BLUETOOTH_ATTRIBUTE_PROTOCOL** associated with this device is destroyed and all services associated are stopped.

BLUETOOTH_LE_CONFIG_PROTOCOL.GetData

Summary
Get BluetoothLE configuration data.

Prototype
```
typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_LE_CONFIG_GET_DATA) (\n  IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL    *This,\n  IN EFI_BLUETOOTH_CONFIG_DATA_TYPE     DataType,\n  IN OUT UINTN               *DataSize,\n  IN OUT VOID                *Data\n);```

Parameters
- **This**: Pointer to the EFI_BLUETOOTH_LE_CONFIG_PROTOCOL instance.
- **DataType**: Configuration data type.
- **DataSize**: On input, indicates the size, in bytes, of the data buffer specified by Data. On output, indicates the amount of data actually returned.
- **Data**: A pointer to the buffer of data that will be returned.

Description
The GetData() function returns BluetoothLE configuration data. For remote BluetoothLE device configuration data, please use GetRemoteData() function with valid BD_ADDR.

**BLUETOOTH_LE_CONFIG_PROTOCOL.SetData**

**Summary**
Set BluetoothLE configuration data.

**Prototype**
```c
typedef
EFI_STATUS
(EIFIAPI *EFI_BLUETOOTH_LE_CONFIG_SET_DATA) (  
    IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL *This,
    IN EFI_BLUETOOTH_CONFIG_DATA_TYPE DataType,
    IN UINTN DataSize,
    IN VOID *Data
);
```

**Parameters**
- **This**  
  Pointer to the `EFI_BLUETOOTH_LE_CONFIG_PROTOCOL` instance.
- **DataType**  
  Configuration data type.
- **DataSize**  
  Indicates the size, in bytes, of the data buffer specified by `Data`.
- **Data**  
  A pointer to the buffer of data that will be set.

**Description**
The `SetData()` function sets local BluetoothLE device configuration data. Not all `DataType` can be set.

**Status Codes Returned**

    IN BLUETOOTH_LE_ADDRESS          *BDAddr,
    IN OUT UINTN               *DataSize,
    IN OUT VOID                *Data
  );
```

Parameters

- **This**: Pointer to the `EFI_BLUETOOTH_LE_CONFIG_PROTOCOL` instance.
- **DataType**: Configuration data type.
- **BDAddr**: Remote BluetoothLE device address.
- **DataSize**: On input, indicates the size, in bytes, of the data buffer specified by `Data`. On output, indicates the amount of data actually returned.
- **Data**: A pointer to the buffer of data that will be returned.

Description

The `GetRemoteData()` function returns remote BluetoothLE device configuration data.

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>

**BLUETOOTH_LE_CONFIG_PROTOCOL.RegisterSmpAuthCallback**

Summary

Register Security Manager Protocol callback function for user authentication/authorization.
Prototype

typedef

EFI_STATUS

(EIFIAPI *EFI_BLUETOOTH_LE_REGISTER_SMP_AUTH_CALLBACK)(
    IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL *This,
    IN EFI_BLUETOOTH_LE_SMP_CALLBACK   Callback,
    IN VOID               *Context
);

Parameters

This  Pointer to the EFI_BLUETOOTH_LE_CONFIG_PROTOCOL instance.
Callback  Callback function for user authentication/authorization.
Context  Data passed into callback function. This is optional parameter and may be NULL.

Description

The RegisterSmpAuthCallback() function register Security Manager Protocol callback function for user authentication/authorization.

Related Definitions

typedef

EFI_STATUS

(EIFIAPI *EFI_BLUETOOTH_LE_SMP_CALLBACK)  (
    IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL    *This,
    IN VOID                  *Context,
    IN BLUETOOTH_LE_ADDRESS          *BDAddr,
    IN EFI_BLUETOOTH_LE_SMP_EVENT_DATA_TYPE  EventDataType,
    IN UINTN                 DataSize,
    IN VOID                  *Data
);

This  Pointer to the EFI_BLUETOOTH_LE_CONFIG_PROTOCOL instance.
Context  Data passed into callback function. This is optional parameter and may be NULL.
BDAddr  Remote BluetoothLE device address.
EventDataType  Event data type in EFI_BLUEOTH_LE_SMP_EVENT_DATA_TYPE.
DataSize  Indicates the size, in bytes, of the data buffer specified by Data.
Data  A pointer to the buffer of data.
typedef enum {
    EfiBlutoothSmpAuthorizationRequestEvent,
    EfiBlutoothSmpPasskeyReadyEvent,
    EfiBlutoothSmpPasskeyRequestEvent,
    EfiBlutoothSmpOOBDataRequestEvent,
    EfiBlutoothSmpNumericComparisonEvent,
} EFI_BLUETOOTH_LE_SMP_EVENT_DATA_TYPE;

EfiBlutoothSmpAuthorizationRequestEvent
It indicates an authorization request. No data is associated with the callback input. In the output data, the application should return the authorization value. The data structure is BOOLEAN. TRUE means YES. FALSE means NO.

EfiBlutoothSmpPasskeyReadyEvent
It indicates that a passkey has been generated locally by the driver, and the same passkey should be entered at the remote device. The callback input data is the passkey of type UINT32, to be displayed by the application. No output data should be returned.

EfiBlutoothSmpPasskeyRequestEvent
It indicates that the driver is requesting for the passkey has been generated at the remote device. No data is associated with the callback input. The output data is the passkey of type UINT32, to be entered by the user.

EfiBlutoothSmpOOBDataRequestEvent
It indicates that the driver is requesting for the passkey that has been pre-shared out-of-band with the remote device. No data is associated with the callback input. The output data is the stored OOB data of type UINT8[16].

EfiBlutoothSmpNumericComparisonEvent
In indicates that a number have been generated locally by the bus driver, and also at the remote device, and the bus driver wants to know if the two numbers match. The callback input data is the number of type UINT32. The output data is confirmation value of type BOOLEAN. TRUE means comparison pass. FALSE means comparison fail.

BLUETOOTH_LE_CONFIG_PROTOCOL.SendSmpAuthData

Summary
Send user authentication/authorization to remote device.
Prototype

```c
typedef
  EFI_STATUS
  (EFIAPI *EFI_BLUETOOTH_LE_SEND_SMP_AUTH_DATA)(
    IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL    *This,
    IN BLUETOOTH_LE_ADDRESS          *BDAddr,
    IN EFI_BLUETOOTH_LE_SMP_EVENT_DATA_TYPE  EventDataType,
    IN UINTN                 DataSize,
    IN VOID                  *Data
  );
```

Parameters

- **This**: Pointer to the `EFI_BLUETOOTH_LE_CONFIG_PROTOCOL` instance.
- **BDAddr**: Remote BluetoothLE device address.
- **EventDataType**: Event data type in `EFI_BLUETOOTH_LE_SMP_EVENT_DATA_TYPE`.
- **DataSize**: The size of `Data` in bytes, of the data buffer specified by `Data`.
- **Data**: A pointer to the buffer of data that will be sent. The data format depends on the type of SMP event data being responded to. See `EFI_BLUETOOTH_LE_SMP_EVENT_DATA_TYPE`.

Description

The `SendSmpAuthData()` function sends user authentication/authorization to remote device. It should be used to send these information after the caller gets the request data from the callback function by `RegisterSmpAuthCallback()`.

Status Codes Returned

<table>
<thead>
<tr>

**BLUETOOTH_LE_CONFIG_PROTOCOL.RegisterSmpGetDataCallback**

Summary

Register a callback function to get SMP related data.
Prototype

typedef
EFI_STATUS
(EFI_API * EFI_BLUETOOTH_LE_CONFIG_REGISTER_SMP_GET_DATA_CALLBACK)(
    IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL *This,
    IN EFI_BLUETOOTH_LE_CONFIG_SMP_GET_DATA_CALLBACK Callback,
    IN VOID *Context
);

Parameters

This Pointer to the EFI_BLUETOOTH_LE_CONFIG_PROTOCOL instance.
Callback Callback function for SMP get data.
Context Data passed into callback function. This is optional parameter and may be NULL.

Description

The RegisterSmpGetDataCallback() function registers a callback function to get SMP related data.

Related Definitions

typedef
EFI_STATUS
(EFI_API * EFI_BLUETOOTH_LE_CONFIG_SMP_GET_DATA_CALLBACK)(

EfiBlutoothSmpLocalSignCounter,
EfiBlutoothSmpLocalDIV,
EfiBlutoothSmpPeerAddressList,
EfiBlutoothSmpMax,
} EFI_BLUETOOTH_LE_SMP_DATA_TYPE;

EfiBlutoothSmpLocalIR
It is a 128-bit Identity Root (IR) key to generate IRK. Data structure is UINT8[16]. See Bluetooth specification. This is only required when Bluetooth key hierarchy is supported. This type is for the local device only.

EfiBlutoothSmpLocalER
It is a 128-bit Encryption Root (ER) key to generate LTK and CSRK. Data structure is UINT8[16]. See Bluetooth specification. This is only required when Bluetooth key hierarchy is supported. This type is for the local device only.

EfiBlutoothSmpLocalDHK
It is a 128-bit Diversifier Hiding Key (DHK) to generate EDIV. Data structure is UINT8[16]. See Bluetooth specification. This is only required when Bluetooth key hierarchy is supported. This type is for the local device only.

EfiBlutoothSmpKeysDistributed
It is LE Key Distribution Format. Data structure is UINT8. See Bluetooth specification. This is the peer device specific information.

EfiBlutoothSmpKeySize
It indicates the size of keys in bytes. It is the negotiated key size between local device and peer device. Data structure is UINTN. This is the peer device specific information.
EfiBlutoothSmpKeyType

Indicates support for MITM/Secure connection. It is the negotiated Authentication Requirements between local device and peer device. See Bluetooth Spec 3.H.3.5.1. Data structure is UINT8. BIT0: MITM, BIT1: SC. This is the peer device specific information.

EfiBlutoothSmpPeerLTK

It is a 128-bit Long-Term Key (LTK) to generate the contributory session key for an encrypted connection. Data structure is UINT8[16]. See Bluetooth specification. This is the peer device specific information.

EfiBlutoothSmpPeerIRK

It is a 128-bit Identity Resolving Key (IRK) to generate and resolve random addresses. Data structure is UINT8[16]. See Bluetooth specification. This is the peer device specific information.

EfiBlutoothSmpPeerCSRK

It is a 128-bit Connection-Signature Resolving Key (CSRK) to sign data and verify signatures on the receiving device. Data structure is UINT8[16]. See Bluetooth specification. This is the peer device specific information.

EfiBlutoothSmpPeerRand

It is a 64-bit Random number (Rand) to identify the LTK distributed during LE legacy pairing. Data structure is UINT64. See Bluetooth specification. This is the peer device specific information.

EfiBlutoothSmpPeerEDIV

It is a 16-bit Encrypted Diversifier (EDIV) to identify the LTK distributed during LE legacy pairing. Data structure is UINT16. See Bluetooth specification. This is the peer device specific information.

EfiBlutoothSmpPeerSignCounter

It is a 32-bit Sign Counter to assist MAC generation. Data structure is UINT32. See Bluetooth specification. This is the peer device specific information.

EfiBlutoothSmpLocalLTK

It is a 128-bit Long-Term Key (LTK) to generate the contributory session key for an encrypted connection. Data structure is UINT8[16]. See Bluetooth specification. This is only required when Bluetooth key hierarchy is not supported. This is the peer specific local device information.

EfiBlutoothSmpLocalIRK

It is a 128-bit Identity Resolving Key (IRK) to generate and resolve random addresses. Data structure is UINT8[16]. See Bluetooth specification. This is only required when Bluetooth key hierarchy is not supported. This is the peer specific local device information.
EfiBlutoothSmpLocalCSRK

It is a 128-bit Connection-Signature Resolving Key (CSRK) to sign data and verify signatures on the receiving device. Data structure is `UINT8[16]`. See Bluetooth specification. This is only required when Bluetooth key hierarchy is not supported. This is the peer specific local device information.

EfiBlutoothSmpLocalSignCounter

It is a 32-bit Sign Counter to assist MAC generation. Data structure is `UINT32`. See Bluetooth specification. This is the peer specific local device information.

EfiBlutoothSmpLocalDIV

It is a 16-bit Diversifier (DIV) to be used as index to recover LTK. Data structure is `UINT16`. See Bluetooth specification. This is the peer specific local device information.

EfiBlutoothSmpPeerAddressList

A list of Bluetooth peer addresses that have been connected before. The data structure is `BLUETOOTH_LE_ADDRESS[]`. The data size must be a multiple of `sizeof(BLUETOOTH_LE_ADDRESS)`.

BLUETOOTH_LE_CONFIG_PROTOCOL.RegisterSmpSetDataCallback

Summary

Register a callback function to set SMP related data.

Prototype

```c
typedef
EFI_STATUS
(EFIAPI * EFI_BLUETOOTH_LE_CONFIG_REGISTER_SMP_SET_DATA_CALLBACK
)(
  IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL       *This,
  IN EFI_BLUETOOTH_LE_CONFIG_SMP_SET_DATA_CALLBACK Callback,
  IN VOID                     *Context
);
```

Parameters

- **This**: Pointer to the `EFI_BLUETOOTH_LE_CONFIG_PROTOCOL` instance.
- **Callback**: Callback function for SMP set data.
Context
Data passed into callback function. This is optional parameter and may be NULL.

Description
The `RegisterSmpSetDataCallback()` function registers a callback function to set SMP related data.

Related Definitions

```
typedef
EFI_STATUS
(EIFIAPI * EFI_BLUETOOTH_LE_CONFIG_SMP_SET_DATA_CALLBACK)  (
    IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL *This,
    IN VOID               *Context,
    IN BLUETOOTH_LE_ADDRESS       *BDAddr,
    IN EFI_BLUETOOTH_LE_SMP_DATA_TYPE  Type,
    IN UINTN               DataSize,
    IN VOID               *Data
);
```

This
Pointer to the `EFI_BLUETOOTH_LE_CONFIG_PROTOCOL` instance.

Context
Data passed into callback function. This is optional parameter and may be NULL.

BDAddr
Remote BluetoothLE device address.

DataType
Data type in `EFI_BLUETOOTH_LE_SMP_DATA_TYPE`.

DataSize
Indicates the size, in bytes, of the data buffer specified by `Data`.

Data
A pointer to the buffer of data.

**BLUETOOTH_LE_CONFIG_PROTOCOL/RegisterLinkConnectCompleteCallback**

Summary
Register link connect complete callback function.
Prototype

typedef
EFI_STATUS
(EFIAPI *EFI_BLUETOOTH_LE_CONFIG_REGISTER_CONNECT_COMPLETE_CALLBACK) (  
    IN EFI_BLUETOOTH_LE_CONFIG_PROTOCOL                   *This,
    IN EFI_BLUETOOTH_LE_CONFIG_CONNECT_COMPLETE_CALLBACK   Callback,
    IN VOID                                                *Context
    );

Parameters

This Pointer to the EFI_BLUETOOTH_LE_CONFIG_PROTOCOL instance.
Callback The callback function. NULL means unregister.
Context Data passed into Callback function. This is optional parameter and may be NULL.

Description

The RegisterLinkConnectCompleteCallback() function registers Bluetooth link connect complete callback function. The Bluetooth Configuration driver may call RegisterLinkConnectCompleteCallback() to register a callback function. During pairing, Bluetooth bus driver must trigger this callback function to report device state, if it is registered. Then Bluetooth Configuration driver will get information on device connection, according to CallbackType defined by EFI_BLUETOOTH_CONNECT_COMPLETE_CALLBACK_TYPE.

Related Definitions

typedef
EFI_STATUS

27 - Network Protocols — VLAN, EAP, Wi-Fi and Supplicant

27.1 VLAN Configuration Protocol

EFI_VLAN_CONFIG_PROTOCOL

Summary
This protocol is to provide manageability interface for VLAN configuration.

GUID
#define EFI_VLAN_CONFIG_PROTOCOL_GUID
{0x9e23d768, 0xd2f3, 0x4366,
{0x9f, 0xc3, 0x3a, 0x7a, 0xba, 0x86, 0x43, 0x74}}

Protocol Interface Structure
typedef struct _EFI_VLAN_CONFIG_PROTOCOL {
  EFI_VLAN_CONFIG_SET         Set;
  EFI_VLAN_CONFIG_FIND        Find;
  EFI_VLAN_CONFIG_REMOVE      Remove;
} EFI_VLAN_CONFIG_PROTOCOL;

Parameters
- **Set**: Create new VLAN device or modify configuration parameter of an already-configured VLAN.
- **Find**: Find configuration information for specified VLAN or all configured VLANs.
- **Remove**: Remove a VLAN device.

Description
This protocol is to provide manageability interface for VLAN setting. The intended VLAN tagging implementation is IEEE802.1Q.

EFI_VLAN_CONFIG_PROTOCOL.Set ()

Summary
Create a VLAN device or modify the configuration parameter of an already-configured VLAN.
Prototype

typedef
EFI_STATUS
(EIFIAPI * EFI_VLAN_CONFIG_SET) (  
    IN EFI_VLAN_CONFIG_PROTOCOL      *This,
    IN UINT16                      VlanId,
    IN UINT8                       Priority
);

Parameters

This Pointer to EFI_VLAN_CONFIG_PROTOCOL instance.
VlanId A unique identifier (1-4094) of the VLAN which is being created or modified, or zero (0).
Priority 3 bit priority in VLAN header. Priority 0 is default value. If VlanId is zero (0), Priority is ignored.

Description

The Set() function is used to create a new VLAN device or change the VLAN configuration parameters. If the VlanId hasn’t been configured in the physical Ethernet device, a new VLAN device will be created. If a VLAN with this VlanId is already configured, then related configuration will be updated as the input parameters.

If VlanId is zero, the VLAN device will send and receive untagged frames. Otherwise, the VLAN device will send and receive VLAN-tagged frames containing the VlanId.

If VlanId is out of scope of (0-4094), EFI_INVALID_PARAMETER is returned.

If Priority is out of the scope of (0-7), then EFI_INVALID_PARAMETER is returned.

If there is not enough system memory to perform the registration, then EFI_OUT_OF_RESOURCES is returned.

</tbody>
</table>

EFI_VLAN_CONFIG_PROTOCOL.Find()

Summary

Find configuration information for specified VLAN or all configured VLANs.
Prototype

```c
typedef EFI_STATUS
  (EFIAPI *EFI_VLAN_CONFIG_FIND) (
    IN EFI_VLAN_CONFIG_PROTOCOL  *This,
    IN UINT16           *VlanId, OPTIONAL
    OUT UINT16           *NumberOfVlan,
    OUT EFI_VLAN_FIND_DATA     **Entries
  );
```

Parameters

- **This**: Pointer to `EFI_VLAN_CONFIG_PROTOCOL` instance.
- **VlanId**: Pointer to VLAN identifier. Set to `NULL` to find all configured VLANs
- **NumberOfVlan**: The number of VLANs which is found by the specified criteria
- **Entries**: The buffer which receive the VLAN configuration. Type `EFI_VLAN_FIND_DATA` is defined below.

Description

The `Find()` function is used to find the configuration information for matching VLAN and allocate a buffer into which those entries are copied.

Related Definitions

```c
//EFI_VLAN_FIND_DATA

typedef struct {
  UINT16 VlanId;
  UINT8  Priority;
} EFI_VLAN_FIND_DATA;
```

- **VlanId**: Vlan Identifier
- **Priority**: Priority of this VLAN

</tbody>
</table>
**EFI_VLAN_CONFIG_PROTOCOL.Remove ()**

**Summary**
Remove the configured VLAN device

**Prototype**

```c
typedef EFI_STATUS (EFIAPI * EFI_VLAN_CONFIG_REMOVE) (  
    IN EFI_VLAN_CONFIG_PROTOCOL *This,  
    IN UINT16 VlanId
);
```

**Parameters**

- **This**: Pointer to `EFI_VLAN_CONFIG_PROTOCOL` instance.
- **VlanId**: Identifier (0-4094) of the VLAN to be removed.

**Description**

The `Remove()` function is used to remove the specified VLAN device. If the `VlanId` is out of the scope of (0-4094), `EFI_INVALID_PARAMETER` is returned. If specified VLAN hasn’t been previously configured, `EFI_NOT_FOUND` is returned.

**Status Codes Returned**

### 27.2 EAP Protocol

This section defines the EAP protocol. This protocol is designed to make the EAP framework configurable and extensible. It is intended for the supplicant side.

**EFI_EAP_PROTOCOL**

**Summary**

This protocol is used to abstract the ability to configure and extend the EAP framework.
GUID
#define EFI_EAP_PROTOCOL_GUID
{ 0x5d9f96db, 0xe731, 0x4caa,
{0xa0, 0x0d, 0x72, 0xe1, 0x87, 0xcd, 0x77, 0x62 } }

Protocol Interface Structure
typedef struct _EFI_EAP_PROTOCOL {
 EFI_EAP_SET_DESIRED_AUTHENTICATION_METHOD SetDesiredAuthMethod;
 EFI_EAP_REGISTER_AUTHENTICATION_METHOD RegisterAuthMethod;
} EFI_EAP_PROTOCOL;

Parameters
 SetDesiredAuthMethod Set the desired EAP authentication method for the Port. See the
 SetDesiredAuthMethod() function description.
 RegisterAuthMethod Register an EAP authentication method. See the
 RegisterAuthMethod() function description.

Description
EFI_EAP_PROTOCOL is used to configure the desired EAP authentication method for the EAP framework
and extend the EAP framework by registering new EAP authentication method on a Port. The EAP
framework is built on a per-Port basis. Herein, a Port means a NIC. For the details of EAP protocol, please
refer to RFC 2284.

Related Definitions
//
// Type for the identification number assigned to the Port by the // System in
which the Port resides.
//
typedef VOID * EFI_PORT_HANDLE;

EFI_EAP.SetDesiredAuthMethod()

Summary
Set the desired EAP authentication method for the Port.

Prototype
typedef
EFI_STATUS
(EIFIAP *EFI_EAP_SET_DESIRED_AUTHENTICATION_METHOD) (  
IN struct _EFI_EAP_PROTOCOL *This,
IN UINT8 EapAuthType
);

Parameters
This A pointer to the EFI_EAP_PROTOCOL instance that indicates the
calling context. Type EFI_EAP_PROTOCOL is defined in Section 1.1.
EapAuthType

The type of the desired EAP authentication method for the Port. It should be the type value defined by RFC. See RFC 2284 for details. Current valid values are defined in “Related Definitions”.

Related Definitions

```c
//
// EAP Authentication Method Type (RFC 3748)
//
#define EFI_EAP_TYPE_TLS 13 /* REQUIRED - RFC 5216 */
```

Description

The `SetDesiredAuthMethod()` function sets the desired EAP authentication method indicated by `EapAuthType` for the Port.

If `EapAuthType` is an invalid EAP authentication type, then `EFI_INVALID_PARAMETER` is returned.

If the EAP authentication method of `EapAuthType` is unsupported, then it will return `EFI_UNSUPPORTED`.

The cryptographic strength of `EFI_EAP_TYPE_TLS` shall be at least of hash strength SHA-256 and RSA key length of at least 2048 bits.

Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The desired EAP authentication method is set successfully.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td><code>EapAuthType</code> is an invalid EAP authentication type.</td>
</tr>
<tr>
<td>EFI_UNSUPPORTED</td>
<td>The EAP authentication method of <code>EapAuthType</code> is unsupported by the Port.</td>
</tr>
</tbody>
</table>

**EFI_EAP.RegisterAuthMethod()**

Summary

Register an EAP authentication method.

Prototype

```c
typedef
EFI_STATUS
(EFIAPI *EFI_EAP_REGISTER_AUTHENTICATION_METHOD) (  
    IN struct _EFI_EAP_PROTOCOL   *This,
    IN UINT8                      EapAuthType,
    IN EFI_EAP_BUILD_RESPONSE_PACKET Handler
    );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>This</td>
<td>A pointer to the <code>EFI_EAP_PROTOCOL</code> instance that indicates the calling context. Type <code>EFI_EAP_PROTOCOL</code> is defined in Section 1.1.</td>
</tr>
<tr>
<td>EapAuthType</td>
<td>The type of the EAP authentication method to register. It should be the type value defined by RFC. See RFC 2284 for details. Current valid</td>
</tr>
</tbody>
</table>
values are defined in the `SetDesiredAuthMethod()` function
description.

**Handler**
The handler of the EAP authentication method to register. Type
`EFI_EAP_BUILD_RESPONSE_PACKET` is defined in “Related
Definitions”.

**Related Definitions**

typedef

`EFI_STATUS`

`(EFI_API *EFI_EAP_BUILD_RESPONSE_PACKET) (``

`IN EFI_PORT_HANDLE` PortNumber

`IN UINT8` *RequestBuffer,

`IN UINTN` RequestSize,

`IN UINT8` *Buffer,

`IN OUT UINTN` *BufferSize

```

/*++

Routine Description:
Build EAP response packet in response to the EAP request packet specified by
(RequestBuffer, RequestSize).

Arguments:
PortNumber   - Specified the Port where the EAP request packet comes.
RequestBuffer  - Pointer to the most recently received EAP-Request packet.
RequestSize   - Packet size in bytes for the most recently received EAP-
Request packet.
Buffer     - Pointer to the buffer to hold the built packet.
BufferSize   - Pointer to the buffer size in bytes. On input, it is the
buffer size provided by the caller. On output, it is the buffer size in fact
needed to contain the packet.

Returns:
EFI_SUCCESS   - The required EAP response packet is built successfully.
others     - Failures are encountered during the packet building process.

--*/
```

**Description**
The `RegisterAuthMethod()` function registers the user provided EAP authentication method, the type
of which is `EapAuthType` and the handler of which is `Handler`.

If `EapAuthType` is an invalid EAP authentication type, then `EFI_INVALID_PARAMETER` is returned.

If there is not enough system memory to perform the registration, then `EFI_OUT_OF_RESOURCES` is
returned.
## Status Codes Returned

### 27.2.1 EAPManagement Protocol

This section defines the EAP management protocol. This protocol is designed to provide ease of management and ease of test for EAPOL state machine. It is intended for the supplicant side. It conforms to IEEE 802.1x specification.

**EFI_EAP_MANAGEMENT_PROTOCOL**

**Summary**

This protocol provides the ability to configure and control EAPOL state machine, and retrieve the status and the statistics information of EAPOL state machine.

**GUID**

```
#define EFI_EAP_MANAGEMENT_PROTOCOL_GUID {
  0xbb62e663, 0x625d, 0x40b2,
  { 0xa0, 0x88, 0xbb, 0xe8, 0x36, 0x23, 0xa2, 0x45 }
```

**Protocol Interface Structure**

```
typedef struct _EFI_EAP_MANAGEMENT_PROTOCOL {
  EFI_EAP_GET_SYSTEM_CONFIGURATION  GetSystemConfiguration;
  EFI_EAP_SET_SYSTEM_CONFIGURATION  SetSystemConfiguration;
  EFI_EAP_INITIALIZE_PORT          InitializePort;
  EFI_EAP_USER_LOGON               UserLogon;
  EFI_EAP_USER_LOGOFF              UserLogoff;
  EFI_EAP_GET_SUPPLICANT_STATUS    GetSupplicantStatus;
  EFI_EAP_SET_SUPPLICANT_CONFIGURATION  SetSupplicantConfiguration;
  EFI_EAP_GET_SUPPLICANT_STATISTICS GetSupplicantStatistics;
} EFI_EAP_MANAGEMENT_PROTOCOL;
```

**Parameters**

- **GetSystemConfiguration** Read the system configuration information associated with the Port. See the `GetSystemConfiguration()` function description.
- **SetSystemConfiguration** Set the system configuration information associated with the Port. See the `SetSystemConfiguration()` function description.
- **InitializePort** Cause the EAPOL state machines for the Port to be initialized. See the `InitializePort()` function description.
- **UserLogon** Notify the EAPOL state machines for the Port that the user of the System has logged on. See the `UserLogon()` function description.
UserLogoff

Notify the EAPOL state machines for the Port that the user of the System has logged off. See the UserLogoff() function description.

GetSupplicantStatus

Read the status of the Supplicant PAE state machine for the Port, including the current state and the configuration of the operational parameters. See the GetSupplicantStatus() function description.

SetSupplicantConfiguration

Set the configuration of the operational parameter of the Supplicant PAE state machine for the Port. See the SetSupplicantConfiguration() function description.

GetSupplicantStatistics

Read the statistical information regarding the operation of the Supplicant associated with the Port. See the GetSupplicantStatistics() function description.

Description

The EFI_EAP_MANAGEMENT protocol is used to control, configure and monitor EAPOL state machine on a Port. EAPOL state machine is built on a per-Port basis. Herein, a Port means a NIC. For the details of EAPOL, please refer to IEEE 802.1x specification.

EFI_EAP_MANAGEMENT.GetSystemConfiguration()

Summary

Read the system configuration information associated with the Port.

Prototype

typedef

EFI_STATUS

(EIFIAPI *EFI_EAP_GET_SYSTEM_CONFIGURATION) (  
IN struct _EFI_EAP_MANAGEMENT_PROTOCOL *This,  
OUT BOOLEAN               *SystemAuthControl,  
OUT EFI_EAPOL_PORT_INFO         *PortInfo OPTIONAL  
);

Parameters

This  

A pointer to the EFI_EAP_MANAGEMENT_PROTOCOL instance that indicates the calling context. Type EFI_EAP_MANAGEMENT_PROTOCOL is defined in <Hyperlink>Section 27.2.1.

SystemAuthControl  

Returns the value of the SystemAuthControl parameter of the System. TRUE means Enabled. FALSE means Disabled.

PortInfo  

Returns EFI_EAPOL_PORT_INFO structure to describe the Port's information. This parameter can be NULL to ignore reading the Port's information. Type EFI_EAPOL_PORT_INFO is defined in “Related Definitions”.

Related Definitions

//
// PAE Capabilities
//
#define PAE_SUPPORT_AUTHENTICATOR 0x01
#define PAE_SUPPORT_SUPPLICANT 0x02

typedef struct _EFI_EAPOL_PORT_INFO {
  EFI_PORT_HANDLE     PortNumber;
  UINT8                ProtocolVersion;
  UINT8                PaeCapabilities;
} EFI_EAPOL_PORT_INFO;

PortNumber The identification number assigned to the Port by the System in which the Port resides.
ProtocolVersion The protocol version number of the EAPOL implementation supported by the Port.
PaeCapabilities The capabilities of the PAE associated with the Port. This field indicates whether Authenticator functionality, Supplicant functionality, both, or neither, is supported by the Port’s PAE.

Description

The GetSystemConfiguration() function reads the system configuration information associated with the Port, including the value of the SystemAuthControl parameter of the System is returned in SystemAuthControl and the Port’s information is returned in the buffer pointed to by PortInfo. The Port’s information is optional. If PortInfo is NULL, then reading the Port’s information is ignored.

If SystemAuthControl is NULL, then EFI_INVALID_PARAMETER is returned.

Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The system configuration information of the Port is read successfully.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>SystemAuthControl is NULL.</td>
</tr>
</tbody>
</table>

EFI_EAP_MANAGEMENT.SetSystemConfiguration()

Summary

Set the system configuration information associated with the Port.

Prototype

typedef

EFI_STATUS

(EIFIAPI *EFI_EAP_SET_SYSTEM_CONFIGURATION) ( 
IN struct _EFI_EAP_MANAGEMENT_PROTOCOL *This, 

IN BOOLEAN SystemAuthControl
);

Parameters

This A pointer to the EFI_EAP_MANAGEMENT_PROTOCOL instance that indicates the calling context. Type EFI_EAP_MANAGEMENT_PROTOCOL is defined in <Hyperlink>Section 27.2.1.

SystemAuthControl The desired value of the SystemAuthControl parameter of the System. TRUE means Enabled. FALSE means Disabled.

Description

The SetSystemConfiguration() function sets the value of the SystemAuthControl parameter of the System to SystemAuthControl.

Status Codes Returned

| EFI_SUCCESS | The system configuration information of the Port is set successfully. |

---

EFI_EAP_MANAGEMENT.InitializePort()

Summary

Cause the EAPOL state machines for the Port to be initialized.

Prototype

typedef EFI_STATUS (EFIAPI *EFI_EAP_INITIALIZE_PORT) (
    IN struct _EFI_EAP_MANAGEMENT_PROTOCOL *This
);

Parameters

This A pointer to the EFI_EAP_MANAGEMENT_PROTOCOL instance that indicates the calling context. Type EFI_EAP_MANAGEMENT_PROTOCOL is defined in <Hyperlink>Section 27.2.1.

Description

The InitializePort() function causes the EAPOL state machines for the Port.

Status Codes Returned

| EFI_SUCCESS | The Port is initialized successfully. |
EFI_EAP_MANAGEMENT.UserLogon()

Summary
Notify the EAPOL state machines for the Port that the user of the System has logged on.

Prototype
typedef
EFI_STATUS
(EIFIAPI *EFI_EAP_USER_LOGON) (  
    IN struct _EFI_EAP_MANAGEMENT_PROTOCOL *This,  
);

Parameters
This
A pointer to the EFI_EAP_MANAGEMENT_PROTOCOL instance that indicates the calling context. Type EFI_EAP_MANAGEMENT_PROTOCOL is defined in <Hyperlink>Section 27.2.1.

Description
The UserLogon() function notifies the EAPOL state machines for the Port.

Status Codes Returned
| EFI_SUCCESS | The Port is notified successfully. |

EFI_EAP_MANAGEMENT.UserLogoff()

Summary
Notify the EAPOL state machines for the Port that the user of the System has logged off.

Prototype
typedef
EFI_STATUS
(EIFIAPI *EFI_EAP_USER_LOGOFF) (  
    IN struct _EFI_EAP_MANAGEMENT_PROTOCOL *This,  
);

Parameters
This
A pointer to the EFI_EAP_MANAGEMENT_PROTOCOL instance that indicates the calling context. Type EFI_EAP_MANAGEMENT_PROTOCOL is defined in <Hyperlink>Section 27.2.1.

Description
The UserLogoff() function notifies the EAPOL state machines for the Port.
Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The Port is notified successfully.</td>
</tr>
</tbody>
</table>

EFI_EAP_MANAGEMENT.GetSupplicantStatus()

Summary

Read the status of the Supplicant PAE state machine for the Port, including the current state and the configuration of the operational parameters.

Prototype

```c
typedef EFI_STATUS (EFIAPI *EFI_EAP_GET_SUPPLICANT_STATUS) (
    IN struct _EFI_EAP_MANAGEMENT_PROTOCOL *This,
    OUT EFI_EAPOL_SUPPLICANT_PAE_STATE *CurrentState,
    IN OUT EFI_EAPOL_SUPPLICANT_PAE_CONFIGURATION *Configuration
);
```

Parameters

- **This**: A pointer to the `EFI_EAP_MANAGEMENT_PROTOCOL` instance that indicates the calling context. Type `EFI_EAP_MANAGEMENT_PROTOCOL` is defined in <Hyperlink>Section 27.2.1.</Hyperlink>

- **CurrentState**: Returns the current state of the Supplicant PAE state machine for the Port. Type `EFI_EAPOL_SUPPLICANT_PAE_STATE` is defined in “Related Definitions”.

- **Configuration**: Returns the configuration of the operational parameters of the Supplicant PAE state machine for the Port as required. This parameter can be NULL to ignore reading the configuration. On input, `Configuration.ValidFieldMask` specifies the operational parameters to be read. On output, `Configuration` returns the configuration of the required operational parameters. Type `EFI_EAPOL_SUPPLICANT_PAE_CONFIGURATION` is defined in “Related Definitions”.

EFI_SUCCESS The Port is notified successfully.
Related Definitions

//
// Supplicant PAE state machine (IEEE Std 802.1X Section 8.5.10)
//
typedef enum _EFI_EAPOL_SUPPLICANT_PAE_STATE {
  Logoff,
  Disconnected,
  Connecting,
  Acquired,
  Authenticating,
  Held,
  Authenticated,
  MaxSupplicantPaeState
} EFI_EAPOL_SUPPLICANT_PAE_STATE;

//
// Definitions for ValidFieldMask
//
#define AUTH_PERIOD_FIELD_VALID 0x01
#define HELD_PERIOD_FIELD_VALID 0x02

typedef struct _EFI_EAPOL_SUPPLICANT_PAE_CONFIGURATION {
  UINT8    ValidFieldMask;
  UINTN    AuthPeriod;
  UINTN    HeldPeriod;
  UINTN    StartPeriod;
  UINTN    MaxStart;
} EFI_EAPOL_SUPPLICANT_PAE_CONFIGURATION;

ValidFieldMask Indicates which of the following fields are valid.
AuthPeriod The initial value for the authWhile timer. Its default value is 30 s.
HeldPeriod The initial value for the heldWhile timer. Its default value is 60 s.
StartPeriod The initial value for the startWhen timer. Its default value is 30 s.
MaxStart The maximum number of successive EAPOL-Start messages will be sent before the Supplicant assumes that there is no Authenticator present. Its default value is 3.

Description

The GetSupplicantStatus() function reads the status of the Supplicant PAE state machine for the Port, including the current state CurrentState and the configuration of the operational parameters Configuration. The configuration of the operational parameters is optional. If Configuration is NULL, then reading the configuration is ignored. The operational parameters in Configuration to be read can also be specified by Configuration.ValidFieldMask.
If `CurrentState` is **NULL**, then **EFI_INVALID_PARAMETER** is returned.

</table>

**EFI_EAP_MANAGEMENT.SetSupplicantConfiguration()**

**Summary**

Set the configuration of the operational parameter of the Supplicant PAE state machine for the Port.

**Prototype**

```c
typedef EFI_STATUS (EFIAPI *EFI_EAP_SET_SUPPLICANT_CONFIGURATION) (
    IN struct _EFI_EAP_MANAGEMENT_PROTOCOL   *This,
    IN EFI_EAPOL_SUPPLICANT_PAE_CONFIGURATION  *Configuration
);
```

**Parameters**

- **This**
  A pointer to the **EFI_EAP_MANAGEMENT_PROTOCOL** instance that indicates the calling context. Type **EFI_EAP_MANAGEMENT_PROTOCOL** is defined in `<Hyperlink>Section 27.2.1</Hyperlink>`.

- **Configuration**
  The desired configuration of the operational parameters of the Supplicant PAE state machine for the Port as required. Type **EFI_EAPOL_SUPPLICANT_PAE_CONFIGURATION** is defined in the **GetSupplicantStatus()** function description.

**Description**

The **SetSupplicantConfiguration()** function sets the configuration of the operational parameter of the Supplicant PAE state machine for the Port to **Configuration**. The operational parameters in **Configuration** to be set can be specified by **Configuration.ValidFieldMask**.

If **Configuration** is **NULL**, then **EFI_INVALID_PARAMETER** is returned.

### Status Codes Returned

</tbody>
</table>
**EFI_EAP_MANAGEMENT.GetSupplicantStatistics()**

**Summary**

Read the statistical information regarding the operation of the Supplicant associated with the Port.

**Prototype**

```c
typedef EFI_STATUS
    (EFIAPI *EFI_EAP_GET_SUPPLICANT_STATISTICS) (
    IN struct _EFI_EAP_MANAGEMENT_PROTOCOL   *This,
    OUT EFI_EAPOL_SUPPLICANT_PAE_STATISTICS   *Statistics
    );
```

**Parameters**

- **This**  
  A pointer to the `EFI_EAP_MANAGEMENT_PROTOCOL` instance that indicates the calling context. Type `EFI_EAP_MANAGEMENT_PROTOCOL` is defined in `<Hyperlink>Section 27.2.1</Hyperlink>`.

- **Statistics**  
  Returns the statistical information regarding the operation of the Supplicant for the Port. Type `EFI_EAPOL_SUPPLICANT_PAE_STATISTICS` is defined in “Related Definitions”.

**Related Definitions**

```c
//
// Supplicant Statistics (IEEE Std 802.1X Section 9.5.2)
//
typedef struct _EFI_EAPOL_SUPPLICANT_PAE_STATISTICS {
    UINTN   EapolFramesReceived;
    UINTN   EapolFramesTransmitted;
    UINTN   EapolStartFramesTransmitted;
    UINTN   EapolLogoffFramesTransmitted;
    UINTN   EapReqIdFramesReceived;
    UINTN   EapRequestFramesReceived;
    UINTN   InvalidEapolFramesReceived;
    UINTN   EapLengthErrorFramesReceived;
    UINTN   LastEapolFrameVersion;
    UINTN   LastEapolFrameSource;
} EFI_EAPOL_SUPPLICANT_PAE_STATISTICS;
```

**EapolFramesReceived**

The number of EAPOL frames of any type that have been received by this Supplicant.
### EapolFramesTransmitted
The number of EAPOL frames of any type that have been transmitted by this Supplicant.

### EapolStartFramesTransmitted
The number of EAPOL Start frames that have been transmitted by this Supplicant.

### EapolLogoffFramesTransmitted
The number of EAPOL Logoff frames that have been transmitted by this Supplicant.

### EapRespIdFramesTransmitted
The number of EAP Resp/Id frames that have been transmitted by this Supplicant.

### EapResponseFramesTransmitted
The number of valid EAP Response frames (other than Resp/Id frames) that have been transmitted by this Supplicant.

### EapReqIdFramesReceived
The number of EAP Req/Id frames that have been received by this Supplicant.

### EapRequestFramesReceived
The number of EAP Request frames (other than Rq/Id frames) that have been received by this Supplicant.

### InvalidEapolFramesReceived
The number of EAPOL frames that have been received by this Supplicant in which the frame type is not recognized.

### EapLengthErrorFramesReceived
The number of EAPOL frames that have been received by this Supplicant in which the Packet Body Length field (7.5.5) is invalid.

### LastEapolFrameVersion
The protocol version number carried in the most recently received EAPOL frame.

### LastEapolFrameSource
The source MAC address carried in the most recently received EAPOL frame.

### Description
The `GetSupplicantStatistics()` function reads the statistical information `Statistics` regarding the operation of the Supplicant associated with the Port.

If `Statistics` is `NULL`, then `EFI_INVALID_PARAMETER` is returned.

### Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The statistical information regarding the operation of the Supplicant for the Port is read successfully.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td><code>Statistics</code> is <code>NULL</code>.</td>
</tr>
</tbody>
</table>
27.2.2 EFI EAP Management2 Protocol

**EFI_EAP_MANAGEMENT2_PROTOCOL**

**Summary**

This protocol provides the ability to configure and control EAPOL state machine, and retrieve the information, status and the statistics information of EAPOL state machine.

**GUID**

```c
#define EFI_EAP_MANAGEMENT2_PROTOCOL_GUID
   { 0x5e93c847, 0x456d, 0x40b3, 
   { 0xa6, 0xb4, 0x78, 0xb0, 0xc9, 0xcf, 0x7f, 0x20 }}
```

**Protocol Interface Structure**

```c
typedef struct _EFI_EAP_MANAGEMENT2_PROTOCOL {
    ....... // Same as EFI_EAP_MANAGEMENT_PROTOCOL
    EFI_EAP_GET_KEY GetKey;
} EFI_EAP_MANAGMENT2_PROTOCOL;
```

**Parameters**

- **GetKey**
  
  Provide Key information parsed from EAP packet. See the `GetKey()` function description.

**Description**

The **EFI_EAP_MANAGEMENT2_PROTOCOL** is used to control, configure and monitor EAPOL state machine on a Port, and return information of the Port. EAPOL state machine is built on a per-Port basis. Herein, a Port means a NIC. For the details of EAPOL, please refer to IEEE 802.1x specification.

**EFI_EAP_MANAGEMENT2_PROTOCOL.GetKey()**

**Summary**

Return key generated through EAP process.

**Prototype**

```c
typedef
EFI_STATUS
(EIFIAPI *EFI_EAP_GET_KEY)(
    IN EFI_EAP_MANAGEMENT2_PROTOCOL *This,
    IN OUT UINT8 *Msk,
    IN OUT UINTN *MskSize,
    IN OUT UINT8 *Emsk,
    IN OUT UINT8 *EmskSize
    );
```
Parameters

<table>
<thead>
<tr>
<th>Pointer to the EFI_EAP_MANAGEMENT2_PROTOCOL instance.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Msk (Master Session Key) buffer.</td>
</tr>
<tr>
<td>MSK buffer size.</td>
</tr>
<tr>
<td>EMSK (Extended Master Session Key) buffer.</td>
</tr>
<tr>
<td>EMSK buffer size.</td>
</tr>
</tbody>
</table>

Description

The GetKey() function returns the key generated through EAP process, so that the 802.11 MAC layer driver can use MSK to derive more keys, e.g. PMK (Pairwise Master Key).

Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The operation completed successfully.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>One or more of the following conditions is TRUE:</td>
</tr>
<tr>
<td>Msk is NULL.</td>
<td></td>
</tr>
<tr>
<td>MskSize is NULL.</td>
<td></td>
</tr>
<tr>
<td>Emsk is NULL.</td>
<td></td>
</tr>
<tr>
<td>EmskSize is NULL.</td>
<td></td>
</tr>
<tr>
<td>EFI_NOT_READY</td>
<td>MSK and EMSK are not generated in current session yet.</td>
</tr>
</tbody>
</table>

27.2.3 EFI EAP Configuration Protocol

EFI_EAP_CONFIGURATION_PROTOCOL

Summary

This protocol provides a way to set and get EAP configuration.

GUID

```
#define EFI_EAP_CONFIGURATION_PROTOCOL_GUID \
{ 0xe5b58dbb, 0x7688, 0x44b4, \ 
{ 0x97, 0xbf, 0x5f, 0x1d, 0x4b, 0xc8, 0xdb }}
```

Protocol Interface Structure

```
typedef struct _EFI_EAP_CONFIGURATION_PROTOCOL {
  EFI_EAP_CONFIGURATION_SET_DATA     SetData;
  EFI_EAP_CONFIGURATION_GET_DATA     GetData;
} EFI_EAP_CONFIGURATION_PROTOCOL;
```

Parameters

<table>
<thead>
<tr>
<th>SetData</th>
<th>Set EAP configuration data. See the SetData() function description.</th>
</tr>
</thead>
<tbody>
<tr>
<td>GetData</td>
<td>Get EAP configuration data. See the GetData() function description.</td>
</tr>
</tbody>
</table>
Description

The `EFI_EAP_CONFIGURATION_PROTOCOL` is designed to provide a way to set and get EAP configuration, such as Certificate, private key file.

### EFI_EAP_CONFIGURATION_PROTOCOL.SetData()

**Summary**

Set EAP configuration data.

**Prototype**

```c
typedef EFI_STATUS
    (EFIAPIC *EFI_EAP_CONFIGURATION_SET_DATA)(
    IN EFI_EAP_CONFIGURATION_PROTOCOL *This,
    IN EFI_EAP_TYPE EapType,
    IN EFI_EAP_CONFIG_DATA_TYPE DataType,
    IN VOID *Data,
    IN UINTN DataSize
    );
```

**Parameters**

- **This** Pointer to the `EFI_EAP_CONFIGURATION_PROTOCOL` instance.
- **EapType** EAP type. See `EFI_EAP_TYPE`.
- **DataType** Configuration data type. See `EFI_EAP_CONFIG_DATA_TYPE`.
- **Data** Pointer to configuration data.
- **DataSize** Total size of configuration data.

**Description**

The `SetData()` function sets EAP configuration to non-volatile storage or volatile storage.

</table>

**EFI_EAP_CONFIGURATION_PROTOCOL.GetData()**

**Summary**

Get EAP configuration data.

**Prototype**

```c
typedef EFI_STATUS
(EFI_API *EFI_EAP_CONFIGURATION_PROTOCOL *This,
 IN EFI_EAP_TYPE EapType,
 IN EFI_EAP_CONFIG_DATA_TYPE DataType,
 IN OUT VOID *Data,
 IN OUT UINTN *DataSize
);
```

**Parameters**

- **This**  
  Pointer to the `EFI_EAP_CONFIGURATION_PROTOCOL` instance.
- **EapType**  
  EAP type. See `EFI_EAP_TYPE`.
- **DataType**  
  Configuration data type. See `EFI_EAP_CONFIG_DATA_TYPE`.
- **Data**  
  Pointer to configuration data.
- **DataSize**  
  Total size of configuration data. On input, it means the size of `Data` buffer. On output, it means the size of copied `Data` buffer if `EFI_SUCCESS`, and means the size of desired `Data` buffer if `EFI_BUFFER_TOO_SMALL`.

**Description**
The \texttt{GetData()} function gets EAP configuration.

- Status Codes Returned

<table>

27.3 EFI Wireless MAC Connection Protocol

\texttt{EFI_WIRELESS_MAC_CONNECTION_PROTOCOL}

Summary

This protocol provides management service interfaces of 802.11 MAC layer. It is used by network applications (and drivers) to establish wireless connection with an access point (AP).

GUID

\begin{verbatim}
#define EFI_WIRELESS_MAC_CONNECTION_PROTOCOL_GUID \{ 0xda55bc9, 0x45f8, 0x4bb4, \{ 0x87, 0x19, 0x52, 0x24, 0xf1, 0x8a, 0x4d, 0x45 \}
\end{verbatim}

Protocol Interface Structure

\begin{verbatim}
typedef struct _EFI_WIRELESS_MAC_CONNECTION_PROTOCOL {
  EFI_WIRELESS_MAC_CONNECTION.Scan Scan;
  EFI_WIRELESS_MAC_CONNECTION.Associate Associate;
  EFI_WIRELESS_MAC_CONNECTION.Disassociate Disassociate;
  EFI_WIRELESS_MAC_CONNECTION.Authenticate Authenticate;
  EFI_WIRELESS_MAC_CONNECTION.Deauthenticate Deauthenticate;
} EFI_WIRELESS_MAC_CONNECTION_PROTOCOL;
\end{verbatim}

Parameters

- \texttt{Scan} Determine the characteristics of the available BSSs. See the \texttt{Scan()} function description.

- \texttt{Associate} Places an association request with a specific peer MAC entity. See the \texttt{Associate()} function description.

- \texttt{Disassociate} Reports a disassociation with a specific peer MAC entity. See the \texttt{Disassociate()} function description.

- \texttt{Authenticate} Requests authentication with a specific peer MAC entity. See the \texttt{Authenticate()} function description.

- \texttt{Deauthenticate} Invalidates an authentication relationship with a peer MAC entity. See the \texttt{Deauthenticate()} function description.
Description
The **EFI_WIRELESS_MAC_CONNECTION_PROTOCOL** is designed to provide management service interfaces for the EFI wireless network stack to establish wireless connection with AP. An EFI Wireless MAC Connection Protocol instance will be installed on each communication device that the EFI wireless network stack runs on.

**EFI_WIRELESS_MAC_CONNECTION_PROTOCOL.Scan()**

Summary
Request a survey of potential BSSs that administrator can later elect to try to join.

Prototype
```
typedef
  EFI_STATUS
(EFI_API *EFI_WIRELESS_MAC_CONNECTION_SCAN)(
  IN EFI_WIRELESS_MAC_CONNECTION_PROTOCOL *This,
  IN EFI_80211_SCAN_DATA_TOKEN *Data
);
```

Parameters
- **This** Pointer to the **EFI_WIRELESS_MAC_CONNECTION_PROTOCOL** instance.
- **Data** Pointer to the scan token. Type **EFI_80211_SCAN_DATA_TOKEN** is defined in “Related Definitions” below.

Description
The **Scan()** function returns the description of the set of BSSs detected by the scan process. Passive scan operation is performed by default.

Related Definitions
```
 targetType
  //**********************************************
  //  EFI_80211_SCAN_DATA_TOKEN
  //**********************************************

typedef struct {
  EFI_EVENT  Event;
  EFI_STATUS Status;
  EFI_80211_SCAN_DATA    *Data;
  EFI_80211_SCAN_RESULT_CODE ResultCode;
  EFI_80211_SCAN_RESULT   *Result;
} EFI_80211_SCAN_DATA_TOKEN;
```

- **Event** This **Event** will be signaled after the **Status** field is updated by the EFI Wireless MAC Connection Protocol driver. The type of **Event** must be ** EFI_NOTIFY_SIGNAL**.

- **Status** Will be set to one of the following values:
**EFI_SUCCESS**: Scan operation completed successfully.

**EFI_NOT_FOUND**: Failed to find available BSS.

**EFI_DEVICE_ERROR**: An unexpected network or system error occurred.

**EFI_ACCESS_DENIED**: The scan operation is not completed due to some underlying hardware or software state.

**EFI_NOT_READY**: The scan operation is started but not yet completed.

**Data**
Pointer to the scan data. Type **EFI_80211_SCAN_DATA** is defined below.

**ResultCode**
Indicates the scan state. Type **EFI_80211_SCAN_RESULT_CODE** is defined below.

**Result**
Indicates the scan result. It is caller’s responsibility to free this buffer. Type **EFI_80211_SCAN_RESULT** is defined below.

The **EFI_80211_SCAN_DATA_TOKEN** structure is defined to support the process of determining the characteristics of the available BSSs. As input, the **Data** field must be filled in by the caller of EFI Wireless MAC Connection Protocol. After the scan operation completes, the EFI Wireless MAC Connection Protocol driver updates the **Status**, **ResultCode** and **Result** field and the **Event** is signaled.

```c
// ****************************************************************************
// EFI_80211_SCAN_DATA
// ****************************************************************************
typedef struct {
    EFI_80211_BSS_TYPE BSSType;
    EFI_80211_MAC_ADDRESS BSSID;
    UINT8 SSIDLlen;
    UINT8 *SSID;
    BOOLEAN PassiveMode;
    UINT32 ProbeDelay;
    UINT32 *ChannelList;
    UINT32 MinChannelTime;
    UINT32 MaxChannelTime;
    EFI_80211_ELEMENT_REQ *RequestInformation;
    EFI_80211_ELEMENT_SSID *SSIDList;
    EFI_80211_ACC_NET_TYPE AccessNetworkType;
    UINT8 *VendorSpecificInfo;
} EFI_80211_SCAN_DATA;
```

**BSSType**
Determines whether infrastructure BSS, IBSS, MBSS, or all, are included in the scan. Type **EFI_80211_BSS_TYPE** is defined below.

**BSSID**
Indicates a specific or wildcard BSSID. Use all binary 1s to represent all SSIDs. Type **EFI_80211_MAC_ADDRESS** is defined below.

**SSIDLen**
Length in bytes of the **SSID**. If **zero**, ignore **SSID** field.
SSId Specifies the desired SSId or the wildcard SSId. Use NULL to represent all SSIDs.

PassiveMode Indicates passive scanning if TRUE.

ProbeDelay The delay in microseconds to be used prior to transmitting a Probe frame during active scanning. If zero, the value can be overridden by an implementation-dependent default value.

ChannelList Specifies a list of channels that are examined when scanning for a BSS. If set to NULL, all valid channels will be scanned.

MinChannelTime Indicates the minimum time in TU to spend on each channel when scanning. If zero, the value can be overridden by an implementation-dependent default value.

MaxChannelTime Indicates the maximum time in TU to spend on each channel when scanning. If zero, the value can be overridden by an implementation-dependent default value.

RequestInformation Points to an optionally present element. This is an optional parameter and may be NULL. Type EFI_80211_ELEMENT_REQ is defined below.

SSIDList Indicates one or more SSID elements that are optionally present. This is an optional parameter and may be NULL. Type EFI_80211_ELEMENT_SSID is defined below.

AccessNetworkType Specifies a desired specific access network type or the wildcard access network type. Use 15 as wildcard access network type. Type EFI_80211_ACC_NET_TYPE is defined below.

VendorSpecificInfo Specifies zero or more elements. This is an optional parameter and may be NULL.

//**********************************************
// EFI_80211_BSS_TYPE
//**********************************************
typedef enum {
    IeeeInfrastructureBSS,
    IeeeIndependentBSS,
    IeeeMeshBSS,
    IeeeAnyBss
} EFI_80211_BSS_TYPE;

The EFI_80211_BSS_TYPE is defined to enumerate BSS type.

//**********************************************
// EFI_80211_MAC_ADDRESS
//**********************************************
typedef struct {
    UINT8 Addr[6];
} EFI_80211_MAC_ADDRESS;
The **EFI_80211_MAC_ADDRESS** is defined to record a 48-bit MAC address.

```c
//******************************************************************************
// EFI_80211_ELEMENT_REQ
//******************************************************************************
typedef struct {
    EFI_80211_ELEMENT_HEADER Hdr;
    UINT8 RequestIDs[1];
} EFI_80211_ELEMENT_REQ;

Hdr      Common header of an element. Type EFI_80211_ELEMENT_HEADER is defined below.
RequestIDs Start of elements that are requested to be included in the Probe Response frame. The elements are listed in order of increasing element ID.

//******************************************************************************
// EFI_80211_ELEMENT_HEADER
//******************************************************************************
typedef struct {
    UINT8 ElementID;
    UINT8 Length;
} EFI_80211_ELEMENT_HEADER;

ElementID  A unique element ID defined in IEEE 802.11 specification.
Length      Specifies the number of octets in the element body.

//******************************************************************************
// EFI_80211_ELEMENT_SSID
//******************************************************************************
typedef struct {
    EFI_80211_ELEMENT_HEADER Hdr;
    UINT8 SSId[32];
} EFI_80211_ELEMENT_SSID;

Hdr      Common header of an element.
SSId      Service set identifier. If **Hdr.Length** is zero, this field is ignored.
typedef enum {
  IeeePrivate      = 0,
  IeeePrivatewithGuest = 1,
  IeeeChargeablePublic = 2,
  IeeeFreePublic    = 3,
  IeeePersonal     = 4,
  IeeeEmergencyServOnly = 5,
  IeeeTestOrExp     = 14,
  IeeeWildcard     = 15
} EFI_80211_ACC_NET_TYPE;

The **EFI_80211_ACC_NET_TYPE** records access network types defined in IEEE 802.11 specification.

typedef enum {
  ScanSuccess,  
  ScanNotSupported
} EFI_80211_SCAN_RESULT_CODE;

ScanSuccess The scan operation finished successfully.
ScanNotSupported The scan operation is not supported in current implementation.

typedef struct {
  UINTN  NumOfBSSDesp;
  EFI_80211_BSS_DESCRIPTION **BSSDespSet;
  UINTN  NumofBSSDespFromPilot;
  EFI_80211_BSS_DESP_PILOT **BSSDespFromPilotSet;
  UINT8   *VendorSpecificInfo;
} EFI_80211_SCAN_RESULT;

NumOfBSSDesp The number of **EFI_80211_BSS_DESCRIPTION** in BSSDespSet. If zero, BSSDespSet should be ignored.

BSSDespSet Points to zero or more instances of **EFI_80211_BSS_DESCRIPTION**. Type **EFI_80211_BSS_DESCRIPTION** is defined below.

NumOfBSSDespFromPilot The number of **EFI_80211_BSS_DESP_PILOT** in BSSDespFromPilotSet. If zero, BSSDespFromPilotSet should be ignored.
BSSDespFromPilotSetPoints to zero or more instances of EFI_80211_BSS_DESP_PILOT. Type EFI_80211_BSS_DESP_PILOT is defined below.

VendorSpecificInfoSpecifies zero or more elements. This is an optional parameter and may be NULL.

// **************************************************************
// EFI_80211_BSS_DESCRIPTION
// **************************************************************
typedef struct {
    EFI_80211_MAC_ADDRESS   BSSID;
    UINT8                   *SSID;
    UINT8                   SSIDLen;
    EFI_80211_BSS_TYPE      BSSType;
    UINT16                  BeaconPeriod;
    UINT64                  Timestamp;
    UINT16                  CapabilityInfo;
    UINT8                   *BSSBasicRateSet;
    UINT8                   *OperationalRateSet;
    EFI_80211_ELEMENT_COUNTRY  *Country;
    EFI_80211_ELEMENT_RSN   RSN;
    UINT8                   RSSI;
    UINT8                   RCPIMeasurement;
    UINT8                   RSNIMeasurement;
    UINT8                   *RequestedElements;
    UINT8                   *BSSMembershipSelectorSet;
    EFI_80211_ELEMENT_EXT_CAP *ExtCapElement;
} EFI_80211_BSS_DESCRIPTION;

BSSID      Indicates a specific BSSID of the found BSS.
SSID       Specifies the SSID of the found BSS. If NULL, ignore SSIDLen field.
SSIDLen    Length in bytes of the SSID. If zero, ignore SSID field.
BSSType    Specifies the type of the found BSS.
BeaconPeriod The beacon period in TU of the found BSS.
Timestamp  The timestamp of the received frame from the found BSS.
CapabilityInfo The advertised capabilities of the BSS.
BSSBasicRateSet The set of data rates that shall be supported by all STAs that desire to join this BSS.
OperationalRateSet The set of data rates that the peer STA desires to use for communication within the BSS.
Country    The information required to identify the regulatory domain in which the peer STA is located. Type EFI_80211_ELEMENT_COUNTRY is defined below.
RSN
The cipher suites and AKM suites supported in the BSS. Type
EFI_80211_ELEMENT_RSN is defined below.

RSSI
Specifies the RSSI of the received frame.

RCPIMeasurement
Specifies the RCPI of the received frame.

RSNIMeasurement
Specifies the RSNI of the received frame.

RequestedElements
Specifies the elements requested by the request element of the
Probe Request frame. This is an optional parameter and may be
NULL.

BSSMembershipSelectorSet
Specifies the BSS membership selectors that represent the
set of features that shall be supported by all STAs to join this BSS.

ExtCapElement
Specifies the parameters within the Extended Capabilities element
that are supported by the MAC entity. This is an optional parameter
and may be NULL. Type EFI_80211_ELEMENT_EXT_CAP is defined
below.

//******************************************************************************
// EFI_80211_ELEMENT_COUNTRY
//******************************************************************************

typedef struct {
    EFI_80211_ELEMENT_HEADER Hdr;
    UINT8         CountryStr[3];
    EFI_80211_COUNTRY_TRIPLET CountryTriplet[1];
} EFI_80211_ELEMENT_COUNTRY;

Hdr         Common header of an element.
CountryStr   Specifies country strings in 3 octets.
CountryTriplet Indicates a triplet that repeated in country element. The number of
triplets is determined by the Hdr.Length field.

//******************************************************************************
// EFI_80211_COUNTRY_TRIPLET
//******************************************************************************

typedef union {
    EFI_80211_COUNTRY_TRIPLET_SUBBAND Subband;
    EFI_80211_COUNTRY_TRIPLET_OPERATE Operating;
} EFI_80211_COUNTRY_TRIPLET;

Subband       The subband triplet.
Operating      The operating triplet.
/**********************************************
// EFI_80211_COUNTRY_TRIPLET_SUBBAND
//**********************************************
typedef struct {
  UINT8 FirstChannelNum;
  UINT8 NumOfChannels;
  UINT8 MaxTxPowerLevel;
} EFI_80211_COUNTRY_TRIPLET_SUBBAND;

FirstChannelNum      Indicates the lowest channel number in the subband. It has a positive integer value less than 201.
NumOfChannels        Indicates the number of channels in the subband.
MaxTxPowerLevel      Indicates the maximum power in dBm allowed to be transmitted.

//**********************************************
// EFI_80211_COUNTRY_TRIPLET_OPERATE
//**********************************************
typedef struct {
  UINT8 OperatingExtId;
  UINT8 OperatingClass;
  UINT8 CoverageClass;
} EFI_80211_COUNTRY_TRIPLET_OPERATE;

OperatingExtId       Indicates the operating extension identifier. It has a positive integer value of 201 or greater.
OperatingClass       Index into a set of values for radio equipment set of rules.
CoverageClass        Specifies aAirPropagationTime characteristics used in BSS operation. Refer the definition of aAirPropagationTime in IEEE 802.11 specification.

//**********************************************
// EFI_80211_ELEMENT_RSN
//**********************************************
typedef struct {
  EFI_80211_ELEMENT_HEADER    Hdr;
  EFI_80211_ELEMENT_DATA_RSN  *Data;
} EFI_80211_ELEMENT_RSN;

Hdr                   Common header of an element.
Data                  Points to RSN element. Type EFI_80211_ELEMENT_DATA_RSN is defined below. The size of a RSN element is limited to 255 octets.
EFI_80211_ELEMENT_DATA_RSN

typedef struct {
    UINT16    Version;
    UINT32    GroupDataCipherSuite;
    //UINT16   PairwiseCipherSuiteCount;
    //UINT32   PairwiseCipherSuiteList[PairwiseCipherSuiteCount];
    //UINT16   AKMSuiteCount;
    //UINT32   AKMSuiteList[AKMSuiteCount];
    //UINT16   RSNCapabilities;
    //UINT16   PMKIDCount;
    //UINT8    PMKIDList[PMKIDCount][16];
    //UINT32   GroupManagementCipherSuite;
} EFI_80211_ELEMENT_DATA_RSN;

Volume indicates the version number of the RSNA protocol. Value 1 is defined in current IEEE 802.11 specification.

GroupDataCipherSuite specifies the cipher suite selector used by the BSS to protect group address frames.

PairwiseCipherSuiteCount indicates the number of pairwise cipher suite selectors that are contained in PairwiseCipherSuiteList.

PairwiseCipherSuiteList contains a series of cipher suite selectors that indicate the pairwise cipher suites contained in this element.

AKMSuiteCount indicates the number of AKM suite selectors that are contained in AKMSuiteList.

AKMSuiteList contains a series of AKM suite selectors that indicate the AKM suites contained in this element.

RSNCapabilities indicates requested or advertised capabilities.

PMKIDCount indicates the number of PKMIDs in the PMKIDList.

PMKIDList contains zero or more PKMIDs that the STA believes to be valid for the destination AP.

GroupManagementCipherSuite specifies the cipher suite selector used by the BSS to protect group addressed robust management frames.

EFI_80211_ELEMENT_EXT_CAP

typedef struct {
    EFI_80211_ELEMENT_HEADER Hdr;
    UINT8     Capabilities[1];
} EFI_80211_ELEMENT_EXT_CAP;

Hdr Common header of an element.
Capabilities
Indicates the capabilities being advertised by the STA transmitting
the element. This is a bit field with variable length. Refer to IEEE
802.11 specification for bit value.

//**********************************************
// EFI_80211_BSS_DESP_PILOT
//**********************************************
typedef struct {
    EFI_80211_MAC_ADDRESS BSSID;
    EFI_80211_BSS_TYPE BSSType;
    UINT8 ConCapInfo;
    UINT8 ConCountryStr[2];
    UINT8 OperatingClass;
    UINT8 Channel;
    UINT8 Interval;
    EFI_80211_MULTIPLE_BSSID *MultipleBSSID;
    UINT8 RCPIMeasurement;
    UINT8 RSNIMeasurement;
} EFI_80211_BSS_DESP_PILOT;

    BSSID      Indicates a specific BSSID of the found BSS.
    BSSType    Specifies the type of the found BSS.
    ConCapInfo One octet field to report condensed capability information.
    ConCountryStr Two octet’s field to report condensed country string.
    OperatingClass Indicates the operating class value for the operating channel.
    Channel Indicates the operating channel.
    Interval Indicates the measurement pilot interval in TU.
    MultipleBSSID Indicates that the BSS is within a multiple BSSID set.
    RCPIMeasurement Specifies the RCPI of the received frame.
    RSNIMeasurement Specifies the RSNI of the received frame.

//**********************************************
// EFI_80211_MULTIPLE_BSSID
//**********************************************
typedef struct {
    EFI_80211_ELEMENT_HEADER Hdr;
    UINT8 Indicator;
    EFI_80211_SUBELEMENT_INFO SubElement[1];
} EFI_80211_MULTIPLE_BSSID;

    Hdr        Common header of an element.
    Indicator  Indicates the maximum number of BSSIDs in the multiple BSSID set.
                When Indicator is set to n, 2^n is the maximum number.
    SubElement Contains zero or more sub-elements. Type
                EFI_80211_SUBELEMENT_INFO is defined below.
typedef struct {
  UINT8 SubElementID;
  UINT8 Length;
  UINT8 Data[1];
} EFI_80211_SUBELEMENT_INFO;

SubElementID Indicates the unique identifier within the containing element or sub-element.
Length Specifies the number of octets in the Data field.
Data A variable length data buffer.

EFI_WIRELESS_MAC_CONNECTION_PROTOCOL.Associate()

Summary
Request an association with a specified peer MAC entity that is within an AP.

Prototype
typedef EFI_STATUS (EFIAPI *EFI_WIRELESS_MAC_CONNECTION_ASSOCIATE)(
  IN EFI_WIRELESS_MAC_CONNECTION_PROTOCOL *This,
  IN EFI_80211_ASSOCIATE_DATA_TOKEN *Data
);

Parameters

This Pointer to the EFI_WIRELESS_MAC_CONNECTION_PROTOCOL instance.

Data Pointer to the association token. Type EFI_80211_ASSOCIATE_DATA_TOKEN is defined in Related Definitions below.
Description

The \texttt{Associate()} function provides the capability for MAC layer to become associated with an AP.

Related Definitions

```c
//**********************************************************
// EFI_80211_ASSOCIATE_DATA_TOKEN
//**********************************************************
typedef struct {
    EFI_EVENT Event;
    EFI_STATUS Status;
    EFI_80211_ASSOCIATE_DATA *Data;
    EFI_80211_ASSOCIATE_RESULT_CODE ResultCode;
    EFI_80211_ASSOCIATE_RESULT *Result;
} EFI_80211_ASSOCIATE_DATA_TOKEN;
```

- **Event**
  This \texttt{Event} will be signaled after the \texttt{Status} field is updated by the EFI Wireless MAC Connection Protocol driver. The type of \texttt{Event} must be \texttt{EFI_NOTIFY_SIGNAL}.

- **Status**
  Will be set to one of the following values:
  - \texttt{EFI_SUCCESS}: Association operation completed successfully.
  - \texttt{EFIDEVICE_ERROR}: An unexpected network or system error occurred.

- **Data**
  Pointer to the association data. Type \texttt{EFI_80211_ASSOCIATE_DATA} is defined below.

- **ResultCode**
  Indicates the association state. Type \texttt{EFI_80211_ASSOCIATE_RESULT_CODE} is defined below.

- **Result**
  Indicates the association result. It is caller’s responsibility to free this buffer. Type \texttt{EFI_80211_ASSOCIATE_RESULT} is defined below.

The \texttt{EFI_80211_ASSOCIATE_DATA_TOKEN} structure is defined to support the process of association with a specified AP. As input, the \texttt{Data} field must be filled in by the caller of EFI Wireless MAC Connection Protocol. After the association operation completes, the EFI Wireless MAC Connection Protocol driver updates the \texttt{Status}, \texttt{ResultCode} and \texttt{Result} field and the \texttt{Event} is signaled.
typedef struct {
    EFI_80211_MAC_ADDRESS   BSSID;
    UINT16                  CapabilityInfo;
    UINT32                  FailureTimeout;
    UINT32                  ListenInterval;
    EFI_80211_ELEMENT_SUPP_CHANNEL *Channels;
    EFI_80211_ELEMENT_RSN    RSN;
    EFI_80211_ELEMENT_EXT_CAP *ExtCapElement;
    UINT8                    *VendorSpecificInfo;
} EFI_80211_ASSOCIATE_DATA;

BSSID       Specifies the address of the peer MAC entity to associate with.
CapabilityInfo  Specifies the requested operational capabilities to the AP in 2 octets.
FailureTimeout   Specifies a time limit in TU, after which the associate procedure is
terminated.
ListenInterval  Specifies if in power save mode, how often the STA awakes and
listens for the next beacon frame in TU.
Channels       Indicates a list of channels in which the STA is capable of operating.
Type EFI_80211_ELEMENT_SUPP_CHANNEL is defined below.
RSN            The cipher suites and AKM suites selected by the STA.
ExtCapElement  Specifies the parameters within the Extended Capabilities element
that are supported by the MAC entity. This is an optional parameter
and may be NULL.
VendorSpecificInfo Specifies zero or more elements. This is an optional parameter and
may be NULL.

typedef struct {
    EFI_80211_ELEMENT_HEADER   Hdr;
    EFI_80211_ELEMENT_SUPP_CHANNEL_TUPLE Subband[1];
} EFI_80211_ELEMENT_SUPP_CHANNEL;

Hdr          Common header of an element.
Subband      Indicates one or more tuples of (first channel, number of channels).
Type EFI_80211_ELEMENT_SUPP_CHANNEL_TUPLE is defined below.
/**********************************************
// EFI_80211_ELEMENT_SUPP_CHANNEL_TUPLE
//**********************************************
typedef struct {
    UINT8    FirstChannelNumber;
    UINT8    NumberOfChannels;
} EFI_80211_ELEMENT_SUPP_CHANNEL_TUPLE;

FirstChannelNumber The first channel number in a subband of supported channels.
NumberOfChannels    The number of channels in a subband of supported channels.

//**********************************************
// EFI_80211_ASSOCIATE_RESULT_CODE
//**********************************************
typedef enum {
    AssociateSuccess,
    AssociateRefusedReasonUnspecified,
    AssociateRefusedCapsMismatch,
    AssociateRefusedExtReason,
    AssociateRefusedAPOutOfMemory,
    AssociateRefusedBasicRatesMismatch,
    AssociateRejectedEmergencyServicesNotAllowed,
    AssociateRefusedTemporarily
} EFI_80211_ASSOCIATE_RESULT_CODE;

The EFI_80211_ASSOCIATE_RESULT_CODE records the result responses to the association request, which are defined in IEEE 802.11 specification.

//**********************************************
// EFI_80211_ASSOCIATE_RESULT
//**********************************************
typedef struct {
    EFI_80211_MAC_ADDRESS   BSSID;
    UINT16                   CapabilityInfo;
    UINT16                   AssociationID;
    UINT8                    RCPIValue;
    UINT8                    RSNIValue;
    EFI_80211_ELEMENT_EXT_CAP *ExtCapElement;
    EFI_80211_ELEMENT_TIMEOUT_VAL TimeoutInterval;
    UINT8                    *VendorSpecificInfo;
} EFI_80211_ASSOCIATE_RESULT;

BSSID    Specifies the address of the peer MAC entity from which the association request was received.
CapabilityInfo  Specifies the operational capabilities advertised by the AP.
AssociationID    Specifies the association ID value assigned by the AP.
RCPIValue Indicates the measured RCPI of the corresponding association request frame. It is an optional parameter and is set to zero if unavailable.

RSNIValue Indicates the measured RSNI at the time the corresponding association request frame was received. It is an optional parameter and is set to zero if unavailable.

ExtCapElement Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity. This is an optional parameter and may be NULL.

TimeoutInterval Specifies the timeout interval when the result code is AssociateRefusedTemporarily.

VendorSpecificInfo Specifies zero or more elements. This is an optional parameter and may be NULL.

/*--------------------------------------------------------*/
/* EFI_80211_ELEMENT_TIMEOUT_VAL */
/*--------------------------------------------------------*/
typedef struct {
    EFI_80211_ELEMENT_HEADER Hdr;
    UINT8 Type;
    UINT32 Value;
} EFI_80211_ELEMENT_TIMEOUT_VAL;

Hdr Common header of an element.
Type Specifies the timeout interval type.
Value Specifies the timeout interval value.

EFI_WIRELESS_MAC_CONNECTION_PROTOCOL.Disassociate()

Summary
Request a disassociation with a specified peer MAC entity.

Prototype

typedef
EFI_STATUS
(EFIAPI *EFI_WIRELESS_MAC_CONNECTION_DISASSOCIATE)(
    IN EFI_WIRELESS_MAC_CONNECTION_PROTOCOL *This,
    IN EFI_80211_DISASSOCIATE_DATA_TOKEN *Data
);

Parameters

This Pointer to the EFI_WIRELESS_MAC_CONNECTION_PROTOCOL instance.

Data Pointer to the disassociation token. Type EFI_80211_DISASSOCIATE_DATA_TOKEN is defined in Related Definitions below.

Description
The Disassociate() function is invoked to terminate an existing association. Disassociation is a notification and cannot be refused by the receiving peer except when management frame protection is negotiated and the message integrity check fails.

Related Definitions

//***************************************************************
// EFI_80211_DISASSOCIATE_DATA_TOKEN
//***************************************************************
typedef struct {
    EFI_EVENT Event;
    EFI_STATUS Status;
    EFI_80211_DISASSOCIATE_DATA *Data;
    EFI_80211_DISASSOCIATE_RESULT_CODE ResultCode;
} EFI_80211_DISASSOCIATE_DATA_TOKEN;

Event This Event will be signaled after the Status field is updated by the EFI Wireless MAC Connection Protocol driver. The type of Event must be EFI_NOTIFY_SIGNAL.

Status Will be set to one of the following values:

EFI_SUCCESS: Disassociation operation completed successfully.

EFI_DEVICE_ERROR: An unexpected network or system error occurred.

EFI_ACCESS_DENIED: The disassociation operation is not completed due to some underlying hardware or software state.
The disassociation operation is started but not yet completed.

Data

Pointer to the disassociation data. Type 
EFI_80211_DISASSOCIATE_DATA is defined below.

ResultCode

Indicates the disassociation state. Type 
EFI_80211_DISASSOCIATE_RESULT_CODE is defined below.

---

EFI_80211_DISASSOCIATE_DATA

typedef struct {
    EFI_80211_MAC_ADDRESS BSSID;
    EFI_80211_REASON_CODE ReasonCode;
    UINT8 *VendorSpecificInfo;
} EFI_80211_DISASSOCIATE_DATA;

BSSID

Specifies the address of the peer MAC entity with which to perform
the disassociation process.

ReasonCode

Specifies the reason for initiating the disassociation process.

VendorSpecificInfo

Zero or more elements, may be NULL.

---

EFI_80211_REASON_CODE

} EFI_80211_REASON_CODE;

---

EFI_80211_DISASSOCIATE_RESULT_CODE

typedef enum {
    DisassociateSuccess,
    DisassociateInvalidParameters
} EFI_80211_DISASSOCIATE_RESULT_CODE;

DisassociateSuccess

Disassociation process completed successfully.

DisassociateInvalidParameters

---

Note: The reason codes are defined in chapter 8.4.1.7 Reason Code field, IEEE 802.11-2012.
Disassociation failed due to any input parameter is invalid.

**EFI_WIRELESS_MAC_CONNECTION_PROTOCOL.Authenticate()**

**Summary**

Request the process of establishing an authentication relationship with a peer MAC entity.

**Prototype**

```c
typedef EFI_STATUS
    (EFIAPI *EFI_WIRELESS_MAC_CONNECTION_AUTHENTICATE)(
    IN EFI_WIRELESS_MAC_CONNECTION_PROTOCOL *This,
    IN EFI_80211_AUTHENTICATE_DATA_TOKEN *Data
    );
```

**Parameters**

- **This**  
  Pointer to the `EFI_WIRELESS_MAC_CONNECTION_PROTOCOL` instance.

- **Data**  
  Pointer to the authentication token. Type `EFI_80211_AUTHENTICATE_DATA_TOKEN` is defined in Related Definitions below.

**Description**

The `Authenticate()` function requests authentication with a specified peer MAC entity. This service might be time-consuming thus is designed to be invoked independently of the association service.
Related Definitions

```c
typedef struct {
    EFI_EVENT Event;
    EFI_STATUS Status;
    EFI_80211_AUTHENTICATE_DATA *Data;
    EFI_80211_AUTHENTICATE_RESULT_CODE ResultCode;
    EFI_80211_AUTHENTICATE_RESULT *Result;
} EFI_80211_AUTHENTICATE_DATA_TOKEN;
```

**Event**  
This `Event` will be signaled after the `Status` field is updated by the EFI Wireless MAC Connection Protocol driver. The type of `Event` must be `EFI_NOTIFY_SIGNAL`.

**Status**  
Will be set to one of the following values:

- **EFI_SUCCESS**: Authentication operation completed successfully.
- **EFI_PROTOCOL_ERROR**: Peer MAC entity rejects the authentication.
- **EFI_NO_RESPONSE**: Peer MAC entity does not respond the authentication request.
- **EFI_DEVICE_ERROR**: An unexpected network or system error occurred.
- **EFI_ACCESS_DENIED**: The authentication operation is not completed due to some underlying hardware or software state.
- **EFI_NOT_READY**: The authentication operation is started but not yet completed.

**Data**  
Pointer to the authentication data. Type `EFI_80211_AUTHENTICATE_DATA` is defined below.

**ResultCode**  
Indicates the association state. Type `EFI_80211_AUTHENTICATE_RESULT_CODE` is defined below.

**Result**  
Indicates the association result. It is caller’s responsibility to free this buffer. Type `EFI_80211_AUTHENTICATE_RESULT` is defined below.
/**********************************************
// EFI_80211_AUTHENTICATION_DATA
//**********************************************
typedef struct {
  EFI_80211_MAC_ADDRESS BSSID;
  EFI_80211_AUTHENTICATION_TYPE AuthType;
  UINT32 FailureTimeout;
  UINT8 *FTContent;
  UINT8 *SAEContent;
  UINT8 *VendorSpecificInfo;
} EFI_80211_AUTHENTICATE_DATA;

BSSID Specifies the address of the peer MAC entity with which to perform the authentication process.

AuthType Specifies the type of authentication algorithm to use during the authentication process.

FailureTimeout Specifies a time limit in TU after which the authentication procedure is terminated.

FTContent Specifies the set of elements to be included in the first message of the FT authentication sequence, may be NULL.

SAEContent Specifies the set of elements to be included in the SAE Commit Message or SAE Confirm Message, may be NULL.

VendorSpecificInfo Zero or more elements, may be NULL.

//**********************************************
// EFI_80211_AUTHENTICATION_TYPE
//**********************************************
typedef enum {
  OpenSystem,
  SharedKey,
  FastBSSTransition,
  SAE
} EFI_80211_AUTHENTICATION_TYPE;

OpenSystem Open system authentication, admits any STA to the DS.

SharedKey Shared Key authentication relies on WEP to demonstrate knowledge of a WEP encryption key.

FastBSSTransition FT authentication relies on keys derived during the initial mobility domain association to authenticate the stations.

SAE SAE authentication uses finite field cryptography to prove knowledge of a shared password.
The result code indicates the result response to the authentication request from the peer MAC entity.

```c
typedef enum {
    AuthenticateSuccess,
    AuthenticateRefused,
    AuthenticateAnticLoggingTokenRequired,
    AuthenticateFiniteCyclicGroupNotSupported,
    AuthenticationRejected,
    AuthenticateInvalidParameter
} EFI_80211_AUTHENTICATE_RESULT_CODE;
```

**EFI_WIRELESS_MAC_CONNECTION_PROTOCOL.Deauthenticate()**

**Summary**
Invalidate the authentication relationship with a peer MAC entity.

**Prototype**
```c
typedef EFI_STATUS (EFIAPI *EFI_WIRELESS_MAC_CONNECTION_DEAUTHENTICATE)(
    IN EFI_WIRELESS_MAC_CONNECTION_PROTOCOL *This,
    IN EFI_80211_DEAUTHENTICATE_DATA_TOKEN *Data
);
```

**Parameters**
- **This**
  Pointer to the **EFI_WIRELESS_MAC_CONNECTION_PROTOCOL** instance.
- **Data**
  Pointer to the deauthentication token. Type **EFI_80211_DEAUTHENTICATE_DATA_TOKEN** is defined in Related Definitions below.

**Description**
The **Deauthenticate()** function requests that the authentication relationship with a specified peer MAC entity be invalidated. Deauthentication is a notification and when it is sent out the association at the transmitting station is terminated.

**Related Definitions**
```c
//****************************************************************************
// EFI_80211_DEAUTHENTICATE_DATA_TOKEN
//****************************************************************************
typedef struct {
    EFI_EVENT Event;
    EFI_STATUS Status;
    EFI_80211_DEAUTHENTICATE_DATA *Data;
} EFI_80211_DEAUTHENTICATE_DATA_TOKEN;
```

- **Event**
  This **Event** will be signaled after the **Status** field is updated by the EFI Wireless MAC Connection Protocol driver. The type of **Event** must be **EFI_NOTIFY_SIGNAL**.

- **Status**
  Will be set to one of the following values:
  - **EFI_SUCCESS**: Deauthentication operation completed successfully.
  - **EFI_DEVICE_ERROR**: An unexpected network or system error occurred.
  - **EFI_ACCESS_DENIED**: The deauthentication operation is not completed due to some underlying hardware or software state.
**EFI_NOT_READY**: The deauthentication operation is started but not yet completed.

**Data**: Pointer to the deauthentication data. Type **EFI_80211_DEAUTHENTICATE_DATA** is defined below.

```c
//***************************************************************************
// EFI_80211_DEAUTHENTICATE_DATA
//***************************************************************************
typedef struct {
   EFI_80211_MAC_ADDRESS  BSSID;
   EFI_80211_REASON_CODE  ReasonCode;
   UINT8                  *VendorSpecificInfo;
} EFI_80211_DEAUTHENTICATE_DATA;
```

**BSSID**: Specifies the address of the peer MAC entity with which to perform the deauthentication process.

**ReasonCode**: Specifies the reason for initiating the deauthentication process.

**VendorSpecificInfo**: Zero or more elements, may be NULL.

### 27.4 EFI Wireless MAC Connection II Protocol

This section provides a detailed description of EFI Wireless MAC Connection II Protocol.

**EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL**

**Summary**

The **EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL** provides network management service interfaces for 802.11 network stack. It is used by network applications (and drivers) to establish wireless connection with a wireless network.
GUID

```c
#define EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL_GUID {
    0xb0f9bf, 0x699d, 0x4fdd, 
    { 0xa7, 0xc3, 0x25, 0x46, 0x68, 0x1b, 0xf6, 0x3b }}
```

Protocol Interface Structure

```c
typedef struct _EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL {
    EFI_WIRELESS_MAC_CONNECTION_II_GET_NETWORKS GetNetworks;
    EFI_WIRELESS_MAC_CONNECTION_II_CONNECT_NETWORK ConnectNetwork;
    EFI_WIRELESS_MAC_CONNECTION_II_DISCONNECT_NETWORK DisconnectNetwork;
} EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL;
```

Parameters

- **GetNetworks**: Get a list of nearby detectable wireless network. See the `GetNetworks()` function description.
- **ConnectNetwork**: Places a connection request with a specific wireless network. See the `ConnectNetwork()` function description.
- **DisconnectNetwork**: Places a disconnection request with a specific wireless network. See the `DisconnectNetwork()` function description.

Description

The **EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL** is designed to provide management service interfaces for the EFI wireless network stack to establish relationship with a wireless network (identified by **EFI_80211_NETWORK** defined below). An EFI Wireless MAC Connection II Protocol instance will be installed on each communication device that the EFI wireless network stack runs on.

**EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL.GetNetworks()**

**Summary**

Request a survey of potential wireless networks that administrator can later elect to try to join.

**Prototype**

```c
typedef
EFI_STATUS
(EIFIAPI *EFI_WIRELESS_MAC_CONNECTION_II_GET_NETWORKS)(
    IN EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL *This,
    IN EFI_80211_GET_NETWORKS_TOKEN *Token
);
```

**Parameters**

- **This**: Pointer to the **EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL** instance.
- **Token**: Pointer to the token for getting wireless network. Type **EFI_80211_GET_NETWORKS_TOKEN** is defined in Related Definitions below.
Description
The `GetNetworks()` function returns the description of a list of wireless networks detected by wireless UNDI driver. This function is always non-blocking. If the operation succeeds or fails due to any error, the `Token->Event` will be signaled and `Token->Status` will be updated accordingly. The caller of this function is responsible for inputting SSIDs in case of searching hidden networks.

Related Definitions

```c
typedef struct {
    EFI_EVENT Event;
    EFI_STATUS Status;
    EFI_80211_GET_NETWORKS_DATA *Data;
    EFI_80211_GET_NETWORKS_RESULT *Result;
} EFI_80211_GET_NETWORKS_TOKEN;
```

- **Event**: If the status code returned by `GetNetworks()` is `EFI_SUCCESS`, then this Event will be signaled after the `Status` field is updated by the EFI Wireless MAC Connection Protocol II driver. The type of `Event` must be `EFI_NOTIFY_SIGNAL`.

- **Status**: Will be set to one of the following values:
  - `EFI_SUCCESS`: The operation completed successfully.
  - `EFI_NOT_FOUND`: Failed to find available wireless networks.
  - `EFI_DEVICE_ERROR`: An unexpected network or system error occurred.
  - `EFI_ACCESS_DENIED`: The operation is not completed due to some underlying hardware or software state.
  - `EFI_NOT_READY`: The operation is started but not yet completed.

- **Data**: Pointer to the input data for getting networks. Type `EFI_80211_GET_NETWORKS_DATA` is defined below.

- **Result**: Indicates the scan result. It is caller's responsibility to free this buffer. Type `EFI_80211_GET_NETWORKS_RESULT` is defined below.

```c
typedef struct {
    UINT32 NumOfSSID;
    EFI_80211_SSID SSIDLList[1];
} EFI_80211_GET_NETWORKS_DATA;
```
NumOfSSID  The number of EFI_80211_SSID in SSIDList. If zero, SSIDList should be ignored.

SSIDList  The SSIDList is a pointer to an array of EFI_80211_SSID instances. The number of entries is specified by NumOfSSID. The array should only include SSIDs of hidden networks. It is suggested that the caller inputs less than 10 elements in the SSIDList. It is the caller's responsibility to free this buffer. Type EFI_80211_SSID is defined below.

#define EFI_MAX_SSID_LEN 32

//**********************************************
// EFI_80211_SSID
//**********************************************
typedef struct {
    UINT8 SSIdLen;
    UINT8 SSId[EFI_MAX_SSID_LEN];
} EFI_80211_SSID;

SSIdLen  Length in bytes of the SSId. If zero, ignore SSId field.

SSID  Specifies the service set identifier.

//**********************************************
// EFI_80211_GET_NETWORKS_RESULT
//**********************************************
typedef struct {
    UINT8 NumOfNetworkDesc;
    EFI_80211_NETWORK_DESCRIPTION NetworkDesc[1];
} EFI_80211_GET_NETWORKS_RESULT;

NumOfNetworkDesc  The number of elements in NetworkDesc. If zero, NetworkDesc should be ignored.

NetworkDesc  The NetworkDesc is a variable-length array of elements of type EFI_80211_NETWORK_DESCRIPTION. Type EFI_80211_NETWORK_DESCRIPTION is defined below.

//**********************************************
// EFI_80211_NETWORK_DESCRIPTION
//**********************************************
typedef struct {
    EFI_80211_NETWORK Network;
    UINT8 NetworkQuality;
} EFI_80211_NETWORK_DESCRIPTION;

Network  Specifies the found wireless network. Type EFI_80211_NETWORK is defined below.

NetworkQuality  Indicates the network quality as a value between 0 to 100, where 100 indicates the highest network quality.
typedef struct {
  EFI_80211_BSS_TYPE BSSType;
  EFI_80211_SSID SSId;
  EFI_80211_AKM_SUITE_SELECTOR *AKMSuite;
  EFI_80211_CIPHER_SUITE_SELECTOR *CipherSuite;
} EFI_80211_NETWORK;

BSSType Specifies the type of the BSS. Type EFI_80211_BSS_TYPE is defined below.

SSId Specifies the SSID of the BSS. Type EFI_80211_SSID is defined above.

AKMSuite Pointer to the AKM suites supported in the wireless network. Type EFI_80211_AKM_SUITE_SELECTOR is defined below.

CipherSuite Pointer to the cipher suites supported in the wireless network. Type EFI_80211_CIPHER_SUITE_SELECTOR is defined below.

typedef enum {
  IeeeInfrastructureBSS,  
  IeeeIndependentBSS, 
  IeeeMeshBSS,           
  IeeeAnyBss            
} EFI_80211_BSS_TYPE;

The EFI_80211_BSS_TYPE is defined to enumerate BSS type.

typedef struct {
  UINT8 Oui[3];
  UINT8 SuiteType;
} EFI_80211_SUITE_SELECTOR;

Oui Organization Unique Identifier, as defined in IEEE 802.11 standard, usually set to 00-0F-AC.

SuiteType Suites types, as defined in IEEE 802.11 standard.
//EFI_80211_AKM_SUITE_SELECTOR
typedef struct {
    UINT16 AKMSuiteCount;
    EFI_80211_SUITE_SELECTOR AKMSuiteList[1];
} EFI_80211_AKM_SUITE_SELECTOR;

AKMSuiteCount Indicates the number of AKM suite selectors that are contained in AKMSuiteList. If zero, the AKMSuiteList is ignored.

AKMSuiteList A variable-length array of AKM suites, as defined in IEEE 802.11 standard, Table 8-101. The number of entries is specified by AKMSuiteCount.

//EFI_80211_CIPHER_SUITE_SELECTOR
typedef struct {
    UINT16 CipherSuiteCount;
    EFI_80211_SUITE_SELECTOR CipherSuiteList[1];
} EFI_80211_CIPHER_SUITE_SELECTOR;

CipherSuiteCount Indicates the number of cipher suites that are contained in CipherSuiteList. If zero, the CipherSuiteList is ignored.

CipherSuiteList A variable-length array of cipher suites, as defined in IEEE 802.11 standard, Table 8-99. The number of entries is specified by CipherSuiteCount.

EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL.ConnectNetwork()

Summary
Connect a wireless network specified by a particular SSID, BSS type and Security type.
Prototype

typedef
  EFI_STATUS
  (EFIAPI *EFI_WIRELESS_MAC_CONNECTION_II_CONNECT_NETWORK)(
   IN EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL *This,
   IN EFI_80211_CONNECT_NETWORK_TOKEN *Token
  );

Parameters

  This  Pointer to the EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL instance.
  Token Pointer to the token for connecting wireless network. Type EFI_80211_CONNECT_NETWORK_TOKEN is defined in Related Definitions below.

Description

The ConnectNetwork() function places a request to wireless UNDI driver to connect a wireless network specified by a particular SSID, BSS type, Authentication method and cipher. This function will trigger wireless UNDI driver to perform authentication and association process to establish connection with a particular Access Point for the specified network. This function is always non-blocking. If the connection succeeds or fails due to any error, the Token->Event will be signaled and Token->Status will be updated accordingly.

After having signaled a successful connection completion, the UNDI driver will update the network connection state using the network media state information type in the EFI_ADAPTER_INFORMATION_PROTOCOL. If needed, the caller should use EFI_ADAPTER_INFORMATION_PROTOCOL to regularly get the network media state to find if the UNDI driver is still connected to the wireless network (EFI_SUCCESS) or not (EFI_NO_MEDIA).

Generally a driver or application in WiFi stack would provide user interface to end user to manage profiles for selecting which wireless network to join and other state management. This module should prompt the user to select a network and input WiFi security data such as certificate, private key file, password, etc. Then the module should deploy WiFi security data through EFI Supplicant Protocol and/ or EFI EAP Configuration Protocol before calling ConnectNetwork() function.

Related Definitions

    /***************************************************************************/
    // EFI_80211_CONNECT_NETWORK_TOKEN
    /***************************************************************************/
    typedef struct {
      EFI_EVENT Event;
      EFI_STATUS Status;
      EFI_80211_CONNECT_NETWORK_DATA *Data;
      EFI_80211_CONNECT_NETWORK_RESULT_CODE ResultCode;
    } EFI_80211_CONNECT_NETWORK_TOKEN;
If the status code returned by `ConnectNetwork()` is `EFI_SUCCESS`, then this `Event` will be signaled after the `Status` field is updated by the EFI Wireless MAC Connection Protocol II driver. The type of `Event` must be `EFI_NOTIFY_SIGNAL`.

The `EFI_80211_CONNECT_NETWORK_TOKEN` structure is defined to support the process of determining the characteristics of the available networks. As input, the `Data` field must be filled in by the caller of EFI Wireless MAC Connection II Protocol. After the operation completes, the EFI Wireless MAC Connection II Protocol driver updates the `Status` and `ResultCode` field and the `Event` is signaled.

```c
typedef struct {
  EFI_80211_NETWORK *Network;
  UINT32 FailureTimeout;
} EFI_80211_CONNECT_NETWORK_DATA;
```

- **Network** Specifies the wireless network to connect to. Type `EFI_80211_NETWORK` is defined above.
- **FailureTimeout** Specifies a time limit in seconds that is optionally present, after which the connection establishment procedure is terminated by the UNDI driver. This is an optional parameter and may be 0. Values of 5 seconds or higher are recommended.
typedef enum {
  ConnectSuccess,
  ConnectRefused,
  ConnectFailed,
  ConnectFailureTimeout,
  ConnectFailedReasonUnspecified
} EFI_80211_CONNECT_NETWORK_RESULT_CODE;

ConnectSuccess      The connection establishment operation finished successfully.
ConnectRefused      The connection was refused by the Network.
ConnectFailed       The connection establishment operation failed (i.e, Network is not detected).
ConnectFailureTimeout
                        The connection establishment operation was terminated on timeout.
ConnectFailedReasonUnspecified
                        The connection establishment operation failed on other reason.

**EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL.DisconnectNetwork()**

**Summary**
Request a disconnection with current connected wireless network.

**Prototype**

typedef
EFI_STATUS
(EIFIAPI *EFI_WIRELESS_MAC_CONNECTION_II_DISCONNECT_NETWORK)(
   IN EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL *This,
   IN EFI_80211_DISCONNECT_NETWORK_TOKEN   *Token
);

**Parameters**

- **This** Pointer to the EFI_WIRELESS_MAC_CONNECTION_II_PROTOCOL instance.
- **Token** Pointer to the token for disconnecting wireless network. Type EFI_80211_DISCONNECT_NETWORK_TOKEN is defined in Related Definitions below.

**Description**
The DisconnectNetwork() function places a request to wireless UNDI driver to disconnect from the wireless network it is connected to. This function will trigger the wireless UNDI driver to perform disassociation and deauthentication process to terminate an existing connection. This function is always non-blocking. After wireless UNDI driver received acknowledgment frame from AP and freed up corresponding resources, the Token->Event will be signaled and Token->Status will be updated accordingly.

**Related Definitions**

```c
//******************************************************************************
// E80211_DISCONNECT_NETWORK_TOKEN //
******************************************************************************
typedef struct {
   EFI_EVENT Event;
   EFI_STATUS Status;
} EFI_80211_DISCONNECT_NETWORK_TOKEN;
```

- **Event** If the status code returned by DisconnectNetwork() is EFI_SUCCESS, then this Event will be signaled after the Status field is updated by the EFI Wireless MAC Connection Protocol II driver. The type of Event must be EFI_NOTIFY_SIGNAL.
- **Status** Will be set to one of the following values:
  - **EFI_SUCCESS**: The operation completed successfully
  - **EFI_DEVICE_ERROR**: An unexpected network or system error occurred.
**EFI_ACCESS_DENIED:** The operation is not completed due to some underlying hardware or software state.

### 27.5 EFI Supplicant Protocol

This section defines the EFI Supplicant Protocol.

#### 27.5.1 Supplicant Service Binding Protocol

**EFI_SUPPLICANT_SERVICE_BINDING_PROTOCOL**

**Summary**

The EFI Supplicant Service Binding Protocol is used to locate EFI Supplicant Protocol drivers to create and destroy child of the driver to communicate with other host using Supplicant protocol.

**GUID**

```c
#define EFI_SUPPLICANT_SERVICE_BINDING_PROTOCOL_GUID  
  { 0x45bcd98e, 0x59ad, 0x4174, 
  { 0x95, 0x46, 0x34, 0x4a, 0x7, 0x48, 0x58, 0x98 }}
```

**Description**

A module that requires supplicant services can call one of the protocol handler services, such as `BS-LocateHandleBuffer()`, to search devices that publish an EFI Supplicant Service Binding Protocol GUID. Such device supports the EFI Supplicant Protocol and may be available for use. After a successful call to the `EFI_SUPPLICANT_SERVICE_BINDING_PROTOCOL.CreateChild()` function, the newly created child EFI Supplicant Protocol driver is in an un-configured state; it is not ready to do any operation until configured via SetData(). Every successful call to the `EFI_SUPPLICANTSERVICE_BINDING_PROTOCOL.CreateChild()` function must be matched with a call to the `EFI_SUPPLICANT_SERVICE_BINDING_PROTOCOL.DestroyChild()` function to release the protocol driver.
27.5.2 Supplicant Protocol

**EFI_SUPPLICANT_PROTOCOL**

**Summary**

This protocol provides services to process authentication and data encryption/decryption for security management.

**GUID**

```c
#define EFI_SUPPLICANT_PROTOCOL_GUID \ 
{ 0x54fcc43e, 0xaa89, 0x4333, \ 
{ 0x9a, 0x85, 0xcd, 0xea, 0x24, 0x5, 0x1e, 0x9e }}
```

**Protocol Interface Structure**

```c
typedef struct _EFI_SUPPLICANT_PROTOCOL {
  EFI_SUPPLICANT_BUILD_RESPONSE_PACKET BuildResponsePacket;
  EFI_SUPPLICANT_PROCESS_PACKET  ProcessPacket;
  EFI_SUPPLICANT_SET_DATA       SetData;
  EFI_SUPPLICANT_GET_DATA       GetData;
} EFI_SUPPLICANT_PROTOCOL;
```

**Parameters**

- **BuildResponsePacket**: This API processes security data for handling key management. See the `BuildResponsePacket()` function description.
- **ProcessPacket**: This API processes frame for encryption or decryption. See the `ProcessPacket()` function description.
- **SetData**: This API sets the information needed during key generated in handshake. See the `SetData()` function description.
- **GetData**: This API gets the information generated in handshake. See the `GetData()` function description.

**Description**

The **EFI_SUPPLICANT_PROTOCOL** is designed to provide unified place for WIFI and EAP security management. Both PSK authentication and 802.1X EAP authentication can be managed via this protocol and driver or application as a consumer can only focus on about packet transmitting or receiving. For 802.1X EAP authentication, an instance of **EFI_EAP_CONFIGURATION_PROTOCOL** must be installed to the same handle as the EFI Suppliant Protocol.

**EFI_SUPPLICANT_PROTOCOL.BuildResponsePacket()**

**Summary**

`BuildResponsePacket()` is called during STA and AP authentication is in progress. Supplicant derives the PTK or session keys depend on type of authentication is being employed.
Prototype

```c
typedef EFI_STATUS
  (EFIAPIC *EFI_SUPPLICANT_BUILD_RESPONSE_PACKET)(
    IN EFI_SUPPLICANT_PROTOCOL *This,
    IN UINT8          *RequestBuffer,  OPTIONAL
    IN UINTN RequestBufferSize, OPTIONAL
    OUT UINT8          *Buffer,
    IN OUT UINTN        *BufferSize
  );
```

Parameters

- **This**: Pointer to the `EFI_SUPPLICANT_PROTOCOL` instance.
- **RequestBuffer**: Pointer to the most recently received EAPOL packet. `NULL` means the supplicant need initiate the EAP authentication session and send EAPOL-Start message.
- **RequestSize**: Packet size in bytes for the most recently received EAPOL packet. 0 is only valid when `RequestBuffer` is `NULL`.
- **Buffer**: Pointer to the buffer to hold the built packet.
- **BufferSize**: Pointer to the buffer size in bytes. On input, it is the buffer size provided by the caller. On output, it is the buffer size in fact needed to contain the packet.

Description

The consumer calls `BuildResponsePacket()` when it receives the security frame. It simply passes the data to supplicant to process the data. It could be WPA-PSK which starts the 4-way handshake, or WPA-EAP first starts with Authentication process and then 4-way handshake, or 2-way group key handshake. In process of authentication, 4-way handshake or group key handshake, Supplicant needs to communicate with its peer (AP/AS) to fill the output buffer parameter. Once the 4 way handshake or group key handshake is over, and PTK (Pairwise Transient keys) and GTK (Group Temporal Key) are generated.

EFI_SUPPLICANT_PROTOCOL.ProcessPacket()

Summary

ProcessPacket() is called to Supplicant driver to encrypt or decrypt the data depending type of authentication type.

Prototype

typedef
EFI_STATUS
(EIFIAPI *EFI_SUPPLICANT_PROCESS_PACKET)(
    IN EFI_SUPPLICANT_PROTOCOL *This,
    IN OUT EFI_SUPPLICANT_FRAGMENT_DATA **FragmentTable,
    IN UINT32 *FragmentCount,
    IN EFI_SUPPLICANT_CRYPT_MODE CryptMode
);

Parameters

This          Pointer to the EFI_SUPPLICANT_PROTOCOL instance.
FragmentTable Pointer to a list of fragment. The caller will take responsible to handle the original FragmentTable while it may be reallocated in Supplicant driver.
FragmentCount Number of fragment.
CryptMode      Crypt mode.

Description

ProcessPacket() is responsible for encrypting or decrypting the data traffic as per authentication type. The consumer routes the data frame as it is to Supplicant module and encrypts or decrypts packet with updated length comes as output parameter. Supplicant holds the derived PTK and GTKs and uses this key to encrypt or decrypt the network traffic.

If the Supplicant driver does not support any encryption and decryption algorithm, then EFI_UNSUPPORTED is returned.

Related Definitions

//******************************************************************************
// EFI_SUPPLICANT_FRAGMENT_DATA
//******************************************************************************
typedef struct {
    UINT32     FragmentLength;
    VOID       *FragmentBuffer;
} EFI_SUPPLICANT_FRAGMENT_DATA;

FragmentLength Length of data buffer in the fragment.
FragmentBuffer   Pointer to the data buffer in the fragment.
typedef enum {
    EfiSupplicantEncrypt,
    EfiSupplicantDecrypt,
} EFI_SUPPLICANT_CRYPT_MODE;

EfiSupplicantEncrypt Encrypt data provided in the fragment buffers.
EfiSupplicantDecrypt Decrypt data provided in the fragment buffers.

**EFI_SUPPLICANT_PROTOCOL.SetData()**

**Summary**
Set Supplicant configuration data.

**Prototype**
```c
typedef
    EFI_STATUS
    (EFIAPI *EFI_SUPPLICANT_SET_DATA)(
        IN EFI_SUPPLICANT_PROTOCOL *This,
        IN EFI_SUPPLICANT_DATA_TYPE  DataType,
        IN VOID                      *Data,
        IN UINTN                     DataSize
    );
```

**Parameters**
- **This** Pointer to the EFI_SUPPLICANT_PROTOCOL instance.
- **DataType** The type of data.
- **Data** Pointer to the buffer to hold the data.
- **DataSize** Pointer to the buffer size in bytes.
Description

The `SetData()` function sets Supplicant configuration. For example, Supplicant driver need to know Password and TargetSSIDName to calculate PSK. Supplicant driver need to know StationMac and TargetSSIDMac to calculate PTK. Then it can derive KCK(key confirmation key) which is needed to calculate MIC, and KEK(key encryption key) which is needed to unwrap GTK.

```
EfiSupplicant80211AKMSuite
Current authentication type in use. The corresponding Data is of type EFI_80211_AKM_SUITE_SELECTOR.

EfiSupplicant80211GroupDataCipherSuite
Group data encryption type in use. The corresponding Data is of type EFI_80211_CIPHER_SUITE_SELECTOR.

EfiSupplicant80211PairwiseCipherSuite
Pairwise encryption type in use. The corresponding Data is of type EFI_80211_CIPHER_SUITE_SELECTOR.

EfiSupplicant80211PskPassword
PSK password. The corresponding Data is a NULL-terminated ASCII string.

EfiSupplicant80211TargetSSIDName
Target SSID name. The corresponding Data is of type EFI_80211_SSID.

EfiSupplicant80211StationMac
Station MAC address. The corresponding Data is of type EFI_80211_MAC_ADDRESS.

EfiSupplicant80211TargetSSIDMac
Target SSID MAC address. The corresponding Data is 6 bytes MAC address.

EfiSupplicant80211PTK
802.11 PTK. The corresponding Data is of type EFI_SUPPLICANT_KEY.

EfiSupplicant80211GTK
802.11 GTK. The corresponding Data is of type EFI_SUPPLICANT_GTK_LIST.

EfiSupplicantState
Supplicant state. The corresponding Data is EFI_EAPOL_SUPPLICANT_PAE_STATE.

EfiSupplicant80211LinkState
802.11 link state. The corresponding Data is EFI_80211_LINK_STATE.

EfiSupplicantKeyRefresh
Flag indicates key is refreshed. The corresponding Data is EFI_SUPPLICANT_KEY_REFRESH.

EfiSupplicant80211SupportedAKMSuites
Supported authentication types. The corresponding Data is of type EFI_80211_AKM_SUITE_SELECTOR.

EfiSupplicant80211SupportedSoftwareCipherSuites
Supported software encryption types provided by supplicant driver.
The corresponding Data is of type 
**EFI_80211_CIPHER_SUITE_SELECTOR**.

EfiSupplicant80211SupportedHardwareCipherSuites

Supported hardware encryption types provided by wireless UNDI
driver. The corresponding Data is of type 
**EFI_80211_CIPHER_SUITE_SELECTOR**.

EfiSupplicant80211IGTK

802.11 Integrity GTK. The corresponding Data is of type 
**EFI_SUPPLICANT_GTK_LIST**.

EfiSupplicant80211IPMK

802.11 PMK. The corresponding Data is 32 bytes pairwise master
key.

',//**********************************************
// EFI_80211_LINK_STATE
//**********************************************
typedef enum {
    Ieee80211UnauthenticatedUnassociated,
    Ieee80211AuthenticatedUnassociated,
    Ieee80211PendingRSNAuthentication,
    Ieee80211AuthenticatedAssociated
} EFI_80211_LINK_STATE;

Ieee80211UnauthenticatedUnassociated
    Indicates initial start state, unauthenticated, unassociated.

Ieee80211AuthenticatedUnassociated
    Indicates authenticated, unassociated.

Ieee80211PendingRSNAuthentication
    Indicates authenticated and associated, but pending RSN
authentication.

Ieee80211AuthenticatedAssociated
    Indicates authenticated and associated.

,//**********************************************
// EFI_SUPPLICANT_KEY_REFRESH
//**********************************************
typedef struct {
    BOOLEAN       GTKRefresh;
} EFI_SUPPLICANT_KEY_REFRESH;

GTKRefresh
    If TRUE, indicates GTK is just refreshed after a successful call to
**EFI_SUPPLICANT_PROTOCOL.BuildResponsePacket()**.
/****************************************************************************
// EFI_SUPPLICANT_GTK_LIST
//****************************************************************************
typedef struct {
    UINT8 GTKCount;
    EFI_SUPPLICANT_KEY GTKList[1];
} EFI_SUPPLICANT_GTK_LIST;

GTKCount Indicates the number of GTKs that are contained in GTKList.
GTKList A variable-length array of GTKs of type EFI_SUPPLICANT_KEY. The number of entries is specified by GTKCount.

#define EFI_MAX_KEY_LEN 64

 /*******************************************************************************/
// EFI_SUPPLICANT_KEY
/*******************************************************************************/
typedef struct {
    UINT8 Key[EFI_MAX_KEY_LEN];
    UINT8 KeyLen;
    UINT8 KeyId;
    EFI_SUPPLICANT_KEY_TYPE KeyType;
    EFI_80211_MAC_ADDRESS Addr;
    UINT8 Rsc[8];
    UINT8 RscLen;
    BOOLEAN IsAuthenticator;
    EFI_80211_SUITE_SELECTOR CipherSuite;
    EFI_SUPPLICANT_KEY_DIRECTION Direction;
} EFI_SUPPLICANT_KEY;

The EFI_SUPPLICANT_KEY descriptor is defined in the IEEE 802.11 standard, section 6.3.19.1.2.

Key The key value.
KeyLen Length in bytes of the Key. Should be up to EFI_MAX_KEY_LEN.
KeyId The key identifier.
KeyType Defines whether this key is a group key, pairwise key, PeerKey, or Integrity Group.
Addr The value is set according to the KeyType.
RSC The Receive Sequence Count value.
RscLen Length in bytes of the Rsc. Should be up to 8.
IsAuthenticator Indicates whether the key is configured by the Authenticator or Supplicant. The value true indicates Authenticator.
CipherSuite The cipher suite required for this association.
Direction Indicates the direction for which the keys are to be installed.
typedef enum {
    Group,
    Pairwise,
    PeerKey,
    IGTK
} EFI_SUPPLICANT_KEY_TYPE;

The EFI_SUPPLICANT_KEY_TYPE is defined in the IEEE 802.11 specification.

typedef enum {
    Receive,
    Transmit,
    Both
} EFI_SUPPLICANT_KEY_DIRECTION;

Receive Indicates that the keys are being installed for the receive direction.
Transmit Indicates that the keys are being installed for the transmit direction.
Both Indicates that the keys are being installed for both the receive and transmit directions.

 EFI_SUPPLICANT_PROTOCOL.GetData()

Summary
Get Supplicant configuration data.
Prototype

typedef
EFI_STATUS
(EIFIAPI *EFI_SUPPLICANT_GET_DATA)(
    IN EFI_SUPPLICANT_PROTOCOL     *This,
    IN EFI_SUPPLICANT_DATA_TYPE   DataType,
    OUT UINT8             *Data, OPTIONAL
    IN OUT UINTN            *DataSize
);

Parameters

  This  Pointer to the EFI_SUPPLICANT_PROTOCOL instance.
  DataType The type of data.
  Data Point to the buffer to hold the data. Ignored if DataSize is 0.
  DataSize Pointer to the buffer size in bytes. On input, it is the buffer size
               provided by the caller. On output, it is the buffer size in fact needed
               to contain the packet.

Description

The GetData() function gets Supplicant configuration. The typical example is PTK and GTK derived from
handshake. The wireless NIC can support software encryption or hardware encryption. If the consumer
uses software encryption, it can call ProcessPacket() to get result. If the consumer supports
hardware encryption, it can get PTK and GTK via GetData() and program to hardware register.

28 - Network Protocols — TCP, IP, IPsec, FTP, TLS and Configurations

28.1 EFI TCPv4 Protocol

This section defines the EFI TCPv4 (Transmission Control Protocol version 4) Protocol.

28.1.1 TCP4 Service Binding Protocol

EFI_TCP4_SERVICE_BINDING_PROTOCOL

Summary

The EFI TCPv4 Service Binding Protocol is used to locate EFI TCPv4 Protocol drivers to create and destroy child of the driver to communicate with other host using TCP protocol.

GUID

#define EFI_TCP4_SERVICE_BINDING_PROTOCOL_GUID
  {0x00720665, 0x67EB, 0x4a99, {0xBA, 0xF7, 0xD3, 0xC3, 0x3A, 0x1C, 0x7C, 0xC9}}

Description

A network application that requires TCPv4 I/O services can call one of the protocol handler services, such as BS->LocateHandleBuffer(), to search devices that publish an EFI TCPv4 Service Binding Protocol GUID. Such device supports the EFI TCPv4 Protocol and may be available for use.

After a successful call to the EFI_TCP4_SERVICE_BINDING_PROTOCOL.CreateChild() function, the newly created child EFI TCPv4 Protocol driver is in an un-configured state; it is not ready to do any operation except Poll() send and receive data packets until configured as the purpose of the user and perhaps some other indispensable function belonged to TCPv4 Protocol driver is called properly.

Every successful call to the EFI_TCP4_SERVICE_BINDING_PROTOCOL.CreateChild() function must be matched with a call to the EFI_TCP4_SERVICE_BINDING_PROTOCOL.DestroyChild() function to release the protocol driver.

28.1.2 TCP4 Protocol

EFI_TCP4_PROTOCOL

Summary

The EFI TCPv4 Protocol provides services to send and receive data stream.

GUID

#define EFI_TCP4_PROTOCOL_GUID
  {0x65530BC7, 0xA359, 0x410f, {0xB0, 0x10, 0x5A, 0xAD, 0xC7, 0xEC, 0x2B, 0x62}}
Protocol Interface Structure

typedef struct _EFI_TCP4_PROTOCOL {
    EFI_TCP4_GET_MODE_DATA   GetModeData;
    EFI_TCP4_CONFIGURE       Configure;
    EFI_TCP4_ROUTES          Routes;
    EFI_TCP4_CONNECT         Connect;
    EFI_TCP4_ACCEPT          Accept;
    EFI_TCP4_TRANSMIT        Transmit;
    EFI_TCP4_RECEIVE         Receive;
    EFI_TCP4_CLOSE           Close;
    EFI_TCP4_CANCEL          Cancel;
    EFI_TCP4_POLL            Poll;
} EFI_TCP4_PROTOCOL;

Parameters

GetModeData Get the current operational status. See the GetModeData() function description.

Configure Initialize, change, or brutally reset operational settings of the EFI TCPv4 Protocol. See the Configure() function description.

Routes Add or delete routing entries for this TCP4 instance. See the Routes() function description.

Connect Initiate the TCP three-way handshake to connect to the remote peer configured in this TCP instance. The function is a nonblocking operation. See the Connect() function description.

Accept Listen for incoming TCP connection request. This function is a nonblocking operation. See the Accept() function description.

Transmit Queue outgoing data to the transmit queue. This function is a nonblocking operation. See the Transmit() function description.

Receive Queue a receiving request token to the receive queue. This function is a nonblocking operation. See the Receive() function description.

Close Gracefully disconnecting a TCP connection follow RFC 793 or reset a TCP connection. This function is a nonblocking operation. See the Close() function description.

Cancel Abort a pending connect, listen, transmit or receive request. See the Cancel() function description.

Poll Poll to receive incoming data and transmit outgoing TCP segments. See the Poll() function description.

Description

The EFI_TCP4_PROTOCOL defines the EFI TCPv4 Protocol child to be used by any network drivers or applications to send or receive data stream. It can either listen on a specified port as a service or actively
connected to remote peer as a client. Each instance has its own independent settings, such as the routing table.

**Note:** In this document, all IPv4 addresses and incoming/outgoing packets are stored in network byte order. All other parameters in the functions and data structures that are defined in this document are stored in host byte order unless explicitly specified.

**EFI_TCP4_PROTOCOL.GetModeData()**

**Summary**
Get the current operational status.

**Prototype**
```c
typedef EFI_STATUS
    (EFIAPI *EFI_TCP4_GET_MODE_DATA) (
    IN EFI_TCP4_PROTOCOL *This,
    OUT EFI_TCP4_CONNECTION_STATE *Tcp4State OPTIONAL,
    OUT EFI_TCP4_CONFIG_DATA *Tcp4ConfigData OPTIONAL,
    OUT EFI_IPv4_MODE_DATA *Ip4ModeData OPTIONAL,
    OUT EFI_MANAGED_NETWORK_CONFIG_DATA *MnpConfigData OPTIONAL,
    OUT EFI_SIMPLE_NETWORK_MODE *SnpModeData OPTIONAL);
```

**Parameters**
- **This** Pointer to the EFI_TCP4_PROTOCOL instance.
- **Tcp4State** Pointer to the buffer to receive the current TCP state. Type EFI_TCP4_CONNECTION_STATE is defined in “Related Definitions” below.
- **Tcp4ConfigData** Pointer to the buffer to receive the current TCP configuration. Type EFI_TCP4_CONFIG_DATA is defined in “Related Definitions” below.
- **Ip4ModeData** Pointer to the buffer to receive the current IPv4 configuration data used by the TCPv4 instance. Type EFI_IP4_MODE_DATA is defined in EFI_IP4_PROTOCOL.GetModeData().
- **MnpConfigData** Pointer to the buffer to receive the current MNP configuration data used indirectly by the TCPv4 instance. Type EFI_MANAGED_NETWORK_CONFIG_DATA is defined in EFI_MANAGED_NETWORK_PROTOCOL.GetModeData().
- **SnpModeData** Pointer to the buffer to receive the current SNP configuration data used indirectly by the TCPv4 instance. Type EFI_SIMPLE_NETWORK_MODE is defined in the EFI_SIMPLE_NETWORK_PROTOCOL.
Description
The `GetModeData()` function copies the current operational settings of this EFI TCPv4 Protocol instance into user-supplied buffers. This function can also be used to retrieve the operational setting of underlying drivers such as IPv4, MNP, or SNP.

Related Definition
```c
typedef struct {
    BOOLEAN UseDefaultAddress;
    EFI_IPv4_ADDRESS StationAddress;
    EFI_IPv4_ADDRESS SubnetMask;
    UINT16 StationPort;
    EFI_IPv4_ADDRESS RemoteAddress;
    UINT16 RemotePort;
    BOOLEAN ActiveFlag;
} EFI_TCP4_ACCESS_POINT;
```

- **UseDefaultAddress**
  Set to `TRUE` to use the default IP address and default routing table. If the default IP address is not available yet, then the underlying EFI IPv4 Protocol driver will use `EFI_IP4_CONFIG2_PROTOCOL` to retrieve the IP address and subnet information.

- **StationAddress**
  The local IP address assigned to this EFI TCPv4 Protocol instance. The EFI TCPv4 and EFI IPv4 Protocol drivers will only deliver incoming packets whose destination addresses exactly match the IP address. Not used when `UseDefaultAddress` is `TRUE`.

- **SubnetMask**
  The subnet mask associated with the station address. Not used when `UseDefaultAddress` is `TRUE`.

- **StationPort**
  The local port number to which this EFI TCPv4 Protocol instance is bound. If the instance doesn't care the local port number, set `StationPort` to zero to use an ephemeral port.

- **RemoteAddress**
  The remote IP address to which this EFI TCPv4 Protocol instance is connected. If `ActiveFlag` is `FALSE` (i.e., a passive TCPv4 instance), the instance only accepts connections from the `RemoteAddress`. If `ActiveFlag` is `TRUE` the instance is connected to the `RemoteAddress`, i.e., outgoing segments will be sent to this address and only segments from this address will be delivered to the application. When `ActiveFlag` is `FALSE` it can be set to zero and means that incoming connection request from any address will be accepted.

- **RemotePort**
  The remote port to which this EFI TCPv4 Protocol instance is connects or connection request from which is accepted by this EFI TCPv4 Protocol instance. If `ActiveFlag` is `FALSE` it can be zero and means that incoming connection request from any port will be accepted. Its value can not be zero when `ActiveFlag` is `TRUE`.

- **ActiveFlag**
  Set it to `TRUE` to initiate an active open. Set it to `FALSE` to initiate a passive open to act as a server.
typedef struct {
  UINT32 ReceiveBufferSize;
  UINT32 SendBufferSize;
  UINT32 MaxSynBackLog;
  UINT32 ConnectionTimeout;
  UINT32 DataRetries;
  UINT32 FinTimeout;
  UINT32 TimeWaitTimeout;
  UINT32 KeepAliveProbes;
  UINT32 KeepAliveTime;
  UINT32 KeepAliveInterval;
  BOOLEAN EnableNagle;
  BOOLEAN EnableTimeStamp;
  BOOLEAN EnableWindowScaling;
  BOOLEAN EnableSelectiveAck;
  BOOLEAN EnablePathMtuDiscovery;
} EFI_TCP4_OPTION;

ReceiveBufferSize The size of the TCP receive buffer.
SendBufferSize The size of the TCP send buffer.
MaxSynBackLog The length of incoming connect request queue for a passive instance. When set to zero, the value is implementation specific.
ConnectionTimeout The maximum seconds a TCP instance will wait for before a TCP connection established. When set to zero, the value is implementation specific.
DataRetries The number of times TCP will attempt to retransmit a packet on an established connection. When set to zero, the value is implementation specific.
FinTimeout How many seconds to wait in the FIN_WAIT_2 states for a final FIN flag before the TCP instance is closed. This timeout is in effective only if the application has called Close() to disconnect the connection completely. It is also called FIN_WAIT_2 timer in other implementations. When set to zero, it should be disabled because the FIN_WAIT_2 timer itself is against the standard.
TimeWaitTimeout How many seconds to wait in TIME_WAIT state before the TCP instance is closed. The timer is disabled completely to provide a method to close the TCP connection quickly if it is set to zero. It is against the related RFC documents.
KeepAliveProbes The maximum number of TCP keep-alive probes to send before giving up and resetting the connection if no response from the other end. Set to zero to disable keep-alive probe.
KeepAliveTime The number of seconds a connection needs to be idle before TCP sends out periodical keep-alive probes. When set to zero, the value is implementation specific. It should be ignored if keep-alive probe is disabled.

KeepAliveInterval The number of seconds between TCP keep-alive probes after the periodical keep-alive probe if no response. When set to zero, the value is implementation specific. It should be ignored if keep-alive probe is disabled.

EnableNagle Set it to **TRUE** to enable the Nagle algorithm as defined in RFC896. Set it to **FALSE** to disable it.

EnableTimeStamp Set it to **TRUE** to enable TCP timestamps option as defined in RFC7323. Set to **FALSE** to disable it.

EnableWindowScaling Set it to **TRUE** to enable TCP window scale option as defined in RFC7323. Set to **FALSE** to disable it.

EnableSelectiveAck Set it to **TRUE** to enable selective acknowledge mechanism described in RFC 2018. Set it to **FALSE** to disable it. Implementation that supports SACK can optionally support DSAK as defined in RFC 2883.

EnablePathMtudiscovery Set it to **TRUE** to enable path MTU discovery as defined in RFC 1191. Set to **FALSE** to disable it.

Option setting with digital value will be modified by driver if it is set out of the implementation specific range and an implementation specific default value will be set accordingly.

```c
//**************************************************************
// EFI_TCP4_CONFIG_DATA
//**************************************************************
typedef struct {
    // Receiving Filters
    // I/O parameters
    UINT8 TypeOfService;
    UINT8 TimeToLive;

    // Access Point
    EFI_TCP4_ACCESS_POINT AccessPoint;

    // TCP Control Options
    EFI_TCP4_OPTION * ControlOption;
} EFI_TCP4_CONFIG_DATA;
```

**TypeOfService** field in transmitted IPv4 packets.

**TimeToLive** field in transmitted IPv4 packets.
AccessPoint  Used to specify TCP communication end settings for a TCP instance.

ControlOption  Used to configure the advance TCP option for a connection. If set to NULL, implementation specific options for TCP connection will be used.

//***************************************************************
// EFI_TCP4_CONNECTION_STATE
//***************************************************************/

typedef enum {
    Tcp4StateClosed    = 0,
    Tcp4StateListen    = 1,
    Tcp4StateSynSent    = 2,
    Tcp4StateSynReceived  = 3,
    Tcp4StateEstablished  = 4,
    Tcp4StateFinWait1   = 5,
    Tcp4StateFinWait2   = 6,
    Tcp4StateClosing    = 7,
    Tcp4StateTimeWait   = 8,
    Tcp4StateCloseWait   = 9,
    Tcp4StateLastAck    = 10
} EFI_TCP4_CONNECTION_STATE;

EFI_TCP4_PROTOCOL.Configure()

Summary

Initialize or brutally reset the operational parameters for this EFI TCPv4 instance.

Prototype

typedef
EFI_STATUS
(EIFIAPI *EFI_TCP4_CONFIGURE) (  
    IN EFI_TCP4_PROTOCOL  *This,
    IN EFI_TCP4_CONFIG_DATA  *TcpConfigData OPTIONAL
);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>This</td>
<td>Pointer to the EFI_TCP4_PROTOCOL instance.</td>
</tr>
<tr>
<td>TcpConfigData</td>
<td>Pointer to the configure data to configure the instance.</td>
</tr>
</tbody>
</table>
Description

The `Configure()` function does the following:

- Initialize this EFI TCPv4 instance, i.e., initialize the communication end setting, specify active open or passive open for an instance.
- Reset this TCPv4 instance brutally, i.e., cancel all pending asynchronous tokens, flush transmission and receiving buffer directly without informing the communication peer.

No other TCPv4 Protocol operation can be executed by this instance until it is configured properly. For an active TCP4 instance, after a proper configuration it may call `Connect()` to initiates the three-way handshake. For a passive TCP4 instance, its state will transit to `Tcp4StateListen` after configuration, and `Accept()` may be called to listen the incoming TCP connection request. If `TcpConfigData` is set to NULL, the instance is reset. Resetting process will be done brutally, the state machine will be set to `Tcp4StateClosed` directly, the receive queue and transmit queue will be flushed, and no traffic is allowed through this instance.

Status Codes Returned

</tbody>
</table>
| EFI_INVALID_PARAMETER        | One or more following conditions are **TRUE**:
- **This** is **NULL**
- `TcpConfigData` `->AccessPoint.StationAddress` isn’t a valid unicast IPv4 address when `TcpConfigData` `->AccessPoint.UseDefaultAddress` is **FALSE**.
- `TcpConfigData` `->AccessPoint.SubnetMask` isn’t a valid IPv4 address mask when `TcpConfigData` `-> AccessPoint.UseDefaultAddress` is **FALSE**. The subnet mask must be contiguous.
- `TcpConfigData` `->AccessPoint.RemoteAddress` isn’t a valid unicast IPv4 address.
- `TcpConfigData` `->AccessPoint.RemoteAddress` is zero or `TcpConfigData` `->AccessPoint.RemotePort` is zero when `TcpConfigData` `->AccessPoint.ActiveFlag` is **TRUE**.
- A same access point has been configured in other TCP instance properly. |
| EFI_ACCESS_DENIED            | Configuring TCP instance when it is configured without calling `Configure()` with NULL to reset it. |
| EFI_DEVICE_ERROR             | An unexpected network or system error occurred. |
EFI_TCP4_PROTOCOL.Routes()

Summary
Add or delete routing entries.

Prototype
```c
typedef EFI_STATUS
    (EFIAPI *EFI_TCP4_ROUTES) (  
        IN EFI_TCP4_PROTOCOL *This,
        IN BOOLEAN DeleteRoute,
        IN EFI_IPv4_ADDRESS *SubnetAddress,
        IN EFI_IPv4_ADDRESS *SubnetMask,
        IN EFI_IPv4_ADDRESS *GatewayAddress
    );
```

Parameters
- This
  Pointer to the EFI_TCP4_PROTOCOL instance.
- DeleteRoute
  Set it to TRUE to delete this route from the routing table. Set it to FALSE to add this route to the routing table. 
  DestinationAddress and SubnetMask are used as the keywords to search route entry.
- SubnetAddress
  The destination network.
- SubnetMask
  The subnet mask of the destination network.
- GatewayAddress
  The gateway address for this route. It must be on the same subnetwork with the station address unless a direct route is specified.

Description
The Routes() function adds or deletes a route from the instance’s routing table.

The most specific route is selected by comparing the SubnetAddress with the destination IP address’s arithmetical AND to the SubnetMask.

The default route is added with both SubnetAddress and SubnetMask set to 0.0.0.0. The default route matches all destination IP addresses if there is no more specific route.

Direct route is added with GatewayAddress set to 0.0.0.0. Packets are sent to the destination host if its address can be found in the Address Resolution Protocol (ARP) cache or it is on the local subnet. If the instance is configured to use default address, a direct route to the local network will be added automatically.
Each TCP instance has its own independent routing table. Instance that uses the default IP address will have a copy of the EFI_IP4_CONFIG2_PROTOCOL’s routing table. The copy will be updated automatically whenever the IP driver reconfigures its instance. As a result, the previous modification to the instance’s local copy will be lost.

The priority of checking the route table is specific with IP implementation and every IP implementation must comply with RFC 1122.

**Note:** There is no way to set up routes to other network interface cards (NICs) because each NIC has its own independent network stack that shares information only through EFI TCP4 variable.

### EFI_TCP4_PROTOCOL.Connect()

#### Summary

Initiate a nonblocking TCP connection request for an active TCP instance.

#### Prototype

```c
typedef EFI_STATUS
(EFIAPI *EFI_TCP4_CONNECT) (    
    IN EFI_TCP4_PROTOCOL    *This,
    IN EFI_TCP4_CONNECTION_TOKEN  *ConnectionToken,
    ...);
```
Parameters

This
    Pointer to the EFI_TCP4_PROTOCOL instance.
ConnectionToken
    Pointer to the connection token to return when the TCP three way handshake finishes. Type EFI_TCP4_CONNECTION_TOKEN is defined in “Related Definition” below.

Description

The Connect() function will initiate an active open to the remote peer configured in current TCP instance if it is configured active. If the connection succeeds or fails due to any error, the ConnectionToken->CompletionToken.Event will be signaled and ConnectionToken->CompletionToken.Status will be updated accordingly. This function can only be called for the TCP instance in Tcp4StateClosed state. The instance will transfer into Tcp4StateSynSent if the function returns EFI_SUCCESS. If TCP three way handshake succeeds, its state will become Tcp4StateEstablished, otherwise, the state will return to Tcp4StateClosed.

Related Definitions

typedef struct {
    EFI_EVENT Event;
    EFI_STATUS Status;
} EFI_TCP4_COMPLETION_TOKEN;

Event
    The Event to signal after request is finished and Status field is updated by the EFI TCPv4 Protocol driver. The type of Event must be EVT_NOTIFY_SIGNAL, and its Task Priority Level (TPL) must be lower than or equal to TPL_CALLBACK.

Status
    The variable to receive the result of the completed operation. EFI_NO_MEDIA. There was a media error

The EFI_TCP4_CONNECTION_TOKEN is used as a common header for various asynchronous tokens.

typedef struct {
    EFI_TCP4_COMPLETION_TOKEN CompletionToken;
} EFI_TCP4_CONNECTION_TOKEN;

Status
    The Status in the CompletionToken will be set to one of the following values if the active open succeeds or an unexpected error happens:
**EFI_SUCCESS.** The active open succeeds and the instance is in `Tcp4StateEstablished`.

**EFI_CONNECTION_RESET.** The connect fails because the connection is reset either by instance itself or communication peer.

**EFI_CONNECTION_REFUSED.** The connect fails because this connection is initiated with an active open and the connection is refused.

**EFI_ABORTED.** The active open was aborted.

**EFI_TIMEOUT.** The connection establishment timer expired and no more specific information is available.

**EFI_NETWORK_UNREACHABLE.** The active open fails because an ICMP network unreachable error is received.

**EFI_HOST_UNREACHABLE.** The active open fails because an ICMP host unreachable error is received.

**EFI_PROTOCOL_UNREACHABLE.** The active open fails because an ICMP protocol unreachable error is received.

**EFI_PORT_UNREACHABLE.** The connection establishment timer times out and an ICMP port unreachable error is received.

**EFI_ICMP_ERROR.** The connection establishment timer timeout and some other ICMP error is received.

**EFI_DEVICE_ERROR.** An unexpected system or network error occurred.

### Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The connection request is successfully initiated and the state of this TCPv4 instance has been changed to <code>Tcp4StateSynSent</code></td>
</tr>
<tr>
<td>EFI_NOT_STARTED</td>
<td>This EFI TCPv4 Protocol instance has not been configured.</td>
</tr>
</tbody>
</table>
| EFI_ACCESS_DENIED   | One or more of the following conditions are **TRUE**:  
  - This instance is not configured as an active one.  
  - This instance is not in `Tcp4StateClosed` state. |
| EFI_INVALID_PARAMETER | One or more of the following are **TRUE**:  
  - This is **NULL**  
  - `ConnectionToken` is **NULL**  
  - `ConnectionToken` ->`CompletionToken.Event` is **NULL**. |
| EFI_OUT_OF_RESOURCES | The driver can’t allocate enough resource to initiate the active open. |
| EFI_DEVICE_ERROR    | An unexpected system or network error occurred. |
**EFI_TCP4_PROTOCOL.Accept()**

**Summary**
Listen on the passive instance to accept an incoming connection request. This is a nonblocking operation.

**Prototype**
```
typedef
EFI_STATUS
(EIFIAPI *EFI_TCP4_ACCEPT) (  
    IN EFI_TCP4_PROTOCOL *This,
    IN EFI_TCP4_LISTEN_TOKEN *ListenToken
);
```

**Parameters**
- **This**: Pointer to the EFI_TCP4_PROTOCOL instance.
- **ListenToken**: Pointer to the listen token to return when operation finishes. Type EFI_TCP4_LISTEN_TOKEN is defined in “Related Definition” below.

**Related Definitions**
```c
//******************************************************************************
// EFI_TCP4_LISTEN_TOKEN
//******************************************************************************
typedef struct {
    EFI_TCP4_COMPLETION_TOKEN CompletionToken;
    EFI_HANDLE NewChildHandle;
} EFI_TCP4_LISTEN_TOKEN;
```

**Status**
The Status in CompletionToken will be set to the following value if accept finishes:

- **EFI_SUCCESS**: A remote peer has successfully established a connection to this instance. A new TCP instance has also been created for the connection.
- **EFI_CONNECTION_RESET**: The accept fails because the connection is reset either by instance itself or communication peer.
- **EFI_ABORTED**: The accept request has been aborted.

**NewChildHandle**
The new TCP instance handle created for the established connection.

**Description**
The **Accept()** function initiates an asynchronous accept request to wait for an incoming connection on the passive TCP instance. If a remote peer successfully establishes a connection with this instance, a new TCP instance will be created and its handle will be returned in ListenToken->NewChildHandle. The newly created
instance is configured by inheriting the passive instance’s configuration and is ready for use upon return. The instance is in the **Tcp4StateEstablished** state.

The `ListenToken->CompletionToken.Event` will be signaled when a new connection is accepted, user aborts the listen or connection is reset.

This function only can be called when current TCP instance is in **Tcp4StateListen** state.

**Status Codes Returned**

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The listen token has been queued successfully.</td>
</tr>
<tr>
<td>EFI_NOT_STARTED</td>
<td>This EFI TCPv4 Protocol instance has not been configured.</td>
</tr>
</tbody>
</table>
| EFI_ACCESS_DENIED | One or more of the following are **TRUE**:  
  - This instance is not a passive instance.  
  - This instance is not in **Tcp4StateListen** state.  
  - The same listen token has already existed in the listen token queue of this TCP instance. |
| EFI_INVALID_PARAMETER | One or more of the following are **TRUE**:  
  - **This** is **NULL**.  
  - **ListenToken** is **NULL**.  
  - **ListenToken->CompletionToken.Event** is **NULL**. |
| EFI_OUT_OF_RESOURCES | Could not allocate enough resource to finish the operation. |
| EFI_DEVICE_ERROR | Any unexpected and not belonged to above category error. |

**EFI_TCP4_PROTOCOL.Transmit()**

**Summary**

Queues outgoing data into the transmit queue.

**Prototype**

```c
typedef EFI_STATUS (EFI_API *EFI_TCP4_TRANSMIT) (  
  IN EFI_TCP4_PROTOCOL *This,  
  IN EFI_TCP4_IO_TOKEN *Token
);
```

**Parameters**

- **This**  
  Pointer to the **EFI_TCP4_PROTOCOL** instance.
- **Token**  
  Pointer to the completion token to queue to the transmit queue. Type **EFI_TCP4_IO_TOKEN** is defined in “Related Definitions” below.
Description

The **Transmit()** function queues a sending request to this TCPv4 instance along with the user data. The status of the token is updated and the event in the token will be signaled once the data is sent out or some error occurs.

Related Definitions

```c
//***************************************************************
// EFI_TCP4_IO_TOKEN
//----------------------------------------------------------------------------
typedef struct {
    EFI_TCP4_COMPLETION_TOKEN    CompletionToken;
    union {
        EFI_TCP4_RECEIVE_DATA    *RxData;
        EFI_TCP4_TRANSMIT_DATA   *TxData;
    }
} EFI_TCP4_IO_TOKEN;
```

**Status**

When transmission finishes or meets any unexpected error it will be set to one of the following values:

- ** EFI_SUCCESS:** The receiving or transmission operation completes successfully.
- ** EFI_CONNECTION_FIN:** The receiving operation fails because the communication peer has closed the connection and there is no more data in the receive buffer of the instance.
- ** EFI_CONNECTION_RESET:** The receiving or transmission operation fails because this connection is reset either by instance itself or communication peer.
- ** EFI_ABORTED:** The receiving or transmission is aborted.
- ** EFI_TIMEOUT:** The transmission timer expires and no more specific information is available.
- ** EFI_NETWORK_UNREACHABLE:** The transmission fails because an ICMP network unreachable error is received.
- ** EFI_HOST_UNREACHABLE:** The transmission fails because an ICMP host unreachable error is received.
- ** EFI_PROTOCOL_UNREACHABLE:** The transmission fails because an ICMP protocol unreachable error is received.
- ** EFI_PORT_UNREACHABLE:** The transmission fails and an ICMP port unreachable error is received.
- ** EFI_ICMP_ERROR:** The transmission fails and some other ICMP error is received.
- ** EFI_DEVICE_ERROR:** An unexpected system or network error occurs.
- ** EFI_NO_MEDIA:** There was a media error.
RxData
When this token is used for receiving, RxData is a pointer to EFI_TCP4_RECEIVE_DATA. Type EFI_TCP4_RECEIVE_DATA is defined below.

TxData
When this token is used for transmitting, TxData is a pointer to EFI_TCP4_TRANSMIT_DATA. Type EFI_TCP4_TRANSMIT_DATA is defined below.

The EFI_TCP4_IO_TOKEN structures are used for both transmit and receive operations.

When used for transmitting, the CompletionToken.Event and TxData fields must be filled in by the user. After the transmit operation completes, the CompletionToken.Status field is updated by the instance and the Event is signaled.

• When used for receiving, the CompletionToken.Event and RxData fields must be filled in by the user. After a receive operation completes, RxData and Status are updated by the instance and the Event is signaled.

***************************************************************
// TCP4 Token Status definition
//***************************************************************
#define EFI_CONNECTION_FIN        EFIERR (104)
#define EFI_CONNECTION_RESET       EFIERR (105)
#define EFI_CONNECTION_REFUSED      EFIERR (106)

Note: EFIERR() sets the maximum bit. Similar to how error codes are described in Appendix D.

//******************************************************************************
// EFI_TCP4_RECEIVE_DATA
//******************************************************************************
typedef struct {
   BOOLEAN UrgentFlag;
   UINT32  DataLength;
   UINT32  FragmentCount;
   EFI_TCP4_FRAGMENT_DATA FragmentTable[1];
} EFI_TCP4_RECEIVE_DATA;

UrgentFlag
Whether those data are urgent. When this flag is set, the instance is in urgent mode. The implementations of this specification should follow RFC793 to process urgent data, and should NOT mix the data across the urgent point in one token.

DataLength
When calling Receive() function, it is the byte counts of all Fragmentbuffer in FragmentTable allocated by user. When the token is signaled by TCPv4 driver it is the length of received data in the fragments.
FragmentCount  Number of fragments.
FragmentTable  An array of fragment descriptors. Type EFI_TCP4_FRAGMENT_DATA is defined below.

When TCPv4 driver wants to deliver received data to the application, it will pick up the first queued receiving token, update its Token->Packet.RxData then signal the Token->CompletionToken.Event.

- The FragmentBuffers in FragmentTable are allocated by the application when calling Receive() function and received data will be copied to those buffers by the driver. FragmentTable may contain multiple buffers that are NOT in the continuous memory locations. The application should combine those buffers in the FragmentTable to process data if necessary.

```c
//***************************************************************
// EFI_TCP4_FRAGMENT_DATA
//***************************************************************
typedef struct {
    UINT32    FragmentLength;
    VOID*     *FragmentBuffer;
} EFI_TCP4_FRAGMENT_DATA;
```

FragmentLength  Length of data buffer in the fragment.
FragmentBuffer  Pointer to the data buffer in the fragment.

EFI_TCP4_FRAGMENT_DATA allows multiple receive or transmit buffers to be specified. The purpose of this structure is to provide scattered read and write.

```c
//***************************************************************
// EFI_TCP4_TRANSMIT_DATA
//***************************************************************
typedef struct {
    BOOLEAN    Push;
    BOOLEAN    Urgent;
    UINT32     DataLength;
    UINT32     FragmentCount;
    EFI_TCP4_FRAGMENT_DATA FragmentTable[1];
} EFI_TCP4_TRANSMIT_DATA;
```

Push  If TRUE, data must be transmitted promptly, and the PUSH bit in the last TCP segment created will be set. If FALSE, data transmission may be delay to combine with data from subsequent Transmit()s for efficiency.
Urgent

The data in the fragment table are urgent and urgent point is in effect if TRUE. Otherwise those data are NOT considered urgent.

DataLength
Length of the data in the fragments.

FragmentCount
Number of fragments.

FragmentTable
A array of fragment descriptors. Type EFI_TCP4_FRAGMENT_DATA is defined above.

The EFI TCPv4 Protocol user must fill this data structure before sending a packet. The packet may contain multiple buffers in non-continuous memory locations.

EFI_TCP4_PROTOCOL.Receive()

Summary
Places an asynchronous receive request into the receiving queue.
Prototype

```
typedef
 EFI_STATUS
 (EFIAPI *EFI_TCP4_RECEIVE) (
   IN EFI_TCP4_PROTOCOL *This,
   IN EFI_TCP4_IO_TOKEN *Token
 );
```

Parameters

This Pointer to the EFI_TCP4_PROTOCOL instance.
Token Pointer to a token that is associated with the receive data descriptor. Type EFI_TCP4_IO_TOKEN is defined in EFI_TCP4_PROTOCOL.Transmit().

Description

The Receive() function places a completion token into the receive packet queue. This function is always asynchronous. The caller must allocate the Token->CompletionToken.Event and the FragmentBuffer used to receive data. He also must fill the DataLength which represents the whole length of all FragmentBuffer. When the receive operation completes, the EFI TCPv4 Protocol driver updates the Token->CompletionToken.Status and Token->Packet.RxData fields and the Token->CompletionToken.Event is signaled. If got data the data and its length will be copy into the FragmentTable, in the same time the full length of received data will be recorded in the DataLength fields. Providing a proper notification function and context for the event will enable the user to receive the notification and receiving status. That notification function is guaranteed to not be re-entered.

Status Codes Returned

</tr>
</tbody>
</table>
**EFI_TCP4_PROTOCOL.Close()**

**Summary**
Disconnecting a TCP connection gracefully or reset a TCP connection. This function is a nonblocking operation.

**Prototype**

```c
typedef
EFI_STATUS
(EIFIAPI *EFI_TCP4_CLOSE)(
    IN EFI_TCP4_PROTOCOL *This,
    IN EFI_TCP4_CLOSE_TOKEN *CloseToken
);
```

**Parameters**

- **This**
  Pointer to the `EFI_TCP4_PROTOCOL` instance.
- **CloseToken**
  Pointer to the close token to return when operation finishes.

**Related Definitions**

```c
//******************************************************************************
// EFI_TCP4_CLOSE_TOKEN
//******************************************************************************
typedef struct {
    EFI_TCP4_COMPLETION_TOKEN CompletionToken;
    BOOLEAN AbortOnClose;
} EFI_TCP4_CLOSE_TOKEN;
```

**Status**
When close finishes or meets any unexpected error it will be set to one of the following values:

- **EFI_SUCCESS.** The close operation completes successfully.
- **EFI_ACCESS_DENIED** One or more of the following conditions is `TRUE`:
  - A receive completion token with the same `Token- >CompletionToken.Event` was already in the receive queue.
  - The current instance is in `Tcp4StateClosed` state.
  - The current instance is a passive one and it is in `Tcp4StateListen` state.
  - User has called `Close()` to disconnect this connection.
- **EFI_CONNECTION_FIN** The communication peer has closed the connection and there is no any buffered data in the receive buffer of this instance.
- **EFI_NOT_READY** The receive request could not be queued because the receive queue is full.
- **EFI_NO_MEDIA** There was a media error.
**AbortOnClose**

Abort the TCP connection on close instead of the standard TCP close process when it is set to **TRUE**. This option can be used to satisfy a fast disconnect.

**Description**

Initiate an asynchronous close token to TCP driver. After **Close()** is called, any buffered transmission data will be sent by TCP driver and the current instance will have a graceful close working flow described as RFC 793 if **AbortOnClose** is set to **FALSE**, otherwise, a rest packet will be sent by TCP driver to fast disconnect this connection. When the close operation completes successfully the TCP instance is in **Tcp4StateClosed** state, all pending asynchronous operation is signaled and any buffers used for TCP network traffic is flushed.

**Status Codes Returned**

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The <strong>Close()</strong> is called successfully.</td>
</tr>
<tr>
<td>EFI_NOT_STARTED</td>
<td>This EFI TCPv4 Protocol instance has not been configured.</td>
</tr>
</tbody>
</table>
| EFI_ACCESS_DENIED | One or more of the following are **TRUE**:  
  - **Configure()** has been called with **TcpConfigData** set to NULL and this function has not returned.  
  - Previous **Close()** call on this instance has not finished. |
| EFI_INVALID_PARAMETER | One or more of the following are **TRUE**:  
  - **This** is NULL  
  - **CloseToken** is NULL  
  - **CloseToken->CompletionToken.Event** is NULL |
| EFI_OUT_OF_RESOURCES | Could not allocate enough resource to finish the operation. |
| EFI_DEVICE_ERROR | Any unexpected and not belonged to above category error. |

**EFI_TCP4_PROTOCOL.Cancel()**

**Summary**

Abort an asynchronous connection, listen, transmission or receive request.

**Prototype**

```c
typedef EFI_STATUS
  (EFIAPI *EFI_TCP4_CANCEL)(
    IN EFI_TCP4_PROTOCOL *This,
    IN EFI_TCP4_COMPLETION_TOKEN *Token OPTIONAL);
```

**Parameters**

- **This**  
  Pointer to the **EFI_TCP4_PROTOCOL** instance.
Token

Pointer to a token that has been issued by
EFI_TCP4_PROTOCOL.Connect(),
EFI_TCP4_PROTOCOL.Accept(),
EFI_TCP4_PROTOCOL.Transmit() or
EFI_TCP4_PROTOCOL.Receive(). If NULL, all pending tokens
issued by above four functions will be aborted. Type
EFI_TCP4_COMPLETION_TOKEN is defined in
EFI_TCP4_PROTOCOL.Connect().

Description

The Cancel() function aborts a pending connection, listen, transmit or receive
request. If Token is not NULL and the token is in the connection, listen, transmission
or receive queue when it is being cancelled, its Token->Status will be set to
EFI_ABORTED and then Token->Event will be signaled. If the token is not in one of
the queues, which usually means that the asynchronous operation has completed,
EFI_NOT_FOUND is returned. If Token is NULL all asynchronous token issued by
Connect(), Accept(), Transmit() and Receive() will be aborted.

Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The asynchronous I/O request is aborted and Token-&gt;Event is signaled.</td>
</tr>

</tr>
<tr>
<td>EFI_NOT_FOUND</td>
<td>The asynchronous I/O request isn’t found in the transmission or receive queue. It has either completed or wasn’t issued by Transmit() and Receive().</td>
</tr>
<tr>
<td>EFI_UNSUPPORTED</td>
<td>The implementation does not support this function.</td>
</tr>
</tbody>
</table>

EFI_TCP4_PROTOCOL.Poll()

Summary

Poll to receive incoming data and transmit outgoing segments.

Prototype

typedef

EFI_STATUS

(EIFIAPI *EFI_TCP4_POLL) (  
  IN EFI_TCP4_PROTOCOL  *This  );

Parameters

This Pointer to the EFI_TCP4_PROTOCOL instance.
Description

The \texttt{Poll()} function increases the rate that data is moved between the network and application and can be called when the TCP instance is created successfully. Its use is optional.

In some implementations, the periodical timer in the MNP driver may not poll the underlying communications device fast enough to avoid drop packets. Drivers and applications that are experiencing packet loss should try calling the \texttt{Poll()} function in a high frequency.

Status Codes Returned

<table>
<thead>
<tr>

28.2 EFI TCPv6 Protocol

This section defines the EFI TCPv6 (Transmission Control Protocol version 6) Protocol.

28.2.1 TCPv6 Service Binding Protocol

\texttt{EFI_TCP6_SERVICE_BINDING_PROTOCOL}

Summary

The EFI TCPv6 Service Binding Protocol is used to locate EFI TCPv6 Protocol drivers to create and destroy protocol child instance of the driver to communicate with other host using TCP protocol.

GUID

\begin{verbatim}
#define EFI_TCP6_SERVICE_BINDING_PROTOCOL_GUID \
{0xec20eb79,0x6c1a,0x4664,} \
{0x9a,0x0d,0xd2,0xe4,0xcc,0x16,0xd6, 0x64}
\end{verbatim}

Description

A network application that requires TCPv6 I/O services can call one of the protocol handler services, such as \texttt{BS->LocateHandleBuffer()}, to search devices that publish an EFI TCPv6 Service Binding Protocol GUID. Such device supports the EFI TCPv6 Protocol and may be available for use.

After a successful call to the \texttt{EFI_TCP6_SERVICE_BINDING_PROTOCOL.CreateChild()} function, the newly created child EFI TCPv6 Protocol driver is in an un-configured state; it is not ready to do any operation except \texttt{Poll()} send and receive data packets until configured.
Every successful call to the `EFI_TCP6_SERVICE_BINDING_PROTOCOL.CreateChild()` function must be matched with a call to the `EFI_TCP6_SERVICE_BINDING_PROTOCOL.DestroyChild()` function to release the protocol driver.

### 28.2.2 TCPv6 Protocol

#### EFI_TCP6_PROTOCOL

**Summary**

The EFI TCPv6 Protocol provides services to send and receive data stream.

**GUID**

```c
#define EFI_TCP6_PROTOCOL_GUID {0x46e44855,0xbd60,0x4ab7,
{0xab,0x0d,0xa6,0x79,0xb9,0x44,0x7d,0x77}}
```

**Protocol Interface Structure**

```c
typedef struct _EFI_TCP6_PROTOCOL {
  EFI_TCP6_GET_MODE_DATA  GetModeData;
  EFI_TCP6_CONFIGURE      Configure;
  EFI_TCP6_CONNECT        Connect;
  EFI_TCP6_ACCEPT         Accept;
  EFI_TCP6_TRANSMIT       Transmit;
  EFI_TCP6_RECEIVE        Receive;
  EFI_TCP6_CLOSE          Close;
  EFI_TCP6_CANCEL         Cancel;
  EFI_TCP6_POLL           Poll;
} EFI_TCP6_PROTOCOL;
```

**Parameters**

- **GetModeData**
  
  Get the current operational status. See the `GetModeData()` function description.

- **Configure**
  
  Initialize, change, or brutally reset operational settings of the EFI TCPv6 Protocol. See the `Configure()` function description.

- **Connect**
  
  Initiate the TCP three-way handshake to connect to the remote peer configured in this TCP instance. The function is a nonblocking operation. See the `Connect()` function description.

- **Accept**
  
  Listen for incoming TCP connection requests. This function is a nonblocking operation. See the `Accept()` function description.
Transmit

Queue outgoing data to the transmit queue. This function is a nonblocking operation. See the Transmit() function description.

Receive

Queue a receiving request token to the receive queue. This function is a nonblocking operation. See the Receive() function description.

Close

Gracefully disconnect a TCP connection follow RFC 793 or reset a TCP connection. This function is a nonblocking operation. See the Close() function description.

Cancel

Abort a pending connect, listen, transmit or receive request. See the Cancel() function description.

Poll

Poll to receive incoming data and transmit outgoing TCP segments. See the Poll() function description.

Description

The EFI_TCP6_PROTOCOL defines the EFI TCPv6 Protocol child to be used by any network drivers or applications to send or receive data stream. It can either listen on a specified port as a service or actively connect to remote peer as a client. Each instance has its own independent settings.

Note: Byte Order: In this document, all IPv6 addresses and incoming/outgoing packets are stored in network byte order. All other parameters in the functions and data structures that are defined in this document are stored in host byte order unless explicitly specified.

EFI_TCP6_PROTOCOL.GetModeData()

Summary

Get the current operational status.

Prototype

typedef

EFI_STATUS

(EIFIAPI *EFI_TCP6_GET_MODE_DATA) (  
  IN EFI_TCP6_PROTOCOL        *This,  
  OUT EFI_TCP6_CONNECTION_STATE    *Tcp6State OPTIONAL,  
  OUT EFI_TCP6_CONFIG_DATA      *Tcp6ConfigData OPTIONAL,  
  OUT EFI_IPv6_MODE_DATA       *Ip6ModeData OPTIONAL,  
  OUT EFI_MANAGED_NETWORK_CONFIG_DATA *MnpConfigData OPTIONAL,  
  OUT EFI_SIMPLE_NETWORK_MODE     *SnpModeData OPTIONAL  
);

Parameters

This

Pointer to the EFI_TCP6_PROTOCOL instance.

Tcp6State

The buffer in which the current TCP state is returned. Type EFI_TCP6_CONNECTION_STATE is defined in "Related Definitions" below.
Tcp6ConfigData The buffer in which the current TCP configuration is returned. Type EFI_TCP6_CONFIG_DATA is defined in "Related Definitions" below.

Ip6ModeData The buffer in which the current IPv6 configuration data used by the TCP instance is returned. Type EFI_IP6_MODE_DATA is defined in EFI_IP6_PROTOCOL.GetModeData().

MnpConfigData The buffer in which the current MNP configuration data used indirectly by the TCP instance is returned. Type EFI_MANAGED_NETWORK_CONFIG_DATA is defined in EFI_MANAGED_NETWORK_PROTOCOL.GetModeData().

SnpModeData The buffer in which the current SNP mode data used indirectly by the TCP instance is returned. Type EFI_SIMPLE_NETWORK_MODE is defined in the EFI_SIMPLE_NETWORK_PROTOCOL.

Description

The GetModeData() function copies the current operational settings of this EFI TCPv6 Protocol instance into user-supplied buffers. This function can also be used to retrieve the operational setting of underlying drivers such as IPv6, MNP, or SNP.

Related Definition

typedef struct {
    EFI_IPv6_ADDRESS StationAddress;
    UINT16 StationPort;
    EFI_IPv6_ADDRESS RemoteAddress;
    UINT16 RemotePort;
    BOOLEAN ActiveFlag;
} EFI_TCP6_ACCESS_POINT;

StationAddress The local IP address assigned to this TCP instance. The EFI TCPv6 driver will only deliver incoming packets whose destination addresses exactly match the IP address. Set to zero to let the underlying IPv6 driver choose a source address. If not zero it must be one of the configured IP addresses in the underlying IPv6 driver.

StationPort The local port number to which this EFI TCPv6 Protocol instance is bound. If the instance doesn't care the local port number, set StationPort to zero to use an ephemeral port.

RemoteAddress The remote IP address to which this EFI TCPv6 Protocol instance is connected. If ActiveFlag is FALSE (i.e., a passive TCPv6 instance), the instance only accepts connections from the RemoteAddress. If ActiveFlag is TRUE the instance will connect to the RemoteAddress, i.e., outgoing segments will be sent to this address and only segments from this address will be delivered to the application. When ActiveFlag is FALSE, it
can be set to zero and means that incoming connection requests from any address will be accepted.

**RemotePort**
The remote port to which this EFI TCPv6 Protocol instance connects or from which connection request will be accepted by this EFI TCPv6 Protocol instance. If **ActiveFlag** is **FALSE** it can be zero and means that incoming connection request from any port will be accepted. Its value can not be zero when **ActiveFlag** is **TRUE**.

**ActiveFlag**
Set it to **TRUE** to initiate an active open. Set it to **FALSE** to initiate a passive open to act as a server.

---

//***********************************************************
typedef struct {
    UINT32 ReceiveBufferSize;
    UINT32 SendBufferSize;
    UINT32 MaxSynBackLog;
    UINT32 ConnectionTimeout;
    UINT32 DataRetries;
    UINT32 FinTimeout;
    UINT32 TimeWaitTimeout;
    UINT32 KeepAliveProbes;
    UINT32 KeepAliveTime;
    UINT32 KeepAliveInterval;
    BOOLEAN EnableNagle;
    BOOLEAN EnableTimeStamp;
    BOOLEAN EnableWindowScaling;
    BOOLEAN EnableSelectiveAck;
    BOOLEAN EnablePathMtuDiscovery;
} EFI_TCP6_OPTION;
```

- **ReceiveBufferSize**: The size of the TCP receive buffer.
- **SendBufferSize**: The size of the TCP send buffer.
- **MaxSynBackLog**: The length of incoming connect request queue for a passive instance. When set to zero, the value is implementation specific.
- **ConnectionTimeout**: The maximum seconds a TCP instance will wait for before a TCP connection established. When set to zero, the value is implementation specific.
- **DataRetries**: The number of times TCP will attempt to retransmit a packet on an established connection. When set to zero, the value is implementation specific.
FinTimeout  How many seconds to wait in the FIN_WAIT_2 states for a final FIN flag before the TCP instance is closed. This timeout is in effective only if the application has called Close() to disconnect the connection completely. It is also called FIN_WAIT_2 timer in other implementations. When set to zero, it should be disabled because the FIN_WAIT_2 timer itself is against the standard.

TimeWaitTimeout  How many seconds to wait in TIME_WAIT state before the TCP instance is closed. The timer is disabled completely to provide a method to close the TCP connection quickly if it is set to zero. It is against the related RFC documents.

KeepAliveProbes  The maximum number of TCP keep-alive probes to send before giving up and resetting the connection if no response from the other end. Set to zero to disable keep-alive probe.

KeepAliveTime  The number of seconds a connection needs to be idle before TCP sends out periodical keep-alive probes. When set to zero, the value is implementation specific. It should be ignored if keep-alive probe is disabled.

KeepAliveInterval  The number of seconds between TCP keep-alive probes after the periodical keep-alive probe if no response. When set to zero, the value is implementation specific. It should be ignored if keep-alive probe is disabled.

EnableNagle  Set it to TRUE to enable the Nagle algorithm as defined in RFC896. Set it to FALSE to disable it.

EnableTimeStamp  Set it to TRUE to enable TCP timestamps option as defined in RFC7323. Set to FALSE to disable it.

EnableWindowScaling  Set it to TRUE to enable TCP window scale option as defined in RFC7323. Set it to FALSE to disable it.

EnableSelectiveAck  Set it to TRUE to enable selective acknowledge mechanism described in RFC 2018. Set it to FALSE to disable it. Implementation that supports SACK can optionally support DSAK as defined in RFC 2883.

EnablePathMtudiscovery  Set it to TRUE to enable path MTU discovery as defined in RFC 1191. Set to FALSE to disable it.

Option setting with digital value will be modified by driver if it is set out of the implementation specific range and an implementation specific default value will be set accordingly.
typedef struct {
    UINT8 TrafficClass;
    UINT8 HopLimit;
    EFI_TCP6_ACCESS_POINT AccessPoint;
    EFI_TCP6_OPTION *ControlOption;
} EFI_TCP6_CONFIG_DATA;

TrafficClass TrafficClass field in transmitted IPv6 packets.
HopLimit HopLimit field in transmitted IPv6 packets.
AccessPoint Used to specify TCP communication end settings for a TCP instance.
ControlOption Used to configure the advance TCP option for a connection. If set to NULL, implementation specific options for TCP connection will be used.

typedef enum {
    Tcp6StateClosed = 0,
    Tcp6StateListen = 1,
    Tcp6StateSynSent = 2,

EFI_TCP6_PROTOCOL.Configure()

Summary
Initialize or brutally reset the operational parameters for this TCP instance.

Prototype

```
typedef EFI_STATUS (EFIAPI *EFI_TCP6_CONFIGURE) (IN EFI_TCP6_PROTOCOL *This,
IN EFI_TCP6_CONFIG_DATA *Tcp6ConfigData OPTIONAL);
```

Parameters

- **This**: Pointer to the EFI_TCP6_PROTOCOL instance.
- **Tcp6ConfigData**: Pointer to the configure data to configure the instance.

Description

The **Configure()** function does the following:

- Initialize this TCP instance, i.e., initialize the communication end settings and specify active open or passive open for an instance.
- Reset this TCP instance brutally, i.e., cancel all pending asynchronous tokens, flush transmission and receiving buffer directly without informing the communication peer.

No other TCPv6 Protocol operation except **Poll()** can be executed by this instance until it is configured properly. For an active TCP instance, after a proper configuration it may call **Connect()** to initiates the three-way handshake. For a passive TCP instance, its state will transit to **Tcp6StateListen** after configuration, and **Accept()** may be called to listen the incoming TCP connection requests. If **Tcp6ConfigData** is set to **NULL**, the instance is reset. Resetting process will be done brutally, the state machine will be set to **Tcp6StateClosed** directly, the receive queue and transmit queue will be flushed, and no traffic is allowed through this instance.

**EFI_TCP6_PROTOCOL.Connect()**

**Summary**
Initiate a nonblocking TCP connection request for an active TCP instance.

**Prototype**
```c
typedef
EFI_STATUS
(EFIAPI *EFI_TCP6_CONNECT) (  
    IN EFI_TCP6_PROTOCOL *This,
    IN EFI_TCP6_CONNECTION_TOKEN *ConnectionToken
);
```

**Parameters**
- **This**: Pointer to the **EFI_TCP6_PROTOCOL** instance.
- **ConnectionToken**: Pointer to the connection token to return when the TCP three-way handshake finishes. Type **EFI_TCP6_CONNECTION_TOKEN** is defined in Related Definition below.

**Description**
The `Connect()` function will initiate an active open to the remote peer configured in current TCP instance if it is configured active. If the connection succeeds or fails due to any error, the `ConnectionToken->CompletionToken.Event` will be signaled and
ConnectionToken->CompletionToken.Status will be updated accordingly. This function can only be called for the TCP instance in Tcp6StateClosed state. The instance will transfer into Tcp6StateSynSent if the function returns EFI_SUCCESS. If TCP three-way handshake succeeds, its state will become Tcp6StateEstablished, otherwise, the state will return to Tcp6StateClosed.

Related Definitions

//***************************************************************
// EFI_TCP6_COMPLETION_TOKEN
//***************************************************************
typedef struct {
  EFI_EVENT Event;
  EFI_STATUS Status;
} EFI_TCP6_COMPLETION_TOKEN;

Event
The Event to signal after request is finished and Status field is updated by the EFI TCPv6 Protocol driver. The type of Event must be EVT_NOTIFY_SIGNAL.

Status
The result of the completed operation. EFI_NO_MEDIA. There was a media error

The EFI_TCP6_COMPLETION_TOKEN is used as a common header for various asynchronous tokens.

//***************************************************************
// EFI_TCP6_CONNECTION_TOKEN
//***************************************************************
typedef struct {
  EFI_TCP6_COMPLETION_TOKEN CompletionToken;
} EFI_TCP6_CONNECTION_TOKEN;

Status
The Status in the CompletionToken will be set to one of the following values if the active open succeeds or an unexpected error happens:

EFI_SUCCESS: The active open succeeds and the instance’s state is Tcp6StateEstablished.

EFI_CONNECTION_RESET: The connect fails because the connection is reset either by instance itself or the communication peer.

EFI_CONNECTION_REFUSED: The receiving or transmission operation fails because this connection is refused.

EFI_ABORTED: The active open is aborted.
**EFI_TIMEOUT**: The connection establishment timer expires and no more specific information is available.

**EFI_NETWORK_UNREACHABLE**: The active open fails because an ICMP network unreachable error is received.

**EFI_HOST_UNREACHABLE**: The active open fails because an ICMP host unreachable error is received.

**EFI_PROTOCOL_UNREACHABLE**: The active open fails because an ICMP protocol unreachable error is received.

**EFI_PORT_UNREACHABLE**: The connection establishment timer times out and an ICMP port unreachable error is received.

**EFI_ICMP_ERROR**: The connection establishment timer times out and some other ICMP error is received.

**EFI_DEVICE_ERROR**: An unexpected system or network error occurred.

**EFI_SECURITY_VIOLATION**: The active open was failed because of IPSec policy check.

### EFI_TCP6_PROTOCOL.Accept()

**Summary**

Listen on the passive instance to accept an incoming connection request. This is a nonblocking operation.
Prototype

typedef
EFI_STATUS
(EIFIAPI *EFI_TCP6_ACCEPT) (  
    IN EFI_TCP6_PROTOCOL *This,
    IN EFI_TCP6_LISTEN_TOKEN *ListenToken
);

Parameters

This Pointer to the EFI_TCP6_PROTOCOL instance.

ListenToken Pointer to the listen token to return when operation finishes. Type EFI_TCP6_LISTEN_TOKEN is defined in Related Definition below.

Related Definitions

//***************************************************************
// EFI_TCP6_LISTEN_TOKEN
//***************************************************************
typedef struct {
    EFI_TCP6_COMPLETION_TOKEN CompletionToken;
    EFI_HANDLE NewChildHandle;
} EFI_TCP6_LISTEN_TOKEN;

Status The Status in CompletionToken will be set to the following value if accept finishes:

EFI_SUCCESS: A remote peer has successfully established a connection to this instance. A new TCP instance has also been created for the connection.

EFI_CONNECTION_RESET: The accept fails because the connection is reset either by instance itself or communication peer.

EFI_ABORTED: The accept request has been aborted.

EFI_SECURITY_VIOLATION: The accept operation was failed because of IPSec policy check.

NewChildHandle The new TCP instance handle created for the established connection.

Description

The Accept() function initiates an asynchronous accept request to wait for an incoming connection on the passive TCP instance. If a remote peer successfully establishes a connection with this instance, a new TCP instance will be created and its handle will be returned in ListenToken->NewChildHandle. The newly created instance is configured by inheriting the passive instance’s configuration and is ready for use upon return. The new instance is in the Tcp6StateEstablished state.
The `ListenToken->CompletionToken.Event` will be signaled when a new connection is accepted, user aborts the listen or connection is reset.

This function only can be called when current TCP instance is in `Tcp6StateListen` state.

### EFI_TCP6_PROTOCOL.Transmit()

#### Summary

Queues outgoing data into the transmit queue.

#### Prototype

```c
typedef
    EFI_STATUS
    (EFIAPI *EFI_TCP6_TRANSMIT) (
        IN EFI_TCP6_PROTOCOL      *This,
        IN EFI_TCP6_IO_TOKEN      *Token
    );
```

#### Parameters

- **This**
  - Pointer to the `EFI_TCP6_PROTOCOL` instance.
- **Token**
  - Pointer to the completion token to queue to the transmit queue. Type `EFI_TCP6_IO_TOKEN` is defined in "Related Definitions" below.

#### Description

The `Transmit()` function queues a sending request to this TCP instance along with the user data.
The status of the token is updated and the event in the token will be signaled once the data is sent out or some error occurs.

Related Definitions

```c
typedef struct {
    EFI_TCP6_COMPLETION_TOKEN CompletionToken;
    union {
        EFI_TCP6_RECEIVE_DATA   *RxData;
        EFI_TCP6_TRANSMIT_DATA  *TxData;
    }
    Packet;
} EFI_TCP6_IO_TOKEN;
```

**Status**

When transmission finishes or meets any unexpected error it will be set to one of the following values:

- **EFI_SUCCESS**: The receiving or transmission operation completes successfully.
- **EFI_CONNECTION_FIN**: The receiving operation fails because the communication peer has closed the connection and there is no more data in the receive buffer of the instance.
- **EFI_CONNECTION_RESET**: The receiving or transmission operation fails because this connection is reset either by instance itself or the communication peer.
- **EFI_ABORTED**: The receiving or transmission is aborted.
- **EFI_TIMEOUT**: The transmission timer expires and no more specific information is available.
- **EFI_NETWORK_UNREACHABLE**: The transmission fails because an ICMP network unreachable error is received.
- **EFI_HOST_UNREACHABLE**: The transmission fails because an ICMP host unreachable error is received.
- **EFI_PROTOCOL_UNREACHABLE**: The transmission fails because an ICMP protocol unreachable error is received.
- **EFI_PORT_UNREACHABLE**: The transmission fails and an ICMP port unreachable error is received.
- **EFI_ICMP_ERROR**: The transmission fails and some other ICMP error is received.
- **EFI_DEVICE_ERROR**: An unexpected system or network error occurs.
- **EFI_SECURITY_VIOLATION**: The receiving or transmission operation was failed because of IPSec policy check.
When this token is used for receiving, RxData is a pointer to EFI_TCP6_RECEIVE_DATA. Type EFI_TCP6_RECEIVE_DATA is defined below.

When this token is used for transmitting, TxData is a pointer to EFI_TCP6_TRANSMIT_DATA. Type EFI_TCP6_TRANSMIT_DATA is defined below.

The EFI_TCP6_IO_TOKEN structure is used for both transmit and receive operations.

When used for transmitting, the CompletionToken.Event and TxData fields must be filled in by the user. After the transmit operation completes, the CompletionToken.Status field is updated by the instance and the Event is signaled.

When used for receiving, the CompletionToken.Event and RxData fields must be filled in by the user. After a receive operation completes, RxData and Status are updated by the instance and the Event is signaled.

```c
typedef struct {
  BOOLEAN UrgentFlag;
  UINT32 DataLength;
  UINT32 FragmentCount;
  EFI_TCP6_FRAGMENT_DATA FragmentTable[1];
} EFI_TCP6_RECEIVE_DATA;
```

UrgentFlag Whether the data is urgent. When this flag is set, the instance is in urgent mode. The implementations of this specification should follow RFC793 to process urgent data, and should NOT mix the data across the urgent point in one token.

DataLength When calling Receive() function, it is the byte counts of all FragmentBuffer in FragmentTable allocated by user. When the token is signaled by TCPv6 driver it is the length of received data in the fragments.

FragmentCount Number of fragments.

FragmentTable An array of fragment descriptors. Type EFI_TCP6_FRAGMENT_DATA is defined below.

When TCPv6 driver wants to deliver received data to the application, it will pick up the first queued receiving token, update its Token->Packet.RxData then signal the Token->CompletionToken.Event.

The FragmentBuffer in FragmentTable is allocated by the application when calling Receive() function and received data will be copied to those buffers by the driver. FragmentTable may contain multiple buffers that are NOT in the continuous
memory locations. The application should combine those buffers in the FragmentTable to process data if necessary.

```c
//****************************************************************************
// EFI_TCP6_FRAGMENT_DATA
//*****************************************************************************
typedef struct {
  UINT32 FragmentLength;
  VOID *FragmentBuffer;
} EFI_TCP6_FRAGMENT_DATA;
```

- **FragmentLength**: Length of data buffer in the fragment.
- **FragmentBuffer**: Pointer to the data buffer in the fragment.

**EFI_TCP6_FRAGMENT_DATA** allows multiple receive or transmit buffers to be specified. The purpose of this structure is to provide scattered read and write.

```c
//****************************************************************************
// EFI_TCP6_TRANSMIT_DATA
//*****************************************************************************
typedef struct {
  BOOLEAN Push;
  BOOLEAN Urgent;
  UINT32 DataLength;
  UINT32 FragmentCount;
  EFI_TCP6_FRAGMENT_DATA FragmentTable[1];
} EFI_TCP6_TRANSMIT_DATA;
```

- **Push**: If **TRUE**, data must be transmitted promptly, and the PUSH bit in the last TCP segment created will be set. If **FALSE**, data transmission may be delayed to combine with data from subsequent Transmit()s for efficiency.
- **Urgent**: The data in the fragment table are urgent and urgent point is in effect if **TRUE**. Otherwise those data are NOT considered urgent.
- **DataLength**: Length of the data in the fragments.
- **FragmentCount**: Number of fragments.
- **FragmentTable**: An array of fragment descriptors. Type **EFI_TCP6_FRAGMENT_DATA** is defined above.
The EFI TCPv6 Protocol user must fill this data structure before sending a packet. The packet may contain multiple buffers in non-continuous memory locations.

</table>
| EFI_INVALID_PARAMETER | One or more of the following are **TRUE**:  
  - This is **NULL**  
  - Token is **NULL**  
  - Token->CompletionToken.Event is **NULL**  
  - Token->Packet.TxData is **NULL**  
  - Token->Packet.FragmentCount is zero.  
  - Token->Packet.DataLength is not equal to the sum of fragment lengths. |
| EFI_ACCESS_DENIED  | One or more of the following conditions are **TRUE**:  
  - A transmit completion token with the same Token->CompletionToken.Event was already in the transmission queue.  
  - The current instance is in Tcp6StateClosed state.  
  - The current instance is a passive one and it is in Tcp6StateListen state.  
  - User has called **Close()** to disconnect this connection. |
| EFI_NOT_READY      | The completion token could not be queued because the transmit queue is full. |
| EFI_OUT_OF_RESOURCES | Could not queue the transmit data because of resource shortage. |
| EFI_NETWORK_UNREACHABLE | There is no route to the destination network or address. |
| EFI_NO_MEDIA       | There was a media error.                                                    |

### EFI_TCP6_PROTOCOL.Receive()

**Summary**

Places an asynchronous receive request into the receiving queue.

**Prototype**

```c
typedef
EFI_STATUS
(EIFIAPI *EFI_TCP6_RECEIVE) (  
  IN EFI_TCP6_PROTOCOL     *This,
  IN EFI_TCP6_IO_TOKEN     *Token
 );
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>This</td>
<td>Pointer to the EFI_TCP6_PROTOCOL instance.</td>
</tr>
<tr>
<td>Token</td>
<td>Pointer to a token that is associated with the receive data descriptor. Type EFI_TCP6_IO_TOKEN is defined in EFI_TCP6_PROTOCOL.Transmit().</td>
</tr>
</tbody>
</table>

Description

The Receive() function places a completion token into the receive packet queue. This function is always asynchronous. The caller must allocate the Token->CompletionToken.Event and the FragmentBuffer used to receive data. The caller also must fill the DataLength which represents the whole length of all FragmentBuffer. When the receive operation completes, the EFI TCPv6 Protocol driver updates the Token->CompletionToken.Status and Token->Packet.RxData fields and the Token->CompletionToken.Event is signaled. If got data the data and its length will be copied into the FragmentTable, at the same time the full length of received data will be recorded in the DataLength fields. Providing a proper notification function and context for the event will enable the user to receive the notification and receiving status. That notification function is guaranteed to not be re-entered.

Status Codes Returned

</table>
| EFI_INVALID_PARAMETER | One or more of the following conditions is TRUE:  
  • This is NULL.  
  • Token is NULL.  
  • Token->CompletionToken.Event is NULL.  
  • Token->Packet.RxData is NULL.  
  • Token->Packet.RxData->DataLength is 0.  
  • The Token->Packet.RxData->DataLength is not the sum of all FragmentBuffer length in FragmentTable. |
| EFI_OUT_OF_RESOURCES | The receive completion token could not be queued due to a lack of system resources (usually memory). |
| EFI_DEVICE_ERROR | An unexpected system or network error occurred. The EFI TCPv6 Protocol instance has been reset to startup defaults. |
| EFI_ACCESS_DENIED | One or more of the following conditions is TRUE:  
  • A receive completion token with the same Token->CompletionToken.Event was already in the receive queue.  
  • The current instance is in Tcp6StateClosed state.  
  • The current instance is a passive one and it is in Tcp6StateListen state.  
  • User has called Close() to disconnect this connection. |
EFI_TCP6_PROTOCOL.Close()

Summary
Disconnecting a TCP connection gracefully or reset a TCP connection. This function is a nonblocking operation.

Prototype
```c
typedef EFI_STATUS (EFIAPI *EFI_TCP6_CLOSE)(
    IN EFI_TCP6_PROTOCOL *This,
    IN EFI_TCP6_CLOSE_TOKEN *CloseToken);
```

Parameters
- **This**: Pointer to the EFI_TCP6_PROTOCOL instance.
- **CloseToken**: Pointer to the close token to return when operation finishes. Type EFI_TCP6_CLOSE_TOKEN is defined in Related Definition below.

Related Definitions
```c
//***************************************************************
// EFI_TCP6_CLOSE_TOKEN
//***************************************************************
typedef struct {
    EFI_TCP6_COMPLETION_TOKEN CompletionToken;
    BOOLEAN AbortOnClose;
} EFI_TCP6_CLOSE_TOKEN;
```

Status
When close finishes or meets any unexpected error it will be set to one of the following values:
- **EFI_SUCCESS**: The close operation completes successfully.
- **EFI_ABORTED**: User called configure with NULL without close stopping.
- **EFI_SECURITY_VIOLATION**: The close operation was failed because of IPSec policy check
- **EFI_CONNECTION_FIN**: The communication peer has closed the connection and there is no any buffered data in the receive buffer of this instance.
- **EFI_NOT_READY**: The receive request could not be queued because the receive queue is full.
- **EFI_NO_MEDIA**: There was a media error.

AbortOnClose
Abort the TCP connection on close instead of the standard TCP close process when it is set to **TRUE**. This option can be used to satisfy a fast disconnect.
**Description**

Initiate an asynchronous close token to TCP driver. After `Close()` is called, any buffered transmission data will be sent by TCP driver and the current instance will have a graceful close working flow described as RFC 793 if `AbortOnClose` is set to `FALSE`, otherwise, a rest packet will be sent by TCP driver to fast disconnect this connection. When the close operation completes successfully the TCP instance is in `Tcp6StateClosed` state, all pending asynchronous operations are signaled and any buffers used for TCP network traffic are flushed.

**EFI_TCP6_PROTOCOL.Cancel()**

**Summary**

Abort an asynchronous connection, listen, transmission or receive request.

**Prototype**

```c
typedef EFI_STATUS
(EFI_API *EFI_TCP6_CANCEL)(
    IN EFI_TCP6_PROTOCOL   *This,
    IN EFI_TCP6_COMPLETION_TOKEN  *Token  OPTIONAL
);
```

**Parameters**

- **This** Pointer to the `EFI_TCP6_PROTOCOL` instance.
- **Token** Pointer to a token that has been issued by `EFI_TCP6_PROTOCOL.Connect()`, `EFI_TCP6_PROTOCOL.Accept()`, `EFI_TCP6_PROTOCOL.Transmit()` or `EFI_TCP6_PROTOCOL.Receive()`. If `NULL`, all pending tokens issued by above four functions will be aborted. Type
EFI_TCP6_COMPLETION_TOKEN is defined in EFI_TCP6_PROTOCOL.Connect().

Description
The Cancel() function aborts a pending connection, listen, transmit or receive request. If Token is not NULL and the token is in the connection, listen, transmission or receive queue when it is being cancelled, its Token->Status will be set to EFI_ABORTED and then Token->Event will be signaled. If the token is not in one of the queues, which usually means that the asynchronous operation has completed, EFI_NOT_FOUND is returned. If Token is NULL all asynchronous token issued by Connect(), Accept(), Transmit() and Receive() will be aborted.

Status Codes Returned

</table>

EFI_TCP6_PROTOCOL.Poll()

Summary
Poll to receive incoming data and transmit outgoing segments.

Prototype
typedef
EFI_STATUS
(EFI_API *EFI_TCP6_POLL) ( |
    IN EFI_TCP6_PROTOCOL   *This |
);

Parameters
This Pointer to the EFI_TCP6_PROTOCOL instance.

Description
The Poll() function increases the rate that data is moved between the network and application and can be called when the TCP instance is created successfully. Its use is optional.

In some implementations, the periodical timer in the MNP driver may not poll the underlying communications device fast enough to avoid drop packets. Drivers and applications that are experiencing packet loss should try calling the Poll() function in a high frequency.

28.3 EFI IPv4 Protocol

This section defines the EFI IPv4 (Internet Protocol version 4) Protocol interface. It is split into the following three main sections:

- EFI IPv4 Service Binding Protocol
- EFI IPv4 Variable
- EFI IPv4 Protocol

The EFI IPv4 Protocol provides basic network IPv4 packet I/O services, which includes support for a subset of the Internet Control Message Protocol (ICMP) and may include support for the Internet Group Management Protocol (IGMP).

The EFI IPv4 Protocol supports IPv4 classless IP addressing, and deprecates the original IPv4 classful IP addressing. Please see links to the following RFC documents at http://uefi.org/uefi:

1. RFC 1122 — “Requirements for Internet Hosts -- Communication Layers”
2. RFC 4632 — “Classless Inter-domain Routing (CIDR): The Internet Address Assignment and Aggregation Plan”
3. RFC 3021 — “Using 31-Bit Prefixes on IPv4 Point-to-Point Links”

28.3.1 IP4 Service Binding Protocol

**EFI_IP4_SERVICE_BINDING_PROTOCOL**

Summary

The EFI IPv4 Service Binding Protocol is used to locate communication devices that are supported by an EFI IPv4 Protocol driver and to create and destroy instances of the EFI IPv4 Protocol child protocol driver that can use the underlying communications device.

GUID

```c
#define EFI_IP4_SERVICE_BINDING_PROTOCOL_GUID
{0xc51711e7,0xb4bf,0x404a,
 {0xbf,0xb8,0x0a,0x04,0x8e,0xf1,0xff,0xe4}}
```

Description

A network application that requires basic IPv4 I/O services can use one of the protocol handler services, such as `BS->LocateHandleBuffer()`, to search for devices that publish an EFI IPv4 Service Binding Protocol GUID. Each device with a
published EFI IPv4 Service Binding Protocol GUID supports the EFI IPv4 Protocol and may be available for use.

After a successful call to the `EFI_IP4_SERVICE_BINDING_PROTOCOL.CreateChild()` function, the newly created child EFI IPv4 Protocol driver is in an unconfigured state; it is not ready to send and receive data packets.

Before a network application terminates execution, every successful call to the `EFI_IP4_SERVICE_BINDING_PROTOCOL.CreateChild()` function must be matched with a call to the `EFI_IP4_SERVICE_BINDING_PROTOCOL.DestroyChild()` function.

### 28.3.2 IP4 Protocol

**EFI_IP4_PROTOCOL**

**Summary**

The EFI IPv4 Protocol implements a simple packet-oriented interface that can be used by drivers, daemons, and applications to transmit and receive network packets.

**GUID**

```c
#define EFI_IP4_PROTOCOL_GUID \
{0x41d94cd2,0x35b6,0x455a,\ 
{0x82,0x58,0xd4,0xe5,0x13,0x34,0xaa,0xdd}
```

**Protocol Interface Structure**

```c
typedef struct _EFI_IP4_PROTOCOL {
  EFI_IP4_GET_MODE_DATA   GetModeData;
  EFI_IP4_CONFIGURE       Configure;
  EFI_IP4_GROUPS          Groups;
  EFI_IP4_ROUTES          Routes;
  EFI_IP4_TRANSMIT        Transmit;
  EFI_IP4_RECEIVE         Receive;
  EFI_IP4_CANCEL          Cancel;
  EFI_IP4_POLL            Poll;
} EFI_IP4_PROTOCOL;
```

**Parameters**

- **GetModeData**
  Gets the current operational settings for this instance of the EFI IPv4 Protocol driver. See the `GetModeData()` function description.

- **Configure**
  Changes or resets the operational settings for the EFI IPv4 Protocol. See the `Configure()` function description.

- **Groups**
  Joins and leaves multicast groups. See the `Groups()` function description.

- **Routes**
  Adds and deletes routing table entries. See the `Routes()` function description.
Transmit  Places outgoing data packets into the transmit queue. See the \texttt{Transmit()} function description.

Receive  Places a receiving request into the receiving queue. See the \texttt{Receive()} function description.

Cancel  Aborts a pending transmit or receive request. See the \texttt{Cancel()} function description.

Poll  Polls for incoming data packets and processes outgoing data packets. See the \texttt{Poll()} function description.

\textbf{Description}

The \texttt{EFI\_IP4\_PROTOCOL} defines a set of simple IPv4, ICMPv4, and IGMPv4 services that can be used by any network protocol driver, daemon, or application to transmit and receive IPv4 data packets.

\textbf{Note:} All the IPv4 addresses that are described in \texttt{EFI\_IP4\_PROTOCOL} are stored in network byte order. Both incoming and outgoing IP packets are also in network byte order. All other parameters that are defined in functions or data structures are stored in host byte order.

\texttt{EFI\_IP4\_PROTOCOL}.GetModeData()

\textbf{Summary}

Gets the current operational settings for this instance of the EFI IPv4 Protocol driver.

\textbf{Prototype}

\begin{verbatim}
typedef EFI_STATUS
(EFI_API *EFI_IP4_GET_MODE_DATA) (    
    IN EFI_IP4_PROTOCOL *This,
    OUT EFI_IP4_MODE_DATA *Ip4ModeData OPTIONAL,
    OUT EFI_MANAGED_NETWORK_CONFIG_DATA *MnpConfigData OPTIONAL,
    OUT EFI_SIMPLE_NETWORK_MODE *SnpData OPTIONAL
    );
\end{verbatim}

\textbf{Parameters}

\begin{itemize}
    \item \texttt{This} Pointer to the \texttt{EFI\_IP4\_PROTOCOL} instance.
    \item \texttt{Ip4ModeData} Pointer to the EFI IPv4 Protocol mode data structure. Type \texttt{EFI\_IP4\_MODE\_DATA} is defined in "Related Definitions" below.
    \item \texttt{MnpConfigData} Pointer to the managed network configuration data structure. Type \texttt{EFI\_MANAGED\_NETWORK\_CONFIG\_DATA} is defined in \texttt{EFI\_MANAGED\_NETWORK\_PROTOCOL}.\texttt{GetModeData()}.\n    \item \texttt{SnpData} Pointer to the simple network mode data structure. Type \texttt{EFI\_SIMPLE\_NETWORK\_MODE} is defined in the \texttt{EFI\_SIMPLE\_NETWORK\_PROTOCOL}.
**Description**

The `GetModeData()` function returns the current operational mode data for this driver instance. The data fields in `EFI_IP4_MODE_DATA` are read only. This function is used optionally to retrieve the operational mode data of underlying networks or drivers.

**Related Definitions**

```c
typedef struct {  
  BOOLEAN    IsStarted;  
  UINT32     MaxPacketSize;  
  EFI_IP4_CONFIG_DATA ConfigData;  
  BOOLEAN    IsConfigured;  
  UINT32     GroupCount;  
  EFI_IPv4_ADDRESS *GroupTable;  
  UINT32     RouteCount;  
  EFI_IP4_ROUTE_TABLE *RouteTable;  
  UINT32     IcmpTypeCount;  
  EFI_IP4_ICMP_TYPE *IcmpTypeList;  
} EFI_IP4_MODE_DATA;
```

- **IsStarted**: Set to `TRUE` after this EFI IPv4 Protocol instance has been successfully configured with operational parameters by calling the `Configure()` interface when EFI IPv4 Protocol instance is stopped. All other fields in this structure are undefined until this field is `TRUE`. Set to `FALSE` when the instance's operational parameter has been reset.

- **MaxPacketSize**: The maximum packet size, in bytes, of the packet which the upper layer driver could feed.

- **ConfigData**: Current configuration settings. Undefined until `IsStarted` is `TRUE`. Type `EFI_IP4_CONFIG_DATA` is defined below.

- **IsConfigured**: Set to `TRUE` when the EFI IPv4 Protocol instance has a station address and subnet mask. If it is using the default address, the default address has been acquired. Set to `FALSE` when the EFI IPv4 Protocol driver is not configured.

- **GroupCount**: Number of joined multicast groups. Undefined until `IsConfigured` is `TRUE`.

- **GroupTable**: List of joined multicast group addresses. Undefined until `IsConfigured` is `TRUE`.

- **RouteCount**: Number of entries in the routing table. Undefined until `IsConfigured` is `TRUE`. 

RouteTable          Routing table entries. Undefined until IsConfigured is TRUE. Type EFI_IP4_ROUTE_TABLE is defined below.
IcmpTypeCount       Number of entries in the supported ICMP types list.
IcmpTypeList        Array of ICMP types and codes that are supported by this EFI IPv4 Protocol driver. Type EFI_IP4_ICMP_TYPE is defined below.

The EFI_IP4_MODE_DATA structure describes the operational state of this IPv4 interface.

//******************************************************************************************
// EFI_IP4_CONFIG_DATA
//******************************************************************************************
typedef struct {
    UINT8     DefaultProtocol;
    BOOLEAN   AcceptAnyProtocol;
    BOOLEAN   AcceptIcmpErrors;
    BOOLEAN   AcceptBroadcast;
    BOOLEAN   AcceptPromiscuous;
    BOOLEAN   UseDefaultAddress;
    EFI_IPv4_ADDRESS  StationAddress;
    EFI_IPv4_ADDRESS  SubnetMask;
    UINT8     TypeOfService;
    UINT8     TimeToLive;
    BOOLEAN   DoNotFragment;
    BOOLEAN   RawData;
    UINT32    ReceiveTimeout;
    UINT32    TransmitTimeout;
} EFI_IP4_CONFIG_DATA;

DefaultProtocol     The default IPv4 protocol packets to send and receive. Ignored when AcceptPromiscuous is TRUE. An updated list of protocol numbers can be found at “Links to UEFI-Related Documents” (http://uefi.org/uefi) under the heading “IANA Assigned Internet Protocol Numbers list”.
AcceptAnyProtocol   Set to TRUE to receive all IPv4 packets that get through the receive filters. Set to FALSE to receive only the DefaultProtocol IPv4 packets that get through the receive filters. Ignored when AcceptPromiscuous is TRUE.
AcceptIcmpErrors    Set to TRUE to receive ICMP error report packets. Ignored when AcceptPromiscuous or AcceptAnyProtocol is TRUE.
AcceptBroadcast     Set to TRUE to receive broadcast IPv4 packets. Ignored when AcceptPromiscuous is TRUE. Set to FALSE to stop receiving broadcast IPv4 packets.
<table>
<thead>
<tr>

</tr>
</tbody>
</table>

The **EFI_IP4_CONFIG_DATA** structure is used to report and change IPv4 session parameters.
typedef struct {
    EFI_IPv4_ADDRESS SubnetAddress;
    EFI_IPv4_ADDRESS SubnetMask;
    EFI_IPv4_ADDRESS GatewayAddress;
} EFI_IP4_ROUTE_TABLE;

SubnetAddress  The subnet address to be routed.
SubnetMask     The subnet mask. If (DestinationAddress & SubnetMask == SubnetAddress), then the packet is to be directed to the GatewayAddress.
GatewayAddress The IPv4 address of the gateway that redirects packets to this subnet. If the IPv4 address is 0.0.0.0, then packets to this subnet are not redirected.

EFI_IP4_ROUTE_TABLE is the entry structure that is used in routing tables.

typedef struct {
    UINT8     Type;
    UINT8     Code;
} EFI_IP4_ICMP_TYPE

Type         The type of ICMP message. See RFC 792 and RFC 950.
Code         The code of the ICMP message, which further describes the different ICMP message formats under the same Type. See RFC 792 and RFC 950.

EFI_IP4_ICMP_TYPE is used to describe those ICMP messages that are supported by this EFI IPv4 Protocol driver.

EFI_IP4_PROTOCOL.Configure()

Summary
Assigns an IPv4 address and subnet mask to this EFI IPv4 Protocol driver instance.

Prototype

typedef
    EFI_STATUS
    (EFIAPI *EFI_IP4_CONFIGURE) (
        IN EFI_IP4_PROTOCOL *This,
        IN EFI_IP4_CONFIG_DATA *IpConfigData OPTIONAL
    );

Parameters
This Pointer to the EFI_IP4_PROTOCOL instance.
IpConfigData Pointer to the EFI IPv4 Protocol configuration data structure. Type EFI_IP4_CONFIG_DATA is defined in EFI_IP4_PROTOCOL.GetModeData().

Description
The Configure() function is used to set, change, or reset the operational parameters and filter settings for this EFI IPv4 Protocol instance. Until these parameters have been set, no network traffic can be sent or received by this instance. Once the parameters have been reset (by calling this function with IpConfigData set to NULL), no more traffic can be sent or received until these parameters have been set again. Each EFI IPv4 Protocol instance can be started and stopped independently of each other by enabling or disabling their receive filter settings with the Configure() function.

When IpConfigData.UseDefaultAddress is set to FALSE, the new station address will be appended as an alias address into the addresses list in the EFI IPv4 Protocol driver. While set to TRUE, Configure() will trigger the EFI_IP4_CONFIG2_PROTOCOL to retrieve the default IPv4 address if it is not available yet. Clients could frequently call GetModeData() to check the status to ensure that the default IPv4 address is ready.

If operational parameters are reset or changed, any pending transmit and receive requests will be cancelled. Their completion token status will be set to EFI_ABORTED and their events will be signaled.

EFI_IP4_PROTOCOL.Groups()

Summary
Joins and leaves multicast groups.

Prototype

typedef
EFI_STATUS
(EIFIAPI *EFI_IP4_GROUPS) (  
    IN EFI_IP4_PROTOCOL *This,
    IN BOOLEAN          JoinFlag,
    IN EFI_IPv4_ADDRESS *GroupAddress OPTIONAL);

Parameters

This Pointer to the EFI_IP4_PROTOCOL instance.

JoinFlag Set to TRUE to join the multicast group session and FALSE to leave.

GroupAddress Pointer to the IPv4 multicast address.

Description
The Groups() function is used to join and leave multicast group sessions. Joining a group will enable reception of matching multicast packets. Leaving a group will disable the multicast packet reception.

If JoinFlag is FALSE and GroupAddress is NULL, all joined groups will be left.

**EFI_IP4_PROTOCOL.Routes()**

**Summary**
Adds and deletes routing table entries.

**Prototype**

```
typedef
EFI_STATUS
(EIFIAPI *EFI_IP4_ROUTES) (  
    IN EFI_IP4_PROTOCOL *This,
    IN BOOLEAN DeleteRoute,
    IN EFI_IPv4_ADDRESS *SubnetAddress,
    IN EFI_IPv4_ADDRESS *SubnetMask,
    IN EFI_IPv4_ADDRESS *GatewayAddress
    );
```

**Parameters**

- **This** Pointer to the EFI_IP4_PROTOCOL instance.
- **DeleteRoute** Set to TRUE to delete this route from the routing table. Set to FALSE to add this route to the routing table. SubnetAddress and SubnetMask are used as the key to each route entry.
- **SubnetAddress** The address of the subnet that needs to be routed.
- **SubnetMask** The subnet mask of SubnetAddress.
- **GatewayAddress** The unicast gateway IPv4 address for this route.
**Description**

The `Routes()` function adds a route to or deletes a route from the routing table.

Routes are determined by comparing the `SubnetAddress` with the destination IPv4 address arithmetically AND-ed with the `SubnetMask`. The gateway address must be on the same subnet as the configured station address.

The default route is added with `SubnetAddress` and `SubnetMask` both set to 0.0.0.0. The default route matches all destination IPv4 addresses that do not match any other routes.

A `GatewayAddress` that is zero is a nonroute. Packets are sent to the destination IP address if it can be found in the ARP cache or on the local subnet. One automatic nonroute entry will be inserted into the routing table for outgoing packets that are addressed to a local subnet (gateway address of 0.0.0.0).

Each EFI IPv4 Protocol instance has its own independent routing table. Those EFI IPv4 Protocol instances that use the default IPv4 address will also have copies of the routing table that was provided by the `EFI_IP4_CONFIG2_PROTOCOL`, and these copies will be updated whenever the EIF IPv4 Protocol driver reconfigures its instances. As a result, client modification to the routing table will be lost.

**Note:** There is no way to set up routes to other network interface cards because each network interface card has its own independent network stack that shares information only through `EFI IPv4 variable`.

</tbody>
</table>

**EFI_IP4_PROTOCOL.Transmit()**

**Summary**

Places outgoing data packets into the transmit queue.
Prototype

typedef
    EFI_STATUS
    (EFIAPI *EFI_IP4_TRANSMIT) (  
        IN EFI_IP4_PROTOCOL *This,  
        IN EFI_IP4_COMPLETION_TOKEN *Token  
    );

Parameters

This
	Pointer to the EFI_IP4_PROTOCOL instance.

Token
	Pointer to the transmit token. Type
	EFI_IP4_COMPLETION_TOKEN is defined in “Related Definitions” below.

Description

The Transmit() function places a sending request in the transmit queue of this EFI IPv4 Protocol instance. Whenever the packet in the token is sent out or some errors occur, the event in the token will be signaled and the status is updated.

Related Definitions

    //**********************************************
    // EFI_IP4_COMPLETION_TOKEN
    //**********************************************
    typedef struct {
        EFI_EVENT Event;
        EFI_STATUS Status;
        union {
            EFI_IP4_RECEIVE_DATA *RxData;
            EFI_IP4_TRANSMIT_DATA *TxData;
        }
        Packet;
    } EFI_IP4_COMPLETION_TOKEN;

    Event
	This Event will be signaled after the Status field is updated by the EFI IPv4 Protocol driver. The type of Event must be EFI_NOTIFY_SIGNAL. The Task Priority Level (TPL) of Event must be lower than or equal to TPL_CALLBACK.

    Status
	Will be set to one of the following values:

	EFI_SUCCESS. The receive or transmit completed successfully.

	EFI_ABORTED. The receive or transmit was aborted.

	EFI_TIMEOUT. The transmit timeout expired.

	EFI_ICMP_ERROR. An ICMP error packet was received.

	EFI_DEVICE_ERROR. An unexpected system or network error occurred.

	EFI_NO_MEDIA. There was a media error
**RxData**

When this token is used for receiving, `RxData` is a pointer to the `EFI_IP4_RECEIVE_DATA`. Type `EFI_IP4_RECEIVE_DATA` is defined below.

**TxData**

When this token is used for transmitting, `TxData` is a pointer to the `EFI_IP4_TRANSMIT_DATA`. Type `EFI_IP4_TRANSMIT_DATA` is defined below.

**EFI_IP4_COMPLETION_TOKEN** structures are used for both transmit and receive operations.

When the structure is used for transmitting, the `Event` and `TxData` fields must be filled in by the EFI IPv4 Protocol client. After the transmit operation completes, EFI IPv4 Protocol updates the `Status` field and the `Event` is signaled.

When the structure is used for receiving, only the `Event` field must be filled in by the EFI IPv4 Protocol client. After a packet is received, the EFI IPv4 Protocol fills in the `RxData` and `Status` fields and the `Event` is signaled. If the packet is an ICMP error message, the `Status` is set to `EFI_ICMP_ERROR`, and the packet is delivered up as usual. The protocol from the IP head in the ICMP error message is used to de-multiplex the packet.

```c
//**********************************************
// EFI_IP4_RECEIVE_DATA
//**********************************************
typedef struct {
    EFI_TIME      TimeStamp;
    EFI_EVENT     RecycleSignal;
    UINT32        HeaderLength;
    EFI_IP4_HEADER *Header;
    UINT32        OptionsLength;
    VOID          *Options;
    UINT32        DataLength;
    UINT32        FragmentCount;
    EFI_IP4_FRAGMENT_DATA FragmentTable[1];
} EFI_IP4_RECEIVE_DATA;
```

**TimeStamp**

Time when the EFI IPv4 Protocol driver accepted the packet. `TimeStamp` is zero filled if receive timestamps are disabled or unsupported.

**RecycleSignal**

After this event is signaled, the receive data structure is released and must not be referenced.

**HeaderLength**

Length of the IPv4 packet header. Zero if `ConfigData.RawData` is `TRUE`.

**Header**

Pointer to the IPv4 packet header. If the IPv4 packet was fragmented, this argument is a pointer to the header in the first fragment. `NULL` if `ConfigData.RawData` is `TRUE`. Type `EFI_IP4_HEADER` is defined below.

**OptionsLength**

Length of the IPv4 packet header options. May be zero.
Options  Pointer to the IPv4 packet header options. If the IPv4 packet was fragmented, this argument is a pointer to the options in the first fragment. May be **NULL**.

DataLength  Sum of the lengths of IPv4 packet buffers in FragmentTable. May be zero.

FragmentCount  Number of IPv4 payload (or raw) fragments. If ConfigData.RawData is **TRUE**, this count is the number of raw IPv4 fragments received so far. May be zero.

FragmentTable  Array of payload (or raw) fragment lengths and buffer pointers. If ConfigData.RawData is **TRUE**, each buffer points to a raw IPv4 fragment and thus IPv4 header and options are included in each buffer. Otherwise, IPv4 headers and options are not included in these buffers. Type **EFI_IP4_FRAGMENT_DATA** is defined below.

The EFI IPv4 Protocol receive data structure is filled in when IPv4 packets have been assembled (or when raw packets have been received). In the case of IPv4 packet assembly, the individual packet fragments are only verified and are not reorganized into a single linear buffer.

The FragmentTable contains a sorted list of zero or more packet fragment descriptors. The referenced packet fragments may not be in contiguous memory locations.

```
//****************************************************************************
// EFI_IP4_HEADER
//****************************************************************************
#pragma pack(1)
typedef struct {
    UINT8     HeaderLength:4;
    UINT8     Version:4;
    UINT8     TypeOfService;
    UINT16    TotalLength;
    UINT16    Identification;
    UINT16    Fragmentation;
    UINT8     TimeToLive;
    UINT8     Protocol;
    UINT16    Checksum;
    EFI_IPv4_ADDRESS     SourceAddress;
    EFI_IPv4_ADDRESS     DestinationAddress;
} EFI_IP4_HEADER;
#pragma pack()```

The fields in the IPv4 header structure are defined in the Internet Protocol version 4 specification, which can be found at “Links to UEFI-Related Documents” ([http://uefi.org/uefi](http://uefi.org/uefi)) under the heading “Internet Protocol version 4 Specification”.
The `EFI_IP4_FRAGMENT_DATA` structure describes the location and length of the IPv4 packet fragment to transmit or that has been received.

```c
typedef struct {
    UINT32     FragmentLength;
    VOID       *FragmentBuffer;
} EFI_IP4_FRAGMENT_DATA;
```

- **FragmentLength**: Length of fragment data. This field may not be set to zero.
- **FragmentBuffer**: Pointer to fragment data. This field may not be set to `NULL`.

The `EFI_IP4_TRANSMIT_DATA` structure describes a possibly fragmented packet to be transmitted.

```c
typedef struct {
    EFI_IPv4_ADDRESS       DestinationAddress;
    EFI_IP4.OverrideData   *OverrideData;
    UINT32                 OptionsLength;
    VOID                    *OptionsBuffer;
    UINT32                 TotalDataLength;
    UINT32                 FragmentCount;
    EFI_IP4_FRAGMENT_DATA   FragmentTable[1];
} EFI_IP4_TRANSMIT_DATA;
```

- **DestinationAddress**: The destination IPv4 address. Ignored if `RawData` is `TRUE`.
- **OverrideData**: If not `NULL`, the IPv4 transmission control override data. Ignored if `RawData` is `TRUE`. Type `EFI_IP4_OVERRIDE_DATA` is defined below.
- **OptionsLength**: Length of the IPv4 header options data. Must be zero if the IPv4 driver does not support IPv4 options. Ignored if `RawData` is `TRUE`.
- **OptionsBuffer**: Pointer to the IPv4 header options data. Ignored if `OptionsLength` is zero. Ignored if `RawData` is `TRUE`.
- **TotalDataLength**: Total length of the `FragmentTable` data to transmit.
- **FragmentCount**: Number of entries in the fragment data table.
- **FragmentTable**: Start of the fragment data table. Type `EFI_IP4_FRAGMENT_DATA` is defined above.
typedef struct {
  EFI_IPv4_ADDRESS SourceAddress;
  EFI_IPv4_ADDRESS GatewayAddress;
  UINT8 Protocol;
  UINT8 TypeOfService;
  UINT8 TimeToLive;
  BOOLEAN DoNotFragment;
} EFI_IP4_OVERRIDE_DATA;

SourceAddress Source address override.
GatewayAddress Gateway address to override the one selected from the routing table. This address must be on the same subnet as this station address. If set to 0.0.0.0, the gateway address selected from routing table will not be overridden.
Protocol Protocol type override.
TypeOfService Type-of-service override.
TimeToLive Time-to-live override.
DoNotFragment Do-not-fragment override.

The information and flags in the override data structure will override default parameters or settings for one Transmit() function call.

| EFI_NO_MEDIA          | There was a media error.                                                                                                                      |

**EFI_IP4_PROTOCOL.Receive()**

**Summary**

Places a receiving request into the receiving queue.
Prototype

```c
typedef
EFI_STATUS
(EFIAPI *EFI_IP4_RECEIVE) (
    IN EFI_IP4_PROTOCOL *This,
    IN EFI_IP4_COMPLETION_TOKEN *Token
);
```

Parameters

- **This**: Pointer to the `EFI_IP4_PROTOCOL` instance.
- **Token**: Pointer to a token that is associated with the receive data descriptor. Type `EFI_IP4_COMPLETION_TOKEN` is defined in “Related Definitions” of above `Transmit()`.

Description

The `Receive()` function places a completion token into the receive packet queue. This function is always asynchronous.

The `Token.Event` field in the completion token must be filled in by the caller and cannot be `NULL`. When the receive operation completes, the EFI IPv4 Protocol driver updates the `Token.Status` and `Token.Packet.RxData` fields and the `Token.Event` is signaled.

Status Codes Returned

EFI_IP4_PROTOCOL.Cancel()

Summary
Abort an asynchronous transmit or receive request.

Prototype

typedef
EFI_STATUS
(EFI_API *EFI_IP4_CANCEL)(
    IN EFI_IP4_PROTOCOL *This,
    IN EFI_IP4_COMPLETION_TOKEN *Token OPTIONAL
);

Parameters
This Pointer to the EFI_IP4_PROTOCOL instance.
Token Pointer to a token that has been issued by
        EFI_IP4_PROTOCOL.Transmit() or
        EFI_IP4_PROTOCOL.Receive(). If NULL, all pending tokens are
        aborted. Type EFI_IP4_COMPLETION_TOKEN is defined in
        EFI_IP4_PROTOCOL.Transmit().

Description
The Cancel() function is used to abort a pending transmit or receive request. If the token is in the
transmit or receive request queues, after calling this function, Token->Status will be set to
EFI_ABORTED and then Token->Event will be signaled. If the token is not in one of the queues, which
usually means the asynchronous operation has completed, this function will not signal the token and
EFI_NOT_FOUND is returned.

Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The asynchronous I/O request was aborted and Token.-&gt;Event was signaled. When Token is NULL, all pending requests were aborted and their events were signaled.</td>

</tr>
<tr>
<td>EFI_NOT_FOUND</td>
<td>When Token is not NULL, the asynchronous I/O request was not found in the transmit or receive queue. It has either completed or was not issued by Transmit() and Receive().</td>
</tr>
</tbody>
</table>

EFI_IP4_PROTOCOL.Poll()

Summary
Polls for incoming data packets and processes outgoing data packets.
Prototype

```c
typedef EFI_STATUS
  (EFIAPI *EFI_IP4_POLL) (
    IN EFI_IP4_PROTOCOL *This
  );
```

Parameters

- **This**: Pointer to the `EFI_IP4_PROTOCOL` instance.

Description

The `Poll()` function polls for incoming data packets and processes outgoing data packets. Network drivers and applications can call the `EFI_IP4_PROTOCOL.Poll()` function to increase the rate that data packets are moved between the communications device and the transmit and receive queues.

In some systems the periodic timer event may not poll the underlying communications device fast enough to transmit and/or receive all data packets without missing incoming packets or dropping outgoing packets. Drivers and applications that are experiencing packet loss should try calling the `EFI_IP4_PROTOCOL.Poll()` function more often.

Status Codes Returned

<table>
<thead>
<tr>

28.4 EFI IPv4 Configuration Protocol

This section provides a detailed description of the EFI IPv4 Configuration Protocol.

**IMPORTANT NOTICE**: The `EFI_IP4_CONFIG_PROTOCOL` has been replaced with the new `EFI_IP4_CONFIG2_PROTOCOL`.

- All new designs based on this specification should exclusively use `EFI_IP4_CONFIG2_PROTOCOL`.
- The `EFI_IP4_CONFIG_PROTOCOL` will be removed in the next revision of this specification.

**EFI_IP4_CONFIG_PROTOCOL**

**IMPORTANT NOTICE**: The `EFI_IP4_CONFIG_PROTOCOL` has been replaced with the new `EFI_IP4_CONFIG2_PROTOCOL`.

- All new designs based on this specification should exclusively use `EFI_IP4_CONFIG2_PROTOCOL`.
- The `EFI_IP4_CONFIG_PROTOCOL` will be removed in the next revision of this specification.
Summary
The **EFI_IP4_CONFIG_PROTOCOL** driver performs platform- and policy-dependent configuration for the EFI IPv4 Protocol driver.

GUID
```
#define EFI_IP4_CONFIG_PROTOCOL_GUID \
{0x3b95aa31,0x3793,0x434b,\ 
{0x86,0x67,0xc8,0x07,0x08,0x92,0xe0,0x5e}}
```

Protocol Interface Structure
```
typedef struct _EFI_IP4_CONFIG_PROTOCOL {
  EFI_IP4_CONFIG_START   Start;
  EFI_IP4_CONFIG_STOP    Stop;
  EFI_IP4_CONFIG_GET_DATA GetData;
} EFI_IP4_CONFIG_PROTOCOL;
```

Parameters
- **Start** Starts running the configuration policy for the EFI IPv4 Protocol driver. See the `Start()` function description.
- **Stop** Stops running the configuration policy for the EFI IPv4 Protocol driver. See the `Stop()` function description.
- **GetData** Returns the default configuration data (if any) for the EFI IPv4 Protocol driver. See the `GetData()` function description.

Description
In an effort to keep platform policy code out of the EFI IPv4 Protocol driver, the **EFI_IP4_CONFIG_PROTOCOL** driver will be used as the central repository of any platform- and policy-specific configuration for the EFI IPv4 Protocol driver.

An EFI IPv4 Configuration Protocol interface will be installed on each communications device handle that is managed by the platform setup policy. The driver that is responsible for creating EFI IPv4 variable must open the EFI IPv4 Configuration Protocol driver interface **BY_DRIVER|EXCLUSIVE**.

An example of a configuration policy decision for the EFI IPv4 Protocol driver would be to use a static IP address/subnet mask pair on the platform management network interface and then use dynamic IP addresses that are configured by DHCP on the remaining network interfaces.

**EFI_IP4_CONFIG_PROTOCOL.Start()**

**IMPORTANT NOTICE:** The **EFI_IP4_CONFIG_PROTOCOL** has been replaced with the new **EFI_IP4_CONFIG2_PROTOCOL**.

- All new designs based on this specification should exclusively use **EFI_IP4_CONFIG2_PROTOCOL**.
- The **EFI_IP4_CONFIG_PROTOCOL** will be removed in the next revision of this specification.

Summary
Starts running the configuration policy for the EFI IPv4 Protocol driver.
Prototype

```c
typedef EFI_STATUS (EFI_API *EFI_IP4_CONFIG_START) (
    IN EFI_IP4_CONFIG_PROTOCOL *This,
    IN EFI_EVENT DoneEvent,
    IN EFI_EVENT ReconfigEvent
    );
```

Parameters

- **This**: Pointer to the **EFI_IP4_CONFIG_PROTOCOL** instance.
- **DoneEvent**: Event that will be signaled when the EFI IPv4 Protocol driver configuration policy completes execution. This event must be of type **EVT_NOTIFY_SIGNAL**.
- **ReconfigEvent**: Event that will be signaled when the EFI IPv4 Protocol driver configuration needs to be updated. This event must be of type **EVT_NOTIFY_SIGNAL**.

Description

The **Start()** function is called to determine and to begin the platform configuration policy by the EFI IPv4 Protocol driver. This determination may be as simple as returning **EFI_UNSUPPORTED** if there is no EFI IPv4 Protocol driver configuration policy. It may be as involved as loading some defaults from nonvolatile storage, downloading dynamic data from a DHCP server, and checking permissions with a site policy server.

Starting the configuration policy is just the beginning. It may finish almost instantly or it may take several minutes before it fails to retrieve configuration information from one or more servers. Once the policy is started, drivers should use the **DoneEvent** parameter to determine when the configuration policy has completed. **EFI_IP4_CONFIG_PROTOCOL.GetData()** must then be called to determine if the configuration succeeded or failed.

Until the configuration completes successfully, EFI IPv4 Protocol driver instances that are attempting to use default configurations must return **EFI_NO_MAPPING**.

Once the configuration is complete, the EFI IPv4 Configuration Protocol driver signals **DoneEvent**. The configuration may need to be updated in the future, however; in this case, the EFI IPv4 Configuration Protocol driver must signal **ReconfigEvent**, and all EFI IPv4 Protocol driver instances that are using default configurations must return **EFI_NO_MAPPING** until the configuration policy has been rerun.
Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>

<td>An unexpected system error or network error occurred.</td>
</tr>
<tr>
<td>EFI_UNSUPPORTED</td>
<td>This interface does not support the EFI IPv4 Protocol driver configuration.</td>
</tr>
</tbody>
</table>

**EFI_IP4_CONFIG_PROTOCOL.Stop()**

**IMPORTANT NOTICE:** The **EFI_IP4_CONFIG_PROTOCOL** has been replaced with the new **EFI_IP4_CONFIG2_PROTOCOL**.

- All new designs based on this specification should exclusively use **EFI_IP4_CONFIG2_PROTOCOL**.
- The **EFI_IP4_CONFIG_PROTOCOL** will be removed in the next revision of this specification.

**Summary**

Stops running the configuration policy for the EFI IPv4 Protocol driver.

**Prototype**

```c
typedef EFI_STATUS (EFIAPI *EFI_IP4_CONFIG_STOP) (
    IN EFI_IP4_CONFIG_PROTOCOL *This
);
```

**Parameters**

- **This** Pointer to the **EFI_IP4_CONFIG_PROTOCOL** instance.

**Description**

The **Stop()** function stops the configuration policy for the EFI IPv4 Protocol driver. All configuration data will be lost after calling **Stop()**.
Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The configuration policy for the EFI IPv4 Protocol driver has been stopped.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>This is <strong>NULL</strong>.</td>
</tr>
<tr>
<td>EFI_NOT_STARTED</td>
<td>The configuration policy for the EFI IPv4 Protocol driver was not started.</td>
</tr>
</tbody>
</table>

**EFI_IP4_CONFIG_PROTOCOL.GetData()**

**IMPORTANT NOTICE:** The **EFI_IP4_CONFIG_PROTOCOL** has been replaced with the new **EFI_IP4_CONFIG2_PROTOCOL**.

- All new designs based on this specification should exclusively use **EFI_IP4_CONFIG2_PROTOCOL**.
- The **EFI_IP4_CONFIG_PROTOCOL** will be removed in the next revision of this specification.

**Summary**

Returns the default configuration data (if any) for the EFI IPv4 Protocol driver.

**Prototype**

```c
typedef EFI_STATUS
    (EFIAPIC *EFI_IP4_CONFIG_GET_DATA) (
        IN EFI_IP4_CONFIG_PROTOCOL *This,
        IN OUT UINTN *IpConfigDataSize,
        OUT EFI_IP4_IPCONFIG_DATA *IpConfigData OPTIONAL
    );
```

**Parameters**

- **This**
  - Pointer to the **EFI_IP4_CONFIG_PROTOCOL** instance.
- **IpConfigDataSize**
  - On input, the size of the IpConfigData buffer. On output, the count of bytes that were written into the IpConfigData buffer.
- **IpConfigData**
  - Pointer to the EFI IPv4 Configuration Protocol driver configuration data structure. Type **EFI_IP4_IPCONFIG_DATA** is defined in “Related Definitions” below.

**Description**

The **GetData()** function returns the current configuration data for the EFI IPv4 Protocol driver after the configuration policy has completed.
Related Definitions

```c
typedef struct {
    EFI_IPv4_ADDRESS   StationAddress;
    EFI_IPv4_ADDRESS   SubnetMask;
    UINT32             RouteTableSize;
    EFI_IP4_ROUTE_TABLE *RouteTable  OPTIONAL;
} EFI_IP4_IPCONFIG_DATA;
```

- **StationAddress**: Default station IP address, stored in network byte order.
- **SubnetMask**: Default subnet mask, stored in network byte order.
- **RouteTableSize**: Number of entries in the following `RouteTable`. May be zero.
- **RouteTable**: Default routing table data (stored in network byte order). Ignored if `RouteTableSize` is zero. Type `EFI_IP4_ROUTE_TABLE` is defined in `EFI_IP4_PROTOCOL.GetModeData()`.

**EFI_IP4_IPCONFIG_DATA** contains the minimum IPv4 configuration data that is needed to start basic network communication. The `StationAddress` and `SubnetMask` must be a valid unicast IP address and subnet mask.

If `RouteTableSize` is not zero, then `RouteTable` contains a properly formatted routing table for the `StationAddress/SubnetMask`, with the last entry in the table being the default route.

### 28.5 EFI IPv4 Configuration II Protocol

This section provides a detailed description of the EFI IPv4 Configuration II Protocol.

**EFI_IP4_CONFIG2_PROTOCOL**

#### Summary

The **EFI_IP4_CONFIG2_PROTOCOL** provides the mechanism to set and get various types of configurations for the EFI IPv4 network stack.
GUID

#define EFI_IP4_CONFIG2_PROTOCOL_GUID \
  { 0x5b446ed1, 0xe30b, 0x4faa, \ 
  { 0x87, 0x1a, 0x36, 0x54, 0xec, 0xa3, 0x60, 0x80 }}

Protocol Interface Structure

typedef struct _EFI_IP4_CONFIG2_PROTOCOL {
  EFI_IP4_CONFIG2_SET_DATA SetData;
  EFI_IP4_CONFIG2_GET_DATA GetData;
  EFI_IP4_CONFIG2_REGISTER_NOTIFY RegisterDataNotify;
  EFI_IP4_CONFIG2_UNREGISTER_NOTIFY UnregisterDataNotify;
} EFI_IP4_CONFIG2_PROTOCOL;

Parameters

SetData
Set the configuration for the EFI IPv4 network stack running on the communication device this EFI IPv4 Configuration II Protocol instance manages. See the SetData() function description.

GetData
Get the configuration for the EFI IPv4 network stack running on the communication device this EFI IPv4 Configuration II Protocol instance manages. See the GetData() function description.

RegisterDataNotify
Register an event that is to be signaled whenever a configuration process on the specified configuration data is done.

UnregisterDataNotify
Remove a previously registered event for the specified configuration data.

Description

The EFI_IP4_CONFIG2_PROTOCOL is designed to be the central repository for the common configurations and the administrator configurable settings for the EFI IPv4 network stack.

An EFI IPv4 Configuration II Protocol instance will be installed on each communication device that the EFI IPv4 network stack runs on.

Note: All the network addresses described in EFI_IP4_CONFIG2_PROTOCOL are stored in network byte order. All other parameters defined in functions or data structures are stored in host byte order.

EFI_IP4_CONFIG2_PROTOCOL.SetData()

Summary
Set the configuration for the EFI IPv4 network stack running on the communication device this EFI IPv4 Configuration II Protocol instance manages.
Prototype

```c
typedef EFI_STATUS
    (EFIAPI *EFI_IP4_CONFIG2_SET_DATA) (  
    IN EFI_IP4_CONFIG2_PROTOCOL  *This,
    IN EFI_IP4_CONFIG2_DATA_TYPE  DataType,
    IN UINTN                     DataSize,
    IN VOID                      *Data
    );
```

Parameters

- **This**
  - Pointer to the `EFI_IP4_CONFIG2_PROTOCOL` instance.
- **DataType**
  - The type of data to set. Type `EFI_IP4_CONFIG2_DATA_TYPE` is defined in “Related Definitions” below.
- **DataSize**
  - Size of the buffer pointed to by `Data` in bytes.
- **Data**
  - The data buffer to set. The type of the data buffer is associated with the `DataType`. The various types are defined in “Related Definitions” below.

Description

This function is used to set the configuration data of type `DataType` for the EFI IPv4 network stack running on the communication device this EFI IPv4 Configuration II Protocol instance manages. The successfully configured data is valid after system reset or power-off.

The `DataSize` is used to calculate the count of structure instances in the `Data` for some `DataType` that multiple structure instances are allowed.

This function is always non-blocking. When setting some type of configuration data, an asynchronous process is invoked to check the correctness of the data, such as doing address conflict detection on the manually set local IPv4 address. `EFI_NOT_READY` is returned immediately to indicate that such an asynchronous process is invoked and the process is not finished yet. The caller willing to get the result of the asynchronous process is required to call `RegisterDataNotify()` to register an event on the specified configuration data. Once the event is signaled, the caller can call `GetData()` to get back the configuration data in order to know the result. For other types of configuration data that do not require an asynchronous configuration process, the result of the operation is immediately returned.
Related Definitions

//***********************************************************
// EFI_IP4_CONFIG2_DATA_TYPE
//***********************************************************
typedef enum {
    Ip4Config2DataTypeInterfaceInfo,
    Ip4Config2DataTypePolicy,
    Ip4Config2DataTypeManualAddress,
    Ip4Config2DataTypeGateway,
    Ip4Config2DataTypeDnsServer,
    Ip4Config2DataTypeMaximum
} EFI_IP4_CONFIG2_DATA_TYPE;

Ip4Config2DataTypeInterfaceInfo
The interface information of the communication device this EFI IPv4 Configuration II Protocol instance manages. This type of data is read only. The corresponding Data is of type EFI_IP4_CONFIG2_INTERFACE_INFO.

Ip4Config2DataTypePolicy
The general configuration policy for the EFI IPv4 network stack running on the communication device this EFI IPv4 Configuration II Protocol instance manages. The policy will affect other configuration settings. The corresponding Data is of type EFI_IP4_CONFIG2_POLICY.

Ip4Config2DataTypeManualAddress
The station addresses set manually for the EFI IPv4 network stack. It is only configurable when the policy is Ip4Config2PolicyStatic. The corresponding Data is of type EFI_IP4_CONFIG2_MANUAL_ADDRESS. When DataSize is 0 and Data is NULL, the existing configuration is cleared from the EFI IPv4 Configuration II Protocol instance.

Ip4Config2DataTypeGateway
The gateway addresses set manually for the EFI IPv4 network stack running on the communication device this EFI IPv4 Configuration II Protocol manages. It is not configurable when the policy is Ip4Config2PolicyDhcp. The gateway addresses must be unicast IPv4 addresses. The corresponding Data is a pointer to an array of EFI_IPv4_ADDRESS instances. When DataSize is 0 and Data is NULL, the existing configuration is cleared from the EFI IPv4 Configuration II Protocol instance.
Ip4Config2DataTypeDnsServer

The DNS server list for the EFI IPv4 network stack running on the communication device this EFI IPv4 Configuration II Protocol manages. It is not configurable when the policy is Ip4Config2PolicyDhcp. The DNS server addresses must be unicast IPv4 addresses. The corresponding Data is a pointer to an array of EFI_IPv4_ADDRESS instances. When DataSize is 0 and Data is NULL, the existing configuration is cleared from the EFI IPv4 Configuration II Protocol instance.

//***********************************************************
// EFI_IP4_CONFIG2_INTERFACE_INFO related definitions
//***********************************************************
#define EFI_IP4_CONFIG2_INTERFACE_INFO_NAME_SIZE 32//

EFI_IP4_CONFIG2_INTERFACE_INFO
//***********************************************************
typedef struct {
  CHAR16     Name[EFI_IP4_CONFIG2_INTERFACE_INFO_NAME_SIZE];
  UINT8      IfType;
  UINT32     HwAddressSize;
  EFI_MAC_ADDRESS  HwAddress;
  EFI_IPv4_ADDRESS StationAddress;
  EFI_IPv4_ADDRESS SubnetMask;
  UINT32     RouteTableSize;
  EFI_IP4_ROUTE_TABLE  *RouteTable OPTIONAL;
} EFI_IP4_CONFIG2_INTERFACE_INFO;

Name     The name of the interface. It is a NULL-terminated Unicode string.
IfType    The interface type of the network interface. See RFC 1700, section “Number Hardware Type”.
HwAddressSize The size, in bytes, of the network interface's hardware address.
HwAddress  The hardware address for the network interface.
StationAddress  The station IPv4 address of this EFI IPv4 network stack.
SubnetMask   The subnet address mask that is associated with the station address.
RouteTableSize Size of the following RouteTable, in bytes. May be zero.
RouteTable   The route table of the IPv4 network stack runs on this interface. Set to NULL if RouteTableSize is zero. Type EFI_IP4_ROUTE_TABLE is defined in EFI_IP4_PROTOCOL.GetModeData().
The **EFI_IP4_CONFIG2_INTERFACE_INFO** structure describes the operational state of the interface this EFI IPv4 Configuration II Protocol instance manages. This type of data is read-only. When reading, the caller allocated buffer is used to return all of the data, i.e., the first part of the buffer is **EFI_IP4_CONFIG2_INTERFACE_INFO** and the followings are the route table if present. The caller should NOT free the buffer pointed to by **RouteTable**, and the caller is only required to free the whole buffer if the data is not needed any more.

```c
typedef enum {
    Ip4Config2PolicyStatic,
    Ip4Config2PolicyDhcp,
    Ip4Config2PolicyMax
} EFI_IP4_CONFIG2_POLICY;
```

**Ip4Config2PolicyStatic**

Under this policy, the **Ip4Config2DataTypeManualAddress**, **Ip4Config2DataTypeGateway** and **Ip4Config2DataTypeDnsServer** configuration data are required to be set manually. The EFI IPv4 Protocol will get all required configuration such as IPv4 address, subnet mask and gateway settings from the EFI IPv4 Configuration II protocol.

**Ip4Config2PolicyDhcp**

Under this policy, the **Ip4Config2DataTypeManualAddress**, **Ip4Config2DataTypeGateway** and **Ip4Config2DataTypeDnsServer** configuration data are not allowed to set via **SetData()**. All of these configurations are retrieved from DHCP server or other auto-configuration mechanism.

The **EFI_IP4_CONFIG2_POLICY** defines the general configuration policy the EFI IPv4 Configuration II Protocol supports. The default policy for a newly detected communication device is beyond the scope of this document. An implementation might leave it to platform to choose the default policy.

The configuration data of type **Ip4Config2DataTypeManualAddress**, **Ip4Config2DataTypeGateway** and **Ip4Config2DataTypeDnsServer** will be flushed if the policy is changed from **Ip4Config2PolicyStatic** to **Ip4Config2PolicyDhcp**.
```c
typedef struct {
  EFI_IPv4_ADDRESS Address;
  EFI_IPv4_ADDRESS SubnetMask;
} EFI_IP4_CONFIG2_MANUAL_ADDRESS;
```

**Address**
The IPv4 unicast address.

**SubnetMask**
The subnet mask.

The `EFI_IP4_CONFIG2_MANUAL_ADDRESS` structure is used to set the station address information for the EFI IPv4 network stack manually when the policy is `Ip4Config2PolicyStatic`.

The `EFI_IP4_CONFIG2_DATA_TYPE` includes current supported data types; this specification allows future extension to support more data types.

**EFI_IP4_CONFIG2_PROTOCOL.GetData()**

**Summary**

Get the configuration data for the EFI IPv4 network stack running on the communication device this EFI IPv4 Configuration II Protocol instance manages.
Prototype

typedef EFI_STATUS (EFIAPI *EFI_IP4_CONFIG2_GET_DATA) (IN EFI_IP4_CONFIG2_PROTOCOL *This,
IN EFI_IP4_CONFIG2_DATA_TYPE DataType,
IN OUT UINTN *DataSize,
IN VOID *Data OPTIONAL);

Parameters

This Pointer to the EFI_IP4_CONFIG2_PROTOCOL instance.
DataType The type of data to get. Type EFI_IP4_CONFIG2_DATA_TYPE is defined in EFI_IP4_CONFIG2_PROTOCOL.SetData().
DataSize On input, in bytes, the size of Data. On output, in bytes, the size of buffer required to store the specified configuration data.
Data The data buffer in which the configuration data is returned. The type of the data buffer is associated with the DataType. Ignored if DataSize is 0. The various types are defined in EFI_IP4_CONFIG2_PROTOCOL.SetData().

Description

This function returns the configuration data of type DataType for the EFI IPv4 network stack running on the communication device this EFI IPv4 Configuration II Protocol instance manages.

The caller is responsible for allocating the buffer used to return the specified configuration data and the required size will be returned to the caller if the size of the buffer is too small.

EFI_NOT_READY is returned if the specified configuration data is not ready due to an already in progress asynchronous configuration process. The caller can call RegisterDataNotify() to register an event on the specified configuration data. Once the asynchronous configuration process is finished, the event will be signaled and a subsequent GetData() call will return the specified configuration data.

EFI_IP4_CONFIG2_PROTOCOL.RegisterDataNotify ()

Summary
Register an event that is to be signaled whenever a configuration process on the specified configuration data is done.

Prototype
typedef
EFI_STATUS
(EIFIAPIF *EFI_IP4_CONFIG2_REGISTER_NOTIFY) (
    IN EFI_IP4_CONFIG2_PROTOCOL *This,
    IN EFI_IP4_CONFIG2_DATA_TYPE DataType,
    IN EFI_EVENT Event
);

Parameters
This Pointer to the EFI_IP4_CONFIG2_PROTOCOL instance.
DataType The type of data to unregister the event for. Type EFI_IP4_CONFIG2_DATA_TYPE is defined in EFI_IP4_CONFIG2_PROTOCOL.SetData().
Event The event to register.

Description
This function registers an event that is to be signaled whenever a configuration process on the specified configuration data is done. An event can be registered for different DataType simultaneously and the caller is responsible for determining which type of configuration data causes the signaling of the event in such case.

Status Codes Returned

<table>
<thead>
<tr>

<tr>
<td>EFI_ACCESS_DENIED</td>
<td>The Event is already registered for the DataType.</td>
</tr>
</tbody>
</table>

EFI_IP4_CONFIG2_PROTOCOL.UnregisterDataNotify ()

Summary
Remove a previously registered event for the specified configuration data.
Prototype

```c
typedef
EFI_STATUS
(EFIAPI *EFI_IP4_CONFIG2_UNREGISTER_NOTIFY) (
    IN EFI_IP4_CONFIG2_PROTOCOL *This,
    IN EFI_IP4_CONFIG2_DATA_TYPE DataType,
    IN EFI_EVENT Event
);
```

Parameters

- **This** - Pointer to the `EFI_IP4_CONFIG2_PROTOCOL` instance.
- **DataType** - The type of data to remove the previously registered event for. Type `EFI_IP4_CONFIG2_DATA_TYPE` is defined in `EFI_IP4_CONFIG2_PROTOCOL.SetData()`.
- **Event** - The event to unregister.

Description

This function removes a previously registered event for the specified configuration data.

Status Codes Returned

<table>

### 28.6 EFI IPv6 Protocol

This section defines the EFI IPv6 (Internet Protocol version 6) Protocol interface. It is split into the following three main sections:

- EFI IPv6 Service Binding Protocol
- EFI IPv6 Variable
- EFI IPv6 Protocol

The EFI IPv6 Protocol provides basic network IPv6 packet I/O services, which includes support for Neighbor Discovery Protocol (ND), Multicast Listener Discovery Protocol (MLD), and a subset of the Internet Control Message Protocol (ICMPv6).

#### 28.6.1 IPv6 Service Binding Protocol

**EFI_IP6_SERVICE_BINDING_PROTOCOL**

**Summary**

The EFI IPv6 Service Binding Protocol is used to locate communication devices that are supported by an EFI IPv6 Protocol driver and to create and destroy EFI IPv6 Protocol child instances of the IP6 driver that can use the underlying communications device.
GUID
#define EFI_IP6_SERVICE_BINDING_PROTOCOL_GUID _GUID \  
{0xec835dd3,0xfe0f,0x617b,\ 
{0xa6,0x21,0xb3,0x50,0xc3,0xe1,0x33,0x88}}

Description
A network application that requires basic IPv6 I/O services can use one of the protocol handler services, such as BS->LocateHandleBuffer(), to search for devices that publish an EFI IPv6 Service Binding Protocol GUID. Each device with a published EFI IPv6 Service Binding Protocol GUID supports the EFI IPv6 Protocol and may be available for use.

After a successful call to the EFI_IP6_SERVICE_BINDING_PROTOCOL.CreateChild() function, the newly created child EFI IPv6 Protocol driver is in an un-configured state; it is not ready to send and receive data packets.

Before a network application terminates execution, every successful call to the EFI_IP6_SERVICE_BINDING_PROTOCOL.CreateChild() function must be matched with a call to the EFI_IP6_SERVICE_BINDING_PROTOCOL.DestroyChild() function.

28.6.2 IPv6 Protocol

EFI_IP6_PROTOCOL

Summary
The EFI IPv6 Protocol implements a simple packet-oriented interface that can be used by drivers, daemons, and applications to transmit and receive network packets.

GUID
#define EFI_IP6_PROTOCOL_GUID \ 
{0x2c8759d5,0x5c2d,0x66ef,\ 
{0x92,0x5f,0xb6,0x6c,0x10,0x19,0x57,0xe2}}

Protocol Interface Structure
typedef struct _EFI_IP6_PROTOCOL 
{ 
  EFI_IP6_GET_MODE_DATA GetModeData;
  EFI_IP6_CONFIGURE Config;
  EFI_IP6_GROUPS Groups;
  EFI_IP6_ROUTES Routes;
  EFI_IP6_NEIGHBORS Neighbors;
  EFI_IP6_TRANSMIT Transmit;
  EFI_IP6_RECEIVE Receive;
  EFI_IP6_CANCEL Cancel;
  EFI_IP6_POLL Poll;
} EFI_IP6_PROTOCOL;
Parameters

GetModeData  Gets the current operational settings for this instance of the EFI IPv6 Protocol driver. See the GetModeData() function description.

Configure  Changes or resets the operational settings for the EFI IPv6 Protocol. See the Configure() function description.

Groups  Joins and leaves multicast groups. See the Groups() function description.

Routes  Adds and deletes routing table entries. See the Routes() function description.

Neighbors  Adds and deletes neighbor cache entries. See the Neighbors() function description.

Transmit  Places outgoing data packets into the transmit queue. See the Transmit() function description.

Receive  Places a receiving request into the receiving queue. See the Receive() function description.

Cancel  Aborts a pending transmit or receive request. See the Cancel() function description.

Poll  Polls for incoming data packets and processes outgoing data packets. See the Poll() function description.

Description

The EFI_IP6_PROTOCOL defines a set of simple IPv6, and ICMPv6 services that can be used by any network protocol driver, daemon, or application to transmit and receive IPv6 data packets.

Note:  Byte Order: All the IPv6 addresses that are described in EFI_IP6_PROTOCOL are stored in network byte order. Both incoming and outgoing IP packets are also in network byte order. All other parameters that are defined in functions or data structures are stored in host byte order.

EFI_IP6_PROTOCOL.GetModeData()

Summary

Gets the current operational settings for this instance of the EFI IPv6 Protocol driver.

Prototype

typedef
EFI_STATUS
(EFIAPI *EFI_IP6_GET_MODE_DATA) (  
    IN EFI_IP6_PROTOCOL *This,  
    OUT EFI_IP6_MODE_DATA *Ip6ModeData OPTIONAL,  
    OUT EFI_MANAGED_NETWORK_CONFIG_DATA *MnpConfigData OPTIONAL,  
    OUT EFI_SIMPLE_NETWORK_MODE *SnpModeData OPTIONAL  
);
Parameters

- **This**: Pointer to the `EFI_IP6_PROTOCOL` instance.
- **Ip6ModeData**: Pointer to the EFI IPv6 Protocol mode data structure. Type `EFI_IP6_MODE_DATA` is defined in "Related Definitions" below.
- **MnpConfigData**: Pointer to the managed network configuration data structure. Type `EFI_MANAGED_NETWORK_CONFIG_DATA` is defined in `EFI_MANAGED_NETWORK_PROTOCOL.GetModeData()`.
- **SnpData**: Pointer to the simple network mode data structure. Type `EFI_SIMPLE_NETWORK_MODE` is defined in the `EFI_SIMPLE_NETWORK_PROTOCOL`.

Description

The `GetModeData()` function returns the current operational mode data for this driver instance. The data fields in `EFI_IP6_MODE_DATA` are read only. This function is used optionally to retrieve the operational mode data of underlying networks or drivers.

Related Definitions

```
//**********************************************
// EFI_IP6_MODE_DATA
//**********************************************
typedef struct {
  BOOLEAN IsStarted;
  UINT32 MaxPacketSize;
  EFI_IP6_CONFIG_DATA ConfigData;
  BOOLEAN IsConfigured;
  UINT32 AddressCount;
  EFI_IP6_ADDRESS_INFO *AddressList;
  UINT32 GroupCount;
  EFI_IP6_ADDRESS *GroupTable;
  UINT32 RouteCount;
  EFI_IP6_ROUTE_TABLE *RouteTable;

  EFI_IP6_ADDRESS_INFO *PrefixTable;
  UINT32 IcmpTypeCount;
  EFI_IP6_ICMP_TYPE *IcmpTypeList;
} EFI_IP6_MODE_DATA;
```

- **IsStarted**: Set to `TRUE` after this EFI IPv6 Protocol instance is started. All other fields in this structure are undefined until this field is `TRUE`. Set to `FALSE` when the EFI IPv6 Protocol instance is stopped.

- **MaxPacketSize**: The maximum packet size, in bytes, of the packet which the upper layer driver could feed.
**ConfigData**

Current configuration settings. Undefined until `IsStarted` is `TRUE`. Type `EFI_IP6_CONFIG_DATA` is defined below.

**IsConfigured**

Set to `TRUE` when the EFI IPv6 Protocol instance is configured. The instance is configured when it has a station address and corresponding prefix length.

Set to `FALSE` when the EFI IPv6 Protocol instance is not configured.

**AddressCount**

Number of configured IPv6 addresses on this interface.

**AddressList**

List of currently configured IPv6 addresses and corresponding prefix lengths assigned to this interface. It is caller's responsibility to free this buffer. Type `EFI_IP6_ADDRESS_INFO` is defined below.

**GroupCount**

Number of joined multicast groups. Undefined until `IsConfigured` is `TRUE`.

**GroupTable**

List of joined multicast group addresses. It is caller's responsibility to free this buffer. Undefined until `IsConfigured` is `TRUE`.

**RouteCount**

Number of entries in the routing table. Undefined until `IsConfigured` is `TRUE`.

**RouteTable**

Routing table entries. It is caller's responsibility to free this buffer. Type `EFI_IP6_ROUTE_TABLE` is defined below.

**NeighborCount**

Number of entries in the neighbor cache. Undefined until `IsConfigured` is `TRUE`.

**NeighborCache**

Neighbor cache entries. It is caller's responsibility to free this buffer. Undefined until `IsConfigured` is `TRUE`. Type `EFI_IP6_NEIGHBOR_CACHE` is defined below.

**PrefixCount**

Number of entries in the prefix table. Undefined until `IsConfigured` is `TRUE`.

**PrefixTable**

On-link Prefix table entries. It is caller's responsibility to free this buffer. Undefined until `IsConfigured` is `TRUE`. Type `EFI_IP6_ADDRESS_INFO` is defined below.

**IcmpTypeCount**

Number of entries in the supported ICMP types list.

**IcmpTypeList**

Array of ICMP types and codes that are supported by this EFI IPv6 Protocol driver. It is caller's responsibility to free this buffer. Type `EFI_IP6_ICMP_TYPE` is defined below.
typedef struct {
    UINT8    DefaultProtocol;
    BOOLEAN  AcceptAnyProtocol;
    BOOLEAN  AcceptIcmpErrors;
    BOOLEAN  AcceptPromiscuous;
    EFI_IPv6_ADDRESS DestinationAddress;
    EFI_IPv6_ADDRESS StationAddress;
    UINT8    TrafficClass;
    UINT8    HopLimit;
    UINT32   FlowLabel;
    UINT32   ReceiveTimeout;
    UINT32   TransmitTimeout;
} EFI_IP6_CONFIG_DATA;

DefaultProtocol For the IPv6 packet to send and receive, this is the default value of the 'Next Header' field in the last IPv6 extension header or in the IPv6 header if there are no extension headers. Ignored when AcceptPromiscuous is TRUE. An updated list of protocol numbers can be found at “Links to UEFI-Related Documents” (http://uefi.org/uefi) under the heading “IANA Assigned Internet Protocol Numbers”. The following values are illegal: 0 (IPv6 Hop-by-Hop Option), 1(ICMP), 2(IGMP), 41(IPv6), 43(Routing Header for IPv6), 44(Fragment Header for IPv6), 59(No Next Header for IPv6), 60(Destination Options for IPv6), 124(ISIS over IPv4).

AcceptAnyProtocol Set to TRUE to receive all IPv6 packets that get through the receive filters. Set to FALSE to receive only the DefaultProtocol IPv6 packets that get through the receive filters. Ignored when AcceptPromiscuous is TRUE.

AcceptIcmpErrors Set to TRUE to receive ICMP error report packets. Ignored when AcceptPromiscuous or AcceptAnyProtocol is TRUE.

AcceptPromiscuous Set to TRUE to receive all IPv6 packets that are sent to any hardware address or any protocol address. Set to FALSE to stop receiving all promiscuous IPv6 packets.

DestinationAddress The destination address of the packets that will be transmitted. Ignored if it is unspecified.

StationAddress The station IPv6 address that will be assigned to this EFI IPv6 Protocol instance. This field can be set and changed only when the EFI IPv6 driver is transitioning from the stopped to the started states. If the StationAddress is specified, the EFI IPv6 Protocol driver will deliver only incoming IPv6 packets
whose destination matches this IPv6 address exactly. The StationAddress is required to be one of currently configured IPv6 addresses. An address containing all zeroes is also accepted as a special case. Under this situation, the IPv6 driver is responsible for binding a source address to this EFI IPv6 protocol instance according to the source address selection algorithm. Only incoming packets destined to the selected address will be delivered to the user. And the selected station address can be retrieved through later GetModeData() call. If no address is available for selecting, EFI_NO_MAPPING will be returned, and the station address will only be successfully bound to this EFI IPv6 protocol instance after IP6ModeData.IsConfigured changed to TRUE.

TrafficClass TrafficClass field in transmitted IPv6 packets. Default value is zero.
HopLimit HopLimit field in transmitted IPv6 packets.
FlowLabel FlowLabel field in transmitted IPv6 packets. Default value is zero.
ReceiveTimeout The timer timeout value (number of microseconds) for the receive timeout event to be associated with each assembled packet. Zero means do not drop assembled packets.
TransmitTimeout The timer timeout value (number of microseconds) for the transmit timeout event to be associated with each outgoing packet. Zero means do not drop outgoing packets.

The EFI_IP6_CONFIG_DATA structure is used to report and change IPv6 session parameters.

```
//******************************************************
// EFI_IP6_ADDRESS_INFO  //******************************************************
typedef struct {
    EFI_IPv6_ADDRESS Address;
    UINT8 PrefixLength;
} EFI_IP6_ADDRESS_INFO;
```

Address The IPv6 address.
PrefixLength The length of the prefix associated with the Address.
//EFI_IP6_ROUTE_TABLE
typedef struct {
    EFI_IPv6_ADDRESS Gateway;
    EFI_IPv6_ADDRESS Destination;
    UINT8 PrefixLength;
} EFI_IP6_ROUTE_TABLE;

Gateway
The IPv6 address of the gateway to be used as the next hop for packets to this prefix. If the IPv6 address is all zeros, then the prefix is on-link.

Destination
The destination prefix to be routed.

PrefixLength
The length of the prefix associated with the Destination.

EFI_IP6_ROUTE_TABLE is the entry structure that is used in routing tables.

//EFI_IP6_NEIGHBOR_CACHE
typedef struct {
    EFI_IPv6_ADDRESS Neighbor;
    EFI_MAC_ADDRESS LinkAddress;
    EFI_IP6_NEIGHBOR_STATE State;
} EFI_IP6_NEIGHBOR_CACHE;

Neighbor
The on-link unicast / anycast IP address of the neighbor.

LinkAddress
Link-layer address of the neighbor.

State
State of this neighbor cache entry.

EFI_IP6_NEIGHBOR_CACHE is the entry structure that is used in neighbor cache. It records a set of entries about individual neighbors to which traffic has been sent recently.
typedef enum {
    EfiNeighborInComplete,
    EfiNeighborReachable,
    EfiNeighborStale,
    EfiNeighborDelay,
    EfiNeighborProbe
} EFI_IP6_NEIGHBOR_STATE;

Following is a description of the fields in the above enumeration.

EfiNeighborInComplete Address resolution is being performed on this entry. Specially, Neighbor Solicitation has been sent to the solicited-node multicast address of the target, but corresponding Neighbor Advertisement has not been received.

EfiNeighborReachable Positive confirmation was received that the forward path to the neighbor was functioning properly.

EfiNeighborStale Reachable Time has elapsed since the last positive confirmation was received. In this state, the forward path to the neighbor was functioning properly.

EfiNeighborDelay This state is an optimization that gives upper-layer protocols additional time to provide reachability confirmation.

EfiNeighborProbe A reachability confirmation is actively sought by retransmitting Neighbor Solicitations every RetransTimer milliseconds until a reachability confirmation is received.

typedef struct {
    UINT8 Type;
    UINT8 Code;
} EFI_IP6_ICMP_TYPE;

The type of ICMP message. See “Links to UEFI-Related Documents” (http://uefi.org/uefi) under the heading “Internet Control Message Protocol Version 6 (ICMPv6) Parameters” for the complete list of ICMP message type.

The code of the ICMP message, which further describes the different ICMP message formats under the same Type. See “Links to UEFI-Related Documents” (http://uefi.org/uefi) under the heading “Internet Control Message Protocol
EFI_IP6_ICMP_TYPE is used to describe those ICMP messages that are supported by this EFI IPv6 Protocol driver.

**EFI_IP6_PROTOCOL.Configure()**

**Summary**
Assign IPv6 address and other configuration parameter to this EFI IPv6 Protocol driver instance.

**Prototype**

```c
typedef EFI_STATUS (EFIAPI *EFI_IP6_CONFIGURE) (
    IN EFI_IP6_PROTOCOL *This,
    IN EFI_IP6_CONFIG_DATA *Ip6ConfigData OPTIONAL);
```

**Parameters**

- **This**
  Pointer to the **EFI_IP6_PROTOCOL** instance.
- **Ip6ConfigData**
  Pointer to the EFI IPv6 Protocol configuration data structure.
  Type **EFI_IP6_CONFIG_DATA** is defined in **EFI_IP6_PROTOCOL.GetModeData()**.

**Description**

The **Configure()** function is used to set, change, or reset the operational parameters and filter settings for this EFI IPv6 Protocol instance. Until these parameters have been set, no network traffic can be sent or received by this instance. Once the parameters have been reset (by calling this function with **Ip6ConfigData** set to **NULL**), no more traffic can be sent or received until these parameters have been set again. Each EFI IPv6 Protocol instance can be started and stopped independently of each other by enabling or disabling their receive filter settings with the **Configure()** function.

If **Ip6ConfigData.StationAddress** is a valid non-zero IPv6 unicast address, it is required to be one of the currently configured IPv6 addresses list in the EFI IPv6 drivers, or else **EFI_INVALID_PARAMETER** will be returned. If **Ip6ConfigData.StationAddress** is unspecified, the IPv6 driver will bind a source address according to the source address selection algorithm. Clients could frequently call **GetModeData()** to check get currently configured IPv6 address list in the EFI IPv6 driver. If both
Ip6ConfigData.StationAddress and Ip6ConfigData.Destination are unspecified, when transmitting the packet afterwards, the source address filled in each outgoing IPv6 packet is decided based on the destination of this packet.

If operational parameters are reset or changed, any pending transmit and receive requests will be cancelled. Their completion token status will be set to EFI_ABORTED and their events will be signaled.

**Status Codes Returned**

**EFI_IP6_PROTOCOL.Groups()**

**Summary**

Joins and leaves multicast groups.

**Prototype**

```c
typedef EFI_STATUS
  (EFIAPI *EFI_IP6_GROUPS) (  
    IN EFI_IP6_PROTOCOL *This,  
    IN BOOLEAN JoinFlag,  
    IN EFI_IPv6_ADDRESS *GroupAddress OPTIONAL  
  );
```

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>This</td>
<td>Pointer to the EFI_IP6_PROTOCOL instance.</td>
</tr>
<tr>
<td>JoinFlag</td>
<td>Set to TRUE to join the multicast group session and FALSE to leave.</td>
</tr>
<tr>
<td>GroupAddress</td>
<td>Pointer to the IPv6 multicast address.</td>
</tr>
</tbody>
</table>
Description
The Groups() function is used to join and leave multicast group sessions. Joining a group will enable reception of matching multicast packets. Leaving a group will disable reception of matching multicast packets. Source-Specific Multicast isn’t required to be supported.

If JoinFlag is FALSE and GroupAddress is NULL, all joined groups will be left.

EFI_IP6_PROTOCOL.Routes()

Summary
Adds and deletes routing table entries.

Prototype

typedef EFI_STATUS
    (EFIAPI *EFI_IP6_ROUTES) ( 
    IN EFI_IP6_PROTOCOL *This, 
    IN BOOLEAN DeleteRoute, 
    IN EFI_IPv6_ADDRESS *Destination OPTIONAL, 
    IN UINT8 PrefixLength, 
    IN EFI_IPv6_ADDRESS *GatewayAddress OPTIONAL )
;

Parameters
This Pointer to the EFI_IP6_PROTOCOL instance.
DeleteRoute

Set to **TRUE** to delete this route from the routing table. Set to **FALSE** to add this route to the routing table. **Destination**, **PrefixLength** and **Gateway** are used as the key to each route entry.

**Destination**

The address prefix of the subnet that needs to be routed.

**PrefixLength**

The prefix length of **Destination**. Ignored if **Destination** is **NULL**.

**GatewayAddress**

The unicast gateway IPv6 address for this route.

**Description**

The **Routes()** function adds a route to or deletes a route from the routing table.

Routes are determined by comparing the leftmost **PrefixLength** bits of **Destination** with the destination IPv6 address arithmetically. The gateway address must be on the same subnet as the configured station address.

The default route is added with **Destination** and **PrefixLegth** both set to all zeros. The default route matches all destination IPv6 addresses that do not match any other routes.

All EFI IPv6 Protocol instances share a routing table.

**Note:** There is no way to set up routes to other network interface cards because each network interface card has its own independent network stack that shares information only through the EFI IPv6 variable.

**EFI_IP6_PROTOCOL.Neighbors()**

**Summary**

Add or delete Neighbor cache entries.
Prototype

typedef
EFI_STATUS
(EIFIAPI *EFI_IP6_NEIGHBORS) (
   IN EFI_IP6_PROTOCOL     *This,
   IN BOOLEAN              DeleteFlag,
   IN EFI_IPv6_ADDRESS     *TargetIp6Address,
   IN EFI_MAC_ADDRESS      *TargetLinkAddress OPTIONAL
   IN UINT32               Timeout,
   IN BOOLEAN              Override
);

Parameters

This Pointer to the EFI_IP6_PROTOCOL instance.
DeleteFlag Set to TRUE to delete the specified cache entry, set to FALSE to add (or update, if it already exists and Override is TRUE) the specified cache entry. TargetIp6Address is used as the key to find the requested cache entry.
TargetIp6Address Pointer to Target IPv6 address.
TargetLinkAddress Pointer to link-layer address of the target. Ignored if NULL.
Timeout Time in 100-ns units that this entry will remain in the neighbor cache, it will be deleted after Timeout. A value of zero means that the entry is permanent. A non-zero value means that the entry is dynamic.
Override If TRUE, the cached link-layer address of the matching entry will be overridden and updated; if FALSE, EFI_ACCESS_DENIED will be returned if a corresponding cache entry already existed.

Description

The Neighbors() function is used to add, update, or delete an entry from neighbor cache.
IPv6 neighbor cache entries are typically inserted and updated by the network protocol driver as network traffic is processed. Most neighbor cache entries will time out and be deleted if the network traffic stops. Neighbor cache entries that were inserted by Neighbors() may be static (will not timeout) or dynamic (will time out).

The implementation should follow the neighbor cache timeout mechanism which is defined in RFC4861. The default neighbor cache timeout value should be tuned for the expected network environment.

</table>

**EFI_IP6_PROTOCOL.Transmit()**

**Summary**
Places outgoing data packets into the transmit queue.

**Prototype**
```c
typedef EFI_STATUS (EFIAPI *EFI_IP6_TRANSMIT) (  
    IN EFI_IP6_PROTOCOL *This,  
    IN EFI_IP6_COMPLETION_TOKEN *Token  
);
```

**Parameters**
- **This** Pointer to the EFI_IP6_PROTOCOL instance.
- **Token** Pointer to the transmit token. Type EFI_IP6_COMPLETION_TOKEN is defined in "Related Definitions" below.

**Description**
The Transmit() function places a sending request in the transmit queue of this EFI IPv6 Protocol instance. Whenever the packet in the token is sent out or some errors occur, the event in the token will be signaled and the status is updated.
Related Definitions

```c
typedef struct {
    EFI_EVENT Event;
    EFI_STATUS Status;
    union {
        EFI_IP6_RECEIVE_DATA *RxData;
        EFI_IP6_TRANSMIT_DATA *TxData;
    }
} EFI_IP6_COMPLETION_TOKEN;
```

**Event**
This event will be signaled after the Status field is updated by the EFI IPv6 Protocol driver. The type of Event must be `EFI_NOTIFY_SIGNAL`.

**Status**
Will be set to one of the following values:

- **EFI_SUCCESS**: The receive or transmit completed successfully.
- **EFI_ABORTED**: The receive or transmit was aborted.
- **EFI_TIMEOUT**: The transmit timeout expired.
- **EFI_ICMP_ERROR**: An ICMP error packet was received.
- **EFI_DEVICE_ERROR**: An unexpected system or network error occurred.
- **EFI_SECURITY_VIOLATION**: The transmit or receive was failed because of an IPsec policy check.

**RxData**
When the Token is used for receiving, RxData is a pointer to the `EFI_IP6_RECEIVE_DATA`. Type `EFI_IP6_RECEIVE_DATA` is defined below.

**TxData**
When the Token is used for transmitting, TxData is a pointer to the `EFI_IP6_TRANSMIT_DATA`. Type `EFI_IP6_TRANSMIT_DATA` is defined below.

`EFI_IP6_COMPLETION_TOKEN` structures are used for both transmit and receive operations.

When the structure is used for transmitting, the Event and TxData fields must be filled in by the EFI IPv6 Protocol client. After the transmit operation completes, the EFI IPv6 Protocol driver updates the Status field and the Event is signaled.

When the structure is used for receiving, only the Event field must be filled in by the EFI IPv6 Protocol client. After a packet is received, the EFI IPv6 Protocol driver fills in the RxData and Status fields and the Event is signaled.
typedef struct _EFI_IP6_RECEIVE_DATA {
    EFI_TIME TimeStamp;
    EFI_EVENT RecycleSignal;
    UINT32 HeaderLength;
    EFI_IP6_HEADER *Header;
    UINT32 DataLength;
    UINT32 FragmentCount;
    EFI_IP6_FRAGMENT_DATA FragmentTable[1];
} EFI_IP6_RECEIVE_DATA;

TimeStamp
    Time when the EFI IPv6 Protocol driver accepted the packet. TimeStamp is zero filled if timestamps are disabled or unsupported.

RecycleSignal
    After this event is signaled, the receive data structure is released and must not be referenced.

HeaderLength
    Length of the IPv6 packet headers, including both the IPv6 header and any extension headers.

Header
    Pointer to the IPv6 packet header. If the IPv6 packet was fragmented, this argument is a pointer to the header in the first fragment. Type EFI_IP6_HEADER is defined below.

DataLength
    Sum of the lengths of IPv6 packet buffers in FragmentTable. May be zero.

FragmentCount
    Number of IPv6 payload fragments. May be zero.

FragmentTable
    Array of payload fragment lengths and buffer pointers. Type EFI_IP6_FRAGMENT_DATA is defined below.

The EFI IPv6 Protocol receive data structure is filled in when IPv6 packets have been assembled. In the case of IPv6 packet assembly, the individual packet fragments are only verified and are not reorganized into a single linear buffer.

The FragmentTable contains a sorted list of zero or more packet fragment descriptors. The referenced packet fragments may not be in contiguous memory locations.
The fields in the IPv6 header structure are defined in the Internet Protocol version 6 specification, which can be found at “Links to UEFI-Related Documents” (http://uefi.org/uefi) under the heading “Internet Protocol version 6 Specification”.

The **EFI_IP6_FRAGMENT_DATA** structure describes the location and length of the IPv6 packet fragment to transmit or that has been received.
typedef struct _EFI_IP6_TRANSMIT_DATA {
    EFI_IPv6_ADDRESS DestinationAddress;
    EFI_IP6_OVERRIDE_DATA  *OverrideData;
    UINT32 ExtHdrsLength;
    VOID *ExtHdrs;
    UINT8 NextHeader;
    UINT32 DataLength;
    UINT32 FragmentCount;
    EFI_IP6_FRAGMENT_DATA FragmentTable[1];
} EFI_IP6_TRANSMIT_DATA;

DestinationAddress The destination IPv6 address. If it is unspecified, ConfigData.DestinationAddress will be used instead.
OverrideData If not NULL, the IPv6 transmission control override data. Type EFI_IP6_OVERRIDE_DATA is defined below.
ExtHdrsLength Total length in byte of the IPv6 extension headers specified in ExtHdrs
ExtHdrs Pointer to the IPv6 extension headers. The IP layer will append the required extension headers if they are not specified by ExtHdrs. Ignored if ExtHdrsLength is zero.
NextHeader The protocol of first extension header in ExtHdrs. Ignored if ExtHdrsLength is zero.
DataLength Total length in bytes of the FragmentTable data to transmit.
FragmentCount Number of entries in the fragment data table.
FragmentTable Start of the fragment data table. Type EFI_IP6_FRAGMENT_DATA is defined above.

The EFI_IP6_TRANSMIT_DATA structure describes a possibly fragmented packet to be transmitted.

typedef struct _EFI_IP6_OVERRIDE_DATA {
    UINT8 Protocol;
    UINT8 HopLimit;
    UINT32 FlowLabel;
} EFI_IP6_OVERRIDE_DATA;

Protocol Protocol type override.
HopLimit Hop-Limit override.
**FlowLabel**

Flow-Label override.

The information and flags in the override data structure will override default parameters or settings for one `Transmit()` function call.

| EFI_BAD_BUFFER_SIZE | If `Token.Packet.TxData.DataLength` is beyond the maximum that which can be described through the Fragment Offset field in Fragment header when performing fragmentation. |
| EFI_DEVICE_ERROR  | An unexpected system or network error occurred.                           |
| EFI_NO_MEDIA      | There was a media error.                                                  |
**EFI_IP6_PROTOCOL.Receive()**

**Summary**
Places a receiving request into the receiving queue.

**Prototype**

```c
typedef EFI_STATUS (EFIAPI *EFI_IP6_RECEIVE) (
    IN EFI_IP6_PROTOCOL *This,
    IN EFI_IP6_COMPLETION_TOKEN *Token
);
```

**Parameters**

- **This** Pointer to the **EFI_IP6_PROTOCOL** instance.
- **Token** Pointer to a token that is associated with the receive data descriptor. Type **EFI_IP6_COMPLETION_TOKEN** is defined in "Related Definitions" of above **Transmit()**.

**Description**

The **Receive()** function places a completion token into the receive packet queue. This function is always asynchronous.

The **Token.Event** field in the completion token must be filled in by the caller and cannot be **NULL**. When the receive operation completes, the EFI IPv6 Protocol driver updates the **Token.Status** and **Token.Packet.RxData** fields and the **Token.Event** is signaled.

EFI_IP6_PROTOCOL.Cancel()

Summary
Abort an asynchronous transmits or receive request.

Prototype

typedef
EFI_STATUS
(EIFIAPIC *EFI_IP6_CANCEL)(
    IN EFI_IP6_PROTOCOL *This,
    IN EFI_IP6_COMPLETION_TOKEN *Token OPTIONAL);

Parameters

This     Pointer to the EFI_IP6_PROTOCOL instance.
Token    Pointer to a token that has been issued by EFI_IP6_PROTOCOL .Transmit() or EFI_IP6_PROTOCOL.Receive(). If NULL, all pending tokens are aborted. Type EFI_IP6_COMPLETION_TOKEN is defined in EFI_IP6_PROTOCOL.Transmit().

Description

The Cancel() function is used to abort a pending transmit or receive request. If the token is in the transmit or receive request queues, after calling this function, Token->Status will be set to EFI_ABORTED and then Token->Event will be signaled. If the token is not in one of the queues, which usually means the asynchronous operation has completed, this function will not signal the token and EFI_NOT_FOUND is returned.

Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>

</table>
**EFI_IP6_PROTOCOL.Poll()**

**Summary**
Polls for incoming data packets and processes outgoing data packets.

**Prototype**
```c
typedef EFI_STATUS (EFIAPI *EFI_IP6_POLL) (IN EFI_IP6_PROTOCOL *This);
```

**Description**
The `Poll()` function polls for incoming data packets and processes outgoing data packets. Network drivers and applications can call the `EFI_IP6_PROTOCOL.Poll()` function to increase the rate that data packets are moved between the communications device and the transmit and receive queues.

In some systems the periodic timer event may not poll the underlying communications device fast enough to transmit and/or receive all data packets without missing incoming packets or dropping outgoing packets. Drivers and applications that are experiencing packet loss should try calling the `EFI_IP6_PROTOCOL.Poll()` function more often.

**Status Codes Returned**

**28.7 EFI IPv6 Configuration Protocol**

This section provides a detailed description of the EFI IPv6 Configuration Protocol.

**EFI_IP6_CONFIG_PROTOCOL**

**Summary**
The `EFI_IP6_CONFIG_PROTOCOL` provides the mechanism to set and get various types of configurations for the EFI IPv6 network stack.
GUID

```c
#define EFI_IP6_CONFIG_PROTOCOL_GUID \ 
{0x937fe521,0x95ae,0x4d1a,\ 
{0x89,0x29,0x48,0xbc,0xd9,0x0a,0xd3,0x1a}
```

Protocol Interface Structure

```c
typedef struct _EFI_IP6_CONFIG_PROTOCOL {
    EFI_IP6_CONFIG_SET_DATA     SetData;
    EFI_IP6_CONFIG_GET_DATA     GetData;
    EFI_IP6_CONFIG_REGISTER_NOTIF RegisterDataNotify;
    EFI_IP6_CONFIG_UNREGISTER_NOTIFY UnregisterDataNotify;
} EFI_IP6_CONFIG_PROTOCOL;
```

Parameters

- **SetData**: Set the configuration for the EFI IPv6 network stack running on the communication device this EFI IPv6 Configuration Protocol instance manages. See the `SetData()` function description.

- **GetData**: Get the configuration or register an event to monitor the change of the configuration for the EFI IPv6 network stack running on the communication device this EFI IPv6 Configuration Protocol instance manages. See the `GetData()` function description.

- **RegisterDataNotify**: Register an event that is to be signaled whenever a configuration process on the specified configuration data is done.

- **UnregisterDataNotify**: Remove a previously registered event for the specified configuration data.

Description

The `EFI_IP6_CONFIG_PROTOCOL` is designed to be the central repository for the common configurations and the administrator configurable settings for the EFI IPv6 network stack.

An EFI IPv6 Configuration Protocol instance will be installed on each communication device that the EFI IPv6 network stack runs on.

**EFI_IP6_CONFIG_PROTOCOL.SetData()**

**Summary**

Set the configuration for the EFI IPv6 network stack running on the communication device this EFI IPv6 Configuration Protocol instance manages.
Prototype

```c
typedef EFI_STATUS
    (EFIAPI *EFI_IP6_CONFIG_SET_DATA) ( 
    IN EFI_IP6_CONFIG_PROTOCOL *This,
    IN EFI_IP6_CONFIG_DATA_TYPE DataType,
    IN UINTN DataSize,
    IN VOID *Data
    );
```

Parameters

- **This**: Pointer to the `EFI_IP6_CONFIG_PROTOCOL` instance.
- **DataType**: The type of data to set. Type `EFI_IP6_CONFIG_DATA_TYPE` is defined in "Related Definitions" below.
- **DataSize**: Size of the buffer pointed to by `Data` in bytes.
- **Data**: The data buffer to set. The type of the data buffer is associated with the `DataType`. The various types are defined in "Related Definitions" below.

Description

This function is used to set the configuration data of type `DataType` for the EFI IPv6 network stack running on the communication device this EFI IPv6 Configuration Protocol instance manages.

The `DataSize` is used to calculate the count of structure instances in the `Data` for some `DataType` that multiple structure instances are allowed.

This function is always non-blocking. When setting some type of configuration data, an asynchronous process is invoked to check the correctness of the data, such as doing Duplicate Address Detection on the manually set local IPv6 addresses. `EFI_NOT_READY` is returned immediately to indicate that such an asynchronous process is invoked and the process is not finished yet. The caller willing to get the result of the asynchronous process is required to call `RegisterDataNotify()` to register an event on the specified configuration data. Once the event is signaled, the caller can call `GetData()` to get back the configuration data in order to know the result. For other types of configuration data that do not require an asynchronous configuration process, the result of the operation is immediately returned.
Related Definitions

```
//***********************************************************
// EFI_IP6_CONFIG_DATA_TYPE
//***********************************************************
typedef enum {
  Ip6ConfigDataTypeInterfaceInfo,
  Ip6ConfigDataTypeAltInterfaceId,
  Ip6ConfigDataTypePolicy,
  Ip6ConfigDataTypeDupAddrDetectTransmits,
  Ip6ConfigDataTypeManualAddress,
  Ip6ConfigDataTypeGateway,
  Ip6ConfigDataTypeDnsServer,
  Ip6ConfigDataTypeMaximum
} EFI_IP6_CONFIG_DATA_TYPE;
```

**Ip6ConfigDataTypeInterfaceInfo**
The interface information of the communication device this EFI IPv6 Configuration Protocol instance manages. This type of data is read only. The corresponding Data is of type `EFI_IP6_CONFIG_INTERFACE_INFO`.

**Ip6ConfigDataTypeAltInterfaceId**
The alternative interface ID for the communication device this EFI IPv6 Configuration Protocol instance manages if the link local IPv6 address generated from the interfaced ID based on the default source the EFI IPv6 Protocol uses is a duplicate address. The length of the interface ID is 64 bit. The corresponding Data is of type `EFI_IP6_CONFIG_INTERFACE_ID`.

**Ip6ConfigDataTypePolicy**
The general configuration policy for the EFI IPv6 network stack running on the communication device this EFI IPv6 Configuration Protocol instance manages. The policy will affect other configuration settings. The corresponding Data is of type `EFI_IP6_CONFIG_POLICY`.

**Ip6ConfigDataTypeDupAddrDetectTransmits**
The number of consecutive Neighbor Solicitation messages sent while performing Duplicate Address Detection on a tentative address. A value of zero indicates that Duplicate Address Detection will not be performed on tentative addresses. The corresponding Data is of type `EFI_IP6_CONFIG_DUP_ADDR_DETECT_TRANSMITS`.

**Ip6ConfigDataTypeManualAddress**
The station addresses set manually for the EFI IPv6 network stack. It is only configurable when the policy is `Ip6ConfigPolicyManual`. The corresponding Data is a pointer to an array of `EFI_IPv6_ADDRESS` instances. When DataSize is 0 and Data is `NULL`, the existing configuration is cleared from the EFI IPv6 Configuration Protocol instance.

**Ip6ConfigDataTypeGateway**
The gateway addresses set manually for the EFI IPv6 network stack running on the communication device this EFI IPv6 Configuration Protocol manages. It is not configurable when the policy is `Ip6ConfigPolicyAutomatic`. The gateway
addresses must be unicast IPv6 addresses. The corresponding Data is a pointer to an array of EFI_IPv6_ADDRESS instances. When dataSize is 0 and Data is NULL, the existing configuration is cleared from the EFI IPv6 Configuration Protocol instance.

Ip6ConfigDataTypeDnsServer The DNS server list for the EFI IPv6 network stack running on the communication device this EFI IPv6 Configuration Protocol manages. It is not configurable when the policy is Ip6ConfigPolicyAutomatic. The DNS server addresses must be unicast IPv6 addresses. The corresponding Data is a pointer to an array of EFI_IPv6_ADDRESS instances. When dataSize is 0 and Data is NULL, the existing configuration is cleared from the EFI IPv6 Configuration Protocol instance.

//***********************************************************
// EFI_IP6_CONFIG_INTERFACE_INFO
//***********************************************************
typedef struct {
    CHAR16 Name[32];
    UINT8 IfType;
    UINT32 HwAddressSize;
    EFI_MAC_ADDRESS HwAddress;
    UINT32 AddressInfoCount;
    EFI_IP6_ADDRESS_INFO *AddressInfo;
    UINT32 RouteCount;
    EFI_IP6_ROUTE_TABLE *RouteTable;
} EFI_IP6_CONFIG_INTERFACE_INFO;

Name The name of the interface. It is a NULL-terminated string.
IfType The interface type of the network interface. See RFC 3232, section "Number Hardware Type".
HwAddressSize The size, in bytes, of the network interface's hardware address.
HwAddress The hardware address for the network interface.
AddressInfoCount Number of EFI_IP6_ADDRESS_INFO structures pointed to by AddressInfo.
AddressInfo Pointer to an array of EFI_IP6_ADDRESS_INFO instances which contain the local IPv6 addresses and the corresponding prefix length information. Set to NULL if AddressInfoCount is zero. Type EFI_IP6_ADDRESS_INFO is defined in EFI_IP6_PROTOCOL.GetModeData().
RouteCount Number of route table entries in the following RouteTable.
RouteTable The route table of the IPv6 network stack runs on this interface. Set to NULL if RouteCount is zero. Type
EFI_IP6_ROUTE_TABLE is defined in EFI_IP6_PROTOCOL.GetModeData().

The EFI_IP6_CONFIG_INTERFACE_INFO structure describes the operational state of the interface this EFI IPv6 Configuration Protocol instance manages. This type of data is read-only. When reading, the caller allocated buffer is used to return all of the data, i.e., the first part of the buffer is EFI_IP6_CONFIG_INTERFACE_INFO and the followings are the array of EFI_IP6_ADDRESS_INFO and the route table if present. The caller should NOT free the buffer pointed to by AddressInfo or RouteTable, and the caller is only required to free the whole buffer if the data is not needed any more.

//***************************************************************************
// EFI_IP6_CONFIG_INTERFACE_ID
//***************************************************************************
typedef struct {
    UINT8 Id[8];
} EFI_IP6_CONFIG_INTERFACE_ID;

The EFI_IP6_CONFIG_INTERFACE_ID structure describes the 64-bit interface ID.

//***************************************************************************
// EFI_IP6_CONFIG_POLICY
//***************************************************************************
typedef enum {
    Ip6ConfigPolicyManual,
    Ip6ConfigPolicyAutomatic
} EFI_IP6_CONFIG_POLICY;

Ip6ConfigPolicyManual Under this policy, the
Ip6ConfigDataTypeManualAddress,
Ip6ConfigDataTypeGateway and
Ip6ConfigDataTypeDnsServer configuration data are
required to be set manually. The EFI IPv6 Protocol will get all
required configuration such as address, prefix and gateway
settings from the EFI IPv6 Configuration protocol.

Ip6ConfigPolicyAutomatic Under this policy, the
Ip6ConfigDataTypeManualAddress,
Ip6ConfigDataTypeGateway and
Ip6ConfigDataTypeDnsServer configuration data are not
allowed to set via SetData(). All of these configurations are
retrieved from some auto configuration mechanism. The EFI
IPv6 Protocol will use the IPv6 stateless address
autoconfiguration mechanism and/or the IPv6 stateful
address autoconfiguration mechanism described in the
related RFCs to get address and other configuration
information.

The EFI_IP6_CONFIG_POLICY defines the general configuration policy the EFI IPv6 Configuration
Protocol supports. The default policy for a newly detected communication device is beyond the scope of
this document. An implementation might leave it to platform to choose the default policy.
The configuration data of type `IpI6ConfigDataTypeManualAddress`, `Ip6ConfigDataTypeGateway` and `Ip6ConfigDataTypeDnsServer` will be flushed if the policy is changed from `Ip6ConfigPolicyManual` to `Ip6ConfigPolicyAutomatic`.

```c
typedef struct {  
    UINT32 DupAddrDetectTransmits;
} EFI_IP6_CONFIG_DUP_ADDR_DETECT_TRANSMITS;
```

The `EFI_IP6_CONFIG_DUP_ADDR_DETECT_TRANSMITS` structure describes the number of consecutive Neighbor Solicitation messages sent while performing Duplicate Address Detection on a tentative address. The default value for a newly detected communication device is 1.

```c
typedef struct {  
    EFI_IPv6_ADDRESS Address;
    BOOLEAN IsAnycast;
    UINT8 PrefixLength;
} EFI_IP6_CONFIG_MANUAL_ADDRESS;
```

The `EFI_IP6_CONFIG_MANUAL_ADDRESS` structure is used to set the station address information for the EFI IPv6 network stack manually when the policy is `Ip6ConfigPolicyManual`. Address represents the IPv6 unicast address. IsAnycast is set to `TRUE` if Address is anycast. PrefixLength is the length, in bits, of the prefix associated with this Address.

**EFI_IP6_CONFIG_PROTOCOL.GetData()**

**Summary**

Get the configuration data for the EFI IPv6 network stack running on the communication device this EFI IPv6 Configuration Protocol instance manages.

**Prototype**

```c
typedef
  EFI_STATUS
(EFIAPI *EFI_IP6_CONFIG_GET_DATA)(
  IN EFI_IP6_CONFIG_PROTOCOL  *This,
  IN EFI_IP6_CONFIG_DATA_TYPE Data_Type,
  IN OUT UINTN               *DataSize,
  IN VOID                    *Data OPTIONAL
);
```

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>This</td>
<td>Pointer to the EFI_IP6_CONFIG_PROTOCOL instance.</td>
</tr>
<tr>
<td>DataType</td>
<td>The type of data to get. Type EFI_IP6_CONFIG_DATA_TYPE is defined in EFI_IP6_CONFIG_PROTOCOL.SetData().</td>
</tr>
<tr>
<td>DataSize</td>
<td>On input, in bytes, the size of Data. On output, in bytes, the size of buffer required to store the specified configuration data.</td>
</tr>
</tbody>
</table>
**Data**

The data buffer in which the configuration data is returned. The type of the data buffer is associated with the `DataType`. Ignored if `DataSize` is 0. The various types are defined in `EFI_IP6_CONFIG_PROTOCOL.SetData()`.

**Description**

This function returns the configuration data of type `DataType` for the EFI IPv6 network stack running on the communication device this EFI IPv6 Configuration Protocol instance manages.

The caller is responsible for allocating the buffer used to return the specified configuration data and the required size will be returned to the caller if the size of the buffer is too small.

`EFI_NOT_READY` is returned if the specified configuration data is not ready due to an already in progress asynchronous configuration process. The caller can call ` EFI_IP6_CONFIG_PROTOCOL.RegisterDataNotify()` to register an event on the specified configuration data. Once the asynchronous configuration process is finished, the event will be signaled and a subsequent `GetData()` call will return the specified configuration data.

**Status Codes Returned**

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The specified configuration data got successfully.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>One or more of the followings are TRUE:</td>

</tbody>
</table>

**EFI_IP6_CONFIG_PROTOCOL.RegisterDataNotify()**

**Summary**

Register an event that is to be signaled whenever a configuration process on the specified configuration data is done.
Prototype

typedef
EFI_STATUS
(EIFIAPI *EFI_IP6_CONFIG_REGISTER_NOTIFY) (
    IN EFI_IP6_CONFIG_PROTOCOL  *This,
    IN EFI_IP6_CONFIG_DATA_TYPE  DataType,
    IN EFI_EVENT                Event
);

Parameters

This        Pointer to the EFI_IP6_CONFIG_PROTOCOL instance.
DataType     The type of data to unregister the event for. Type
             EFI_IP6_CONFIG_DATA_TYPE is defined in
             EFI_IP6_CONFIG_PROTOCOL.SetData().
Event        The event to register.

Description

This function registers an event that is to be signaled whenever a configuration process on the specified
configuration data is done. An event can be registered for different DataType simultaneously and the
caller is responsible for determining which type of configuration data causes the signaling of the event in
such case.

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The notification event for the specified configuration data is registered.</td>
</tr>
<tr>

<td>This is NULL or Event is NULL.</td>
</tr>
<tr>
<td>EFI_UNSUPPORTED</td>
<td>The configuration data type specified by DataType is not supported.</td>
</tr>
<tr>
<td>EFI_OUT_OF_RESOURCES</td>
<td>Required system resources could not be allocated.</td>
</tr>
<tr>
<td>EFI_ACCESS_DENIED</td>
<td>The Event is already registered for the DataType.</td>
</tr>
</tbody>
</table>

EFI_IP6_CONFIG_PROTOCOL.UnregisterDataNotify ()

Summary

Remove a previously registered event for the specified configuration data.
Prototype

typedef EFI_STATUS
(EFIAPI *EFI_IP6_CONFIG_UNREGISTER_NOTIFY) (
    IN EFI_IP6_CONFIG_PROTOCOL *This,
    IN EFI_IP6_CONFIG_DATA_TYPE DataType,
    IN EFI_EVENT Event
);

Parameters

This
Pointer to the EFI_IP6_CONFIG_PROTOCOL instance.

DataType
The type of data to remove the previously registered event for. Type EFI_IP6_CONFIG_DATA_TYPE is defined in EFI_IP6_CONFIG_PROTOCOL.SetData().

Event
The event to unregister.

Description
This function removes a previously registered event for the specified configuration data.

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The event registered for the specified configuration data is removed.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>This is NULL or Event is NULL.</td>
</tr>
<tr>
<td>EFI_NOT_FOUND</td>
<td>The Event has not been registered for the specified DataType.</td>

</tbody>
</table>

28.8 IPsec

28.8.1 IPsec Overview

IPsec is a framework of open standards that provides data confidentiality, data integrity, data authentication and replay protection between participating peers. A set of security services is provided by IPsec for traffic at the IP layer, in both the IPv4 and IPv6 environment. To the stronger, IPV6 requires IPsec support.

IPsec is documented in a series of Internet RFCs. The overall IPsec architecture and implementation are guided by “Security Architecture for the Internet Protocol”, RFC 4301.

Two different security protocols – Authentication Header (AH, described in RFC 4302) and Encapsulated Security Payload (ESP, described in RFC 4303) – are used to provide package-level security for IP datagram.

This section attempts to capture the generic configuration for an IPsec implementation in an EFI environment.
28.8.2 EFI IPsec Configuration Protocol

This section provides a detailed description of the EFI IPsec Configuration Protocol. This protocol sets and obtains the IPsec configuration information.

**EFI_IPSEC_CONFIG_PROTOCOL**

**Summary**

The `EFI_IPSEC_CONFIG_PROTOCOL` provides the mechanism to set and retrieve security and policy related information for the EFI IPsec protocol driver.

**GUID**

```c
#define EFI_IPSEC_CONFIG_PROTOCOL_GUID \
{0xce5e5929,0xc7a3,0x4602,\} \
{0xad,0x9e,0xc9,0xda,0xf9,0x4e,0xbf,0xcf}\
```

**Protocol Interface Structure**

```c
typedef struct _EFI_IPSEC_CONFIG_PROTOCOL {
  EFI_IPSEC_CONFIG_SET_DATA    SetData;
  EFI_IPSEC_CONFIG_GET_DATA    GetData;
  EFI_IPSEC_CONFIG_GET_NEXT_SELECTOR GetNextSelector;
  EFI_IPSEC_CONFIG_REGISTER_NOTIFY    RegisterDataNotify;
  EFI_IPSEC_CONFIG_UNREGISTER_NOTIFY    UnregisterDataNotify;
} EFI_IPSEC_CONFIG_PROTOCOL;
```

**Parameters**

- **SetData**: Set the configuration and control information for the EFI IPsec protocol driver. See the `SetData()` function description.
- **GetData**: Look up and retrieve the IPsec configuration data. See the `GetData()` function description.
- **GetNextSelector**: Enumerates the current IPsec configuration data entry selector. See the `GetNextSelector()` function description.
- **RegisterNotify**: Register an event that is to be signaled whenever a configuration process on the specified IPsec configuration data is done.
- **UnregisterNotify**: Remove a registered event for the specified IPsec configuration data.

**Description**

The `EFI_IPSEC_CONFIG_PROTOCOL` provides the ability to set and lookup the IPsec SAD (Security Association Database), SPD (Security Policy Database) data entry and configure the security association management protocol such as IKEv2. This protocol is used as the central repository of any policy-specific configuration for EFI IPsec driver.
EFI_IPSEC_CONFIG_PROTOCOL can be bound to both IPv4 and IPv6 stack. User can use this protocol for IPsec configuration in both IPv4 and IPv6 environment.

EFI_IPSEC_CONFIG_PROTOCOL.SetData()

Summary
Set the security association, security policy and peer authorization configuration information for the EFI IPsec driver.

Prototype

typedef
EFI_STATUS
(EIFIAPI *EFI_IPSEC_CONFIG_SET_DATA) (  
    IN EFI_IPSEC_CONFIG_PROTOCOL    *This,
    IN EFI_IPSEC_CONFIG_DATA_TYPE   DataType,
    IN EFI_IPSEC_CONFIG_SELECTOR    *Selector,
    IN VOID               *Data
    IN EFI_IPSEC_CONFIG_SELECTOR    *InsertBefore OPTIONAL
);

Parameters
This
   Pointer to the EFI_IPSEC_CONFIG_PROTOCOL instance.
InsertBefore
   Pointer to one entry selector which describes the expected position the new data entry will be added. If InsertBefore is NULL, the new entry will be appended the end of database.
DataType
   The type of data to be set. Type EFI_IPSEC_CONFIG_DATA_TYPE is defined in "Related Definitions" below.
Selector
   Pointer to an entry selector on operated configuration data specified by DataType. A NULL Selector causes the entire specified-type configuration information to be flushed.
Data
   The data buffer to be set. The structure of the data buffer is associated with the DataType. The various types are defined in "Related Definitions" below.

Description
This function is used to set the IPsec configuration information of type DataType for the EFI IPsec driver.

The IPsec configuration data has a unique selector/identifier separately to identify a data entry. The selector structure depends on DataType’s definition.

Using SetData() with a Data of NULL causes the IPsec configuration data entry identified by DataType and Selector to be deleted.
Related Definitions

```c
typedef enum {
  IPsecConfigDataTypeSpd,
  IPsecConfigDataTypeSad,
  IPsecConfigDataTypePad,
  IPsecConfigDataTypeMaximum
} EFI_IPSEC_CONFIG_DATA_TYPE;
```

**IPsecConfigDataTypeSpd**

The IPsec Security Policy Database (aka SPD) setting. In IPsec, an essential element of Security Association (SA) processing is the underlying SPD that specifies what services are to be offered to IP datagram and in what fashion. The SPD must be consulted during the processing of all traffic (inbound and outbound), including traffic not protected by IPsec, that traverses the IPsec boundary. With this **DataType**, the **SetData()** function is to set the SPD entry information, which may add one new entry, delete one existed entry or flush the whole database according to the parameter values. The corresponding **Data** is of type `EFI_IPSEC_SPD_DATA`.

**IPsecConfigDataTypeSad**

The IPsec Security Association Database (aka SAD) setting. A SA is a simplex connection that affords security services to the traffic carried by it. Security services are afforded to an SA by the use of AH, or ESP, but not both. The corresponding **Data** is of type `EFI_IPSEC_SA_DATA2` or `EFI_IPSEC_SAD_DATA`. Compared with `EFI_IPSEC_SA_DATA`, the `EFI_IPSEC_SA_DATA2` contains the extra Tunnel Source Address and Tunnel Destination Address thus it is recommended to be use if the implementation supports tunnel mode.

**IPsecConfigDataTypePad**

The IPsec Peer Authorization Database (aka PAD) setting, which provides the link between the SPD and a security association management protocol. The PAD entry specifies the authentication protocol (e.g. IKEv1, IKEv2) method used and the authentication data. The corresponding **Data** is of type `EFI_IPSEC_PAD_DATA`.
The `EFI_IPSEC_CONFIG_SELECTOR` describes the expected IPsec configuration data selector of type `EFI_IPSEC_CONFIG_DATA_TYPE`.

```c
typedef union {
    EFI_IPSEC_SPD_SELECTOR     SpdSelector;
    EFI_IPSEC_SA_ID            SaId;
    EFI_IPSEC_PAD_ID           PadId;
} EFI_IPSEC_CONFIG_SELECTOR;
```

LocalAddressCount specifies the actual number of entries in `LocalAddress`. A list of ranges of IPv4 or IPv6 addresses, which refers to the addresses being protected by IPsec policy.

RemoteAddressCount specifies the actual number of entries in `RemoteAddress`. A list of ranges of IPv4 or IPv6 addresses, which are peer entities to `LocalAddress`.

NextLayerProtocol Next layer protocol. Obtained from the IPv4 Protocol or the IPv6 Next Header fields. The next layer protocol is whatever comes after any IP extension headers that are present. A zero value is a wildcard that matches any value in `NextLayerProtocol` field.

LocalPort Local Port if the Next Layer Protocol uses two ports (as do TCP, UDP, and others). A zero value is a wildcard that matches any value in `LocalPort` field.
LocalPortRange  A designed port range size. The start port is LocalPort, and the total number of ports is described by LocalPortRange. This field is ignored if NextLayerProtocol does not use ports.

RemotePort  Remote Port if the Next Layer Protocol uses two ports. A zero value is a wildcard that matches any value in RemotePort field.

RemotePortRange  A designed port range size. The start port is RemotePort, and the total number of ports is described by RemotePortRange. This field is ignored if NextLayerProtocol does not use ports.

Note: The LocalPort and RemotePort selectors have different meaning depending on the NextLayerProtocol field. For example, if NextLayerProtocol value is ICMP, LocalPort and RemotePort describe the ICMP message type and code. This is described in section 4.4.1.1 of RFC 4301).

```c
//************************************************************
// EFI_IP_ADDRESS_INFO
//************************************************************
typedef struct _EFI_IP_ADDRESS_INFO {
    EFI_IP_ADDRESS Address;
    UINT8 PrefixLength;
} EFI_IP_ADDRESS_INFO;

#define MAX_PEERID_LEN   128
```

Name  A null-terminated ASCII name string which is used as a symbolic identifier for an IPsec Local or Remote address. The Name is optional, and can be NULL.

PackageFlag  Bit-mapped list describing Populate from Packet flags. When creating a SA, if PackageFlag bit is set to TRUE, instantiate the selector from the corresponding field in the package that
triggered the creation of the SA, else from the value(s) in the corresponding SPD entry. The PackageFlag bit setting for corresponding selector field of EFI_IPSEC_SPD_SELECTOR:
- Bit 0: EFI_IPSEC_SPD_SELECTOR.LocalAddress
- Bit 1: EFI_IPSEC_SPD_SELECTOR.RemoteAddress
- Bit 2: EFI_IPSEC_SPD_SELECTOR.NextLayerProtocol
- Bit 3: EFI_IPSEC_SPD_SELECTOR.LocalPort
- Bit 4: EFI_IPSEC_SPD_SELECTOR.RemotePort
Others: Reserved.

TrafficDirection
The traffic direction of datagram.

Action
Processing choices to indicate which action is required by this policy.

ProcessingPolicy
The policy and rule information for a SPD entry. The type EFI_IPSEC_PROCESSPOLICY is defined in below.

SaIdCount
Specifies the actual number of entries in SaId list.

SaId
Pointer to the SAD entry used for the traffic processing. The existed SAD entry links indicate this is the manual key case.

//************************************************************
// EFI_IPSEC_TRAFFIC_DIR
//************************************************************
typedef enum {
  EfiIPsecInBound,
  EfiIPsecOutBound
} EFI_IPSEC_TRAFFIC_DIR;

The EFI_IPSEC_TRAFFIC_DIR represents the directionality in an SPD entry. The EfiIPsecInBound refers to traffic entering an IPsec implementation via the unprotected interface or emitted by the implementation on the unprotected side of the boundary and directed towards the protected interface. The EfiIPsecOutBound refers to traffic entering the implementation via the protected interface, or emitted by the implementation on the protected side of the boundary and directed toward the unprotected interface.

//************************************************************
// EFI_IPSEC_ACTION
//************************************************************
typedef enum {
  EfiIPsecActionDiscard,
  EfiIPsecActionBypass,
  EfiIPsecActionProtect
} EFI_IPSEC_ACTION;

For any inbound or outbound datagram, EFI_IPSEC_ACTION represents three possible processing choices:
EfiIPsecActionDiscard
Refers to traffic that is not allowed to traverse the IPsec boundary (in the direction specified by EFi_IPSEC_TRAFFIC_DIR);

EfiIPsecActionByPass
Refers to traffic that is allowed to cross the IPsec boundary without protection.

EfiIPsecActionProtect
Refers to traffic that is afforded IPsec protection, and for such traffic the SPD must specify the security protocols to be employed, their mode, security service options, and the cryptographic algorithms to be used.

//EFI_IPSEC_PROCESS_POLICY
typedef struct _EFI_IPSEC_PROCESS_POLICY {
    BOOLEAN ExtSeqNum;
    BOOLEAN SeqOverflow;
    BOOLEAN FragCheck;
    EFI_IPSEC_SA_LIFETIME SaLifetime;
    EFI_IPSEC_MODE Mode;
    EFI_IPSEC_TUNNEL_OPTION *TunnelOption;
    EFI_IPSEC_PROTOCOL_TYPE Proto;
    UINT8 AuthAlgoId;
    UINT8 EncAlgoId;
} EFI_IPSEC_PROCESS_POLICY;

If required action of an SPD entry is EfiIPsecActionProtect, the EFI_IPSEC_PROCESS_POLICY structure describes a policy list for traffic processing.

- **ExtSeqNum**
  Extended Sequence Number. Is this SA using extended sequence numbers. 64 bit counter is used if TRUE.

- **SeqOverflow**
  A flag indicating whether overflow of the sequence number counter should generate an auditable event and prevent transmission of additional packets on the SA, or whether rollover is permitted.

- **FragCheck**
  Is this SA using stateful fragment checking. TRUE represents stateful fragment checking.

- **SaLifetime**
  A time interval after which a SA must be replaced with a new SA (and new SPI) or terminated. The type EFI_IPSEC_SA_LIFETIME is defined in below.

- **Mode**
  IPsec mode: tunnel or transport
TunnelOption

Tunnel Option. TunnelOption is ignored if Mode is EfiIPsecTransport. The type EFI_IPSEC_TUNNEL_OPTION is defined in below

Proto

IPsec protocol: AH or ESP

AuthAlgoId

Cryptographic algorithm type used for authentication

EncAlgoId

Cryptographic algorithm type used for encryption. EncAlgo is NULL when IPsec protocol is AH. For ESP protocol, EncAlgo can also be used to describe the algorithm if a combined mode algorithm is used.

// EFII_IPSEC_SA_LIFETIME
typedef struct _EFI_IPSEC_SA_LIFETIME {
  UINT64 ByteCount;
  UINT64 SoftLifetime;
  UINT64 HardLifetime
} EFI_IPSEC_SA_LIFETIME;

 EFI_IPSEC_SA_LIFETIME defines the lifetime of an SA, which represents when a SA must be replaced or terminated. A value of all 0 for each field removes the limitation of a SA lifetime.

  ByteCount
  The number of bytes to which the IPsec cryptographic algorithm can be applied. For ESP, this is the encryption algorithm and for AH, this is the authentication algorithm. The ByteCount includes pad bytes for cryptographic operations.

  SoftLifetime
  A time interval in second that warns the implementation to initiate action such as setting up a replacement SA.

  HardLifetime
  A time interval in second when the current SA ends and is destroyed.

// EFII_IPSEC_MODE
typedef enum {
  EfiIPsecTransport,
  EfiIPsecTunnel
} EFI_IPSEC_MODE;

There are two modes of IPsec operation: transport mode and tunnel mode. In EfiIPsecTransport mode, AH and ESP provide protection primarily for next layer protocols; In EfiIPsecTunnel mode, AH and ESP are applied to tunneled IP packets.
typedef enum {
    EfiIPsecTunnelClearDf,
    EfiIPsecTunnelSetDf,
    EfiIPsecTunnelCopyDf
} EFI_IPSEC_TUNNEL_DF_OPTION;

The option of copying the DF bit from an outbound package to the tunnel mode header that it emits, when traffic is carried via a tunnel mode SA. This applies to SAs where both inner and outer headers are IPv4. The value can be:

**EfiIPsecTunnelClearDf**: Clear DF bit from inner header

**EfiIPsecTunnelSetDf**: Set DF bit from inner header

**EfiIPsecTunnelCopyDf**: Copy DF bit from inner header

typedef struct _ EFI_IPSEC_TUNNEL_OPTION {
    EFI_IP_ADDRESS LocalTunnelAddress;
    EFI_IP_ADDRESS RemoteTunnelAddress;
    EFI_IPSEC_TUNNEL_DF_OPTION DF;
} EFI_IPSEC_TUNNEL_OPTION;

LocalTunnelAddress Local tunnel address when IPsec mode is EfiIPsecTunnel
RemoteTunnelAddress Remote tunnel address when IPsec mode is EfiIPsecTunnel
DF The option of copying the DF bit from an outbound package to the tunnel mode header that it emits, when traffic is carried via a tunnel mode SA.

typedef enum {
    EfiIPsecAH,
    EfiIPsecESP
} EFI_IPSEC_PROTOCOL_TYPE;

IPsec protocols definition. **EfiIPsecAH** is the IP Authentication Header protocol which is specified in RFC 4302. **EfiIPsecESP** is the IP Encapsulating Security Payload which is specified in RFC 4303.
typedef struct _EFI_IPSEC_SA_ID {
  UINT32 Spi;
  EFI_IPSEC_PROTOCOL_TYPE Proto;
  EFI_IP_ADDRESS DestAddress;
} EFI_IPSEC_SA_ID;

A triplet to identify an SA, consisting of the following members:

Spi Security Parameter Index (aka SPI). An arbitrary 32-bit value that is used by a receiver to identify the SA to which an incoming package should be bound.

Proto IPsec protocol: AH or ESP

DestAddress Destination IP address.

typedef struct _EFI_IPSEC_SA_DATA {
  EFI_IPSEC_MODE Mode;
  UINT64 SNCount;
  UINT8 AntiReplayWindows;
  EFI_IPSEC_ALGO_INFO AlgoInfo;
  EFI_IPSEC_SA_LIFETIME SaLifetime;
  UINT32 PathMTU;
  EFI_IPSEC_SPD_SELECTOR *SpdSelector;
  BOOLEAN ManualSet
} EFI_IPSEC_SA_DATA;

The data items defined in one SAD entry:

Mode IPsec mode: tunnel or transport

SNCount Sequence Number Counter. A 64-bit counter used to generate the sequence number field in AH or ESP headers.

ReplayWindows Anti-Replay Window. A 64-bit counter and a bit-map used to determine whether an inbound AH or ESP packet is a replay.

AlgoInfo AH/ESP cryptographic algorithm, key and parameters.

SaLifeTime Lifetime of this SA.

PathMTU Any observed path MTU and aging variables. The Path MTU processing is defined in section 8 of RFC 4301.

SpdSelector Link to one SPD entry.
ManualSet: Indication of whether it's manually set or negotiated automatically. If ManualSet is FALSE, the corresponding SA entry is inserted through IKE protocol negotiation.

---

```c
/*EFI_IPSEC_SA_DATA2*/
typedef struct _EFI_IPSEC_SA_DATA2 {
    EFI_IPSEC_MODE Mode;
    UINT64 SNCount;
    UINT8 AntiReplayWindows;
    EFI_IPSEC_ALGO_INFO AlgoInfo;
    EFI_IPSEC_SA_LIFETIME SaLifetime;
    UINT32 PathMTU;
    EFI_IPSEC_SPD_SELECTOR *SpdSelector;
    BOOLEAN ManualSet;
    EFI_IP_ADDRESS TunnelSourceAddress;
    EFI_IP_ADDRESS TunnelDestinationAddress
} EFI_IPSEC_SA_DATA2;
```

The data items defined in one SAD entry:

- **Mode**: IPsec mode: tunnel or transport.
- **SNCount**: Sequence Number Counter. A 64-bit counter used to generate the sequence number field in AH or ESP headers.
- **ReplayWindows**: Anti-Replay Window. A 64-bit counter and a bit-map used to determine whether an inbound AH or ESP packet is a replay.
- **AlgoInfo**: AH/ESP cryptographic algorithm, key and parameters.
- **SaLifeTime**: Lifetime of this SA.
- **PathMTU**: Any observed path MTU and aging variables. The Path MTU processing is defined in section 8 of RFC 4301.
- **SpdSelector**: Link to one SPD entry.
- **ManualSet**: Indication of whether it's manually set or negotiated automatically. If ManualSet is FALSE, the corresponding SA entry is inserted through IKE protocol negotiation.
- **TunnelSourceAddress**: The tunnel header IP source address.
- **TunnelDestinationAddress**: The tunnel header IP destination address.
The security algorithm selection for IPsec AH authentication. The required authentication algorithm is specified in RFC 4305.

The security algorithm selection for IPsec ESP encryption and authentication. The required authentication algorithm is specified in RFC 4305. EncAlgoId fields can also specify an ESP combined mode algorithm (e.g. AES with CCM mode, specified in RFC 4309), which provides both confidentiality and authentication services.
typedef struct _EFI_IPSEC_PAD_ID {
    BOOLEAN          PeerIdValid;
    union {
        EFI_IP_ADDRESS_INFO   IpAddress;
        UINT8                PeerId [MAX_PEERID_LEN];
    } Id;
} EFI_IPSEC_PAD_ID;

The entry selector for IPsec PAD that represents how to authenticate each peer. EFI_IPSEC_PAD_ID specifies the identifier for PAD entry, which is also used for SPD lookup.

IpAddress    Pointer to the IPv4 or IPv6 address range.
PeerId        Pointer to a null-terminated ASCII string representing the symbolic names. A PeerId can be a DNS name, Distinguished Name, RFC 822 email address or Key ID (specified in section 4.4.3.1 of RFC 4301)

typedef struct _EFI_IPSEC_PAD_DATA {
    EFI_IPSEC_AUTH_PROTOCOL_TYPE AuthProtocol;
    EFI_IPSEC_AUTH_METHOD        AuthMethod;
    BOOLEAN                     IkeIdFlag;
    UINTN                       AuthDataSize;
    VOID                        *AuthData;
    UINTN                       RevocationDataSize;
    VOID                        *RevocationData;
} EFI_IPSEC_PAD_DATA;

The data items defined in one PAD entry:

AuthProtocol    Authentication Protocol for IPsec security association management
AuthMethod      Authentication method used.
IkeIdFlag       The IKE ID payload will be used as a symbolic name for SPD lookup if IkeIdFlag is TRUE. Otherwise, the remote IP address provided in traffic selector payloads will be used.
AuthDataSize    The size of Authentication data buffer, in bytes.
AuthData        Buffer for Authentication data, (e.g., the pre-shared secret or the trust anchor relative to which the peer's certificate will be validated).
RevocationDataSize The size of RevocationData, in bytes.
RevocationData Pointer to CRL or OCSP data, if certificates are used for authentication method.

//***************************************************************
// EFI_IPSEC_AUTH_PROTOCOL
//***************************************************************
typedef enum {
    EfiIPsecAuthProtocolIKEv1,
    EfiIPsecAuthProtocolIKEv2,
    EfiIPsecAuthProtocolMaximum
} EFI_IPSEC_AUTH_PROTOCOL_TYPE;

EFI_IPSEC_AUTH_PROTOCOL_TYPE defines the possible authentication protocol for IPsec security association management.

//***************************************************************
// EFI_IPSEC_AUTH_METHOD
//***************************************************************
typedef enum {
    EfiIPsecAuthMethodPreSharedSecret,
    EfiIPsecAuthMethodCertificates,
    EfiIPsecAuthMethodMaximum
} EFI_IPSEC_AUTH_METHOD;

EfiIPsecAuthMethodCertificates IKE employs X.509 certificates for SA establishment.

EFI_IPSEC_CONFIG_PROTOCOL.GetData()

Summary
Return the configuration value for the EFI IPsec driver.
Prototype

typedef
   EFI_STATUS
   (EFIAPI *EFI_IPSEC_CONFIG_GET_DATA) (
      IN EFI_IPSEC_CONFIG_PROTOCOL    *This,
      IN EFI_IPSEC_CONFIG_DATA_TYPE   DataType,
      IN EFI_IPSEC_CONFIG_SELECTOR    *Selector,
      IN OUT UINTN            *DataSize,
      OUT VOID              *Data
    );

Parameters

This    Pointer to the EFI_IPSEC_CONFIG_PROTOCOL instance.
DataType The type of data to retrieve. Type EFI_IPSEC_CONFIG_DATA_TYPE is defined in EFI_IPSEC_CONFIG_PROTOCOL.SetData().
Selector Pointer to an entry selector which is an identifier of the IPsec configuration data entry. Type EFI_IPSEC_CONFIG_SELECTOR is defined in the EFI_IPSEC_CONFIG_PROTOCOL.SetData() function description.
DataSize On output the size of data returned in Data.
Data     The buffer to return the contents of the IPsec configuration data. The type of the data buffer is associated with the DataType.

Description

This function lookup the data entry from IPsec database or IKEv2 configuration information. The expected data type and unique identification are described in DataType and Selector parameters.

</tbody>
</table>
EFI_IPSEC_CONFIG_PROTOCOL.GetNextSelector()

Summary
Enumerates the current selector for IPsec configuration data entry.

Prototype
```c
typedef EFI_STATUS
    (EFIAPI *EFI_IPSEC_CONFIG_GET_NEXT_SELECTOR) (
    IN EFI_IPSEC_CONFIG_PROTOCOL    *This,
    IN EFI_IPSEC_CONFIG_DATA_TYPE    DataType,
    IN OUT UINTN            *SelectorSize,
    IN OUT EFI_IPSEC_CONFIG_SELECTOR  *Selector,
    );
```

Parameters
- **This**: Pointer to the EFI_IPSEC_CONFIG_PROTOCOL instance.
- **DataType**: The type of IPsec configuration data to retrieve. Type EFI_IPSEC_CONFIG_DATA_TYPE is defined in EFI_IPSEC_CONFIG_PROTOCOL.SetData().
- **SelectorSize**: The size of the Selector buffer.
- **Selector**: On input, supplies the pointer to last Selector that was returned by GetNextSelector(). On output, returns one copy of the current entry Selector of a given DataType. Type EFI_IPSEC_CONFIG_SELECTOR is defined in the EFI_IPSEC_CONFIG_PROTOCOL.SetData() function description.

Description
This function is called multiple times to retrieve the entry Selector in IPsec configuration database. On each call to GetNextSelector(), the next entry Selector are retrieved into the output interface. If the entire IPsec configuration database has been iterated, the error EFI_NOT_FOUND is returned. If the Selector buffer is too small for the next Selector copy, an EFI_BUFFER_TOO_SMALL error is returned, and SelectorSize is updated to reflect the size of buffer needed.

On the initial call to GetNextSelector() to start the IPsec configuration database search, a pointer to the buffer with all zero value is passed in Selector. Calls to SetData() between calls to GetNextSelector may produce unpredictable results.

**EFI_IPSEC_CONFIG_PROTOCOL.RegisterDataNotify ()**

**Summary**

Register an event that is to be signaled whenever a configuration process on the specified IPsec configuration information is done.

**Prototype**

```c
typedef EFI_STATUS (EFIAPI *EFI_IPSEC_CONFIG_REGISTER_NOTIFY) (  
    IN EFI_IPSEC_CONFIG_PROTOCOL    *This,  
    IN EFI_IPSEC_CONFIG_DATA_TYPE    DataType,  
    IN EFI_EVENT                      Event );
```

**Parameters**

- **This**
  - Pointer to the **EFI_IPSEC_CONFIG_PROTOCOL** instance.
- **DataType**
  - The type of data to be registered the event for. Type **EFI_IPSEC_CONFIG_DATA_TYPE** is defined in **EFI_IPSEC_CONFIG_PROTOCOL.SetData()** function description.
- **Event**
  - The event to be registered.

**Description**

This function registers an event that is to be signaled whenever a configuration process on the specified IPsec configuration data is done (e.g. IPsec security policy database configuration is ready). An event can be registered for different **DataType** simultaneously and the caller is responsible for determining which type of configuration data causes the signaling of the event in such case.
Status Codes Returned

<td>supported.</td>
</tr>
</tbody>
</table>

EFI_IPSEC_CONFIG_PROTOCOL.UnregisterDataNotify()

Summary
Remove the specified event that is previously registered on the specified IPsec configuration data.

Prototype

typedef
    EFI_STATUS
    (EFIAPI *EFI_IPSEC_CONFIG_UNREGISTER_NOTIFY) (  
        IN EFI_IPSEC_CONFIG_PROTOCOL    *This,  
        IN EFI_IPSEC_CONFIG_DATA_TYPE   DataType,  
        IN EFI_EVENT                   Event
    );

Parameters

This Pointer to the EFI_IPSEC_CONFIG_PROTOCOL instance.

DataType The configuration data type to remove the registered event for. Type EFI_IPSEC_CONFIG_DATA_TYPE is defined in EFI_IPSEC_CONFIG_PROTOCOL.SetData() function description.

Event The event to be unregistered.

Description
This function removes a previously registered event for the specified configuration data.

Status Codes Returned

28.8.3 EFI IPsec Protocol
This section provides a detailed description of the EFI_IPSEC_PROTOCOL. This protocol handles IPsec-protected traffic.
**EFI_IPSEC_PROTOCOL**

**Summary**
The **EFI_IPSEC_PROTOCOL** is used to abstract the ability to deal with the individual packets sent and received by the host and provide packet-level security for IP datagram.

**GUID**
```c
#define EFI_IPSEC_PROTOCOL_GUID {
{0xdfb386f7,0xe100,0x43ad,
{0x9c,0x9a,0xed,0x90,0xd0,0x8a,0x5e,0x12 }}
```

**Protocol Interface Structure**
```c
typedef struct _EFI_IPSEC_PROTOCOL {
  EFI_IPSEC_PROCESS  Process;
  EFI_EVENT DisabledEvent;
  BOOLEAN DisabledFlag;
} EFI_IPSEC_PROTOCOL;
```

**Parameters**
- **Process** Handle the IPsec message.
- **DisabledEvent** Event signaled when the interface is disabled.
- **DisabledFlag** State of the interface.

**Description**
The **EFI_IPSEC_PROTOCOL** provides the ability for securing IP communications by authenticating and/or encrypting each IP packet in a data stream.

**EFI_IPSEC_PROTOCOL** can be consumed by both the IPv4 and IPv6 stack. A user can employ this protocol for IPsec package handling in both IPv4 and IPv6 environment.

**EFI_IPSEC_PROTOCOL.Process()**

**Summary**
Handles IPsec packet processing for inbound and outbound IP packets.
Prototype

typedef
EFI_STATUS
(EFI_API *EFI_IPSEC_PROCESS) (
    IN EFI_IPSEC_PROTOCOL     *This,
    IN EFI_HANDLE              NicHandle,
    IN UINT8                    IpVer,
    IN OUT VOID                 *IpHead,
    IN UINT8                    *LastHead,
    IN VOID                     *OptionsBuffer,
    IN UINT32                   OptionsLength,
    IN OUT EFI_IPSEC_FRAGMENT_DATA **FragmentTable,
    IN UINT32                   *FragmentCount,
    IN EFI_IPSEC_TRAFFIC_DIR     TrafficDirection,
    OUT EFI_EVENT               *RecycleSignal
)

Related definitions

//***********************************************************
// EFI_IPSEC_FRAGMENT_DATA //
***********************************************************
typedef struct _EFI_IPSEC_FRAGMENT_DATA {
    UINT32 FragmentLength;
    VOID  *FragmentBuffer;
} EFI_IPSEC_FRAGMENT_DATA;

EFI_IPSEC_FRAGMENT_DATA defines the instances of packet fragments.

Parameters

This            Pointer to the EFI_IPSEC_PROTOCOL instance.
NicHandle       Instance of the network interface.
IpVer           IPV4 or IPV6.
IpHead          Pointer to the IP Header.
LastHead        The protocol of the next layer to be processed by IPsec.
OptionsBuffer   Pointer to the options buffer.
OptionsLength   Length of the options buffer.
FragmentTable   Pointer to a list of fragments.
FragmentCount   Number of fragments.
TrafficDirection Traffic direction.
RecycleSignal   Event for recycling of resources.
Description

The **EFI_IPSEC_PROCESS** process routine handles each inbound or outbound packet. The behavior is that it can perform one of the following actions: bypass the packet, discard the packet, or protect the packet.

**Status Codes Returned**

<table>
<thead>
<tr>
<th>Code</th>

28.8.4 EFI IPsec2 Protocol

This section provides a detailed description of the **EFI_IPSEC2_PROTOCOL**. This protocol handles IPsec-protected traffic.

**EFI_IPSEC2_PROTOCOL**

**Summary**

The **EFI_IPSEC2_PROTOCOL** is used to abstract the ability to deal with the individual packets sent and received by the host and provide packet-level security for IP datagram.

**GUID**

```
#define EFI_IPSEC2_PROTOCOL_GUID \
{0xa3979e64, 0xace8, 0x4ddc, \
 {0xbc, 0x07, 0x4d, 0x66, 0xb8, 0xfd, 0x09, 0x77}};
```

**Protocol Interface Structure**

```
typedef struct _EFI_IPSEC2_PROTOCOL {
    EFI_IPSEC_PROCESSEXT ProcessExt;
    EFI_EVENT DisabledEvent;
    BOOLEAN DisabledFlag;
} EFI_IPSEC2_PROTOCOL;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ProcessExt</td>
<td>Handle the IPsec message with the extension header processing support.</td>
</tr>
<tr>
<td>DisabledEvent</td>
<td>Event signaled when the interface is disabled.</td>
</tr>
<tr>
<td>DisabledFlag</td>
<td>State of the interface.</td>
</tr>
</tbody>
</table>

**Description**

The **EFI_IPSEC2_PROTOCOL** provides the ability for securing IP communications by authenticating and/or encrypting each IP packet in a data stream.

**EFI_IPSEC2_PROTOCOL** can be consumed by both the IPv4 and IPv6 stack. A user can employ this protocol for IPsec package handling in both IPv4 and IPv6 environment.
EFI_IPSEC2_PROTOCOL.ProcessExt()

Summary
Handles IPsec processing for both inbound and outbound IP packets. Compare with Process() in EFI_IPSEC_PROTOCOL, this interface has the capability to process Option(Extension Header).

Prototype
Typedef
EFI_STATUS
(EFI_API *EFI_IPSEC_PROCESSEX T) (  
IN EFI_IPSEC2_PROTOCOL *This,  
IN EFI_HANDLE NicHandle,  
IN UINT8 IpVer,  
IN OUT VOID *IpHead,  
IN OUT UINT8 *LastHead,  
IN OUT VOID **OptionsBuffer,  
IN OUT UINT8 *OptionsLength,  
IN OUT EFI_IPSEC_FRAGMENT_DATA **FragmentTable,  
IN OUT UINT32 *FragmentCount,  
IN EFI_IPSEC_TRAFFIC_DIR TrafficDirection,  
OUT EFI_EVENT *RecycleSignal  
)

Parameters
This
Pointer to the EFI_IPSEC2_PROTOCOL instance.
NicHandle
Instance of the network interface.
IpVer
IP version.IPV4 or IPV6.
IpHead
Pointer to the IP Header it is either the EFI_IP4_HEADER or EFI_IP6_HEADER. On input, it contains the IP header. On output,
1) in tunnel mode and the traffic direction is inbound, the buffer will be reset to zero by IPsec;
2) in tunnel mode and the traffic direction is outbound, the buffer will reset to be the tunnel IP header.
3) in transport mode, the related fielders (like payload length, Next header) in IP header will be modified according to the condition.
LastHead
For IP4, it is the next protocol in IP header. For IP6 it is the Next Header of the last extension header.
OptionsBuffer
On input, it contains the options (extensions header) to be processed by IPsec. On output,
1) in tunnel mode and the traffic direction is outbound, it will be set to NULL, and that means this contents was wrapped
after inner header and should not be concatenated after tunnel header again;

2) in transport mode and the traffic direction is inbound, if there are IP options (extension headers) protected by IPsec, IPsec will concatenate the those options after the input options (extension headers);

3) on other situations, the output of contents of 
\texttt{OptionsBuffer} might be same with input's. The caller should take the responsibility to free the buffer both on input and on output.

\begin{itemize}
  \item \textbf{OptionsLength} On input, the input length of the options buffer. On output, the output length of the options buffer.
  \item \textbf{FragmentTable} Pointer to a list of fragments. On input, these fragments contain the IP payload. On output,
    \begin{itemize}
      \item 1) in tunnel mode and the traffic direction is inbound, the fragments contain the whole IP payload which is from the IP inner header to the last byte of the packet;
      \item 2) in tunnel mode and the traffic direction is the outbound, the fragments contains the whole encapsulated payload which encapsulates the whole IP payload between the encapsulated header and encapsulated trailer fields.
      \item 3) in transport mode and the traffic direction is inbound, the fragments contains the IP payload which is from the next layer protocol to the last byte of the packet;
      \item 4) in transport mode and the traffic direction is outbound, the fragments contains the whole encapsulated payload which encapsulates the next layer protocol information between the encapsulated header and encapsulated trailer fields.
    \end{itemize}
  \item \textbf{FragmentCount} Number of fragments.
  \item \textbf{TrafficDirection} Traffic direction.
  \item \textbf{RecycleSignal} Event for recycling of resources.
\end{itemize}

\textbf{Description}

The \texttt{EFI_IPSEC_PROCESSEXT} process routine handles each inbound or outbound packet with the support of options (extension headers) processing. The behavior is that it can perform one of the following actions: bypass the packet, discard the packet, or protect the packet.
28.9 Network Protocol - EFI FTP Protocol

This section defines the EFI FTPv4 (File Transfer Protocol version 4) Protocol that interfaces over EFI FTPv4 Protocol

**EFI_FTP4_SERVICE_BINDING_PROTOCOL Summary**

**Summary**

The **EFI_FTP4_SERVICE_BINDING_PROTOCOL** is used to locate communication devices that are supported by an EFI FTPv4 Protocol driver and to create and destroy instances of the EFI FTPv4 Protocol child protocol driver that can use the underlying communication device.

**GUID**

```c
#define EFI_FTP4_SERVICE_BINDING_PROTOCOL_GUID \
    {0xfaaecb1, 0x226e, 0x4782, \ 
     {0xaa, 0xce, 0x7d, 0xb9, 0xbc, 0xbf, 0x4d, 0xaf}}
```

**Description**

A network application or driver that requires FTPv4 I/O services can use one of the protocol handler services, such as **BS->LocateHandleBuffer()**, to search for devices that publish an EFI FTPv4 Service Binding Protocol GUID. Each device with a published EFI FTPv4 Service Binding Protocol GUID supports the EFI FTPv4 Protocol service and may be available for use.

After a successful call to the **EFI_FTP4_SERVICE_BINDING_PROTOCOL.CreateChild()** function, the newly created child EFI FTPv4 Protocol driver instance is in an unconfigured state; it is not ready to transfer data.

Before a network application terminates execution, every successful call to the **EFI_FTP4_SERVICE_BINDING_PROTOCOL.CreateChild()** function must be matched with a call to the **EFI_FTP4_SERVICE_BINDING_PROTOCOL.DestroyChild()** function.

Each instance of the EFI FTPv4 Protocol driver can support one file transfer operation at a time. To download two files at the same time, two instances of the EFI FTPv4 Protocol driver will need to be created.

Note: Byte Order: if not specifically specified, the IP addresses used in the EFI_FTP4_PROTOCOL are in network byte order and the ports are in host byte order.

EFI_FTP4_PROTOCOL

Summary
The EFI FTPv4 Protocol provides basic services for client-side FTP (File Transfer Protocol) operations.

GUID
#define EFI_FTP4_PROTOCOL_GUID \
{0xeb338826, 0x681b, 0x4295, \
{0xb3, 0x56, 0x2b, 0x36, 0x4c, 0x75, 0x7b, 0x09}}

Protocol Interface Structure
typedef struct _EFI_FTP4_PROTOCOL {
  EFI_FTP4_GET_MODE_DATA  GetModeData;
  EFI_FTP4_CONNECT        Connect;
  EFI_FTP4_CLOSE          Close;
  EFI_FTP4_CONFIGURE      Configure;
  EFI_FTP4_READ_FILE      ReadFile;
  EFI_FTP4_WRITE_FILE     WriteFile;
  EFI_FTP4_READ_DIRECTORY ReadDirectory;
  EFI_FTP4_POLL           Poll;
} EFI_FTP4_PROTOCOL;

Parameters
GetModeData Reads the current operational settings. See the GetModeData() function description.
Connect Establish control connection with the FTP server by using the TELNET protocol according to FTP protocol definition. See the Connect() function description.
Close Gracefully disconnecting a FTP control connection. This function is a nonblocking operation. See the Close() function description.
Configure Sets and clears operational parameters for an FTP child driver. See the Configure() function description.
ReadFile Downloads a file from an FTPv4 server. See the ReadFile() function description.
WriteFile Uploads a file to an FTPv4 server. This function may be unsupported in some EFI implementations. See the WriteFile() function description.
ReadDirectory Download a related file "directory" from an FTPv4 server. This function may be unsupported in some implementations. See the ReadDirectory() function description.
Poll Polls for incoming data packets and processes outgoing data packets. See the Poll() function description.
**EFI_FTP4_PROTOCOL.GetModeData()**

**Summary**
Gets the current operational settings

**Prototype**
```c
typedef
  EFI_STATUS
  (EFIAPI *EFI_FTP4_GET_MODE_DATA)(
    IN EFI_FTP4_PROTOCOL    *This,
    OUT EFI_FTP4_CONFIG_DATA  *ModeData
  );
```

**Parameters**
- **This**
  Pointer to the EFI_FTP4_PROTOCOL instance.
- **ModeData**
  Pointer to storage for the EFI FTPv4 Protocol driver mode data. Type EFI_FTP4_CONFIG_DATA is defined in "Related Definitions" below. The string buffers for Username and Password in EFI_FTP4_CONFIG_DATA are allocated by the function, and the caller should take the responsibility to free the buffer later.

**Description**
The GetModeData() function reads the current operational settings of this EFI FTPv4 Protocol driver instance. EFI_FTP4_CONFIG_DATA is defined in the EFI_FTP4_PROTOCOL.Configure.

**Status Codes Returned**

**EFI_FTP4_PROTOCOL.Connect()**

**Summary**
Initiate a FTP connection request to establish a control connection with FTP server
Prototype

typedef
EFI_STATUS
(EIFIAPI *EFI_FTP4_CONNECT) (
    IN EFI_FTP4_PROTOCOL *This,
    IN EFI_FTP4_CONNECTION_TOKEN *Token
);

Parameters

This Pointer to the EFI_FTP4_PROTOCOL instance.
Token Pointer to the token used to establish control connection.

Related Definitions

//***************************************************************
// EFI_FTP4_CONNECTION_TOKEN
//***************************************************************
typedef struct {
    EFI_EVENT Event;
    EFI_STATUS Status;
} EFI_FTP4_CONNECTION_TOKEN;

Event

The Event to signal after the connection is established and Status field is updated by the EFI FTP v4 Protocol driver. The type of Event must be EVENT_NOTIFY_SIGNAL, and its Task Priority Level (TPL) must be lower than or equal to TPL_CALLBACK. If it is set to NULL, this function will not return until the function completes.

Status

The variable to receive the result of the completed operation.

Status Codes Returned

EFI_SUCCESS The FTP connection is established successfully.
EFI_ACCESS_DENIED The FTP server denied the access the user’s request to access it.
EFI_CONNECTION_RESET The connect fails because the connection is reset either by instance itself or communication peer.
EFI_TIMEOUT The connection establishment timer expired and no more specific information is available.
EFI_NETWORK_UNREACHABLE The active open fails because an ICMP network unreachable error is received.
EFI_HOST_UNREACHABLE The active open fails because an ICMP host unreachable error is received.
EFI_PROTOCOL_UNREACHABLE The active open fails because an ICMP protocol unreachable error is received.
EFI_PORT_UNREACHABLE The connection establishment timer times out and an ICMP port unreachable error is received.
The Connect() function will initiate a connection request to the remote FTP server with the corresponding connection token. If this function returns EFI_SUCCESS, the connection sequence is initiated successfully. If the connection succeeds or failed due to any error, the Token->Event will be signaled and Token->Status will be updated accordingly.

### Status Codes Returned

### EFI_FTP4_PROTOCOL.Close()

#### Summary
Disconnecting a FTP connection gracefully.

#### Prototype
```c
typedef EFI_STATUS (EFIAPI *EFI_FTP4_CLOSE)(
    IN EFI_FTP4_PROTOCOL       *This,
    IN EFI_FTP4_CONNECTION_TOKEN   *Token
);
```

#### Parameters
- **This** Pointer to the EFI_FTP4_PROTOCOL instance.
- **Token** Pointer to the token used to close control connection.

#### Description
The Close() function will initiate a close request to the remote FTP server with the corresponding connection token. If this function returns EFI_SUCCESS, the control connection with the remote FTP server is closed.
Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The close request is successfully initiated.</td>

| EFI_DEVICE_ERROR          | An unexpected system or network error occurred.                             |

**EFI_FTP4_PROTOCOL.Configure()**

**Summary**

Sets or clears the operational parameters for the FTP child driver.

**Prototype**

```c
typedef EFI_STATUS (EFIAPI *EFI_FTP4_CONFIGURE) (   
   IN EFI_FTP4_PROTOCOL *This,   
   IN EFI_FTP4_CONFIG_DATA *FtpConfigData OPTIONAL   
);
```

**Parameters**

- **This**: Pointer to the `EFI_FTP4_PROTOCOL` instance.
- **FtpConfigData**: Pointer to configuration data that will be assigned to the FTP child driver instance. If `NULL`, the FTP child driver instance is reset to startup defaults and all pending transmit and receive requests are flushed.
Related Definitions

```c
//***************************************************************
// EFI_FTP4_CONFIG_DATA
//***************************************************************
typedef struct {
  UINT8                *Username;
  UINT8                *Password;
  BOOLEAN              Active;
  BOOLEAN              UseDefaultSetting;
  EFI_IPv4_ADDRESS     StationIp;
  EFI_IPv4_ADDRESS     SubnetMask;
  EFI_IPv4_ADDRESS     GatewayIp;
  EFI_IPv4_ADDRESS     ServerIp;
  UINT16               ServerPort;
  UINT16               AltDataPort;
  UINT8                RepType;
  UINT8                FileStruct;
  UINT8                TransMode;
} EFI_FTP4_CONFIG_DATA;
```

Username  
Pointer to a ASCII string that contains user name. The caller is responsible for freeing Username after GetModeData() is called.

Password  
Pointer to a ASCII string that contains password. The caller is responsible for freeing Password after GetModeData() is called.

Active  
Set it to TRUE to initiate an active data connection. Set it to FALSE to initiate a passive data connection.

UseDefaultSetting  
Boolean value indicating if default network setting used.

StationIp  
IP address of station if UseDefaultSetting is FALSE.

SubnetMask  
Subnet mask of station if UseDefaultSetting is FALSE.

GatewayIp  
IP address of gateway if UseDefaultSetting is FALSE.

ServerIp  
IP address of FTPv4 server.

ServerPort  
FTPv4 server port number of control connection, and the default value is 21 as convention.

AltDataPort  
FTPv4 server port number of data connection. If it is zero, use (ServerPort - 1) by convention.

RepType  
A byte indicate the representation type. The right 4 bit is used for first parameter, the left 4 bit is use for second parameter

- For the first parameter, 0x0 = image, 0x1 = EBCDIC, 0x2 = ASCII, 0x3 = local
- For the second parameter, 0x0 = Non-print, 0x1 = Telnet format effectors, 0x2 = Carriage Control
• If it is a local type, the second parameter is the local byte size.
• If it is a image type, the second parameter is undefined.

FileStruct
Defines the file structure in FTP used. 0x00 = file, 0x01 =
record, 0x02 = page

TransMode
Defines the transfer mode used in FTP. 0x00 = stream, 0x01 = Block,
0x02 = Compressed

Description
The Configure() function will configure the connected FTP session with the configuration setting
specified in FtpConfigData. The configuration data can be reset by calling Configure() with
FtpConfigData set to NULL.

Status Codes Returned.

**EFI_FTP4_PROTOCOL.ReadFile()**

Summary
Downloads a file from an FTPv4 server.

Prototype

typedef
EFI_STATUS
(EIFIAPI *EFI_FTP4_READ_FILE)(
    IN EFI_FTP4_PROTOCOL    *This,
    IN EFI_FTP4_COMMAND_TOKEN *Token
);

Parameters
This Pointer to the EFI_FTP4_PROTOCOL instance.
Token

Point to the token structure to provide the parameters that are used in this operation. Type `EFI_FTP4_COMMAND_TOKEN` is defined in "Related Definitions" below.

**Related Definitions**

```c
typedef struct {
    EFI_EVENT   Event;
    UINT8       *Pathname;
    UINT64      DataBufferSize;
    VOID        *DataBuffer;
    EFI_FTP4_DATA_CALLBACK DataCallback;
    VOID        *Context;
    EFI_STATUS  Status;
} EFI_FTP4_COMMAND_TOKEN;
```

**Event**

The `Event` to signal after request is finished and `Status` field is updated by the EFI FTP v4 Protocol driver. The type of `Event` must be `EVT_NOTIFY_SIGNAL`, and its Task Priority Level (TPL) must be lower than or equal to `TPL_CALLBACK`. If it is set to `NULL`, related function must wait until the function completes.

**Pathname**

Pointer to a null-terminated ASCII name string.

**DataBufferSize**

The size of data buffer in bytes.

**DataBuffer**

Pointer to the data buffer. Data downloaded from FTP server through connection is downloaded here.

**DataCallback**

Pointer to a callback function. If it is receiving function that leads to inbound data, the callback function is called when data buffer is full. Then, old data in the data buffer should be flushed and new data is stored from the beginning of data buffer. If it is a transmit function that lead to outbound data and `DataBufferSize` of `Data` in `DataBuffer` has been transmitted, this callback function is called to supply additional data to be transmitted. The size of additional data to be transmitted is indicated in `DataBufferSize`, again. If there is no data remained, `DataBufferSize` should be set to 0.

**Context**

Pointer to the parameter for `DataCallback`.

**Status**

The variable to receive the result of the completed operation.

- **EFI_SUCCESS**
  
  The FTP command is completed successfully.

- **EFI_ACCESS_DENIED**
  
  The FTP server denied the access to the requested file.
**EFI_CONNECTION_RESET**

- The connect fails because the connection is reset either by instance itself or communication peer.

**EFI_TIMEOUT**

- The connection establishment timer expired and no more specific information is available.

**EFI_NETWORK_UNREACHABLE**

- The active open fails because an ICMP network unreachable error is received.

**EFI_HOST_UNREACHABLE**

- The active open fails because an ICMP host unreachable error is received.

**EFI_PROTOCOL_UNREACHABLE**

- The active open fails because an ICMP protocol unreachable error is received.

**EFI_PORT_UNREACHABLE**

- The connection establishment timer times out and an ICMP port unreachable error is received.

**EFI_ICMP_ERROR**

- The connection establishment timer timeout and some other ICMP error is received.

**EFI_DEVICE_ERROR**

- An unexpected system or network error occurred.

**Related Definitions**

```c
//******************************************************************************
// EFI_FTP4_DATA_CALLBACK
//******************************************************************************
typedef
EFI_STATUS
(EFIAPI *EFI_FTP4_DATA_CALLBACK)(
    IN EFI_FTP4_PROTOCOL      *This,
    IN EFI_FTP4_COMMAND_TOKEN   *Token,
);
```

- **This**
  - Pointer to the **EFI_FTP4_PROTOCOL** instance.

- **Token**
  - Pointer to the token structure to provide the parameters that are used in this operation. Type **EFI_FTP4_COMMAND_TOKEN** is defined in "Related Definitions" above.

**Description**

The **ReadFile()** function is used to initialize and start an FTPv4 download process and optionally wait for completion. When the download operation completes, whether successfully or not, the **Token.Status** field is updated by the EFI FTPv4 Protocol driver and then **Token.Event** is signaled (if it is not **NULL**).
Data will be downloaded from the FTPv4 server into `Token.DataBuffer`. If the file size is larger than `Token.DataBufferSize`, `Token.DataCallback` will be called to allow for processing data and then new data will be placed at the beginning of `Token.DataBuffer`.

### Status Codes Returned

### EFI_FTP4_PROTOCOL.WriteFile()

**Summary**

Uploads a file from an FTPv4 server.

**Prototype**

```c
typedef EFI_STATUS (EFIAPI *EFI_FTP4_WRITE_FILE)(
    IN EFI_FTP4_PROTOCOL     *This,
    IN EFI_FTP4_COMMAND_TOKEN  *Token
);
```

**Parameters**

- **This** Pointer to the `EFI_FTP4_PROTOCOL` instance.
- **Token** Pointer to the token structure to provide the parameters that are used in this operation. Type `EFI_FTP4_COMMAND_TOKEN` is defined in "EFI_FTP4_READ_FILE".

**Description**

The `WriteFile()` function is used to initialize and start an FTPv4 upload process and optionally wait for completion. When the upload operation completes, whether successfully or not, the `Token.Status` field is updated by the EFI FTPv4 Protocol driver and then `Token.Event` is signaled (if it is not `NULL`).

Data to be uploaded to server is stored into `Token.DataBuffer`. `Token.DataBufferSize` is the number bytes to be transferred. If the file size is larger than `Token.DataBufferSize`, `Token.DataCallback` will be called to allow for processing data and then new data will be placed at
the beginning of Token.DataBuffer. Token.DataBufferSize is updated to reflect the actual number of bytes to be transferred. Token.DataBufferSize is set to 0 by the call back to indicate the completion of data transfer.

**Status Codes Returned**

**EFI_FTP4_PROTOCOL.ReadDirectory()**

**Summary**

Download a data file "directory" from a FTPv4 server. May be unsupported in some EFI implementations.

**Prototype**

```c
typedef EFI_STATUS
  (EFIAPI *EFI_FTP4_READ_DIRECTORY) ( 
   IN EFI_FTP4_PROTOCOL *This,
   IN EFI_FTP4_COMMAND_TOKEN *Token
);
```

**Parameters**

- **This**
  - Pointer to the **EFI_FTP4_PROTOCOL** instance.
- **Token**
  - Pointer to the token structure to provide the parameters that are used in this operation. Type **EFI_FTP4_COMMAND_TOKEN** is defined in "**EFI_FTP4_READ_FILE**".

**Description**

The **ReadDirectory()** function is used to return a list of files on the FTPv4 server that logically (or operationally) related to Token.Pathname, and optionally wait for completion. When the download operation completes, whether successfully or not, the Token.Status field is updated by the EFI FTPv4 Protocol driver and then Token.Event is signaled (if it is not **NULL**).
Data will be downloaded from the FTPv4 server into `Token.DataBuffer`. If the file size is larger than `Token.DataBufferSize`, `Token.DataCallback` will be called to allow for processing data and then new data will be placed at the beginning of `Token.DataBuffer`.

### Status Codes Returned

#### EFI_FTP4_PROTOCOL.Poll()

**Summary**
Polls for incoming data packets and processes outgoing data packets.

**Prototype**

```c
typedef EFI_STATUS
  (EFIAPI *EFI_FTP4_POLL) (    
    IN EFI_FTP4_PROTOCOL    *This
  );
```

**Parameters**

- `This` Pointer to the `EFI_FTP4_PROTOCOL` instance.

**Description**

The `Poll()` function can be used by network drivers and applications to increase the rate that data packets are moved between the communications device and the transmit and receive queues.

In some systems, the periodic timer event in the managed network driver may not poll the underlying communications device fast enough to transmit and/or receive all data packets without missing incoming packets or dropping outgoing packets. Drivers and applications that are experiencing packet loss should try calling the `Poll()` function more often.
Status Codes Returned

28.10 EFI TLS Protocols

28.10.1 EFI TLS Service Binding Protocol

EFI_TLS_SERVICE_BINDING_PROTOCOL

Summary
The EFI TLS Service Binding Protocol is used to locate EFI TLS Protocol drivers to create and destroy child of the driver to communicate with other host using TLS protocol.

GUID

```
#define EFI_TLS_SERVICE_BINDING_PROTOCOL_GUID 
  { \
    0x952cb795, 0xff36, 0x48cf, 0xa2, 0x49, 0x4d, 0xf4, 0x86, 0xd6, 0xab, 0x8d \n  }
```

Description
The TLS consumer need locate EFI_TLS_SERVICE_BINDING_PROTOCOL and call CreateChild() to create a new child of EFI_TLS_PROTOCOL and EFI_TLS_CONFIGURATION_PROTOCOL instance. Then use EFI_TLS_CONFIGURATION_PROTOCOL to set TLS configuration data, and use EFI_TLS_PROTOCOL to start TLS session. After use, the TLS consumer needs to call DestroyChild() to destroy it.

28.10.2 EFI TLS Protocol

EFI_TLS_PROTOCOL

Summary
This protocol provides the ability to manage TLS session.
GUID

#define EFI_TLS_PROTOCOL_GUID \
{ 0xca959f, 0x6cfa, 0x4db1, \ 
{0x95, 0xbc, 0xe4, 0x6c, 0x47, 0x51, 0x43, 0x90 }}

Protocol Interface Structure

typedef struct _EFI_TLS_PROTOCOL {
    EFI_TLS_SET_SESSION_DATA  SetSessionData;
    EFI_TLS_GET_SESSION_DATA  GetSessionData;
    EFI_TLS_BUILD_RESPONSE_PACKET  BuildResponsePacket;
    EFI_TLS_PROCESS_PACKET  ProcessPacket;
} EFI_TLS_PROTOCOL;

Parameters

SetSessionData   Set TLS session data. See the SetSessionData () function description.

GetSessionData   Get TLS session data. See the GetSessionData () function description.

BuildResponsePacket Build response packet according to TLS state machine. This function is only valid for alert, handshake and change_cipher_spec content type. See the BuildResponsePacket () function description.

ProcessPacket   Decrypt or encrypt TLS packet during session. This function is only valid after session connected and for application_data content type. See the ProcessPacket () function description.

Description

The EFI_TLS_PROTOCOL is used to create, destroy and manage TLS session. For detail of TLS, please refer to TLS related RFC.

EFI_TLS_PROTOCOL.SetSessionData ()

Summary

Set TLS session data.
Prototype

typedef
 EFI_STATUS
 (EFIAPI *EFI_TLS_SET_SESSION_DATA)(
  IN EFI_TLS_PROTOCOL *This,
  IN EFI_TLS_SESSION_DATA_TYPE DataType,
  IN VOID *Data,
  IN UINTN DataSize
);

Parameters

This         Pointer to the EFI_TLS_PROTOCOL instance.
DataType     TLS session data type. See EFI_TLS_SESSION_DATA_TYPE
Data         Pointer to session data.
DataSize     Total size of session data.

Description

The SetSessionData() function set data for a new TLS session. All session data should be set before BuildResponsePacket() invoked.

Related Definitions

//***************************************************************
// EFI_TLS_SESSION_DATA_TYPE
//***************************************************************
typedef enum {
  EfiTlsVersion,
  EfiTlsConnectionEnd,
  EfiTlsCipherList,

  EfiTlsSessionDataTypeMaximum
} EFI_TLS_SESSION_DATA_TYPE;

EfiTlsVersion   TLS session Version. The corresponding Data is of type EFI_TLS_VERSION.
EfiTlsConnectionEnd TLS session as client or as server. The corresponding Data is of EFI_TLS_CONNECTION_END.
EfiTlsCipherList  A priority list of preferred algorithms for the TLS session. The corresponding Data is a list of EFI_TLS_CIPHER.

EfiTlsCompressionMethod  TLS session compression method. The corresponding Data is of type EFI_TLS_COMPRESSION.

EfiTlsExtensionData  TLS session extension data. The corresponding Data is a list of type EFI_TLS_EXTENSION.

EfiTlsVerifyMethod  TLS session verify method. The corresponding Data is of type EFI_TLS_VERIFY.

EfiTlsSessionID  TLS session data session ID. For SetSessionData(), it is TLS session ID used for session resumption. For GetSessionData(), it is the TLS session ID used for current session. The corresponding Data is of type EFI_TLS_SESSION_ID.

EfiTlsSessionState  TLS session data session state. The corresponding Data is of type EFI_TLS_SESSION_STATE.

EfiTlsClientRandom  TLS session data client random. The corresponding Data is of type EFI_TLS_RANDOM.

EfiTlsServerRandom  TLS session data server random. The corresponding Data is of type EFI_TLS_RANDOM.

EfiTlsKeyMaterial  TLS session data key material. The corresponding Data is of type EFI_TLS_MASTER_SECRET.

EfiTlsVerifyHost  TLS session hostname for validation which is used to verify whether the name within the peer certificate matches a given host name. This parameter is invalid when EfiTlsVerifyMethod is EFI_TLS_VERIFY_NONE. The corresponding Data is of type EFI_TLS_VERIFY_HOST.

//******************************************************************************
// EFI_TLS_VERSION
//******************************************************************************
typedef struct {
    UINT8 Major;
    UINT8 Minor;
} EFI_TLS_VERSION;
**Note:** The TLS version definition is from SSL3.0 to latest TLS (e.g. 1.2). SSL2.0 is obsolete and should not be used.

```c
// EFi_TLS_CONNECTION_END
typedef enum {
    EfiTlsClient,
    EfiTlsServer,
} EFi_TLS_CONNECTION_END;
```

TLS connection end is to define TLS session as client or as server.

```c
// EFi_TLS_CIPHER
typedef struct {
    UINT8 Data1;
    UINT8 Data2;
} EFi_TLS_CIPHER;
```

**Note:** The definition of EFi_TLS_CIPHER is from RFC 5246 A.4.1. Hello Messages. The value of EFi_TLS_CIPHER is from TLS Cipher Suite Registry of IANA.

```c
// EFi_TLS_COMPRESSION
typedef UINT8 EFi_TLS_COMPRESSION;
```

**Note:** The value of EFi_TLS_COMPRESSION definition is from RFC 3749.

```c
// EFi_TLS_EXTENSION
typedef struct {
    UINT16 ExtensionType;
    UINT16 Length;
    UINT8 Data[];
} EFi_TLS_EXTENSION;
```

**Note:** The definition of EFi_TLS_EXTENSION is from RFC 5246 A.4.1. Hello Messages.
typedef UINT32 EFI_TLS_VERIFY;
#define EFI_TLS_VERIFY_NONE                  0x0
#define EFI_TLS_VERIFY_PEER                  0x1
#define EFI_TLS_VERIFY_FAIL_IF_NO_PEER_CERT  0x2
#define EFI_TLS_VERIFY_CLIENT_ONCE           0x4

The consumer needs to use either EFI_TLS_VERIFY_NONE or EFI_TLS_VERIFY_PEER.
EFI_TLS_VERIFY_FAIL_IF_NO_PEER_CERT and EFI_TLS_VERIFY_CLIENT_ONCE can be ORed with EFI_TLS_VERIFY_PEER. EFI_TLS_VERIFY_FAIL_IF_NO_PEER_CERT is only meaningful in the server mode, which means the TLS session will fail if the client certificate is absent. EFI_TLS_VERIFY_CLIENT_ONCE means the TLS session only verifies the client once, and doesn’t request a certificate during re-negotiation.

typedef struct {
    EFI_TLS_VERIFY_HOST_FLAG Flags;
    CHAR8                    *HostName;
} EFI_TLS_VERIFY_HOST;

Flags       The host name validation flags. The flags arguments can be ORed.
HostName    The specified host name to be verified.

typedef UINT32 EFI_TLS_VERIFY_HOST_FLAG;
#define EFI_TLS_VERIFY_FLAG_NONE                    0x00
#define EFI_TLS_VERIFY_FLAG_ALWAYS_CHECK_SUBJECT    0x01
#define EFI_TLS_VERIFY_FLAG_NO_WILDCARDS            0x02
#define EFI_TLS_VERIFY_FLAG_NO_PARTIAL_WILDCARDS    0x04
#define EFI_TLS_VERIFY_FLAG_MULTI_LABEL_WILDCARDS   0x08
#define EFI_TLS_VERIFY_FLAG_SINGLE_LABEL_SUBDOMAINS 0x10
#define EFI_TLS_VERIFY_FLAG_NEVER_CHECK_SUBJECT     0x20

EFI_TLS_VERIFY_FLAG_NONE means no additional flags set for hostname validation. Wildcards are supported and they match only in the left-most label.
EFI_TLS_VERIFY_FLAG_ALWAYS_CHECK_SUBJECT means to always check the Subject Distinguished Name (DN) in the peer certificate even if the certificate contains Subject Alternative Name (SAN).
EFI_TLS_VERIFY_FLAG_NO_WILDCARDS means to disable the match of all wildcards.
**EFI_TLS_VERIFY_FLAG_NO_PARTIAL_WILDCARDS** means to disable the "*" as wildcard in
labels that have a prefix or suffix (e.g. "www*" or "*www").

**EFI_TLS_VERIFY_FLAG_MULTI_LABEL_WILDCARDS** allows the "*" to match more than one
labels. Otherwise, only matches a single label.

**EFI_TLS_VERIFY_FLAG_SINGLE_LABEL_SUBDOMAINS** restricts to only match direct child
sub-domains which start with ".". For example, a name of ".example.com" would match
"www.example.com" with this flag, but would not match "www.sub.example.com".

**EFI_TLS_VERIFY_FLAG_NEVER_CHECK_SUBJECT** means never check the Subject
Distinguished Name (DN) even there is no Subject Alternative Name (SAN) in the certificate.

If both **EFI_TLS_VERIFY_FLAG_ALWAYS_CHECK_SUBJECT** and
**EFI_TLS_VERIFY_FLAG_NEVER_CHECK_SUBJECT** are specified, **EFI_INVALID_PARAMETER**
will be returned. If **EFI_TLS_VERIFY_FLAG_NO_WILDCARDS** is set with
**EFI_TLS_VERIFY_FLAG_NO_PARTIAL_WILDCARDS** or
**EFI_TLS_VERIFY_FLAG_MULTI_LABEL_WILDCARDS**, **EFI_INVALID_PARAMETER** will be
returned.

```
//******************************************************************************
// EFI_TLS_RANDOM
//******************************************************************************
typedef struct {
   UINT32  GmtUnixTime;
   UINT8   RandomBytes[28];
} EFI_TLS_RANDOM;
```

**Note:** The definition of **EFI_TLS_RANDOM** is from RFC 5246 A.4.1. Hello Messages.

```
//******************************************************************************
// EFI_TLS_MASTER_SECRET
//******************************************************************************
typedef struct {
   UINT8   Data[48];
} EFI_TLS_MASTER_SECRET;
```

**Note:** The definition of **EFI_TLS_MASTER_SECRET** is from RFC 5246 8.1. Computing the Master
Secret.
//*******************************************************************************
// EFI_TLS_SESSION_ID
//*******************************************************************************
#define MAX_TLS_SESSION_ID_LENGTH 32
typedef struct {
    UINT16 Length;
    UINT8 Data[MAX_TLS_SESSION_ID_LENGTH];
} EFI_TLS_SESSION_ID;

Note: The definition of EFI_TLS_SESSION_ID is from RFC 5246 A.4.1. Hello Messages.

//*******************************************************************************
// EFI_TLS_SESSION_STATE
//*******************************************************************************
typedef enum {
    EfiTlsSessionNotStarted,
    EfiTlsSessionHandShaking,
    EfiTlsSessionDataTransferring,
    EfiTlsSessionClosing,
    EfiTlsSessionError,
    EfiTlsSessionStateMaximum
} EFI_TLS_SESSION_STATE;

The definition of EFI_TLS_SESSION_STATE is below:

When a new child of TLS protocol is created, the initial state of TLS session is EfiTlsSessionNotStarted.

The consumer can call BuildResponsePacket() with NULL to get ClientHello to start the TLS session. Then the status is EfiTlsSessionHandShaking.

During handshake, the consumer need call BuildResponsePacket() with input data from peer, then get response packet and send to peer. After handshake finish, the TLS session status becomes EfiTlsSessionDataTransferring, and consumer can use ProcessPacket() for data transferring.

Finally, if consumer wants to active close TLS session, consumer need call SetSessionData to set TLS session state to EfiTlsSessionClosing, and call BuildResponsePacket() with NULL to get CloseNotify alert message, and sent it out.

If any error happen during parsing ApplicationData content type, EFI_ABORT will be returned by ProcessPacket(), and TLS session state will become EfiTlsSessionError. Then consumer need call BuildResponsePacket() with NULL to get alert message and sent it out.

**EFI_TLS_PROTOCOL.GetSessionData()**

**Summary**

Get TLS session data.

**Prototype**

```c
typedef EFI_STATUS (EFIAPI *EFI_TLS_GET_SESSION_DATA)(
    IN EFI_TLS_PROTOCOL        *This,
    IN EFI_TLS_SESSION_DATA_TYPE   DataType,
    IN OUT VOID           *Data, OPTIONAL
    IN OUT UINTN           *DataSize
);
```

**Parameters**

- **This**: Pointer to the EFI_TLS_PROTOCOL instance.
- **DataType**: TLS session data type. See EFI_TLS_SESSION_DATA_TYPE
- **Data**: Pointer to session data.
- **DataSize**: Total size of session data. On input, it means the size of Data buffer. On output, it means the size of copied Data buffer if EFI_SUCCESS, and means the size of desired Data buffer if EFI_BUFFER_TOO_SMALL.

**Description**

The GetSessionData() function return the TLS session information.

EFI_TLS_PROTOCOL.BuildResponsePacket()

**Summary**

Build response packet according to TLS state machine. This function is only valid for alert, handshake and change_cipher_spec content type.

**Prototype**

```c
typedef EFI_STATUS
    (EFIAPI *EFI_TLS_BUILD_RESPONSE_PACKET)(
    IN EFI_TLS_PROTOCOL        *This,
    IN UINT8             *RequestBuffer, OPTIONAL
    IN UINTN             RequestSize, OPTIONAL
    OUT UINT8            *Buffer, OPTIONAL
    IN OUT UINTN          *BufferSize);
```

**Parameters**

- **This**
  Pointer to the EFI_TLS_PROTOCOL instance.
- **RequestBuffer**
  Pointer to the most recently received TLS packet. NULL means TLS need initiate the TLS session and response packet need to be ClientHello.
- **RequestSize**
  Packet size in bytes for the most recently received TLS packet. 0 is only valid when RequestBuffer is NULL.
- **Buffer**
  Pointer to the buffer to hold the built packet.
- **BufferSize**
  Pointer to the buffer size in bytes. On input, it is the buffer size provided by the caller. On output, it is the buffer size in fact needed to contain the packet.

**Description**

The BuildResponsePacket() function builds TLS response packet in response to the TLS request packet specified by RequestBuffer and RequestSize. If RequestBuffer is NULL and RequestSize is 0, the returned packet is a ClientHello packet. If RequestBuffer is not NULL and RequestSize is 0, the returned packet is a ClientHello packet with a zero-length record. If RequestBuffer is NULL and RequestSize is not 0, the returned packet is a ServerHello packet.

The function can return the following status code:

- EFI_SUCCESS
  The TLS session data is got successfully.
- EFI_INVALID_PARAMETER
  One or more of the following conditions is TRUE:
  • This is NULL.
  • DataSize is NULL.
  • Data is NULL if *DataSize is not zero.
- EFI_UNSUPPORTED
  The DataType is unsupported.
- EFI_NOT_FOUND
  The TLS session data is not found.
- EFI_NOT_READY
  The DataType is not ready in current session state.
- EFI_BUFFER_TOO_SMALL
  The buffer is too small to hold the data.
is 0, and TLS session status is `EfiTlsSessionNot Started`, the TLS session will be initiated and the response packet needs to be ClientHello. If `RequestBuffer` is NULL and `RequestSize` is 0, and TLS session status is `EfiTlsSessionClosing`, the TLS session will be closed and response packet needs to be CloseNotify. If `RequestBuffer` is NULL and `RequestSize` is 0, and TLS session status is `EfiTlsSessionError`, the TLS session has errors and the response packet needs to be Alert message based on error type.

**Status Codes Returned**

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The required TLS packet is built successfully.</td>

</tr>
</tbody>
</table>

**EFI_TLS_PROTOCOL.ProcessPacket ()**

**Summary**

Decrypt or encrypt TLS packet during session. This function is only valid after session connected and for application_data content type.

**Prototype**

```c
typedef EFI_STATUS (EFIAPI *EFI_TLS_PROCESS_PACKET)(
    IN EFI_TLS_PROTOCOL       *This,
    IN OUT EFI_TLS_FRAGMENT_DATA **FragmentTable,
    IN UINT32            *FragmentCount,
    IN EFI_TLS_CRYPT_MODE   CryptMode
);
```

**Parameters**

- **This** Pointer to the `EFI_TLS_PROTOCOL` instance.
- **FragmentTable** Pointer to a list of fragment. The caller will take responsible to handle the original `FragmentTable` while it may be reallocated in TLS driver. If `CryptMode` is `EfiTlsEncrypt`, on input these fragments contain the TLS header and plain text TLS APP payload; on output these fragments contain the TLS header and cypher text TLS APP payload. If `CryptMode` is `EfiTlsDecrypt`, on input these fragments contain the TLS
header and cypher text TLS APP payload; on output these fragments contain the TLS header and plain text TLS APP payload.

<table>
<thead>
<tr>
<th>FragmentCount</th>
<th>Number of fragment.</th>
</tr>
</thead>
<tbody>
<tr>
<td>CryptMode</td>
<td>Crypt mode.</td>
</tr>
</tbody>
</table>

**Description**

The ProcessPacket() function process each inbound or outbound TLS APP packet.

**Related Definitions**

//******************************************************************************************
// EFI_TLS_FRAGMENT_DATA
//******************************************************************************************
typedef struct {
    UINT32     FragmentLength;
    VOID   *FragmentBuffer;

28.10.3 EFI TLS Configuration Protocol

**EFI_TLS_CONFIGURATION_PROTOCOL**

Summary
This protocol provides a way to set and get TLS configuration.

GUID

```c
#define EFI_TLS_CONFIGURATION_PROTOCOL_GUID \
{ 0x1682fe44, 0xbd7a, 0x4407, \ 
 {0xb7, 0xc7, 0xdc, 0xa3, 0x7c, 0xa3, 0x92, 0x2d }}
```

Protocol Interface Structure

```c
typedef struct _EFI_TLS_CONFIGURATION_PROTOCOL {
  EFI_TLS_CONFIGURATION_SET_DATA    SetData;
  EFI_TLS_CONFIGURATION_GET_DATA    GetData;
} EFI_TLS_CONFIGURATION_PROTOCOL;
```

Parameters

- **SetData**
  Set TLS configuration data. See the `SetData()` function description.

- **GetData**
  Get TLS configuration data. See the `GetData()` function description.

Description

The **EFI_TLS_CONFIGURATION_PROTOCOL** is designed to provide a way to set and get TLS configuration, such as Certificate, private key file.
EFI_TLS_CONFIGURATION_PROTOCOL.SetData()

Summary
Set TLS configuration data.

Prototype

typedef

EFI_STATUS

(EIFIAPI *EFI_TLS_CONFIGURATION_SET_DATA)(

IN EFI_TLS_CONFIGURATION_PROTOCOL *This,
IN EFI_TLS_CONFIG_DATA_TYPE.DataType,
IN VOID *Data,
IN UINTN DataSize
);

Parameters

This Pointer to the EFI_TLS_CONFIGURATION_PROTOCOL instance.
DataType Configuration data type. See EFI_TLS_CONFIG_DATA_TYPE
Data Pointer to configuration data.
DataSize Total size of configuration data.

Description

The SetData() function sets TLS configuration to non-volatile storage or volatile storage.

Related Definitions

//**************************************************************
// EFI_TLS_CONFIG_DATA_TYPE
//**************************************************************
typedef enum {
 EfiTlsConfigDataTypeHostPublicCert,
 EfiTlsConfigDataTypeHostPrivateKey,
 EfiTlsConfigDataTypeCACertificate,
 EfiTlsConfigDataTypeCertRevocationList,
 EfiTlsConfigDataTypeTypeMaximum
} EFI_TLS_CONFIG_DATA_TYPE;

EfiTlsConfigDataTypeHostPublicCert
Local host configuration data: public certificate data. This data should be DER-encoded binary X.509 certificate or PEM-encoded X.509 certificate.

EfiTlsConfigDataTypeHostPrivateKey
Local host configuration data: private key data.

EfiTlsConfigDataTypeCACertificate
CA certificate to verify peer. This data should be PEM-encoded RSA or PKCS#8 private key.

EfiTlsConfigDataTypeCertRevocationList
CA-supplied Certificate Revocation List data. This data should be DER-encoded CRL data.

### EFI_TLS_CONFIGURATION_PROTOCOL.GetData()

**Summary**

Get TLS configuration data.

**Prototype**

```c
typedef
    EFI_STATUS
(EFIAPI *EFI_TLS_CONFIGURATION_GET_DATA)(
    IN EFI_TLS_CONFIGURATION_PROTOCOL *This,
    IN EFI_TLS_CONFIG_DATA_TYPE     DataType,
    IN OUT VOID             *Data,
    OPTIONAL IN OUT UINTN    *DataSize
);
```

**Parameters**

- **This**
  - Pointer to the EFI_TLS_CONFIGURATION_PROTOCOL instance.
- **DataType**
  - Configuration data type. See EFI_TLS_CONFIG_DATA_TYPE
- **Data**
  - Pointer to configuration data.
- **DataSize**
  - Total size of configuration data. On input, it means the size of Data buffer. On output, it means the size of copied Data buffer if EFI_SUCCESS, and means the size of desired Data buffer if EFI_BUFFER_TOO_SMALL.

**Description**

The GetData() function gets TLS configuration.

29.1 ARP Protocol

This section defines the EFI Address Resolution Protocol (ARP) Protocol interface. It is split into the following two main sections:

- ARP Service Binding Protocol (ARPSBP)
- ARP Protocol (ARP)

ARP provides a generic implementation of the Address Resolution Protocol that is described in RFCs 826 and 1122. For RFCs can be found see “Links to UEFI-Related Documents” (http://uefi.org/uefi) under the heading “IETF” (RFCs 826 and 1122) for details for code of ICMP message.

EFI_ARP_SERVICE_BINDING_PROTOCOL

Summary

The ARPSBP is used to locate communication devices that are supported by an ARP driver and to create and destroy instances of the ARP child protocol driver.

The EFI Service Binding Protocol in Section 2.5.8 defines the generic Service Binding Protocol functions. This section discusses the details that are specific to the ARP.

GUID

```c
#define EFI_ARP_SERVICE_BINDING_PROTOCOL_GUID \
{0xf44c00ee,0x1f2c,0x4a00,\} \
{0xaa,0x09,0x1c,0x9f,0x3e,0x08,0x00,0xa3}
```

Description

A network application (or driver) that requires network address resolution can use one of the protocol handler services, such as `BS->LocateHandleBuffer()`, to search for devices that publish a ARPSBP GUID. Each device with a published ARPSBP GUID supports ARP and may be available for use.

After a successful call to the `EFI_ARP_SERVICE_BINDING_PROTOCOL.CreateChild()` function, the child ARP driver instance is in an unconfigured state; it is not ready to resolve addresses.

All child ARP driver instances that are created by one `EFI_ARP_SERVICE_BINDING_PROTOCOL` instance will share an ARP cache to improve efficiency.

Before a network application terminates execution, every successful call to the `EFI_ARP_SERVICE_BINDING_PROTOCOL.CreateChild()` function must be matched with a call to the `EFI_ARP_SERVICE_BINDING_PROTOCOL.DestroyChild()` function.
Note: All the network addresses that are described in EFI_ARP_PROTOCOL are stored in network byte order. Both incoming and outgoing ARP packets are also in network byte order. All other parameters that are defined in functions or data structures are stored in host byte order.

EFI_ARP_PROTOCOL

Summary
ARP is used to resolve local network protocol addresses into network hardware addresses.

GUID
#define EFI_ARP_PROTOCOL_GUID
{0xf4b427bb,0xba21,0x4f16,
{0xbc,0x4e,0x43,0xe4,0x16,0xab,0x61,0x9c}

Protocol Interface Structure
typedef struct _EFI_ARP_PROTOCOL {
    EFI_ARP_CONFIGURE Configure;
    EFI_ARP_ADD Add;
    EFI_ARP_FIND Find;
    EFI_ARP_DELETE Delete;
    EFI_ARP_FLUSH Flush;
    EFI_ARP_REQUEST Request;
    EFI_ARP_CANCEL Cancel;
} EFI_ARP_PROTOCOL;

Parameters
  Configure Adds a new station address (protocol type and network address) to the ARP cache. See the Configure() function description.
  Add Manually inserts an entry to the ARP cache for administrative purpose. See the Add() function description.
  Find Locates one or more entries in the ARP cache. See the Find() function description.
  Delete Removes an entry from the ARP cache. See the Delete() function description.
  Flush Removes all dynamic ARP cache entries of a specified protocol type. See the Flush() function description.
  Request Starts an ARP request session. See the Request() function description.
  Cancel Abort previous ARP request session. See the Cancel() function description.

Description
The EFI_ARP_PROTOCOL defines a set of generic ARP services that can be used by any network protocol driver to resolve subnet local network addresses into hardware addresses. Normally, a periodic timer event internally sends and receives packets for ARP. But in some systems where the periodic timer is not
supported, drivers and applications that are experiencing packet loss should try calling the \texttt{Poll()} function of the EFI Managed Network Protocol frequently.

\textbf{Note:} \texttt{Add()} and \texttt{Delete()} are typically used for administrative purposes, such as denying traffic to and from a specific remote machine, preventing ARP requests from coming too fast, and providing static address pairs to save time. \texttt{Find()} is also used to update an existing ARP cache entry.

\texttt{EFI_ARP_PROTOCOL.Configure()}

\textbf{Summary}
Assigns a station address (protocol type and network address) to this instance of the ARP cache.

\textbf{Prototype}
\begin{verbatim}
typedef EFI_STATUS (EFIAPI *EFI_ARP_CONFIGURE) ( 
    IN EFI_ARP_PROTOCOL *This, 
    IN EFI_ARP_CONFIG_DATA *ConfigData OPTIONAL );
\end{verbatim}

\textbf{Parameters}
- \texttt{This} A pointer to the \texttt{EFI_ARP_PROTOCOL} instance.
- \texttt{ConfigData} A pointer to the \texttt{EFI_ARP_CONFIG_DATA} structure. Type \texttt{EFI_ARP_CONFIG_DATA} is defined in “Related Definitions” below.

\textbf{Description}
The \texttt{Configure()} function is used to assign a station address to the ARP cache for this instance of the ARP driver. Each ARP instance has one station address. The \texttt{EFI_ARP_PROTOCOL} driver will respond to ARP requests that match this registered station address. A call to \texttt{Configure()} with the \texttt{ConfigData} field set to \texttt{NULL} will reset this ARP instance.

Once a protocol type and station address have been assigned to this ARP instance, all the following ARP functions will use this information. Attempting to change the protocol type or station address to a configured ARP instance will result in errors.
Related Definitions

```c
typedef struct {  
UINT16   SwAddressType;
UINT8    SwAddressLength;
VOID     *StationAddress;
UINT32   EntryTimeOut;
UINT32   RetryCount;
UINT32   RetryTimeOut;
} EFI_ARP_CONFIG_DATA;
```

- **SwAddressType**: 16-bit protocol type number in host byte order. For more information see “Links to UEFI-Related Documents” ([http://uefi.org/uefi](http://uefi.org/uefi)) under the heading “16-bit protocol type numbers”.

- **SwAddressLength**: Length in bytes of the station’s protocol address to register.

- **StationAddress**: Pointer to the first byte of the protocol address to register. For example, if `SwAddressType` is 0x0800 (IP), then `StationAddress` points to the first byte of this station’s IP address stored in network byte order.

- **EntryTimeOut**: The timeout value in 100-ns units that is associated with each new dynamic ARP cache entry. If it is set to zero, the value is implementation-specific.

- **RetryCount**: The number of retries before a MAC address is resolved. If it is set to zero, the value is implementation-specific.

- **RetryTimeOut**: The timeout value in 100-ns units that is used to wait for the ARP reply packet or the timeout value between two retries. Set to zero to use implementation-specific value.

**EFI_ARP_PROTOCOL.Add()**

**Summary**

Inserts an entry to the ARP cache.

**Prototype**

```c
typedef
  EFI_STATUS
  (EFIAPI *EFI_ARP_ADD) (    
  IN EFI_ARP_PROTOCOL *This,  
  IN BOOLEAN DenyFlag,       
  IN VOID *TargetSwAddress OPTIONAL, 
  IN VOID *TargetHwAddress OPTIONAL, 
  IN UINT32 TimeoutValue,    
  IN BOOLEAN Overwrite    
);    
```

**Parameters**

- **This**
  A pointer to the **EFI_ARP_PROTOCOL** instance.

- **DenyFlag**
  Set to **TRUE** if this entry is a “deny” entry. Set to **FALSE** if this entry is a “normal” entry.

- **TargetSwAddress**
  Pointer to a protocol address to add (or deny). May be set to **NULL** if DenyFlag is **TRUE**.

- **TargetHwAddress**
  Pointer to a hardware address to add (or deny). May be set to **NULL** if DenyFlag is **TRUE**.

- **TimeoutValue**
  Time in 100-ns units that this entry will remain in the ARP cache. A value of zero means that the entry is permanent. A nonzero value will override the one given by **Configure()** if the entry to be added is dynamic entry.

- **Overwrite**
  If **TRUE**, the matching cache entry will be overwritten with the supplied parameters. If **FALSE**, **EFI_ACCESS_DENIED** is returned if the corresponding cache entry already exists.
Description
The Add() function is used to insert entries into the ARP cache.

ARP cache entries are typically inserted and updated by network protocol drivers as network traffic is processed. Most ARP cache entries will time out and be deleted if the network traffic stops. ARP cache entries that were inserted by the Add() function may be static (will not time out) or dynamic (will time out).

Default ARP cache timeout values are not covered in most network protocol specifications (although RFC 1122 comes pretty close) and will only be discussed in general in this specification. The timeout values that are used in the EFI Sample Implementation should be used only as a guideline. Final product implementations of the EFI network stack should be tuned for their expected network environments.

The Add() function can insert the following two types of entries into the ARP cache:

- “Normal” entries
- “Deny” entries

“Normal” entries must have both a TargetSwAddress and TargetHwAddress and are used to resolve network protocol addresses into network hardware addresses. Entries are keyed by TargetSwAddress. Each TargetSwAddress can have only one TargetHwAddress. A TargetHwAddress may be referenced by multiple TargetSwAddress entries.

“Deny” entries may have a TargetSwAddress or a TargetHwAddress, but not both. These entries tell the ARP driver to ignore any traffic to and from (and to) these addresses. If a request comes in from an address that is being denied, then the request is ignored.

If a normal entry to be added matches a deny entry of this driver, Overwrite decides whether to remove the matching deny entry. On the other hand, an existing normal entry can be removed based on the value of Overwrite if a deny entry to be added matches the existing normal entry. Two entries are matched only when they have the same addresses or when one of the normal entry addresses is the same as the address of a deny entry.

EFI_ARP_PROTOCOL.Find()

Summary
Locates one or more entries in the ARP cache.

Prototype

typedef
 EFI_STATUS
 (EFIAPI *EFI_ARP_FIND) (  
  IN EFI_ARP_PROTOCOL *This,
  IN BOOLEAN BySwAddress,
  IN VOID *AddressBuffer OPTIONAL,
  OUT UINT32 *EntryLength OPTIONAL,
  OUT UINT32 *EntryCount OPTIONAL,
  OUT EFI_ARP_FIND_DATA **Entries OPTIONAL,
  IN BOOLEAN Refresh
 );

Parameters

  This A pointer to the EFI_ARP_PROTOCOL instance.
  BySwAddress Set to TRUE to look for matching software protocol addresses.
                Set to FALSE to look for matching hardware protocol addresses.
  AddressBuffer Pointer to address buffer. Set to NULL to match all addresses.
  EntryLength The size of an entry in the entries buffer. To keep the
               EFI_ARP_FIND_DATA structure properly aligned, this field may be
               longer than sizeof(EFI_ARP_FIND_DATA) plus the length of the
               software and hardware addresses.
  EntryCount The number of ARP cache entries that are found by the specified
               criteria.
  Entries Pointer to the buffer that will receive the ARP cache entries. Type
           EFI_ARP_FIND_DATA is defined in “Related Definitions” below.
  Refresh Set to TRUE to refresh the timeout value of the matching ARP cache
           entry.

Description

The Find() function searches the ARP cache for matching entries and allocates a buffer into which those
entries are copied. The first part of the allocated buffer is EFI_ARP_FIND_DATA, following which are
protocol address pairs and hardware address pairs.

When finding a specific protocol address (BySwAddress is TRUE and AddressBuffer is not NULL), the
ARP cache timeout for the found entry is reset if Refresh is set to TRUE. If the found ARP cache entry is a
permanent entry, it is not affected by Refresh.
Related Definitions

```c
typedef struct {
    UINT32 Size;
    BOOLEAN DenyFlag;
    BOOLEAN StaticFlag;
    UINT16 HwAddressType;
    UINT16 SwAddressType;
    UINT8 HwAddressLength;
    UINT8 SwAddressLength;
} EFI_ARP_FIND_DATA;
```

- **Size**: Length in bytes of this entry.
- **DenyFlag**: Set to `TRUE` if this entry is a “deny” entry. Set to `FALSE` if this entry is a “normal” entry.
- **StaticFlag**: Set to `TRUE` if this entry will not time out. Set to `FALSE` if this entry will time out.
- **HwAddressType**: 16-bit ARP hardware identifier number.
- **SwAddressType**: 16-bit protocol type number.
- **HwAddressLength**: Length of the hardware address.
- **SwAddressLength**: Length of the protocol address.

| EFI_NOT_STARTED             | The ARP driver instance has not been configured.            |

### EFI_ARP_PROTOCOL.Delete()

**Summary**

Removes entries from the ARP cache.
Prototype

typedef

EFI_STATUS

(EIFI_API *EFI_ARP_DELETE) (  
  IN EFI_ARP_PROTOCOL *This,
  IN BOOLEAN BySwAddress,
  IN VOID *AddressBuffer OPTIONAL
 );

Parameters

This A pointer to the EFI_ARP_PROTOCOL instance.
BySwAddress Set to TRUE to delete matching protocol addresses.  
Set to FALSE to delete matching hardware addresses.
AddressBuffer Pointer to the address buffer that is used as a key to look for the 
  cache entry. Set to NULL to delete all entries.

Description

The Delete() function removes specified ARP cache entries.

Status Codes Returned

EFI_ARP_PROTOCOL.Flush()

Summary

Removes all dynamic ARP cache entries that were added by this interface.

Prototype

typedef

EFI_STATUS

(EIFI_API *EFI_ARP_FLUSH) (  
  IN EFI_ARP_PROTOCOL *This
 );

Parameters

This A pointer to the EFI_ARP_PROTOCOL instance.

Description

The Flush() function deletes all dynamic entries from the ARP cache that match the specified software protocol type.
Status Codes Returned

</tbody>
</table>

### EFI_ARP_PROTOCOL.Request()

**Summary**

Starts an ARP request session.

**Prototype**

```c
typedef EFI_STATUS (EFIAPIC *EFI_ARP_REQUEST) ( 
  IN EFI_ARP_PROTOCOL *This, 
  IN VOID *TargetSwAddress OPTIONAL, 
  IN EFI_EVENT ResolvedEvent OPTIONAL, 
  OUT VOID *TargetHwAddress
);
```

**Parameters**

- **This**
  
  A pointer to the `EFI_ARP_PROTOCOL` instance.

- **TargetSwAddress**
  
  Pointer to the protocol address to resolve.

- **ResolvedEvent**
  
  Pointer to the event that will be signaled when the address is resolved or some error occurs.

- **TargetHwAddress**
  
  Pointer to the buffer for the resolved hardware address in network byte order. The buffer must be large enough to hold the resulting hardware address. `TargetHwAddress` must not be NULL.

**Description**

The `Request()` function tries to resolve the `TargetSwAddress` and optionally returns a `TargetHwAddress` if it already exists in the ARP cache.

If the registered `SwAddressType` (see `EFI_ARP_PROTOCOL.Add()`) is IPv4 or IPv6 and the `TargetSwAddress` is a multicast address, then the `TargetSwAddress` is resolved using the underlying `EFI_MANAGED_NETWORK_PROTOCOL.McastIpToMac()` function.

If the `TargetSwAddress` is NULL, then the network interface hardware broadcast address is returned immediately in `TargetHwAddress`.

If the `ResolvedEvent` is not NULL and the address to be resolved is not in the ARP cache, then the event will be signaled when the address request completes and the requested hardware address is returned in the `TargetHwAddress`. If the timeout expires and the retry count is exceeded or an unexpected error occurs, the event will be signaled to notify the caller, which should check the `TargetHwAddress` to see if the requested hardware address is available. If it is not available, the `TargetHwAddress` is filled by zero.
If the address to be resolved is already in the ARP cache and resolved, then the event will be signaled immediately if it is not **NULL**, and the requested hardware address is also returned in `TargetHwAddress`.

### Status Codes Returned

<table>
<thead>
<tr>

<td>The requested conversion is not supported in this implementation or configuration.</td>
</tr>
</tbody>
</table>

### EFI_ARP_PROTOCOL.Cancel()

#### Summary
Cancels an ARP request session.

#### Prototype

```c
typedef
    EFI_STATUS
    (EFIAPI *EFI_ARP_CANCEL) (  
    IN EFI_ARP_PROTOCOL *This,
    IN VOID *TargetSwAddress OPTIONAL,
    IN EFI_EVENT ResolvedEvent OPTIONAL
    );
```

#### Parameters

- **This** A pointer to the **EFI_ARP_PROTOCOL** instance.
- **TargetSwAddress** Pointer to the protocol address in previous request session.
- **ResolvedEvent** Pointer to the event that is used as the notification event in previous request session.

#### Description
The `Cancel()` function aborts the previous ARP request (identified by `This`, `TargetSwAddress` and `ResolvedEvent`) that is issued by `EFI_ARP_PROTOCOL.Request()`. If the request is in the internal ARP request queue, the request is aborted immediately and its `ResolvedEvent` is signaled. Only an asynchronous address request needs to be canceled. If `TargetSwAddress` and `ResolvedEvent` are both **NULL**, all the pending asynchronous requests that have been issued by `This` instance will be cancelled and their corresponding events will be signaled.
29.2 EFI DHCPv4 Protocol

This section provides a detailed description of the `EFI_DHCP4_PROTOCOL` and the `EFI_DHCP4_SERVICE_BINDING_PROTOCOL`. The EFI DHCPv4 Protocol is used to collect configuration information for the EFI IPv4 Protocol drivers and to provide DHCPv4 server and PXE boot server discovery services.

**EFI_DHCP4_SERVICE_BINDING_PROTOCOL**

*Summary*

The EFI DHCPv4 Service Binding Protocol is used to locate communication devices that are supported by an EFI DHCPv4 Protocol driver and to create and destroy EFI DHCPv4 Protocol child driver instances that can use the underlying communications device.

**GUID**

```c
#define EFI_DHCP4_SERVICE_BINDING_PROTOCOL_GUID \
{0x9d9a39d8,0xbd42,0x4a73,\ 
{0xa4,0xd5,0x8e,0xe9,0x4b,0xe1,0x13,0x80}}
```

*Description*

A network application or driver that requires basic DHCPv4 services can use one of the protocol handler services, such as `BS->LocateHandleBuffer()`, to search for devices that publish an EFI DHCPv4 Service Binding Protocol GUID. Each device with a published EFI DHCPv4 Service Binding Protocol GUID supports the EFI DHCPv4 Protocol and may be available for use.

After a successful call to the `EFI_DHCP4_SERVICE_BINDING_PROTOCOL.CreateChild()` function, the newly created EFI DHCPv4 Protocol child driver instance is ready to be used by a network application or driver.

Before a network application or driver terminates execution, every successful call to the `EFI_DHCP4_SERVICE_BINDING_PROTOCOL.CreateChild()` function must be matched with a call to the `EFI_DHCP4_SERVICE_BINDING_PROTOCOL.DestroyChild()` function.

---

### Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The pending request session(s) is/are aborted and corresponding event(s) is/are signaled.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>One or more of the following conditions is <strong>TRUE</strong>:</td>
</tr>
<tr>
<td></td>
<td>• This is <strong>NULL</strong></td>
</tr>
<tr>

<td>The ARP driver instance has not been configured.</td>
</tr>
<tr>
<td>EFI_NOT_FOUND</td>
<td>The request is not issued by <code>EFI_ARP_PROTOCOL.Request()</code>.</td>
</tr>
</tbody>
</table>

EFI_SUCCESS

The pending request session(s) is/are aborted and corresponding event(s) is/are signaled.

EFI_INVALID_PARAMETER

One or more of the following conditions is **TRUE**:

- **This is NULL**
- TargetSwAddress is **not NULL** and ResolvedEvent is **NULL**
- TargetSwAddress is **NULL** and ResolvedEvent is **not NULL**

EFI_NOT_STARTED

The ARP driver instance has not been configured.

EFI_NOT_FOUND

The request is not issued by `EFI_ARP_PROTOCOL.Request()`.
**EFI_DHCP4_PROTOCOL**

**Summary**
This protocol is used to collect configuration information for the EFI IPv4 Protocol drivers and to provide DHCPv4 server and PXE boot server discovery services.

**GUID**
```
#define EFI_DHCP4_PROTOCOL_GUID \ 
{0x8a219718,0x4ef5,0x4761,\ 
{0x91,0xc8,0xc0,0xf0,0x4b,0xda,0x9e,0x56}}
```

**Protocol Interface Structure**
```c
typedef struct _EFI_DHCP4_PROTOCOL {
    EFI_DHCP4_GET_MODE_DATA  GetModeData;
    EFI_DHCP4_CONFIGURE      Configure;
    EFI_DHCP4_START          Start;
    EFI_DHCP4_RENEW_REBIND   RenewRebind;
    EFI_DHCP4_RELEASE        Release;
    EFI_DHCP4_STOP           Stop;
    EFI_DHCP4_BUILD          Build;
    EFI_DHCP4_TRANSMIT_RECEIVE TransmitReceive;
    EFI_DHCP4PARSE           Parse;
} EFI_DHCP4_PROTOCOL;
```

**Parameters**
- **GetModeData**
  Gets the EFI DHCPv4 Protocol driver status and operational data. See the `GetModeData()` function description.
- **Configure**
  Initializes, changes, or resets operational settings for the EFI DHCPv4 Protocol driver. See the `Configure()` function description.
- **Start**
  Starts the DHCP configuration process. See the `Start()` function description.
- **RenewRebind**
  Tries to manually extend the lease time by sending a request packet. See the `RenewRebind()` function description.
- **Release**
  Releases the current configuration and returns the EFI DHCPv4 Protocol driver to the initial state. See the `Release()` function description.
- **Stop**
  Stops the DHCP configuration process no matter what state the driver is in. After being stopped, this driver will not automatically communicate with the DHCP server. See the `Stop()` function description.
- **Build**
  Puts together a DHCP or PXE packet. See the `Build()` function description.
- **TransmitReceive**
  Transmits a DHCP or PXE packet and waits for response packets. See the `TransmitReceive()` function description.
- **Parse**
  Parses the packed DHCP or PXE option data. See the `Parse()` function description.
Description
The EFI_DHCP4_PROTOCOL is used to collect configuration information for the EFI IPv4 Protocol driver and provide DHCP server and PXE boot server discovery services.

Byte Order Note
All the IPv4 addresses that are described in EFI_DHCP4_PROTOCOL are stored in network byte order. Both incoming and outgoing DHCP packets are also in network byte order. All other parameters that are defined in functions or data structures are stored in host byte order.

EFI_DHCP4_PROTOCOL.GetModeData()

Summary
Returns the current operating mode and cached data packet for the EFI DHCPv4 Protocol driver.

Prototype
typedef
    EFI_STATUS
    (EFFIAPI *EFI_DHCP4_GET_MODE_DATA)(
    IN EFI_DHCP4_PROTOCOL *This,
    OUT EFI_DHCP4_MODE_DATA *Dhcp4ModeData
    );

Parameters
This Pointer to the EFI_DHCP4_PROTOCOL instance.
Dhcp4ModeData Pointer to storage for the EFI_DHCP4_MODE_DATA structure. Type EFI_DHCP4_MODE_DATA is defined in “Related Definitions” below.

Description
The GetModeData() function returns the current operating mode and cached data packet for the EFI DHCPv4 Protocol driver.

Related Definitions
//************************************************************************************
// EFI_DHCP4_MODE_DATA
//************************************************************************************
typedef struct {
    EFI_DHCP4_STATE State;
    EFI_DHCP4_CONFIG_DATA ConfigData;
    EFI_IPv4_ADDRESS ClientAddress;
    EFI_MAC_ADDRESS ClientMacAddress;
    EFI_IPv4_ADDRESS ServerAddress;
    EFI_IPv4_ADDRESS RouterAddress;
    EFI_IPv4_ADDRESS SubnetMask;
    UINT32 LeaseTime;
    EFI_DHCP4_PACKET *ReplyPacket;
} EFI_DHCP4_MODE_DATA;
State

The EFI DHCPv4 Protocol driver operating state. Type EFI_DHCP4_STATE is defined below.

ConfigData

The configuration data of the current EFI DHCPv4 Protocol driver instance. Type EFI_DHCP4_CONFIG_DATA is defined in EFI_DHCP4_PROTOCOL.Confirm().

ClientAddress

The client IP address that was acquired from the DHCP server. If it is zero, the DHCP acquisition has not completed yet and the following fields in this structure are undefined.

ClientMacAddress

The local hardware address.

ServerAddress

The server IP address that is providing the DHCP service to this client.

RouterAddress

The router IP address that was acquired from the DHCP server. May be zero if the server does not offer this address.

SubnetMask

The subnet mask of the connected network that was acquired from the DHCP server.

LeaseTime

The lease time (in 1-second units) of the configured IP address. The value 0xFFFFFFFF means that the lease time is infinite. A default lease of 7 days is used if the DHCP server does not provide a value.

ReplyPacket

The cached latest DHCPACK or DHCPNAK or BOOTP REPLY packet. May be NULL if no packet is cached.

The EFI_DHCP4_MODE_DATA structure describes the operational data of the current DHCP procedure.

```c
typedef enum {
    Dhcp4Stopped      = 0x0,
    Dhcp4Init         = 0x1,
    Dhcp4Selecting    = 0x2,
    Dhcp4Requesting   = 0x3,
    Dhcp4Bound        = 0x4
    Dhcp4Renewing     = 0x5,
    Dhcp4Rebinding    = 0x6,
    Dhcp4InitReboot   = 0x7,
    Dhcp4Rebooting    = 0x8
} EFI_DHCP4_STATE;
```

Table 29-1 describes the fields in the above enumeration.
Table 29-1 DHCP Enumerations

</tr>
<tr>
<td>Dhcp4Rebooting</td>
<td>The EFI DHCPv4 Protocol driver is seeking to reuse the previously allocated IP address by sending a request to the DHCP server. The rest of the \texttt{EFI_DHCP4_MODE_DATA} structure is undefined in this state.</td>
</tr>
</tbody>
</table>

\texttt{EFI\_DHCP4\_STATE} defines the DHCP operational states that are described in RFC 2131, which can be obtained at “Links to UEFI-Related Documents” (http://uefi.org/uefi) under the heading “RFC 2131”.

A variable number of EFI DHCPv4 Protocol driver instances can coexist but they share the same state machine. More precisely, each communication device has a separate DHCP state machine if there are multiple communication devices. Each EFI DHCPv4 Protocol driver instance that is created by the same EFI DHCPv4 Service Binding Protocol driver instance shares the same state machine. In this document, when we refer to the state of EFI DHCPv4 Protocol driver, we actually refer to the state of the communication device from which the current EFI DHCPv4 Protocol Driver instance is created.
# EFI_DHCP4 PACKET

```c
#pragma pack(1)
typedef struct {
  UINT32 Size;
  UINT32 Length;
  struct{
    EFI_DHCP4_HEADER Header;
    UINT32 Magik;
    UINT8 Option[1];
  } Dhcp4;
} EFI_DHCP4_PACKET;
#pragma pack()
```

**Size**
Size of the **EFI_DHCP4_PACKET** buffer.

**Length**
Length of the **EFI_DHCP4_PACKET** from the first byte of the **Header** field to the last byte of the **Option[]** field.

**Header**
DHCP packet header.

**Magik**
DHCP magik cookie in network byte order.

**Option**
Start of the DHCP packed option data.

**EFI_DHCP4_PACKET** defines the format of DHCPv4 packets. See RFC 2131 for more information.

## EFI_DHCP4_PROTOCOL.Configure()

**Summary**
Initializes, changes, or resets the operational settings for the EFI DHCPv4 Protocol driver.

**Prototype**

```c
typedef
  EFI_STATUS
  (EFI_API *EFI_DHCP4_CONFIGURE) (
    IN EFI_DHCP4_PROTOCOL *This,
    IN EFI_DHCP4_CONFIG_DATA *Dhcp4CfgData OPTIONAL
  );
```

**Parameters**

*This* Pointer to the **EFI_DHCP4_PROTOCOL** instance.
Dhcp4CfgData

Pointer to the EFI_DHCP4_CONFIG_DATA Type.

EFI_DHCP4_CONFIG_DATA is defined in “Related Definitions” below.

Description

The Configure() function is used to initialize, change, or reset the operational settings of the EFI DHCPv4 Protocol driver for the communication device on which the EFI DHCPv4 Service Binding Protocol is installed. This function can be successfully called only if both of the following are true:

- This instance of the EFI DHCPv4 Protocol driver is in the Dhcp4Stopped, Dhcp4Init, Dhcp4InitReboot, or Dhcp4Bound states.
- No other EFI DHCPv4 Protocol driver instance that is controlled by this EFI DHCPv4 Service Binding Protocol driver instance has configured this EFI DHCPv4 Protocol driver.

When this driver is in the Dhcp4Stopped state, it can transfer into one of the following two possible initial states:

- Dhcp4Init
- Dhcp4InitReboot

The driver can transfer into these states by calling Configure() with a non-NULL Dhcp4CfgData. The driver will transfer into the appropriate state based on the supplied client network address in the ClientAddress parameter and DHCP options in the OptionList parameter as described in RFC 2131.

When Configure() is called successfully while Dhcp4CfgData is set to NULL, the default configuring data will be reset in the EFI DHCPv4 Protocol driver and the state of the EFI DHCPv4 Protocol driver will not be changed. If one instance wants to make it possible for another instance to configure the EFI DHCPv4 Protocol driver, it must call this function with Dhcp4CfgData set to NULL.

    UINT32 DiscoverTryCount;
    UINT32 *DiscoverTimeout;
    UINT32 RequestTryCount;
    UINT32 *RequestTimeout;
    EFI_IPv4_ADDRESS ClientAddress;
    EFI_DHCP4_CALLBACK Dhcp4Callback;
    VOID *CallbackContext;
    UINT32 OptionCount;
    EFI_DHCP4_PACKET_OPTION **OptionList;
} EFI_DHCP4_CONFIG_DATA;

DiscoverTryCount

Number of times to try sending a packet during the Dhcp4SendDiscover event and waiting for a response during the Dhcp4RcvdOffer event. (This value is also the number of entries in
the DiscoverTimeout array.) Set to zero to use the default try counts and timeout values.

DiscoverTimeout  Maximum amount of time (in seconds) to wait for returned packets in each of the retries. Timeout values of zero will default to a timeout value of one second. Set to NULL to use default timeout values.

RequestTryCount  Number of times to try sending a packet during the Dhcp4SendRequest event and waiting for a response during the Dhcp4RcvdAck event before accepting failure. (This value is also the number of entries in the RequestTimeout array.) Set to zero to use the default try counts and timeout values.

RequestTimeout  Maximum amount of time (in seconds) to wait for return packets in each of the retries. Timeout values of zero will default to a timeout value of one second. Set to NULL to use default timeout values.

ClientAddress  For a DHCPDISCOVER, setting this parameter to the previously allocated IP address will cause the EFI DHCPv4 Protocol driver to enter the Dhcp4InitReboot state. Also, set this field to 0.0.0.0 to enter the Dhcp4Init state. For a DHCPINFORM this parameter should be set to the client network address which was assigned to the client during a DHCPDISCOVER.

Dhcp4Callback  The callback function to intercept various events that occurred in the DHCP configuration process. Set to NULL to ignore all those events. Type EFI_DHCP4_CALLBACK is defined below.

CallbackContext  Pointer to the context that will be passed to Dhcp4Callback when it is called.

OptionCount  Number of DHCP options in the OptionList.

OptionList  List of DHCP options to be included in every packet that is sent during the Dhcp4SendDiscover event. Pad options are appended automatically by DHCP driver in outgoing DHCP packets. If OptionList itself contains pad option, they are ignored by the driver. OptionList can be freed after EFI_DHCP4_PROTOCOL.Configure() returns. Ignored if OptionCount is zero. Type EFI_DHCP4_PACKET_OPTION is defined below.

//**********************************************************
// EFI_DHCP4_CALLBACK
//**********************************************************
typedef EFI_STATUS (*EFI_DHCP4_CALLBACK)(
    IN EFI_DHCP4_PROTOCOL *This,
    IN VOID *Context,
    IN EFI_DHCP4_STATE CurrentState,
    IN EFI_DHCP4_EVENT Dhcp4Event,
    IN EFI_DHCP4_PACKET *Packet, OPTIONAL
    OUT EFI_DHCP4_PACKET **NewPacket OPTIONAL
);
This

Pointer to the EFI DHCPv4 Protocol instance that is used to configure this callback function.

Context

Pointer to the context that is initialized by `EFI_DHCP4_PROTOCOL.Configure()`.

currentState

The current operational state of the EFI DHCPv4 Protocol driver. Type `EFI_DHCP4_STATE` is defined in `EFI_DHCP4_PROTOCOL.GetModeData()`.

Dhcp4Event

The event that occurs in the current state, which usually means a state transition. Type `EFI_DHCP4_EVENT` is defined below.

Packet

The DHCP packet that is going to be sent or already received. May be `NULL` if the event has no associated packet. Do not cache this packet except for copying it. Type `EFI_DHCP4_PACKET` is defined in `EFI_DHCP4_PROTOCOL.GetModeData()`.

NewPacket

The packet that is used to replace the above `Packet`. Do not set this pointer exactly to the above `Packet` or a modified `Packet`. `NewPacket` can be `NULL` if the EFI DHCPv4 Protocol driver does not expect a new packet to be returned. The user may set `*NewPacket` to `NULL` if no replacement occurs.

`EFI_DHCP4_CALLBACK` is provided by the consumer of the EFI DHCPv4 Protocol driver to intercept events that occurred in the configuration process. This structure provides advanced control of each state transition of the DHCP process. The returned status code determines the behavior of the EFI DHCPv4 Protocol driver. There are three possible returned values, which are described in the following table.

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>EFI_SUCCESS</code></td>
<td>Tells the EFI DHCPv4 Protocol driver to continue the DHCP process. When</td>
</tr>
<tr>
<td></td>
<td>it is in the <code>Dhcp4Selecting</code> state, it tells the EFI DHCPv4 Protocol</td>
</tr>
<tr>
<td></td>
<td>driver to stop collecting additional packets. The driver will exit the</td>
</tr>
<tr>
<td></td>
<td><code>Dhcp4Selecting</code> state and enter the <code>Dhcp4Requesting</code> state.</td>
</tr>
<tr>
<td><code>EFI_NOT_READY</code></td>
<td>Only used in the <code>Dhcp4Selecting</code> state. The EFI DHCPv4 Protocol driver</td>
</tr>
<tr>
<td></td>
<td>will continue to wait for more packets until the retry timeout</td>
</tr>
<tr>
<td></td>
<td>expires.</td>
</tr>
<tr>
<td><code>EFI_ABORTED</code></td>
<td>Tells the EFI DHCPv4 Protocol driver to abort the current process and</td>
</tr>
<tr>
<td></td>
<td>return to the <code>Dhcp4Init</code> or <code>Dhcp4InitReboot</code> state.</td>
</tr>
</tbody>
</table>
typedef enum {
    Dhcp4SendDiscover    = 0x01,
    Dhcp4RcvdOffer       = 0x02,
    Dhcp4SelectOffer     = 0x03,
    Dhcp4SendRequest     = 0x04,
    Dhcp4RcvdAck         = 0x05,
    Dhcp4RcvdNak         = 0x06,
    Dhcp4SendDecline     = 0x07,
    Dhcp4BoundCompleted  = 0x08,
    Dhcp4EnterRenewing   = 0x09,
    Dhcp4EnterRebinding  = 0x0a,
    Dhcp4AddressLost     = 0x0b,
    Dhcp4Fail            = 0x0c
} EFI_DHCP4_EVENT;

Following is a description of the fields in the above enumeration.

**Dhcp4SendDiscover** The packet to start the configuration sequence is about to be sent. The packet is passed to Dhcp4Callback and can be modified or replaced in Dhcp4Callback.

**Dhcp4RcvdOffer** A reply packet was just received. This packet is passed to Dhcp4Callback, which may copy this packet and cache it for selecting a task later. If the callback returns EFI_SUCCESS, this driver will finish the selecting state. If EFI_NOT_READY is returned, this driver will continue to wait for additional reply packets until the timer expires. In either case, Dhcp4SelectOffer will occur for the user to select an offer.

**Dhcp4SelectOffer** It is time for Dhcp4Callback to select an offer. This driver passes the latest received DHCPOFFER packet to the callback. The Dhcp4Callback may store one packet in the NewPacket parameter of the function that was selected from previously received DHCPOFFER packets. If the latest packet is the selected one or if the user does not care about it, no extra overhead is needed. Simply skipping this event is enough.

**Dhcp4SendRequest** A request packet is about to be sent. The user can modify or replace this packet.

**Dhcp4RcvdAck** A DHCPACK packet was received and will be passed to Dhcp4Callback. The callback may decline this DHCPACK packet by returning EFI_ABORTED. In this case, the EFI DHCPv4 Protocol driver will proceed to the Dhcp4SendDecline event.

**Dhcp4RcvdNak** A DHCPNAK packet was received and will be passed to Dhcp4Callback. The EFI DHCPv4 Protocol driver will then return to the Dhcp4Init state no matter what status code is returned from the callback function.
Dhcp4SendDecline A decline packet is about to be sent. Dhcp4Callback can modify or replace this packet. The EFI DHCPv4 Protocol driver will then be set to the Dhcp4Init state.

Dhcp4BoundCompleted The DHCP configuration process has completed. No packet is associated with this event.

Dhcp4EnterRenewing It is time to enter the Dhcp4Renewing state and to contact the server that originally issued the network address. No packet is associated with this event.

Dhcp4EnterRebinding It is time to enter the Dhcp4Rebinding state and to contact any server. No packet is associated with this event.

Dhcp4AddressLost The configured IP address was lost either because the lease has expired, the user released the configuration, or a DHCPNAK packet was received in the Dhcp4Renewing or Dhcp4Rebinding state. No packet is associated with this event.

Dhcp4Fail The DHCP process failed because a DHCPNAK packet was received or the user aborted the DHCP process at a time when the configuration was not available yet. No packet is associated with this event.

//*******************************************
// EFI_DHCP4_HEADER
//*******************************************
#pragma pack(1)
typedef struct{
    UINT8(Op Code);
    UINT8(Hw Type);
    UINT8(Hw AddrLen);
    UINT8(Hops);
    UINT32(Xid);
    UINT16(Seconds);
    UINT16(Reserved);
    EFI_IPv4_ADDRESS(ClientAddr);
    EFI_IPv4_ADDRESS(YourAddr);
    EFI_IPv4_ADDRESS(ServerAddr);
    EFI_IPv4_ADDRESS(GatewayAddr);
    UINT8(ClientHwAddr[16]);
    CHAR8(ServerName[64]);
    CHAR8(BootFileName[128]);
} EFI_DHCP4_HEADER;
#pragma pack()
Seconds  Number of seconds that have elapsed since the client began address
acquisition or the renewal process.
Reserved   Reserved for future use.
ClientAddr Client IP address from the client.
YourAddr   Client IP address from the server.
ServerAddr IP address of the next server in bootstrap.
GatewayAddr Relay agent IP address.
ClientHwAddr Client hardware address.
ServerName Optional server host name.
BootFileName Boot file name.

EFI_DHCP4_HEADER describes the semantics of the DHCP packet header. This packet header is in
network byte order.

```c
//*******************************************
// EFI_DHCP4_PACKET_OPTION
//*******************************************
#pragma pack(1)
typedef struct {
    UINT8    OpCode;
    UINT8    Length;
    UINT8[1] Data;
} EFI_DHCP4_PACKET_OPTION;
#pragma pack()
```

OpCode   DHCP option code.
Length   Length of the DHCP option data. Not present if OpCode is 0 or 255.
Data     Start of the DHCP option data. Not present if OpCode is 0 or 255 or if
Length is zero.

The DHCP packet option data structure is used to reference option data that is packed in the DHCP
packets. Use caution when accessing multibyte fields because the information in the DHCP packet may
not be properly aligned for the machine architecture.

UEFI Forum, Inc.  March 2021  1464
 EFI_DHCP4_PROTOCOL.Start()

Summary
Starts the DHCP configuration process.

Prototype
typedef
EFI_STATUS
(EIFIAPI *EFI_DHCP4_START) (  
IN EFI_DHCP4_PROTOCOL *This,
IN EFI_EVENT CompletionEvent OPTIONAL );

Parameters
This Pointer to the EFI_DHCP4_PROTOCOL instance.
CompletionEvent If not NULL, indicates the event that will be signaled when the EFI DHCPv4 Protocol driver is transferred into the Dhc4Bound state or when the DHCP process is aborted.
EFI_DHCP4_PROTOCOL.GetModeData() can be called to check the completion status. If NULL, EFI_DHCP4_PROTOCOL.Start() will wait until the driver is transferred into the Dhc4Bound state or the process fails.

Description
The Start() function starts the DHCP configuration process. This function can be called only when the EFI DHCPv4 Protocol driver is in the Dhcp4Init or Dhcp4InitReboot state.

If the DHCP process completes successfully, the state of the EFI DHCPv4 Protocol driver will be transferred through Dhc4Selecting and Dhc4Requesting to the Dhc4Bound state. The CompletionEvent will then be signaled if it is not NULL.

If the process aborts, either by the user or by some unexpected network error, the state is restored to the Dhcp4Init state. The Start() function can be called again to restart the process.

Refer to RFC 2131 for precise state transitions during this process. At the time when each event occurs in this process, the callback function that was set by EFI_DHCP4_PROTOCOL.Configure() will be called and the user can take this opportunity to control the process.

**EFI_DHCP4_PROTOCOL.RenewRebind()**

Summary

Extends the lease time by sending a request packet.

Prototype

```c
typedef EFI_STATUS (EFIAPIC *EFI_DHCP4_RENEW_REBIND) (  
   IN EFI_DHCP4_PROTOCOL *This,
   IN BOOLEAN        RebindRequest,
   IN EFI_EVENT      CompletionEvent OPTIONAL
);
```

Parameters

- **This**: Pointer to the EFI_DHCP4_PROTOCOL instance.
- **RebindRequest**: If TRUE, this function broadcasts the request packets and enters the Dhcp4Rebinding state. Otherwise, it sends a unicast request packet and enters the Dhcp4Renewing state.
- **CompletionEvent**: If not NULL, this event is signaled when the renew/rebind phase completes or some error occurs. EFI_DHCP4_PROTOCOL.GetModeData() can be called to check the completion status. If NULL, EFI_DHCP4_PROTOCOL.RenewRebind() will busy-wait until the DHCP process finishes.

Description

The **RenewRebind()** function is used to manually extend the lease time when the EFI DHCPv4 Protocol driver is in the Dhcp4Bound state and the lease time has not expired yet. This function will send a request packet to the previously found server (or to any server when RebindRequest is TRUE) and transfer the
state into the **Dhcp4Renewing** state (or **Dhcp4Rebinding** when **RebindingRequest** is **TRUE**). When a response is received, the state is returned to **Dhcp4Bound**.

If no response is received before the try count is exceeded (the **RequestTryCount** field that is specified in **EFI_DHCP4_CONFIG_DATA**) but before the lease time that was issued by the previous server expires, the driver will return to the **Dhcp4Bound** state and the previous configuration is restored. The outgoing and incoming packets can be captured by the **EFI_DHCP4_CALLBACK** function.

**Status Codes Returned**

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>EFI_SUCCESS</strong></td>
<td>The EFI DHCPv4 Protocol driver is now in the <strong>Dhcp4Renewing</strong> state or is back to the <strong>Dhcp4Bound</strong> state.</td>
</tr>

</tbody>
</table>

**EFI_DHCP4_PROTOCOL.Release()**

**Summary**
Releases the current address configuration.

**Prototype**
```c
typedef
EFI_STATUS
(EIFI_API *EFI_DHCP4_RELEASE) (|
IN EFI_DHCP4_PROTOCOL *This |
);
```

**Parameters**

| This | Pointer to the **EFI_DHCP4_PROTOCOL** instance. |

**Description**
The **Release()** function releases the current configured IP address by doing either of the following:

- Sending a DHCPRELEASE packet when the EFI DHCPv4 Protocol driver is in the **Dhcp4Bound** state
- Setting the previously assigned IP address that was provided with the **EFI_DHCP4_PROTOCOL.Configure()** function to 0.0.0.0 when the driver is in the **Dhcp4InitReboot** state

After a successful call to this function, the EFI DHCPv4 Protocol driver returns to the **Dhcp4Init** state and any subsequent incoming packets will be discarded silently.
**Status Codes Returned**

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The EFI DHCPv4 Protocol driver is now in the <strong>Dhcp4Init</strong> phase.</td>
</tr>
<tr>

<td>The EFI DHCPv4 Protocol driver is not in the <strong>Dhcp4Bound</strong> or <strong>Dhcp4InitReboot</strong> state.</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>An unexpected network or system error occurred.</td>
</tr>
</tbody>
</table>

**EFI_DHCP4_PROTOCOL.Stop()**

**Summary**

Stops the DHCP configuration process.

**Prototype**

```c
typedef
    EFI_STATUS
(EFI_API *EFI_DHCP4_STOP)(
    IN EFI_DHCP4_PROTOCOL    *This
);```

**Parameters**

- `This` Pointer to the **EFI_DHCP4_PROTOCOL** instance.

**Description**

The **Stop()** function is used to stop the DHCP configuration process. After this function is called successfully, the EFI DHCPv4 Protocol driver is transferred into the **Dhcp4Stopped** state. **EFI_DHCP4_PROTOCOL.Configure()** needs to be called before DHCP configuration process can be started again. This function can be called when the EFI DHCPv4 Protocol driver is in any state.

**Status Codes Returned**

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The EFI DHCPv4 Protocol driver is now in the <strong>Dhcp4Stopped</strong> state.</td>

**EFI_DHCP4_PROTOCOL.Build()**

**Summary**

Builds a DHCP packet, given the options to be appended or deleted or replaced.
Prototype

typedef
    EFI_STATUS
    (EFIAPI *EFI_DHCP4_BUILD) (  
        IN EFI_DHCP4_PROTOCOL    *This,
        IN EFI_DHCP4_PACKET      *SeedPacket,
        IN UINT32               DeleteCount,
        IN UINT8                *DeleteList  OPTIONAL,
        IN UINT32               AppendCount,
        IN EFI_DHCP4_PACKET_OPTION   *AppendList[] OPTIONAL,
        OUT EFI_DHCP4_PACKET     **NewPacket
    );

Parameters

This
    Pointer to the EFI_DHCP4_PROTOCOL instance.

SeedPacket
    Initial packet to be used as a base for building new packet. Type
    EFI_DHCP4_PACKET is defined in
    EFI_DHCP4_PROTOCOL.GetModeData().

DeleteCount
    Number of opcodes in the DeleteList.

DeleteList
    List of opcodes to be deleted from the seed packet. Ignored if
    DeleteCount is zero.

AppendCount
    Number of entries in the OptionList.

AppendList
    Pointer to a DHCP option list to be appended to SeedPacket. If
    SeedPacket also contains options in this list, they are replaced by
    new options (except pad option). Ignored if AppendCount is zero.
    Type EFI_DHCP4_PACKET_OPTION is defined in
    EFI_DHCP4_PROTOCOL.Configure().

NewPacket
    Pointer to storage for the pointer to the new allocated packet. Use
    the EFI Boot Service FreePool() on the resulting pointer when
    done with the packet.

Description

The Build() function is used to assemble a new packet from the original packet by replacing or deleting
existing options or appending new options. This function does not change any state of the EFI DHCPv4
Protocol driver and can be used at any time.
Status Codes Returned

</tbody>
</table>

EFI_DHCP4_PROTOCOL.TransmitReceive()

Summary
Transmits a DHCP formatted packet and optionally waits for responses.

Prototype
```c
typedef EFI_STATUS
    (EFIAPI *EFI_DHCP4_TRANSMIT_RECEIVE) (    
    IN EFI_DHCP4_PROTOCOL     *This,    
    IN EFI_DHCP4_TRANSMIT_RECEIVE_TOKEN *Token
    );
```

Parameters
- **This** Pointer to the EFI_DHCP4_PROTOCOL instance.
- **Token** Pointer to the EFI_DHCP4_TRANSMIT_RECEIVE_TOKEN structure.

Type **EFI_DHCP4_TRANSMIT_RECEIVE_TOKEN** is defined in “Related Definitions” below.

Description
The TransmitReceive() function is used to transmit a DHCP packet and optionally wait for the response from servers. This function does not change the state of the EFI DHCPv4 Protocol driver and thus can be used at any time.
Related Definitions

```c
typedef struct {
    EFI_STATUS     Status;
    EFI_EVENT     CompletionEvent;
    EFI_IPv4_ADDRESS RemoteAddress;
    UINT16        RemotePort;
    EFI_IPv4_ADDRESS GatewayAddress;
    UINT32        ListenPointCount;
    EFI_DHCP4_LISTEN_POINT *ListenPoints;
    UINT32        TimeoutValue;
    EFI_DHCP4_PACKET   *Packet;
    UINT32        ResponseCount;
    EFI_DHCP4_PACKET   *ResponseList;
} EFI_DHCP4_TRANSMIT_RECEIVE_TOKEN;
```

**Status**  
The completion status of transmitting and receiving. Possible values are described in the “Status Codes Returned” table below. When `CompletionEvent` is `NULL`, this status is the same as the one returned by the `TransmitReceive()` function.

**CompletionEvent**  
If not `NULL`, the event that will be signaled when the collection process completes. If `NULL`, this function will busy-wait until the collection process completes.

**RemoteAddress**  
Pointer to the server IP address. This address may be a unicast, multicast, or broadcast address.

**RemotePort**  
Server listening port number. If zero, the default server listening port number (67) will be used.

**GatewayAddress**  
Pointer to the gateway address to override the existing setting.

**ListenPointCount**  
The number of entries in `ListenPoints`. If zero, the default station address and port number 68 are used.

**ListenPoints**  
An array of station address and port number pairs that are used as receiving filters. The first entry is also used as the source address and source port of the outgoing packet. Type `EFI_DHCP4_LISTEN_POINT` is defined below.

**TimeoutValue**  
Number of seconds to collect responses. Zero is invalid.

**Packet**  
Pointer to the packet to be transmitted. Type `EFI_DHCP4_PACKET` is defined in `EFI_DHCP4_PROTOCOL.GetModeData()`.

**ResponseCount**  
Number of received packets.

**ResponseList**  
Pointer to the allocated list of received packets. The caller must use the EFI Boot Service `FreePool()` when done using the received packets.
typedef struct {
  EFI_IPv4_ADDRESS  ListenAddress;
  EFI_IPv4_ADDRESS  SubnetMask;
  UINT16            ListenPort;
} EFI_DHCP4_LISTEN_POINT;

**ListenAddress**
Alternate listening address. It can be a unicast, multicast, or broadcast address. The `TransmitReceive()` function will collect only those packets that are destined to this address.

**SubnetMask**
The subnet mask of above listening unicast/broadcast IP address. Ignored if `ListenAddress` is a multicast address. If it is `0.0.0.0`, the subnet mask is automatically computed from unicast `ListenAddress`. Cannot be `0.0.0.0` if `ListenAddress` is direct broadcast address on subnet.

**ListenPort**
Alternate station source (or listening) port number. If zero, then the default station port number (68) will be used.

### EFI_DHCP4_PROTOCOL.Parse()

**Summary**

Parses the packed DHCP option data.
Prototype

typedef
 EFI_STATUS
 (EFI_API EFI_DHCP4_PARSE) (  
 IN EFI_DHCP4_PROTOCOL *This,
 IN EFI_DHCP4_PACKET *Packet
 IN OUT UINT32 *OptionCount,
 IN OUT EFI_DHCP4_PACKET_OPTION *PacketOptionList[] OPTIONAL
);

Parameters

This Pointer to the EFI_DHCP4_PROTOCOL instance.
Packet Pointer to packet to be parsed. Type EFI_DHCP4_PACKET is defined in EFI_DHCP4_PROTOCOL.GetModeData().
OptionCount On input, the number of entries in the PacketOptionList. On output, the number of entries that were written into the PacketOptionList.
PacketOptionList List of packet option entries to be filled in. End option or pad options are not included. Type EFI_DHCP4_PACKET_OPTION is defined in EFI_DHCP4_PROTOCOL.Configure().

Description

The Parse() function is used to retrieve the option list from a DHCP packet. If *OptionCount isn’t zero, and there is enough space for all the DHCP options in the Packet, each element of PacketOptionList is set to point to somewhere in the Packet->Dhcp4.Option where a new DHCP option begins. If RFC3396 is supported, the caller should reassemble the parsed DHCP options to get the final result. If *OptionCount is zero or there isn’t enough space for all of them, the number of DHCP options in the Packet is returned in OptionCount.

Status Codes Returned

29.3 EFI DHCP6 Protocol

This section provides a detailed description of the EFI_DHCP6_PROTOCOL and the EFI_DHCP6_SERVICE_BINDING_PROTOCOL.

29.3.1 DHCP6 Service Binding Protocol

EFI_DHCP6_SERVICE_BINDING_PROTOCOL

Summary

The EFI DHCPv6 Service Binding Protocol is used to locate communication devices that are supported by an EFI DHCPv6 Protocol driver and to create and destroy EFI DHCPv6 Protocol child instances that can use the underlying communications device.

GUID

#define EFI_DHCP6_SERVICE_BINDING_PROTOCOL _GUID \\
{0x9fb9a8a1,0x2f4a,0x43a6,\}
{0x88,0x9c,0xd0,0xf7,0xb6,0xc4,0x7a,0xd5}

Description

A network application or driver that requires basic DHCPv6 services can use one of the protocol handler services, such as BS->LocateHandleBuffer(), to search for devices that publish an EFI DHCPv6 Service Binding Protocol GUID. Each device with a published EFI DHCPv6 Service Binding Protocol GUID supports the EFI DHCPv6 Protocol and may be available for use.

After a successful call to the EFI_DHCP6_SERVICE_BINDING_PROTOCOL.CreateChild() function, the newly created EFI DHCPv6 Protocol child instance is ready to be used by a network application or driver.

Before a network application or driver terminates execution, every successful call to the EFI_DHCP6_SERVICE_BINDING_PROTOCOL.CreateChild() function must be matched with a call to the EFI_DHCP6_SERVICE_BINDING_PROTOCOL.DestroyChild() function.

29.3.2 DHCP6 Protocol

EFI_DHCP6_PROTOCOL

Summary

The EFI DHCPv6 Protocol is used to get IPv6 addresses and other configuration parameters from DHCPv6 servers.
GUID

```c
#define EFI_DHCP6_PROTOCOL_GUID  \{
    0x87c8bad7, 0x595, 0x4053, 0x82, 0x97, 0xde, 0xde, 0x39, 0x5f, 0x5d, 0x5b
```

Protocol Interface Structure

```c
typedef struct _EFI_DHCP6_PROTOCOL  {
    EFI_DHCP6_GET_MODE_DATA GetModeData;
    EFI_DHCP6_CONFIGURE Configure;
    EFI_DHCP6_START Start;
    EFI_DHCP6_INFO_REQUEST InfoRequest;
    EFI_DHCP6_RENEW_REBIND RenewRebind;
    EFI_DHCP6_DECLINE Decline;
    EFI_DHCP6_RELEASE Release;
    EFI_DHCP6_STOP Stop;
    EFI_DHCP6_PARSE Parse;
} EFI_DHCP6_PROTOCOL;
```

Parameters

**GetModeData**

Get the current operating mode data and configuration data for the EFI DHCPv6 Protocol instance. See the `GetModeData()` function description.

**Configure**

Initialize or clean up the configuration data for the EFI DHCPv6 Protocol instance. See the `Configure()` function description.

**Start**

Start the DHCPv6 S.A.R.R process. See the `Start()` function description.

**InfoRequest**

Request configuration parameters without the assignment of any IPv6 addresses to the client. See the `InfoRequest()` function description.

**RenewRebind**

Tries to manually extend the valid and preferred lifetimes for the IPv6 addresses of the configured IA by sending Renew or Rebind packet. See the `RenewRebind()` function description.

**Decline**

Inform that one or more addresses assigned by a DHCPv6 server are already in use by another node. See the `Decline()` function description.

**Release**

Release one or more addresses associated with the configured IA. See the `Release()` function description.

**Stop**

Stop the DHCPv6 S.A.R.R process. See the `Stop()` function description.
**Parse**

Parses the option data in the DHCPv6 packet. See the `Parse()` function description.

**Description**

The EFI DHCPv6 Protocol is used to get IPv6 addresses and other configuration parameters from DHCPv6 servers.

**Note:** Byte Order: All the IPv6 addresses that are described in `EFI_DHCPv6_PROTOCOL` are stored in network byte order. Both incoming and outgoing DHCPv6 packets are also in network byte order. All other parameters that are defined in functions or data structures are stored in host byte order.

**EFI_DHCPv6_PROTOCOL.GetModeData()**

**Summary**

Retrieve the current operating mode data and configuration data for the EFI DHCPv6 Protocol instance.

**Prototype**

```c
typedef EFI_STATUS
  (EFIAPI *EFI_DHCP6_GET_MODE_DATA)(
   IN EFI_DHCP6_PROTOCOL *This,
   OUT EFI_DHCP6_MODE_DATA *Dhcp6ModeData OPTIONAL,
   OUT EFI_DHCP6_CONFIG_DATA *Dhcp6ConfigData OPTIONAL);
```

**Parameters**

- **This**
  Pointer to the `EFI_DHCP6_PROTOCOL` instance.

- **Dhcp6ModeData**
  Pointer to the DHCPv6 mode data structure. The caller is responsible for freeing this structure and each reference buffer. Type `EFI_DHCP6_MODE_DATA` is defined in “Related Definitions” below.

- **Dhcp6ConfigData**
  Pointer to the DHCPv6 configuration data structure. The caller is responsible for freeing this structure and each reference buffer. Type `EFI_DHCP6_CONFIG_DATA` is defined in `EFI_DHCP6_PROTOCOL.Configure()`.

**Description**

Retrieve the current operating mode data and configuration data for the EFI DHCPv6 Protocol instance.
Related Definitions

```c
//***************************************************************
// EFI_DHCP6_MODE_DATA
//***************************************************************
typedef struct {
    EFI_DHCP6_DUID   *ClientId;
    EFI_DHCP6_IA     *Ia;
} EFI_DHCP6_MODE_DATA;

ClientId
Pointer to the DHCPv6 unique identifier. The caller is responsible for freeing this buffer. Type EFI_DHCP6_DUID is defined below.

Ia
Pointer to the configured IA of current instance. The caller can free this buffer after using it. Type EFI_DHCP6_IA is defined below.

//***************************************************************
// EFI_DHCP6_DUID
//***************************************************************
typedef struct {
    UINT16    Length;
    UINT8     Duid[1];
} EFI_DHCP6_DUID;

Length
Length of DUID in octets.

Duid
Array of DUID octets.

The EFI_DHCP6_DUID structure is to specify DHCPv6 unique identifier for either DHCPv6 client or DHCPv6 server. The DUID-UUID shall be used for all transactions.

//***************************************************************
// EFI_DHCP6_IA
//***************************************************************
typedef struct {
    EFI_DHCP6_IA_DESCRIPTOR Descriptor;
    EFI_DHCP6_STATE     State;
    EFI_DHCP6_PACKET    *ReplyPacket;
    UINT32    IaAddressCount;
    EFI_DHCP6_IA_ADDRESS IaAddress[1];
} EFI_DHCP6_IA;
```
Descriptor

The descriptor for IA. Type `EFI_DHCP6_IA_DESCRIPTOR` is defined below.

State

The state of the configured IA. Type `EFI_DHCP6_STATE` is defined below.

ReplyPacket

Pointer to the cached latest Reply packet. May be `NULL` if no packet is cached.

IaAddressCount

Number of IPv6 addresses of the configured IA.

IaAddress

List of the IPv6 addresses of the configured IA. When the state of the configured IA is in `Dhcp6Bound`, `Dhcp6Renewing` and `Dhcp6Rebinding`, the IPv6 addresses are usable. Type `EFI_DHCP6_IA_ADDRESS` is defined below.

```c
typedef struct {
    UINT16 Type;
    UINT32 IaId;
} EFI_DHCP6_IA_DESCRIPTOR;
```

Type

Type for an IA.

IaId

The identifier for an IA.

#define EFI_DHCP6_IA_TYPE_NA 3
#define EFI_DHCP6_IA_TYPE_TA 4

`EFI_DHCP6_IA_TYPE_NA`

An IA which carries assigned not temporary address.

`EFI_DHCP6_IA_TYPE_TA`

An IA which carries assigned temporary address.
typedef enum {
    Dhcp6Init      = 0x0,
    Dhcp6Selecting = 0x1,
    Dhcp6Requesting = 0x2,
    Dhcp6Declining = 0x3,
    Dhcp6Confirming = 0x4,
    Dhcp6Releasing = 0x5,
    Dhcp6Bound     = 0x6,
    Dhcp6Renewing  = 0x7,
    Dhcp6Rebinding = 0x8
} EFI_DHCP6_STATE;

Table 29-2 describes the fields in the above enumeration.

    UINT32           PreferredLifetime;
    UINT32           ValidLifetime;
} EFI_DHCP6_IA_ADDRESS;

IpAddress
    The IPv6 address.

PreferredLifetime
    The preferred lifetime in unit of seconds for the IPv6 address.

ValidLifetime
    The valid lifetime in unit of seconds for the IPv6 address.

The EFI_DHCP6_IA_ADDRESS structure is specify IPv6 address associated with an IA.

    UINT32 MessageType:8;
} EFI_DHCP6_HEADER;
#pragma pack()

TransactionId
The DHCPv6 transaction ID.

MessageType
The DHCPv6 message type.

EFI_DHCP6_HEADER defines the format of the DHCPv6 header. See RFC 3315 for more information.

  • Both Dhcp6ConfigData and Dhcp6ModeData are NULL |

EFI_DHCP6_PROTOCOL.Configure ()

Summary
Initialize or clean up the configuration data for the EFI DHCPv6 Protocol instance.

Prototype

typedef EFI_STATUS
(EFIAPI *EFI_DHCP6_CONFIGURE) (  
   IN EFI_DHCP6_PROTOCOL *This,  
   IN EFI_DHCP6_CONFIG_DATA *Dhcp6CfgData OPTIONAL  
);

Parameters
This
Pointer to the EFI_DHCP6_PROTOCOL instance.
Dhcp6CfgData

Pointer to the DHCPv6 configuration data structure. Type EFI_DHCP6_CONFIG_DATA is defined in “Related Definitions” below.

Description

The **Configure()** function is used to initialize or clean up the configuration data of the EFI DHCPv6 Protocol instance.

- When Dhcp6CfgData is not **NULL** and **Configure()** is called successfully, the configuration data will be initialized in the EFI DHCPv6 Protocol instance and the state of the configured IA will be transferred into Dhcp6Init.
- When Dhcp6CfgData is **NULL** and **Configure()** is called successfully, the configuration data will be cleaned up and no IA will be associated with the EFI DHCPv6 Protocol instance.

To update the configuration data for an EFI DCHPv6 Protocol instance, the original data must be cleaned up before setting the new configuration data.

Related Definitions

```c
//***************************************************************
// EFI_DHCP6_CONFIG_DATA
//***************************************************************
typedef struct {
  EFI_DHCP6_CALLBACK Dhcp6Callback;
  VOID *CallbackContext;
  UINT32 OptionCount;
  EFI_DHCP6_PACKET_OPTION **OptionList;
  EFI_DHCP6_IA_DESCRIPTOR IaDescriptor;
  EFI_EVENT IaInfoEvent;
  BOOLEAN ReconfigureAccept;
  BOOLEAN RapidCommit;
  EFI_DHCP6_RETRANSMISSION *SolicitRetransmission;
} EFI_DHCP6_CONFIG_DATA;
```

**Dhcp6Callback**

The callback function is to intercept various events that occur in the DHCPv6 S.A.R.R process. Set to **NULL** to ignore all those events. Type EFI_DHCP6_CALLBACK is defined below.

**CallbackContext**

Pointer to the context that will be passed to Dhcp6Callback.

**OptionCount**

Number of the DHCPv6 options in the OptionList.

**OptionList**

List of the DHCPv6 options to be included in Solicit and Request packet. The buffer can be freed after EFI_DHCP6_PROTOCOL.Configure() returns. Ignored if OptionCount is zero. OptionList should not contain Client Identifier option and any
IA option, which will be appended by EFI DHCPv6 Protocol instance automatically. Type `EFI_DHCP6_PACKET_OPTION` is defined below.

IaDescriptor

The descriptor for the IA of the EFI DHCPv6 Protocol instance. Type `EFI_DHCP6_IA_DESCRIPTOR` is defined below.

IaInfoEvent

If not `NULL`, the event will be signaled when any IPv6 address information of the configured IA is updated, including IPv6 address, preferred lifetime and valid lifetime, or the DHCPv6 S.A.R.R process fails. Otherwise, `Start()`, `renewrebind()`, `decline()`, `release()` and `stop()` will be blocking operations, and they will wait for the exchange process completion or failure.

ReconfigureAccept

If `TRUE`, the EFI DHCPv6 Protocol instance is willing to accept Reconfigure packet. Otherwise, it will ignore it. Reconfigure Accept option can not be specified through `OptionList` parameter.

RapidCommit

If `TRUE`, the EFI DHCPv6 Protocol instance will send Solicit packet with Rapid Commit option. Otherwise, Rapid Commit option will not be included in Solicit packet. Rapid Commit option can not be specified through `OptionList` parameter.

SolicitRetransmission

Parameter to control Solicit packet retransmission behavior. Type `EFI_DHCP6_RETRANSMISSION` is defined in “Related Definition” below. The buffer can be freed after `EFI_DHCP6_PROTOCOL.Configure()` returns.

//**************************************************************
// EFI_DHCP6_CALLBACK
//**************************************************************
typedef EFI_STATUS (EFIAPI *EFI_DHCP6_CALLBACK)(
   IN EFI_DHCP6_PROTOCOL   *This,
   IN VOID          *Context,
   IN EFI_DHCP6_STATE   CurrentState,
   IN EFI_DHCP6_EVENT    Dhcp6Event,
   IN EFI_DHCP6_PACKET   *Packet,
   OUT EFI_DHCP6_PACKET  **NewPacket OPTIONAL
);

This

Pointer to the `EFI_DHCP6_PROTOCOL` instance that is used to configure this callback function.

Context

Pointer to the context that is initialized by `EFI_DHCP6_PROTOCOL.Configure()`.
CurrentState

The current state of the configured IA. Type \texttt{EFI\_DHCP6\_STATE} is defined in \texttt{EFI\_DHCP6\_PROTOCOL\_GetModeData()}. 

Dhcp6Event

The event that occurs in the current state, which usually means a state transition. Type \texttt{EFI\_DHCP6\_EVENT} is defined below. 

Packet

Pointer to the DHCPv6 packet that is about to be sent or has been received. The EFI DHCPv6 Protocol instance is responsible for freeing the buffer. Type \texttt{EFI\_DHCP6\_PACKET} is defined in \texttt{EFI\_DHCP6\_PROTOCOL\_GetModeData()}. 

NewPacket

Pointer to the new DHCPv6 packet to overwrite the \texttt{Packet}. \texttt{NewPacket} can not share the buffer with \texttt{Packet}. If *\texttt{NewPacket} is not NULL, the EFI DHCPv6 Protocol instance is responsible for freeing the buffer. 

\texttt{EFI\_DHCP6\_CALLBACK} is provided by the consumer of the EFI DHCPv6 Protocol instance to intercept events that occurs in the DHCPv6 S.A.R.R process. There are two possible returned values, which are described in the following table. 

\begin{table}[h]
\centering
\begin{tabular}{|l|l|}
\hline
\texttt{EFI\_SUCCESS} & Tell the EFI DHCPv6 Protocol instance to continue the DHCPv6 S.A.R.R process. \\
\hline
\texttt{EFI\_ABORTED} & Tell the EFI DHCPv6 Protocol instance to abort the DHCPv6 S.A.R.R process, and the state of the configured IA will be transferred to \texttt{Dhcp6Init}. \\
\hline
\end{tabular}
\end{table}

//***************************************************
// \texttt{EFI\_DHCP6\_PACKET\_OPTION}
//***************************************************
#pragma pack(1)
typedef struct {
    UINT16     OpCode;
    UINT16     OpLen;
    UINT8      Data[1];
} \texttt{EFI\_DHCP6\_PACKET\_OPTION};
#pragma pack()

\texttt{OpCode}

The DHCPv6 option code, stored in network order.

\texttt{OpLen}

Length of the DHCPv6 option data, stored in network order. From the first byte to the last byte of the \texttt{Data} field.
Data

The data for the DHCPv6 option.

EFI_DHCP6_PACKET_OPTION defines the format of the DHCPv6 option, stored in network order. See RFC 3315 for more information. This data structure is used to reference option data that is packed in the DHCPv6 packet.

```
//***********************************************************************
// EFI_DHCP6_EVENT
//***********************************************************************
typedef enum {
    Dhcp6SendSolicit   = 0x0,
    Dhcp6RcvdAdvertise  = 0x1,
    Dhcp6SelectAdvertise = 0x2,
    Dhcp6SendRequest   = 0x3,
    Dhcp6RcvdReply    = 0x4,
    Dhcp6RcvdReconfigure = 0x5,
    Dhcp6SendDecline   = 0x6,
    Dhcp6SendConfirm   = 0x7,
    Dhcp6SendRelease   = 0x8,
    Dhcp6SendRenew     = 0x9,
    Dhcp6SendRebind    = 0xa
} EFI_DHCP6_EVENT;
```

Dhcp6SendSolicit

A Solicit packet is about to be sent. The packet is passed to Dhcp6Callback and can be modified or replaced in Dhcp6Callback.

Dhcp6RcvdAdvertise

An Advertise packet is received and will be passed to Dhcp6Callback.

Dhcp6SelectAdvertise

It is time for Dhcp6Callback to determine whether select the default Advertise packet by RFC 3315 policy, or overwrite it by specific user policy.

Dhcp6SendRequest

A Request packet is about to be sent. The packet is passed to Dhcp6Callback and can be modified or replaced in Dhcp6Callback.

Dhcp6RcvdReply

A Reply packet is received and will be passed to Dhcp6Callback.

Dhcp6RcvdReconfigure

A Reconfigure packet is received and will be passed to Dhcp6Callback.

Dhcp6SendDecline

A Decline packet is about to be sent. The packet is passed to Dhcp6Callback and can be modified or replaced in Dhcp6Callback.
Dhcp6SendConfirm

A Confirm packet is about to be sent. The packet is passed to Dhcp6Callback and can be modified or replaced in Dhcp6Callback.

Dhcp6SendRelease

A Release packet is about to be sent. The packet is passed to Dhcp6Callback and can be modified or replaced in Dhcp6Callback.

Dhcp6SendRenew

A Renew packet is about to be sent. The packet is passed to Dhcp6Callback and can be modified or replaced in Dhcp6Callback.

Dhcp6SendRebind

A Rebind packet is about to be sent. The packet is passed to Dhcp6Callback and can be modified or replaced in Dhcp6Callback.

//**********************************************************************
// EFI_DHCP6_RETRANSMISSION
//********************************************************************************
typedef struct {  
UINT32     Irt;  
UINT32     Mrc;  
UINT32     Mrt;  
UINT32     Mrd;  
} EFI_DHCP6_RETRANSMISSION;

Irt
Initial retransmission timeout.

Mrc
Maximum retransmission count for one packet. If Mrc is zero, there’s no upper limit for retransmission count.

Mrt
Maximum retransmission timeout for each retry. It’s the upper bound of the number of retransmission timeout. If Mrt is zero, there is no upper limit for retransmission timeout.

Mrd
Maximum retransmission duration for one packet. It’s the upper bound of the numbers the client may retransmit a message. If Mrd is zero, there’s no upper limit for retransmission duration.

</table>

**EFI_DHCP6_PROTOCOL.Start ()**

Summary
Start the DHCPv6 S.A.R.R process.

Prototype
```c
typedef
    EFI_STATUS
        (EFIAPI *EFI_DHCP6_START) (          
          IN EFI_DHCP6_PROTOCOL  *This       
        );
```

Parameters
**This**
Pointer to the **EFI_DHCP6_PROTOCOL** instance.

Description
The **Start()** function starts the DHCPv6 S.A.R.R process. This function can be called only when the state of the configured IA is in the **Dhcp6Init** state. If the DHCPv6 S.A.R.R process completes successfully, the state of the configured IA will be transferred through **Dhcp6Selecting** and **Dhcp6Requesting** to
Dhcp6Bound state. The update of the IPv6 addresses will be notified through **EFI_DHCP6_CONFIG_DATA.IaInfoEvent**. At the time when each event occurs in this process, the callback function set by **EFI_DHCP6_PROTOCOL.Configure()** will be called and the user can take this opportunity to control the process. If **EFI_DHCP6_CONFIG_DATA.IaInfoEvent** is **NULL**, the **Start()** function call is a blocking operation. It will return after the DHCPv6 S.A.R.R process completes or aborted by users. If the process is aborted by system or network error, the state of the configured IA will be transferred to Dhcp6Init. The **Start()** function can be called again to restart the process.

**EFI_DHCP6_PROTOCOL.InfoRequest ()**

**Summary**

Request configuration information without the assignment of any IA addresses of the client.

**Prototype**

```c
Typedef
EFI_STATUS
(EFI_API *EFI_DHCP6_INFO_REQUEST) (  
  IN EFI_DHCP6_PROTOCOL    *This,
  IN BOOLEAN SendClientId,
  IN EFI_DHCP6_PACKET_OPTION *OptionRequest,
  IN UINT32 OptionCount,
  IN EFI_DHCP6_PACKET_OPTION *OptionList[]   OPTIONAL,
  IN EFI_DHCP6_RETRANSMISSION *Retransmission,
  IN EFI_EVENT TimeoutEvent    OPTIONAL,
  IN EFI_DHCP6_INFO_CALLBACK ReplyCallback,
  IN VOID           *CallbackContext OPTIONAL
);
```
Parameters

This

Pointer to the EFI_DHCP6_PROTOCOL instance.

SendClientId

If TRUE, the EFI DHCPv6 Protocol instance will build Client Identifier option and include it into Information Request packet. If FALSE, Client Identifier option will not be included. Client Identifier option can not be specified through OptionList parameter.

OptionRequest

Pointer to the Option Request option in the Information Request packet. Option Request option can not be specified through OptionList parameter.

OptionCount

Number of options in OptionList.

OptionList

List of other DHCPv6 options. These options will be appended to the Option Request option. The caller is responsible for freeing this buffer. Type is defined in EFI_DHCP6_PROTOCOL.GetModeData().

Retransmission

Parameter to control Information Request packet retransmission behavior. Type EFI_DHCP6_RETRANSMISSION is defined in “Related Definition” below. The buffer can be freed after EFI_DHCP6_PROTOCOL.InfoRequest() returns.

TimeoutEvent

If not NULL, this event is signaled when the information request exchange aborted because of no response. If NULL, the function call is a blocking operation; and it will return after the information-request exchange process finish or aborted by users.

ReplyCallback

The callback function is to intercept various events that occur in the Information Request exchange process. It should not be set to NULL. Type EFI_DHCP6_INFO_CALLBACK is defined below.

CallbackContext

Pointer to the context that will be passed to ReplyCallback.

Description

The InfoRequest() function is used to request configuration information without the assignment of any IPv6 address of the client. Client sends out Information Request packet to obtain the required configuration information, and DHCPv6 server responds with Reply packet containing the information for the client. The received Reply packet will be passed to the user by ReplyCallback function. If user returns EFI_NOT_READY from ReplyCallback, the EFI DHCPv6 Protocol instance will continue to receive other Reply packets unless timeout according to the Retransmission parameter. Otherwise, the Information Request exchange process will be finished successfully if user returns EFI_SUCCESS from ReplyCallback.
Related Definitions

```c
typedef EFI_STATUS (EFIAPI *EFI_DHCP6_INFO_CALLBACK)(
    IN EFI_DHCP6_PROTOCOL  *This,
    IN VOID          *Context,
    IN EFI_DHCP6_PACKET    *Packet,
);
```

*This*  
Pointer to the `EFI_DHCP6_PROTOCOL` instance that is used to configure this callback function.

*Context*  
Pointer to the context that is initialized in the `EFI_DHCP6_PROTOCOL.InfoRequest()`.

*Packet*  
Pointer to Reply packet that has been received. The EFI DHCPv6 Protocol instance is responsible for freeing the buffer. Type `EFI_DHCP6_PACKET` is defined in `EFI_DHCP6_PROTOCOL.GetModeData()`.

`EFI_DHCP6_INFO_CALLBACK` is provided by the consumer of the EFI DHCPv6 Protocol instance to intercept events that occurs in the DHCPv6 Information Request exchange process. There are three possible returned values, which are described in the following table.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>Tell the EFI DHCPv6 Protocol instance to finish Information Request exchange process.</td>
</tr>
<tr>
<td>EFI_NOT_READY</td>
<td>Tell the EFI DHCPv6 Protocol instance to continue Information Request exchange process.</td>
</tr>
<tr>
<td>EFI_ABORTED</td>
<td>Tell the EFI DHCPv6 Protocol instance to abort the Information Request exchange process</td>
</tr>
</tbody>
</table>
Status Codes Returned

| EFI.SUCCESS | The DHCPv6 information request exchange process completed when TimeoutEvent is NULL. Information Request packet has been sent to DHCPv6 server when TimeoutEvent is not NULL. |
|EFI_INVALID_PARAMETER | One or more following conditions are TRUE:  
• This is NULL.  
• OptionRequest is NULL or OptionRequest->OpCode is invalid.  
• OptionCount > 0 and OptionList is NULL.  
• OptionList is not NULL, and Client Identify option or Option Request option is specified in the OptionList.  
• Retransmission is NULL.  
• Both Retransmission->Mrc and Retransmission->Mrd are zero.  
• ReplyCallback is NULL. |
|EFI DEVICE_ERROR | An unexpected network or system error occurred. |
|EFI_NO_RESPONSE | The DHCPv6 information request exchange process failed because of no response, or not all requested-options are responded by DHCPv6 servers when Timeout happened. |
|EFI_ABORTED | The DHCPv6 information request exchange process aborted by user. |

**EFI_DHCP6_PROTOCOL.RenewRebind ()**

**Summary**

Manually extend the valid and preferred lifetimes for the IPv6 addresses of the configured IA and update other configuration parameters by sending Renew or Rebind packet.

**Prototype**

```c
typedef EFI_STATUS (EFIAPIC *EFI_DHCP6_RENEW_REBIND) (  
    IN EFI_DHCP6_PROTOCOL *This,  
    IN BOOLEAN RebindRequest  
    );
```

**Parameters**

**This**

Pointer to the EFI_DHCP6_PROTOCOL instance.

**RebindRequest**

If TRUE, it will send Rebind packet and enter the Dhcp6Rebinding state. Otherwise, it will send Renew packet and enter the Dhcp6Renewing state.
Description

The RenewRebind() function is used to manually extend the valid and preferred lifetimes for the IPv6 addresses of the configured IA and update other configuration parameters by sending Renew or Rebind packet.

- When RebindRequest is FALSE and the state of the configured IA is Dhcp6Bound, it will send Renew packet to the previously DHCPv6 server and transfer the state of the configured IA to Dhcp6Renewing. If valid Reply packet received, the state transfers to Dhcp6Bound and the valid and preferred timer restarts. If fails, the state transfers to Dhcp6Bound but the timer continues.

- When RebindRequest is TRUE and the state of the configured IA is Dhcp6Bound, it will send Rebind packet. If valid Reply packet received, the state transfers to Dhcp6Bound and the valid and preferred timer restarts. If fails, the state transfers to Dhcp6Init and the IA can’t be used.

Status Codes Returned

EFI_DHCP6_PROTOCOL.Decline()

Summary

Inform that one or more IPv6 addresses assigned by a server are already in use by another node.
Prototype

```c
typedef
  EFI_STATUS
  (EFIAPI *EFI_DHCP6_DECLINE) (
    IN EFI_DHCP6_PROTOCOL   *This,
    IN UINT32 AddressCount,
    IN EFI_IPv6_ADDRESS    *Addresses
  );
```

Parameters

- **This**
  - Pointer to the `EFI_DHCP6_PROTOCOL` instance.
- **AddressCount**
  - Number of declining IPv6 addresses.
- **Addresses**
  - Pointer to the buffer stored all the declining IPv6 addresses.

Description

The `Decline()` function is used to manually decline the assignment of IPv6 addresses, which have been already used by another node. If all IPv6 addresses of the configured IA are declined through this function, the state of the IA will switch through `Dhcp6Declining` to `Dhcp6Init`, otherwise, the state of the IA will restore to `Dhcp6Bound` after the declining process. The `Decline()` can only be called when the IA is in `Dhcp6Bound` state. If the `EFI_DHCP6_CONFIG_DATA.IaInfoEvent` is NULL, this function is a blocking operation. It will return after the declining process finishes, or aborted by user.

</tbody>
</table>
**EFI_DHCP6_PROTOCOL.Release ()**

**Summary**
Release one or more IPv6 addresses associated with the configured IA for current instance.

**Prototype**
```
typedef
    EFI_STATUS
    (EFIAPI *EFI_DHCP6_RELEASE) (  
        IN EFI_DHCP6_PROTOCOL   *This,
        IN UINT32 AddressCount,
        IN EFI_IPv6_ADDRESS    *Addresses
    );
```

**Parameters**
- **This**
  Pointer to the ** EFI_DHCP6_PROTOCOL** instance.
- **AddressCount**
  Number of releasing IPv6 addresses.
- **Addresses**
  Pointer to the buffer stored all the releasing IPv6 addresses. Ignored if **AddressCount** is zero.

**Description**
The **Release()** function is used to manually release the one or more IPv6 address. If **AddressCount** is zero, it will release all IPv6 addresses of the configured IA. If all IPv6 addresses of the IA are released through this function, the state of the IA will switch through **Dhcp6Releasing** to **Dhcp6Init**, otherwise, the state of the IA will restore to **Dhcp6Bound** after the releasing process. The **Release()** can only be called when the IA is in **Dhcp6Bound** state. If the **EFI_DHCP6_CONFIG_DATA.IaInfoEvent** is **NULL**, the function is a blocking operation. It will return after the releasing process finishes, or aborted by user.

</tr>
</tbody>
</table>
| EFI_INVALID_PARAMETER | One or more following conditions are TRUE:  
  - `This` is `NULL`.  
  - `AddressCount` is not zero and `Addresses` is `NULL`. |
| EFI_NOT_FOUND | Any specified IPv6 address is not correlated with the configured IA for this instance. |
| EFI_ACCESS_DENIED | The EFI DHCPv6 Child instance hasn’t been configured, or the state of the configured IA is not in `Dhcp6Bound`. |
| EFI_DEVICE_ERROR | An unexpected network or system error occurred. |
| EFI_ABORTED | The DHCPv6 release exchange process aborted by user. |

`EFI_DHCP6_PROTOCOL.Stop()`

**Summary**

Stop the DHCPv6 S.A.R.R process.

**Prototype**

```c
typedef
EFI_STATUS
(EFIAPI *EFI_DHCP6_STOP) (  
    IN EFI_DHCP6_PROTOCOL *This  
);
```

**Parameters**

`This`

Pointer to the `EFI_DHCP6_PROTOCOL` instance.

**Description**

The `Stop()` function is used to stop the DHCPv6 S.A.R.R process. If this function is called successfully, all the IPv6 addresses of the configured IA will be released and the state of the configured IA will be transferred to `Dhcp6Init`. 
Status Codes Returned

<table>
<thead>

<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The DHCPv6 S.A.R.R process has been stopped when __EFI_DHCP6_CONFIG_DATA.IaInfoEvent__ is NULL. The EFI DHCPv6 Protocol instance has sent Release packet if need release or has been stopped if needn't, when __EFI_DHCP6_CONFIG_DATA.IaInfoEvent__ is not NULL.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>This is NULL.</td>
</tr>
<tr>
<td>EFI_NO_MEDIA</td>
<td>There was a media error.</td>
</tr>
</tbody>
</table>

**EFI_DHCP6_PROTOCOL.Parse ()**

**Summary**

Parse the option data in the DHCPv6 packet.

**Prototype**

```c
typedef EFI_STATUS
  (EFIAPI *EFI_DHCP6_PARSE) (
    IN EFI_DHCP6_PROTOCOL *This,
    IN EFI_DHCP6_PACKET *Packet,
    IN OUT UINT32 *OptionCount,
    IN EFI_DHCP6_PACKET_OPTION *PacketOptionList[] OPTIONAL
  );
```

**Parameters**

- **This**
  Pointer to the EFI_DHCP6_PROTOCOL instance.

- **Packet**
  Pointer to packet to be parsed. Type EFI_DHCP6_PACKET is defined in EFIisodes.IDE_DHCP6_PROTOCOL.GetModeData().

- **OptionCount**
  On input, the number of entries in the PacketOptionList. On output, the number of DHCPv6 options in the Packet.

- **PacketOptionList**
  List of pointers to the DHCPv6 options in the Packet. Type EFI_DHCP6_PACKET_OPTION is defined in EFI_DHCP6_PROTOCOL.Configure(). The OpCode and OpLen in EFI_DHCP6_PACKET_OPTION are both stored in network byte order.

**Description**

The Parse() function is used to retrieve the option list in the DHCPv6 packet.
29.4 EFI DNSv4 Protocol

This section defines the EFI Domain Name Service Binding Protocol interface. It is split into the following two main sections.

- DNSv4 Service Binding Protocol (DNSv4SB)
- DNSv4 Protocol (DNSv4)

**EFI_DNS4_SERVICE_BINDING_PROTOCOL**

**Summary**

The DNSv4SB is used to locate communication devices that are supported by a DNS driver and to create and destroy instances of the DNS child protocol driver.

The EFI Service Binding Protocol in Section 2.5.8 defines the generic Service Binding Protocol functions. This section discusses the details that are specific to the DNSv4.

**GUID**

```plaintext
#define EFI_DNS4_SERVICE_BINDING_PROTOCOL_GUID \
{ 0xb625b186, 0xe063, 0x44f7,\ 
{ 0x89, 0x5, 0x6a, 0x74, 0xdc, 0x6f, 0x52, 0xb4}}
```

**Description**

A network application (or driver) that requires network address resolution can use one of the protocol handler services, such as `BS->LocateHandleBuffer()`, to search for devices that publish a DNSv4SB GUID. Each device with a published DNSv4SB GUID supports DNS and may be available for use.

After a successful call to the `EFI_DNS4_SERVICE_BINDING_PROTOCOL.CreateChild()` function, the child DNS driver instance is in an unconfigured state; it is not ready to resolve addresses.

Before a network application terminates execution, every successful call to the `EFI_DNS4_SERVICE_BINDING_PROTOCOL.CreateChild()` function must be matched with a call to the `EFI_DNS4_SERVICE_BINDING_PROTOCOL.DestroyChild()` function.

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The packet was successfully parsed.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>One or more following conditions are <strong>TRUE</strong></td>
</tr>
<tr>
<td></td>
<td>- <strong>This</strong> is <strong>NULL</strong>.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Packet</strong> is <strong>NULL</strong>.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Packet</strong> is not a well-formed DHCPv6 packet.</td>
</tr>
<tr>
<td></td>
<td>- <strong>OptionCount</strong> is <strong>NULL</strong>.</td>
</tr>
<tr>
<td></td>
<td>- <em>OptionCount</em> is not zero and <strong>PacketOptionList</strong> is <strong>NULL</strong>.</td>
</tr>
</tbody>
</table>
| EFI_BUFFER_TOO_SMALL        | *OptionCount* is smaller than the number of options that were found in the **Packet**.
Note: All the network addresses that are described in EFI_DNS4_PROTOCOL are stored in network byte order. Both incoming and outgoing DNS packets are also in network byte order. All other parameters that are defined in functions or data structures are stored in host byte order.

EFI_DNS4_PROTOCOL

Summary

This protocol provides the function to get the host name and address mapping, also provides pass through interface to retrieve arbitrary information from DNS.

The EFI_DNS4_Protocol is primarily intended to retrieve host addresses using the standard DNS protocol (RFC1035), and support for this protocol is required. Implementations may optionally also support local network name resolution methods such as LLMNR (RFC4795) however DNS queries shall always take precedence, and any use of local network name protocols would be restricted to cases where resolution using DNS protocol fails.

As stated above, all instances of EFI_DNS4_Protocol will utilize a common DNS cache containing the successful results of previous queries on any interface. However, it should be noted that every instance of EFI_DNS4_Protocol is associated with a specific network device or interface, and that all network actions initiated using a specific instance of the DNS protocol will occur only via use of the associated network interface. This means, in a system with multiple network interfaces, that a specific DNS server will often only be reachable using a specific network instance, and therefore the protocol user will need to take steps to insure the DNS instance associated with the proper network interface is used. Or alternatively, the caller may perform DNS functions against all interfaces until successful result is achieved.

GUID

```
#define EFI_DNS4_PROTOCOL_GUID \
{ 0xae3d28cc, 0xe05b, 0x4fa1,\ 
  {0xa0, 0x11, 0x7e, 0xb5, 0x5a, 0x3f, 0x14, 0x1 }}
```

Protocol Interface Structure

```
typedef struct _EFI_DNS4_PROTOCOL {
  EFI_DNS4_GET_MODE_DATA       GetModeData;
  EFI_DNS4_CONFIGURE           Configure;
  EFI_DNS4_HOST_NAME_TO_IP     HostNameToIp;
  EFI_DNS4_IP_TO_HOST_NAME    IpToHostName;
  EFI_DNS4_GENERAL_LOOKUP     GeneralLookUp;
  EFI_DNS4_UPDATE_DNS_CACHE  UpdateDnsCache;
  EFI_DNS4_POLL               Poll;
  EFI_DNS4_CANCEL            Cancel;
} EFI_DNS4_PROTOCOL;
```
**EFI_DNS4_PROTOCOL.GetModeData()**

**Summary**
Retrieve the current mode data of this DNS instance.

**Prototype**
```c
typedef
EFI_STATUS
(EIFIAPI *EFI_DNS4_GET_MODE_DATA)(
    IN EFI_DNS4_PROTOCOL     *This,
    OUT EFI_DNS4_MODE_DATA    *DnsModeData
);
```

**Description**
This function is used to retrieve DNS mode data for this DNS instance.

**Parameter**
- **This** Pointer to `EFI_DNS4_PROTOCOL` instance.
- **DnsModeData** Pointer to the caller-allocated storage for the `EFI_DNS4_MODE_DATA` structure.

**Related Definitions**
```c
//**********************************************
// EFI_DNS4_MODE_DATA
//**********************************************
typedef struct {
    EFI_DNS4_CONFIG_DATA DnsConfigData;
    UINT32 DnsServerCount;
    EFI_IPv4_ADDRESS   *DnsServerList;
    UINT32 DnsCacheCount;
    EFI_DNS4_CACHE_ENTRY *DnsCacheList;
} EFI_DNS4_MODE_DATA;
```

- **DnsConfigData** The current configuration data of this instance. Type `EFI_DNS4_CONFIG_DATA` is defined below.
- **DnsServerCount** Number of configured DNS servers.
- **DnsServerList** Pointer to common list of addresses of all configured DNS server used by `EFI_DNS4_PROTOCOL` instances. List will include DNS servers configured by this or any other `EFI_DNS4_PROTOCOL` instance. The storage for this list is allocated by the driver publishing this protocol, and must be freed by the caller.
- **DnsCacheCount** Number of DNS Cache entries. The DNS Cache is shared among all DNS instances.
- **DnsCacheList** Pointer to a buffer containing `DnsCacheCount` DNS Cache entry structures. The storage for this list is allocated by the driver publishing this protocol and must be freed by caller.
typedef struct {
  UINTN  DnsServerListCount;
  EFI_IPv4_ADDRESS  *DnsServerList;
  BOOLEAN       UseDefaultSetting;
  BOOLEAN       EnableDnsCache;
  UINT8          Protocol;
  EFI_IPv4_ADDRESS  StationIp;
  EFI_IPv4_ADDRESS  SubnetMask;
  UINT16         LocalPort;
  UINT32         RetryCount;
  UINT32         RetryInterval;
} EFI_DNS4_CONFIG_DATA;

DnsServerListCount  Count of the DNS servers. When used with GetModeData(), this field is the count of originally configured servers when Configure() was called for this instance. When used with Configure() this is the count of caller-supplied servers. If the DnsServerListCount is zero, the DNS server configuration will be retrieved from DHCP server automatically.

DnsServerList  Pointer to DNS server list containing DnsServerListCount entries or NULL if DnsServerListCount is 0. For Configure(), this will be NULL when there are no caller-supplied server addresses, and, the DNS instance will retrieve DNS server from DHCP Server. The provided DNS server list is recommended to be filled up in the sequence of preference. When used with GetModeData(), the buffer containing the list will be allocated by the driver implementing this protocol and must be freed by the caller. When used with Configure(), the buffer containing the list will be allocated and released by the caller.

UseDefaultSetting  Set to TRUE to use the default IP address/subnet mask and default routing table.

EnableDnsCache  If TRUE, enable DNS cache function for this DNS instance. If FALSE, all DNS query will not lookup local DNS cache.

Protocol  Use the protocol number defined in “Links to UEFI-Related Documents” (http://uefi.org/uefi) under the heading “IANA Protocol Numbers”. Only TCP or UDP are supported, and other protocol values are invalid. An implementation can choose to support only UDP, or both TCP and UDP.

StationIp  If UseDefaultSetting is FALSE indicates the station address to use.

SubnetMask  If UseDefaultSetting is FALSE indicates the subnet mask to use.

LocalPort  Local port number. Set to zero to use the automatically assigned port number.

RetryCount  Retry number if no response received after RetryInterval.
RetryInterval

Minimum interval of retry is 2 second. If the retry interval is less than 2 second, then use the 2 second.

//***************************************************************
// EFI_DNS4_CACHE_ENTRY //***************************************************************
typedef struct {
    CHAR16    *HostName;
    EFI_IPv4_ADDRESS  *IpAddress;
    UINT32  Timeout;
} EFI_DNS4_CACHE_ENTRY;

HostName

Host name.

IpAddress

IP address of this host.

Timeout

Time in second unit that this entry will remain in DNS cache. A value of zero means that this entry is permanent. A nonzero value will override the existing one if this entry to be added is dynamic entry. Implementations may set its default timeout value for the dynamically created DNS cache entry after one DNS resolve succeeds.

EFI_DNS4_PROTOCOL.Configure()

Summary

Configures this DNS instance.

Prototype

typedef
    EFI_STATUS
    (EFIAPI *EFI_DNS4_CONFIGURE)(
        IN EFI_DNS4_PROTOCOL      *This,
        IN EFI_DNS4_CONFIG_DATA    *DnsConfigData
    );

Descriptions

This function is used to configure DNS mode data for this DNS instance.
Parameters

- **This**: Pointer to **EFI_DNS4_PROTOCOL** instance.
- **DnsConfigData**: Pointer to caller-allocated buffer containing **EFI_DNS4_CONFIG_DATA** structure containing the desired Configuration data. If NULL, the driver will reinitialize the protocol instance to the unconfigured state.

</table>

**EFI_DNS4_PROTOCOL.HostNameToIp()**

Summary

- Host name to host address translation.

Prototype

```c
typedef
  EFI_STATUS
(EFI_API *EFI_DNS4_HOST_NAME_TO_IP) (  
    IN EFI_DNS4_PROTOCOL  *This,
    IN CHAR16            *HostName,
    IN EFI_DNS4_COMPLETION_TOKEN   *Token
  );
```

Parameter

- **This**: Pointer to **EFI_DNS4_PROTOCOL** instance.
- **Hostname**: Pointer to buffer containing fully-qualified Domain Name including Hostname. To resolve successfully, characters within the FQDN string must be chosen according to the format and from within the set of ASCII characters authorized by DNS specifications. Any translation required for reference to domains or hostnames defined...
as containing Unicode characters, for example use of Punycode, must be performed by caller.

**Token**

Pointer to the caller-allocated completion token to return at the completion of the process to translate host name to host address. Type **EFI_DNS4_COMPLETION_TOKEN** is defined in "Related Definitions" below.

**Related Definition**

```c
typedef struct {
    EFI_EVENT      Event;
    EFI_STATUS      Status;
    UINT32        RetryCount;
    UINT32        RetryInterval;
    union {
        DNS_HOST_TO_ADDR_DATA    *H2AData;
        DNS_ADDR_TO_HOST_DATA    *A2HData;
        DNS_GENERAL_LOOKUP_DATA   *GLookupData;
    } RspData;
} EFI_DNS4_COMPLETION_TOKEN;
```

**Event**

This **Event** will be signaled after the **Status** field is updated by the EFI DNS protocol driver. The type of **Event** must be **EFI_NOTIFY_SIGNAL**.

**Status**

Will be set to one of the following values.

- **EFI_SUCCESS**: The host name to address translation completed successfully.
- **EFI_NOT_FOUND**: No matching Resource Record (RR) is found.
- **EFI_TIMEOUT**: No DNS server reachable, or RetryCount was exhausted without response from all specified DNS servers.
- **EFI_DEVICE_ERROR**: An unexpected system or network error occurred.
- **EFI_NO_MEDIA**: There was a media error.

**RetryCount**

Retry number if no response received after **RetryInterval**. If zero, use the parameter configured through Dns.Configure() interface.

**RetryInterval**

Minimum interval of retry is 2 second. If the retry interval is less than 2 second, then use the 2 second. If zero, use the parameter configured through Dns.Configure() interface.

**H2AData**

When the Token is used for host name to address translation, **H2AData** is a pointer to the **DNS_HOST_TO_ADDR_DATA**. Type **DNS_HOST_TO_ADDR_DATA** is defined below.

**A2HData**

When the Token is used for host address to host name translation, **A2HData** is a pointer to the **DNS_ADDR_TO_HOST_DATA**. Type **DNS_ADDR_TO_HOST_DATA** is defined below.
When the Token is used for a general lookup function, GLookupDATA is a pointer to the DNS GENERAL_LOOKUP_DATA. Type DNSGENERAL_LOOKUP_DATA is defined below.

EFI DNS4_COMPLETION_TOKEN structures are used for host name to address translation, host address to name translation and general lookup operation, the Event, RetryCount and RetryInterval fields filled must be filled by the EFI DNS4 Protocol Client. After the operation completes, the EFI DNS4 protocol driver fill in the RspData and Status field and the Event is signaled.

```c
//******************************************
// DNS_HOST_TO_ADDR_DATA
//******************************************
typedef struct {
    UINT32           IpCount;
    EFI_IPv4_Address      *IpList;
} DNS_HOST_TO_ADDR_DATA;

IpCount Number of the returned IP addresses.
IpList Pointer to the all the returned IP addresses.

//******************************************
// DNS_ADDR_TO_HOST_DATA
//******************************************
typedef struct {
    CHAR16            *HostName;
} DNS_ADDR_TO_HOST_DATA;

HostName Pointer to the primary name for this host address. It’s the caller’s responsibility to free the response memory.

//******************************************
// DNS_GENERAL_LOOKUP_DATA
//******************************************
typedef struct {
    UINTN
    RRCount;
    DNS_RESOURCE_RECORD  *RRList;
} DNS_GENERAL_LOOKUP_DATA;

RRCount Number of returned matching RRs.
RRList Pointer to the all the returned matching RRs. It’s caller responsibility to free the allocated memory to hold the returned RRs.
typedef struct {
    CHAR8    *QName;
    UINT16   QType;
    UINT16   QClass;
    UINT32   TTL;
    UINT16   DataLength;
    CHAR8    *RData;
} DNS_RESOURCE_RECORD;

QName        The Owner name.
QType        The Type Code of this RR.
QClass       The CLASS code of this RR.
TTL          32 bit integer which specify the time interval that the resource
             record may be cached before the source of the information should
             again be consulted. Zero means this RR cannot be cached.
DataLength   16 big integer which specify the length of RData.
RData        A string of octets that describe the resource, the format of this
             information varies according to QType and QClass difference.

Description

The HostNameToIp() function is used to translate the host name to host IP address. A
type A query is used to get the one or more IP addresses for this host.

EFI_DNS4_PROTOCOL.IpToHostName()

Summary
IPv4 address to host name translation also known as Reverse DNS lookup.
Prototype

```c
typedef EFI_STATUS
(EFI_API *EFI_DNS4_IP_TO_HOST_NAME) (IN EFI_DNS4_PROTOCOL *This,
  IN EFI_IPv4_ADDRESS IpAddress,
  IN EFI_DNS4_COMPLETION_TOKEN *Token);
```

Parameter

- **This**: Pointer to `EFI_DNS4_PROTOCOL` instance.
- **IpAddress**: IP address.
- **Token**: Pointer to the caller-allocated completion used token to translate host address to host name. Type `EFI_DNS4_COMPLETION_TOKEN` is defined in "Related Definitions" of above `HostNameToIp()`.

Description

The `IpToHostName()` function is used to translate the host address to host name. A type PTR query is used to get the primary name of the host. Support of this function is optional.

Status Codes Returned

</table>

`EFI_DNS4_PROTOCOL.GeneralLookUp()`

Summary

Retrieve arbitrary information from the DNS server.
Prototype

```c
typedef
  EFI_STATUS
  (EFI_API *EFI_DNS4_GENERAL_LOOKUP) (
    IN EFI_DNS4_PROTOCOL        *This,
    IN CHAR8              *QName,
    IN UINT16              QType,
    IN UINT16              QClass,
    IN EFI_DNS4_COMPLETION_TOKEN    *Token
  );
```

Description

This `GeneralLookUp()` function retrieves arbitrary information from the DNS. The caller supplies a `QNAME`, `QTYPE`, and `QCLASS`, and all of the matching RRs are returned. All RR content (e.g., TTL) was returned. The caller need parse the returned RR to get required information. This function is optional.

Parameters

- This: Pointer to `EFI_DNS4_PROTOCOL` instance.
- QName: Pointer to Query Name.
- QType: Query Type.
- QClass: Query Name.
- Token: Pointer to the caller-allocated completion token to retrieve arbitrary information. Type `EFI_DNS4_COMPLETION_TOKEN` is defined in "Related Definitions" of above `HostNameToIp()`.

`EFI_DNS4_PROTOCOL.UpdateDnsCache()`

Summary

This function is used to update the DNS Cache.
Prototype

```c
typedef
 EFI_STATUS
 (EFIAPI *EFI_DNS4_UPDATE_DNS_CACHE) (  
   IN EFI_DNS4_PROTOCOL   *This,
   IN BOOLEAN            DeleteFlag,
   IN BOOLEAN            Override,
   IN EFI_DNS4_CACHE_ENTRY DnsCacheEntry
  );
```

Parameters

- **This**: Pointer to `EFI_DNS4_PROTOCOL` instance.
- **DeleteFlag**: If `FALSE`, this function is to add one entry to the DNS Cache. If `TRUE`, this function will delete matching DNS Cache entry.
- **Override**: If `TRUE`, the matching DNS cache entry will be overwritten with the supplied parameter. If `FALSE`, `EFI_ACCESS_DENIED` will be returned if the entry to be added is already exists.
- **DnsCacheEntry**: Pointer to DNS Cache entry.

Description

The `UpdateDnsCache()` function is used to add/delete/modify DNS cache entry. DNS cache can be normally dynamically updated after the DNS resolve succeeds. This function provided capability to manually add/delete/modify the DNS cache.

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>EFI_SUCCESS</code></td>
<td>The operation completed successfully.</td>

<td><code>DnsCacheEntry.HostName</code> is <code>NULL</code></td>
<td></td>
</tr>
<tr>
<td><code>DnsCacheEntry.IpAddress</code> is <code>NULL</code></td>
<td></td>
</tr>
<tr>
<td><code>DnsCacheEntry.Timeout</code> is zero</td>
<td></td>
</tr>
<tr>
<td><code>EFI_ACCESS_DENIED</code></td>
<td>The DNS cache entry already exists and <code>Override</code> is not <code>TRUE</code>.</td>
</tr>
</tbody>
</table>

`EFI_DNS4_PROTOCOL.Poll()`

Summary

Polls for incoming data packets and processes outgoing data packets.
Prototype

```c
typedef
    EFI_STATUS
    (EFIAPI *EFI_DNS4_POLL) (
        IN EFI_DNS4_PROTOCOL *This
    );
```

Parameters

This Pointer to **EFI_DNS4_PROTOCOL** instance.

Description

The `Poll()` function can be used by network drivers and applications to increase the rate that data packets are moved between the communications device and the transmit and receive queues.

In some systems, the periodic timer event in the managed network driver may not poll the underlying communications device fast enough to transmit and/or receive all data packets without missing incoming packets or dropping outgoing packets. Drivers and applications that are experiencing packet loss should try calling the `Poll()` function more often.

Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>Incoming or outgoing data was processed.</td>
</tr>
<tr>
<td>EFI_NOT_STARTED</td>
<td>This EFI DNS Protocol instance has not been started.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>This is <strong>NULL</strong>.</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>An unexpected system or network error occurred.</td>
</tr>
<tr>
<td>EFI_TIMEOUT</td>
<td>Data was dropped out of the transmit and/or receive queue. Consider increasing the polling rate.</td>
</tr>
</tbody>
</table>

**EFI_DNS4_PROTOCOL.Cancel()**

Summary

Abort an asynchronous DNS operation, including translation between IP and Host, and general look up behavior.

Prototype

```c
EFI Protocol
typedef
    EFI_STATUS
    (EFIAPI *EFI_DNS4_CANCEL) (
        IN EFI_DNS4_PROTOCOL *This,
        IN EFI_DNS4_COMPLETION_TOKEN *Token
    );
```

Parameters

This Pointer to **EFI_DNS4_PROTOCOL** instance.
Token

Pointer to a token that has been issued by
EFI_DNS4_PROTOCOL.HostNameToIp(),
EFI_DNS4_PROTOCOL.IpToHostName() or
EFI_DNS4_PROTOCOL.GeneralLookUp(). If NULL, all pending
tokens are aborted.

Description

The Cancel() function is used to abort a pending resolution request. After calling this
function, Token.Status will be set to EFI_ABORTED and then Token.Event will be
signaled. If the token is not in one of the queues, which usually means that the
asynchronous operation has completed, this function will not signal the token and
EFI_NOT_FOUND is returned.

Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The asynchronous DNS operation was aborted and Token-&gt;Event is signaled.</td>
</tr>
<tr>
<td>EFI_NOT_STARTED</td>
<td>This EFI DNS4 Protocol instance has not been started.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>This is NULL.</td>
</tr>
<tr>
<td>EFI_NOT_FOUND</td>
<td>When Token is not NULL, and the asynchronous DNS operation was not found in the transmit queue. It was either completed or was not issued by HostNameToIp(), IpToHostName() or GeneralLookUp().</td>
</tr>
</tbody>
</table>

29.5 EFI DNSv6 Protocol

This section defines the EFI DNSv6 (Domain Name Service version 6) Protocol. It is split into the following
two main sections.

- DNSv6 Service Binding Protocol (DNSv6SB)
- DNSv6 Protocol (DNSv6)

29.5.1 DNSv6 Service Binding Protocol

EFI_DNS6_SERVICE_BINDING_PROTOCOL

Summary

The DNSv6SB is used to locate communication devices that are supported by a DNS
driver and to create and destroy instances of the DNS child protocol driver.

The EFI Service Binding Protocol in Section 2.5.8 defines the generic Service Binding
Protocol functions. This section discusses the details that are specific to the DNSv6.

GUID
#define EFI_DNS6_SERVICE_BINDING_PROTOCOL_GUID \
{ 0x7f1647c8, 0xb76e, 0x44b2,\} 
{ 0xa5, 0x65, 0xf7, 0xf, 0xf1, 0x9c, 0xd1, 0x9e}}

Description

A network application (or driver) that requires network address resolution can use one of the protocol handler services, such as `BS->LocateHandleBuffer()`, to search for devices that publish a DNSv6SB GUID. Each device with a published DNSv6SB GUID supports DNSv6 and may be available for use.

After a successful call to the `EFI_DNS6_SERVICE_BINDING_PROTOCOL.CreateChild()` function, the child DNS driver instance is in an un-configured state; it is not ready to resolve addresses.

Before a network application terminates execution, every successful call to the `EFI_DNS6_SERVICE_BINDING_PROTOCOL.CreateChild()` function must be matched with a call to the `EFI_DNS6_SERVICE_BINDING_PROTOCOL_DestroyChild()` function.

Note: All the network addresses that are described in `EFI_DNS6_PROTOCOL` are stored in network byte order. Both incoming and outgoing DNS packets are also in network byte order. All other parameters that are defined in functions or data structures are stored in host byte order.

29.5.2 DNS6 Protocol

**EFI_DNS6_PROTOCOL**

Summary

This protocol provides the function to get the host name and address mapping, also provide pass through interface to retrieve arbitrary information from DNSv6.

The EFI_DNS6_Protocol is primarily intended to retrieve host addresses using the standard DNS protocol (RFC3596), and support for this protocol is required. Implementations may optionally also support local network name resolution methods such as LLMNR (RFC4795) however DNS queries shall always take precedence, and any use of local network name protocols would be restricted to cases where resolution using DNS protocol fails.

As stated above, all instances of EFI_DNS6_Protocol will utilize a common DNS cache containing the successful results of previous queries on any interface. However, it should be noted that every instance of EFI_DNS6_Protocol is associated with a specific network device or interface, and that all network actions initiated using a specific instance of the DNS protocol will occur only via use of the associated network interface. This means, in a system with multiple network interfaces, that a specific DNS server will often only be reachable using a specific network instance, and therefore the protocol user will need to take steps to insure the DNS instance associated with the proper network interface is used. Or alternatively, the caller may perform DNS functions against all interfaces until successful result is achieved.
GUID

```c
#define EFI_DNS6_PROTOCOL_GUID \
{ 0xca37bc1f, 0xa327, 0x4ae9,\ 
  { 0x82, 0x8a, 0x8c, 0x40, 0xd8, 0x50, 0x6a, 0x17 }}
```

Protocol Interface Structure

```c
typedef struct _EFI_DNS6_PROTOCOL {
  EFI_DNS6_GET_MODE_DATA       GetModeData;
  EFI_DNS6_CONFIGURE           Configure;
  EFI_DNS6_HOST_NAME_TO_IP     HostNameToIp;
  EFI_DNS6_IP_TO_HOST_NAME    IpToHostName;
  EFI_DNS6_GENERAL_LOOKUP     GeneralLookUp;
  EFI_DNS6_UPDATE_DNS_CACHE   UpdateDnsCache;
  EFI_DNS6_POLL               Poll;
  EFI_DNS6_CANCEL             Cancel;
} EFI_DNS6_PROTOCOL;
```

`EFI_DNS6_PROTOCOL.GetModeData()`

**Summary**
Retrieve mode data of this DNS instance.

**Prototype**

```c
typedef
EFI_STATUS
(EIFIAPI *EFI_DNS6_GET_MODE_DATA)(
  IN EFI_DNS6_PROTOCOL      *This,
  OUT EFI_DNS6_MODE_DATA    *DnsModeData
);
```

**Description**
This function is used to retrieve DNS mode data for this DNS instance.

**Parameter**

- **This** Pointer to `EFI_DNS6_PROTOCOL` instance.
- **DnsModeData** Pointer to the caller-allocated storage for the `EFI_DNS6_MODE_DATA` data.
Related Definitions

```c
// EDF_DNS6_MODE_DATA
typedef struct {
  EFI_DNS6_CONFIG_DATA DnsConfigData;
  UINT32 DnsServerCount;
  EFI_IPV6_ADDRESS *DnsServerList;
  UINT32 DnsCacheCount;
  EFI_DNS6_CACHE_ENTRY *DnsCacheList;
} EFI_DNS6_MODE_DATA;
```

- **DnsConfigData** is the configuration data of this instance. Type `EFI_DNS6_CONFIG_DATA` is defined below.
- **DnsServerCount** is the number of configured DNS6 servers.
- **DnsServerList** is a pointer to a common list of addresses of all configured DNS server used by `EFI_DNS6_PROTOCOL` instances. List will include DNS servers configured by this or any other `EFI_DNS6_PROTOCOL` instance. The storage for this list is allocated by the driver publishing this protocol, and must be freed by the caller.
- **DnsCacheCount** is the number of DNS Cache entries. The DNS Cache is shared among all DNS6 instances.
- **DnsCacheList** is a pointer to a buffer containing `DnsCacheCount` DNS Cache entry structures. The storage for this list is allocated by the driver publishing this protocol and must be freed by caller.

```c
// EFI_DNS6_CONFIG_DATA
typedef struct {
  BOOLEAN EnableDnsCache;
  UINT8 Protocol;
  EFI_IPV6_ADDRESS StationIp;
  UINT16 LocalPort;
  UINT32 DnsServerCount;
  EFI_IPV6_ADDRESS *DnsServerList;
  UINT32 RetryCount;
  UINT32 RetryInterval;
} EFI_DNS6_CONFIG_DATA;
```

- **IsDnsServerAuto** If `TRUE`, the DNS server configuration will be retrieved from DHCP server. If `FALSE`, the DNS server configuration will be manually configured through call of `DNSv6.Configure()` interface.
- **EnableDnsCache** If `TRUE`, enable DNS cache function for this DNS instance. If `FALSE`, all DNS query will not lookup local DNS cache.
- **Protocol** Use the protocol number defined in Links to UEFI-Related Documents” (http://uefi.org/uefi) under the heading “IANA Protocol
“Numbers”. Only TCP or UDP are supported, and other protocol values are invalid. An implementation can choose to support only UDP, or both TCP and UDP.

StationIp

The local IP address to use. Set to zero to let the underlying IPv6 driver choose a source address. If not zero it must be one of the configured IP addresses in the underlying IPv6 driver.

DnsServerCount

Count of the DNS servers. When used with GetModeData(), this field is the count of originally configured servers when Configure() was called for this instance. When used with Configure() this is the count of caller-supplied servers. If the DnsServerListCount is zero, the DNS server configuration will be retrieved from DHCP server automatically.

DnsServerList

Pointer to DNS server list containing DnsServerListCount entries or NULL if DnsServerListCount is 0. For Configure(), this will be NULL when there are no caller-supplied server addresses and the DNS instance will retrieve DNS server from DHCP Server. The provided DNS server list is recommended to be filled up in the sequence of preference. When used with GetModeData(), the buffer containing the list will be allocated by the driver implementing this protocol and must be freed by the caller. When used with Configure(), the buffer containing the list will be allocated and released by the caller.

LocalPort

Local port number. Set to zero to use the automatically assigned port number.

RetryCount

Retry number if no response received after RetryInterval.

RetryInterval

Minimum interval of retry is 2 second. If the retry interval is less than 2 second, then use the 2 second.

//**********************************************
// EFI_DNS6_CACHE_ENTRY
//**********************************************
typedef struct {
    CHAR16    *HostName;
    EFI_IPv6_ADDRESS   *IpAddress;
    UINT32    Timeout;
} EFI_DNS6_CACHE_ENTRY;

HostName

Host name. This should be interpreted as Unicode characters.

IpAddress

IP address of this host.

Timeout

Time in second unit that this entry will remain in DNS cache. A value of zero means that this entry is permanent. A nonzero value will override the existing one if this entry to be added is dynamic entry. Implementations may set its default timeout value for the dynamically created DNS cache entry after one DNS resolve succeeds.

**EFI_DNS6_PROTOCOL.Configure()**

**Summary**

Configure this DNS instance

**Prototype**

```c
typedef EFI_STATUS (EFIAPI * EFI_DNS6_CONFIGURE)(
    IN EFI_DNS6_PROTOCOL      *This,
    IN EFI_DNS6_CONFIG_DATA    *DnsConfigData
);
```

**Descriptions**

The **Configure()** function is used to set and change the configuration data for this EFI DNSv6 Protocol driver instance. Reset the DNS instance if DnsConfigData is NULL.

**Parameters**

- **This**
  
  Pointer to **EFI_DNS6_PROTOCOL** instance.

- **DnsConfigData**
  
  Pointer to the configuration data structure. Type **EFI_DNS6_CONFIG_DATA** is defined in **EFI_DNS6_PROTOCOL.GetModeData()**. All associated storage to be allocated and released by caller.

**EFI_DNS6_PROTOCOL.HostNameToIp()**

**Summary**
Host name to host address translation

**Prototype**
```c
typedef EFI_STATUS
(EFI_API *EFI_DNS6_HOST_NAME_TO_IP) (    
  IN EFI_DNS6_PROTOCOL       *This,
  IN CHAR16            *HostName,
  IN EFI_DNS6_COMPLETION_TOKEN   *Token
);
```

**Parameter**
- **This**
  Pointer to **EFI_DNS6_PROTOCOL** instance.

- **Hostname**
  Pointer to buffer containing fully-qualified Domain Name including Hostname. To resolve successfully, characters within the FQDN string must be chosen according to the format and from within the set of ASCII characters authorized by DNS specifications. Any translation required for reference to domains or hostnames defined as containing Unicode characters, for example use of Punycode, must be performed by caller.

- **Token**
  Point to the completion token to translate host name to host address. Type **EFI_DNS6_COMPLETION_TOKEN** is defined in "Related Definitions" below.
Related Definition

```c
typedef struct {
    EFI_EVENT      Event;
    EFI_STATUS      Status;
    UINT32        RetryCount;
    UINT32        RetryInterval;
    union {
        DNS6_HOST_TO_ADDR_DATA    *H2AData;
        DNS6_ADDR_TO_HOST_DATA    *A2HData;
        DNS6_GENERAL_LOOKUP_DATA   *GLookupData;
    } RspData;
} EFI_DNS6_COMPLETION_TOKEN;
```

**Event**
This `Event` will be signaled after the `Status` field is updated by the EFI DNSv6 protocol driver. The type of `Event` must be `EFI_NOTIFY_SIGNAL`.

**Status**
Will be set to one of the following values.

- **EFI_SUCCESS**: The host name to address translation completed successfully.
- **EFI_NOT_FOUND**: No matching Resource Record (RR) is found.
- **EFI_TIMEOUT**: No DNS server reachable, or `RetryCount` was exhausted without response from all specified DNS servers.
- **EFIDEVICE_ERROR**: An unexpected system or network error occurred.
- **EFI_NO_MEDIA**: There was a media error.

**RetryCount**
The parameter configured through `DNSv6.Configure()` interface. Retry number if no response received after `RetryInterval`.

**RetryInterval**
The parameter configured through `DNSv6.Configure()` interface. Minimum interval of retry is 2 second. If the retry interval is less than 2 second, then use the 2 second.

**H2AData**
When the `Token` is used for host name to address translation, `H2AData` is a pointer to the `DNS6_HOST_TO_ADDR_DATA`. Type `DNS6_HOST_TO_ADDR_DATA` is defined below.

**A2HData**
When the `Token` is used for host address to host name translation, `A2HData` is a pointer to the `DNS6_ADDR_TO_HOST_DATA`. Type `DNS6_ADDR_TO_HOST_DATA` is defined below.

**GLookupDATA**
When the `Token` is used for a general lookup function, `GLookupDATA` is a pointer to the `DNS6_GENERAL_LOOKUP_DATA`. Type `DNS6_GENERAL_LOOKUP_DATA` is defined below.

**EFI_DNS6_COMPLETION_TOKEN** structures are used for host name to address translation, host address to name translation and general lookup operation, the `Event` filed must be filled by the EFI DNSv6 Protocol Client. If the caller attempts to reuse `Token` before the completion event is triggered or
canceled, **EFI_ALREADY_STARTED** will be returned. After the operation completes, the EFI DNSv6 protocol driver fill in the **RspData** and **Status** field and the **Event** is signaled.

```c
//******************************************
// DNS6_HOST_TO_ADDR_DATA
//******************************************
typedef struct {
    UINT32       IpCount;
    EFI_IPv6_ADDRESS   *IpList;
} DNS6_HOST_TO_ADDR_DATA;

IpCount       Number of the returned IP address
IpList       Pointer to the all the returned IP address

//******************************************
// DNS6_ADDR_TO_HOST_DATA
//******************************************
typedef struct {
    CHAR16        *HostName;
} DNS6_ADDR_TO_HOST_DATA;

HostName       Pointer to the primary name for this host address. It’s the caller’s responsibility to free the response memory.

//******************************************
// DNS6_GENERAL_LOOKUP_DATA
//******************************************
typedef struct {
    UINTN          RRCount;
    DNS6_RESOURCE_RECORD  *RRList;
} DNS6_GENERAL_LOOKUP_DATA;

RRCount       Number of returned matching RRs.
RRList       Pointer to the all the returned matching RRs. It’s caller responsibility to free the allocated memory to hold the returned RRs
typedef struct {
    CHAR8 *QName;
    UINT16 QType;
    UINT16 QClass;
    UINT32 TTL;
    UINT16 DataLength;
    CHAR8 *RData;
} DNS6_RESOURCE_RECORD;

QName The Owner name.
QType The Type Code of this RR
QClass The CLASS code of this RR.
TTL 32 bit integer which specify the time interval that the resource record may be cached before the source of the information should again be consulted. Zero means this RR cannot be cached.
DataLength 16 big integer which specify the length of RData.
RData A string of octets that describe the resource, the format of this information varies according to QType and QClass difference.

Description
The HostNameToIp () function is used to translate the host name to host IP address. A type AAAA record query is used to get the one or more IPv6 addresses for this host.

**EFI_DNS6_PROTOCOL.IpToHostName()**

**Summary**

Host address to host name translation

**Prototype**

```c
typedef EFI_STATUS
(EIFIAPI *EFI_DNS6_IP_TO_HOST_NAME) ( 
    IN EFI_DNS6_PROTOCOL       *This,
    IN EFI_IPv6_ADDRESS        IpAddress,
    IN EFI_DNS6_COMPLETION_TOKEN   *Token
);
```

**Parameter**

- **This**: Pointer to EFI_DNS6_PROTOCOL instance.
- **IpAddress**: IP address.
- **Token**: Point to the completion token to translate host address to host name. Type EFI_DNS6_COMPLETION_TOKEN is defined in "Related Definitions" of above HostNameToIp().

**Description**

The IpToHostName() function is used to translate the host address to host name. A type PTR query is used to get the primary name of the host. Implementation can choose to support this function or not.

**EFI_DNS6_PROTOCOL.GeneralLookUp()**

**Summary**

This function provides capability to retrieve arbitrary information from the DNS server.
Prototype

typedef
EFI_STATUS
(EFI_API *EFI_DNS6_GENERAL_LOOKUP) (
    IN EFI_DNS6_PROTOCOL *This,
    IN CHAR8 *QName,
    IN UINT16 QType,
    IN UINT16 QClass,
    IN EFI_DNS6_COMPLETION_TOKEN *Token
);

Description

This **GeneralLookUp()** function retrieves arbitrary information from the DNS. The caller supplies a **QNAME**, **QTYPE**, and **QCLASS**, and all of the matching RRs are returned. All RR content (e.g., TTL) was returned. The caller need parse the returned RR to get required information. The function is optional. Implementation can choose to support it or not.

Parameters

- **This** Pointer to **EFI_DNS6_PROTOCOL** instance.
- **QName** Pointer to Query Name.
- **QType** Query Type.
- **QClass** Query Name.
- **Token** Pointer to the completion token to retrieve arbitrary information. Type **EFI_DNS6_COMPLETION_TOKEN** is defined in "Related Definitions" of above **HostNameToIp()**.

EFI_DNS6_PROTOCOL.UpdateDnsCache()

Summary
This function is to update the DNS Cache.

Prototype
typedef
 EFI_STATUS
(EFIAPI *EFI_DNS6_UPDATE_DNS_CACHE) (  
 IN EFI_DNS6_PROTOCOL   *This,  
 IN BOOLEAN DeleteFlag,  
 IN BOOLEAN Override,  
 IN EFI_DNS6_CACHE_ENTRY DnsCacheEntry  
);

Parameters
This Pointer to EFI_DNS6_PROTOCOL instance.
DeleteFlag If FALSE, this function is to add one entry to the DNS Cache. If TRUE, this function will delete matching DNS Cache entry.
Override If TRUE, the matching DNS Cache entry will be overwritten with the supplied parameter. If FALSE, EFI_ACCESS_DENIED will be returned if the entry to be added is already existed.
DnsCacheEntry Pointer to DNS Cache entry.

Description
The UpdateDnsCache() function is used to add/delete/modify DNS cache entry. DNS cache can be normally dynamically updated after the DNS resolve succeeds. This function provided capability to manually add/delete/modify the DNS cache.

Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The operation completed successfully.</td>
</tr>
</tbody>
</table>
| EFI_INVALID_PARAMETER | One or more of the following conditions is TRUE:  
This is NULL.

DnsCacheEntry.IpAddress is NULL.  
DnsCacheEntry.Timeout is ZERO. |
| EFI_ACCESS_DENIED | The DNS cache entry already exists and Override is not TRUE.                                    |
| EFI_OUT_OF_RESOURCE | Failed to allocate needed resources.                                                            |

EFI_DNS6_PROTOCOL.POLL()

Summary
Polls for incoming data packets and processes outgoing data packets.
Prototype

typedef

EFI_STATUS

(EIFIAPI *EFI_DNS6_POLL) (  
IN EFI_DNS6_PROTOCOL  *This
);

Parameters

This Pointer to EFI_DNS6_PROTOCOL instance.

Description

The Poll() function can be used by network drivers and applications to increase the rate that data packets are moved between the communications device and the transmit and receive queues.

In some systems, the periodic timer event in the managed network driver may not poll the underlying communications device fast enough to transmit and/or receive all data packets without missing incoming packets or dropping outgoing packets. Drivers and applications that are experiencing packet loss should try calling the Poll() function more often.

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>Incoming or outgoing data was processed.</td>
</tr>
<tr>

<td>Data was dropped out of the transmit and/or receive queue. Consider increasing the polling rate.</td>
</tr>
</tbody>
</table>

EFI_DNS6_PROTOCOL.Cancel()

Abort an asynchronous DNS operation, including translation between IP and Host, and general look up behavior.

EFI Protocol

typedef

EFI_STATUS

(EIFIAPI *EFI_DNS6_CANCEL) (  
IN EFI_DNS6_PROTOCOL  *This,  
IN EFI_DNS6_COMPLETION_TOKEN *Token
);

Parameters

This Pointer to EFI_DNS6_PROTOCOL instance.
Token

Pointer to a token that has been issued by
EFI_DNS6_PROTOCOL.HostNameToIp(),
EFI_DNS6_PROTOCOL.IpToHostName() or
EFI_DNS6_PROTOCOL.GeneralLookUp(). If NULL, all pending
tokens are aborted.

Description
The Cancel() function is used to abort a pending resolution request. After calling this function, Token.Status will be set to EFI_ABORTED and then Token.Event will be signaled. If the token is not in one of the queues, which usually means that the asynchronous operation has completed, this function will not signal the token and EFI_NOT_FOUND is returned.

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The asynchronous DNS operation was aborted and Token-&gt;Event is signaled.</td>

<td>There's no source address is available for use.</td>
</tr>
<tr>
<td>EFI_NOT_FOUND</td>
<td>When Token is not NULL and the asynchronous DNS operation was not found in the transmit queue, it is either completed or was not issued by HostNameToIp(), IpToHostName() or GeneralLookUp().</td>
</tr>
</tbody>
</table>

29.6 EFI HTTP Protocols
This section defines the EFI HTTP Protocol interface. It is split into the following two main sections.

- HTTP Service Binding Protocol (HTTPSB)
- HTTP Protocol (HTTP)

29.6.1 HTTP Service Binding Protocol

EFI_HTTP_SERVICE_BINDING_PROTOCOL

Summary
The HTTPSB is used to locate communication devices that are supported by a HTTP driver and to create and destroy instances of the HTTP child protocol driver.

The EFI Service Binding Protocol in Section 2.5.8 defines the generic Service Binding Protocol functions. This section discusses the details that are specific to the HTTP.
GUID
#define EFI_HTTP_SERVICE_BINDING_PROTOCOL_GUID \ 
{0xbdc8e6af, 0xd9bc, 0x4379, \ 
{0xa7, 0x2a, 0xe0, 0xc4, 0xe7, 0x5d, 0xae, 0x1c}}

Description
A network application (or driver) that requires HTTP communication service can use one of the protocol handler services, such as BS->LocateHandleBuffer(), to search for devices that publish a HTTPSB GUID. Each device with a published HTTP SB GUID supports HTTP Service Binding Protocol and may be available for use.

After a successful call to the EFI_HTTP_SERVICE_BINDING_PROTOCOL.CreateChild() function, the child HTTP driver instance is in an uninitialized state; it is not ready to initiate HTTP data transfer.

Before a network application terminates execution, every successful call to the EFI_HTTP_SERVICE_BINDING_PROTOCOL.CreateChild() function must be matched with a call to the EFI_HTTP_SERVICE_BINDING_PROTOCOL.DestroyChild() function.

29.6.2 EFI HTTP Protocol Specific Definitions

EFI_HTTP_PROTOCOL

Protocol GUID
#define EFI_HTTP_PROTOCOL_GUID \ 
{0x7A59B29B, 0x910B, 0x4171, \ 
{0x82, 0x42, 0xA8, 0x5A, 0x0D, 0xF2, 0x5B, 0x5B}}

Protocol Interface Structure
typedef struct _EFI_HTTP_PROTOCOL {
  EFI_HTTP_GET_MODE_DATA GetModeData;
  EFI_HTTP_CONFIGURE Configure;
  EFI_HTTP_REQUEST Request;
  EFI_HTTP_CANCEL Cancel;
  EFI_HTTP_RESPONSE Response;
  EFI_HTTP_POLL Poll;
} EFI_HTTP_PROTOCOL;

Parameters
GetModeData Gets the current operational status. See the GetModeData() function description.
Configure Initialize, change, or reset operational settings in the EFI HTTP protocol instance. See Configure() for function description.
Request Queue a request token into the transmit queue. This function is a non-blocking operation. See Request() for function description.
Cancel Abort a pending request or response operation. See Cancel() for function description.
Response
Queue a response token into the receive queue. This function is a non-blocking operation. See `Response()` for function description.

Poll
Poll to receive incoming HTTP response and transmit outgoing HTTP request. See `Poll()` for function description.

Description
The EFI HTTP protocol is designed to be used by EFI drivers and applications to create and transmit HTTP Requests, as well as handle HTTP responses that are returned by a remote host. This EFI protocol uses and relies on an underlying EFI TCP protocol.

**EFI_HTTP_PROTOCOL.GetModeData()**

Summary
Returns the operational parameters for the current HTTP child instance.

EFI Protocol

```c
typedef
    EFI_STATUS
    (EFIAPI * EFI_HTTP_GET_MODE_DATA)(
        IN EFI_HTTP_PROTOCOL *This,
        OUT EFI_HTTP_CONFIG_DATA *HttpConfigData
    );
```

Parameters
- **This**: Pointer to `EFI_HTTP_PROTOCOL` instance.
- **HttpConfigData**: Pointer to the buffer for operational parameters of this HTTP instance. Type `EFI_HTTP_CONFIG_DATA` is defined in “Related Definitions” below. It is the responsibility of the caller to allocate the memory for `HttpConfigData` and `HttpConfigData->AccessPoint.IPv6Node/IPv4Node`. In fact, it is recommended to allocate sufficient memory to record IPv6Node since it is big enough for all possibilities.

Description
The `GetModeData()` function is used to read the current mode data (operational parameters) for this HTTP protocol instance.

Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>Operation succeeded</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>This is NULL. <code>HttpConfigData</code> is NULL. <code>HttpConfigData-&gt;AccessPoint.IPv4Node</code> or <code>HttpConfigData-&gt;AccessPoint.IPv6Node</code> is NULL</td>
</tr>
<tr>
<td>EFI_NOT_STARTED</td>
<td>This EFI HTTP Protocol instance has not been started.</td>
</tr>
</tbody>
</table>
typedef struct {
    EFI_HTTP_VERSION HttpVersion;
    UINT32 TimeOutMillisec;
    BOOLEAN LocalAddressIsIPv6;
    union {
        EFI_HTTPv4_ACCESS_POINT *IPv4Node;
        EFI_HTTPv6_ACCESS_POINT *IPv6Node;
    }
} EFI_HTTP_CONFIG_DATA;

HttpVersion  HTTP version that this instance will support.
TimeOutMillsec Time out (in milliseconds) when blocking for requests.
LocalAddressIsIPv6 Defines behavior of EFI DNS and TCP protocols consumed by this instance. If FALSE, this instance will use EFI_DNS4_PROTOCOL and EFI_TCP4_PROTOCOL. If TRUE, this instance will use EFI_DNS6_PROTOCOL and EFI_TCP6_PROTOCOL.
IPv4Node When LocalAddressIsIPv6 is FALSE, this points to the local address, subnet, and port used by the underlying TCP protocol.
IPv6Node When LocalAddressIsIPv6 is TRUE, this points to the local IPv6 address and port used by the underlying TCP protocol.

typedef enum {
    HttpVersion10,
    HttpVersion11,
    HttpVersionUnsupported
} EFI_HTTP_VERSION;

typedef struct {
    BOOLEAN UseDefaultAddress;
    EFI_IPv4_ADDRESS LocalAddress;
    EFI_IPv4_ADDRESS LocalSubnet;
    UINT16 LocalPort;
} EFI_HTTPv4_ACCESS_POINT;

UseDefaultAddress Set to TRUE to instruct the EFI HTTP instance to use the default address information in every TCP connection made by this instance.
In addition, when set to TRUE, `LocalAddress` and `LocalSubnet` are ignored.

**LocalAddress**
If `UseDefaultAddress` is set to FALSE, this defines the local IP address to be used in every TCP connection opened by this instance.

**LocalSubnet**
If `UseDefaultAddress` is set to FALSE, this defines the local subnet to be used in every TCP connection opened by this instance.

**LocalPort**
This defines the local port to be used in every TCP connection opened by this instance.

//**********************************************************
// EFI_HTTPv6_ACCESS_POINT
//**********************************************************
typedef struct {
    EFI_IPv6_ADDRESS LocalAddress;
    UINT16 LocalPort;
} EFI_HTTPv6_ACCESS_POINT;

**LocalAddress**
Local IP address to be used in every TCP connection opened by this instance.

**LocalPort**
Local port to be used in every TCP connection opened by this instance.

**EFI_HTTP_PROTOCOL.Configure()**

**Summary**
Initialize or brutally reset the operational parameters for this EFI HTTP instance.

**EFI Protocol**

```
typedef EFI_STATUS (EFIAPI *EFI_HTTP_CONFIGURE)(
    IN EFI_HTTP_PROTOCOL *This,
    IN EFI_HTTP_CONFIG_DATA *HttpConfigData  OPTIONAL
    );
```

**Parameters**

- **This**
  Pointer to **EFI_HTTP_PROTOCOL** instance.
- **HttpConfigData**
  Pointer to the configure data to configure the instance.

**Description**
The `Configure()` function does the following:

- When `HttpConfigData` is not NULL Initialize this EFI HTTP instance by configuring timeout, local address, port, etc.
- When `HttpConfigData` is `NULL`, reset this EFI HTTP instance by closing all active connections with remote hosts, canceling all asynchronous tokens, and flush request and response buffers without informing the appropriate hosts.

No other EFI HTTP function can be executed by this instance until the `Configure()` function is executed and returns successfully.

</tbody>
</table>

### `EFI_HTTP_PROTOCOL.Request()`

**Summary**

The `Request()` function queues an HTTP request to this HTTP instance, similar to `Transmit()` function in the EFI TCP driver. When the HTTP request is sent successfully, or if there is an error, `Status` in token will be updated and `Event` will be signaled.

**EFI Protocol**

```c
typedef
  EFI_STATUS
  (EFIAPI *EFI_HTTP_REQUEST) (
    IN EFI_HTTP_PROTOCOL  *This,
    IN EFI_HTTP_TOKEN     *Token
  );
```

**Parameters**

- **This** Pointer to `EFI_HTTP_PROTOCOL` instance.
- **Token** Pointer to storage containing HTTP request token. Type `EFI_HTTP_TOKEN` is defined in "Related Definitions" below.
Related Definition

```c
typedef struct {
  EFI_EVENT Event;
  EFI_STATUS Status;
  EFI_HTTP_MESSAGE *Message;
} EFI_HTTP_TOKEN;
```

**Event**
This `Event` will be signaled after the `Status` field is updated by the EFI HTTP Protocol driver. The type of `Event` must be `EFI_NOTIFY_SIGNAL`. The Task Priority Level (TPL) of `Event` must be lower than or equal to `TPL_CALLBACK`.

**Status**
`Status` will be set to one of the following value if the HTTP request is successfully sent or if an unexpected error occurs:

- **EFI_SUCCESS**: The HTTP request was successfully sent to the remote host.
- **EFI_HTTP_ERROR**: The response message was successfully received but contains a HTTP error. The response status code is returned in `Token`.
- **EFI_ABORTED**: The HTTP request was canceled by the caller and removed from the transmit queue.
- **EFI_TIMEOUT**: The HTTP request timed out before reaching the remote host.
- **EFI_DEVICE_ERROR**: An unexpected system or network error occurred.

**Message**
Pointer to storage containing HTTP message data.

```c
typedef struct {
  union {
    EFI_HTTP_REQUEST_DATA *Request;
    EFI_HTTP_RESPONSE_DATA *Response;
  } Data;
  UINTN HeaderCount;
  EFI_HTTP_HEADER *Headers;
  UINTN BodyLength;
  VOID *Body;
} EFI_HTTP_MESSAGE;
```

**Request**
When the token is used to send a HTTP request, `Request` is a pointer to storage that contains such data as URL and HTTP method.

**Response**
When used to await a response, `Response` points to storage containing HTTP response status code.
HeaderCount  Number of HTTP header structures in Headers list. On request, this count is provided by the caller. On response, this count is provided by the HTTP driver.

Headers  Array containing list of HTTP headers. On request, this array is populated by the caller. On response, this array is allocated and populated by the HTTP driver. It is the responsibility of the caller to free this memory on both request and response.

BodyLength  Length in bytes of the HTTP body. This can be zero depending on the HttpMethod type.

Body  Body associated with the HTTP request or response. This can be NULL depending on the HttpMethod type.

The HTTP driver will prepare a request string from the information contained in and queue it to the underlying TCP instance to be sent to the remote host. Typically, all fields in the structure will contain content (except Body and BodyLength when HTTP method is not POST or PUT), but there is a special case when using PUT or POST to send large amounts of data. Depending on the size of the data, it may not be able to be stored in a contiguous block of memory, so the data will need to be provided in chunks. In this case, if Body is not NULL and BodyLength is non-zero and all other fields are NULL or 0, the HTTP driver will queue the data to be sent to the last remote host that a token was successfully sent. If no previous token was sent successfully, this function will return EFI_INVALID_PARAMETER.

The HTTP driver is expected to close existing (if any) underlying TCP instance and create new TCP instance if the host name in the request URL is different from previous calls to Request(). This is consistent with RFC 2616 recommendation that HTTP clients should attempt to maintain an open TCP connection between client and host.

```c
//**************************************
// EFI_HTTP_REQUEST_DATA
//**************************************
typedef struct {
    EFI_HTTP_METHOD   Method;
    CHAR16       *Url;
} EFI_HTTP_REQUEST_DATA;
```

Method  The HTTP method (e.g. GET, POST) for this HTTP Request.

Url  The URI of a remote host. From the information in this field, the HTTP instance will be able to determine whether to use HTTP or HTTPS and will also be able to determine the port number to use. If no port number is specified, port 80 (HTTP) is assumed. See RFC 3986 for more details on URI syntax.
EFI_HTTP_METHOD

typedef enum {
    HttpMethodGet,
    HttpMethodPost,
    HttpMethodPatch,
    HttpMethodOptions,
    HttpMethodConnect,
    HttpMethodHead,
    HttpMethodPut,
    HttpMethodDelete,
    HttpMethodTrace,
    HttpMethodMax
} EFI_HTTP_METHOD;

EFI_HTTP_RESPONSE_DATA

typedef struct {
    EFI_HTTP_STATUS_CODE StatusCode;
} EFI_HTTP_RESPONSE_DATA;

StatusCode Response status code returned by the remote host.

EFI_HTTP_HEADER

typedef struct {
    CHAR8 *FieldName;
    CHAR8 *FieldValue;
} EFI_HTTP_HEADER;

FieldName Null terminated string which describes a field name. See RFC 2616 Section 14 for detailed information about field names.

FieldValue Null terminated string which describes the corresponding field value. See RFC 2616 Section 14 for detailed information about field values.
typedef enum {
    HTTP_STATUS_UNSUPPORTED_STATUS = 0,

**EFI_HTTP_PROTOCOL.Cancel()**

**Summary**
Abort an asynchronous HTTP request or response token.

**EFI Protocol**
```c
typedef
  EFI_STATUS
  (EFIAPI * EFI_HTTP_CANCEL)(
    IN EFI_HTTP_PROTOCOL  *This,
    IN EFI_HTTP_TOKEN     *Token,
  );
```

**Parameters**
- **This** Pointer to **EFI_HTTP_PROTOCOL** instance.
- **Token** Point to storage containing HTTP request or response token.

**Description**
The **Cancel()** function aborts a pending HTTP request or response transaction. If **Token** is not **NULL** and the token is in transmit or receive queues when it is being cancelled, its **Token->Status** will be set to **EFI_ABORTED** and then **Token->Event** will be signaled. If the token is not in one of the queues, which usually means that the asynchronous operation has completed, **EFI_NOT_FOUND** is returned. If **Token** is **NULL**, all asynchronous tokens issued by **Request()** or **Response()** will be aborted.

</tbody>
</table>

**EFI_HTTP_PROTOCOL.Response()**

**Summary**

The `Response()` function queues an HTTP response to this HTTP instance, similar to the `Receive()` function in the EFI TCP driver. When the HTTP response is received successfully, or if there is an error, `Status` in token will be updated and `Event` will be signaled.

**EFI Protocol**

```c
typedef EFI_STATUS
    (EFIAPI *EFI_HTTP_RESPONSE) (
    IN EFI_HTTP_PROTOCOL  *This,
    IN EFI_HTTP_TOKEN     *Token
    );
```

**Parameters**

- **This** Pointer to `EFI_HTTP_PROTOCOL` instance.
- **Token** Pointer to storage containing HTTP response token. See `Request()` function for the definition of `EFI_HTTP_TOKEN`.

**Description**

The HTTP driver will queue a receive token to the underlying TCP instance. When data is received in the underlying TCP instance, the data will be parsed and Token will be populated with the response data. If the data received from the remote host contains an incomplete or invalid HTTP header, the HTTP driver will continue waiting (asynchronously) for more data to be sent from the remote host before signaling Event in Token.

It is the responsibility of the caller to allocate a buffer for `Body` and specify the size in `BodyLength`. If the remote host provides a response that contains a content body, up to `BodyLength` bytes will be copied from the receive buffer into `Body` and `BodyLength` will be updated with the amount of bytes received and copied to `Body`. This allows the client to download a large file in chunks instead of into one contiguous block of memory. Similar to HTTP request, if `Body` is not NULL and `BodyLength` is non-zero and all other fields are NULL or 0, the HTTP driver will queue a receive token to underlying TCP instance. If data arrives in the receive buffer, up to `BodyLength` bytes of data will be copied to `Body`. The HTTP driver will then update `BodyLength` with the amount of bytes received and copied to `Body`. 
If the HTTP driver does not have an open underlying TCP connection with the host specified in the response URL, `Response()` will return `EFI_ACCESS_DENIED`. This is consistent with RFC 2616 recommendation that HTTP clients should attempt to maintain an open TCP connection between client and host.

### EFI_HTTP_PROTOCOL.Poll()

Polls for incoming data packets and processes outgoing data packets.

```c
typedef EFI_STATUS
  (EFIAPI *EFI_HTTP_POLL) (
    IN EFI_HTTP_PROTOCOL*This
  );
```

**Parameters**

- `This` Pointer to `EFI_HTTP_PROTOCOL` instance.

**Description**

The `Poll()` function can be used by network drivers and applications to increase the rate that data packets are moved between the communication devices and the transmit and receive queues. In some systems, the periodic timer event in the managed network driver may not poll the underlying communications device fast enough to transmit and/or receive all data packets without missing incoming packets or dropping outgoing packets. Drivers and applications that are experiencing packet loss should try calling the `Poll()` function more often.

// Perform any necessary cleanup and handling of downloaded file
// assuming we succeeded at downloading the content. Depending on
// where the data was stored as per business need, that data can
// be consumed at this point. For example, if the data was stored
// to a file system, the file can be opened and consumed.
return EFI_SUCCESS;
}

29.6.3 HTTP Utilities Protocol

Summary
This section defines the EFI HTTP Utilities Protocol interface.

**EFI_HTTP_UTILITIES_PROTOCOL**

Protocol GUID

```
#define EFI_HTTP_UTILITIES_PROTOCOL_GUID \
{ 0x3E35C163, 0x4074, 0x45DD,\ 
{ 0x43, 0x1E, 0x23, 0x98, 0x9D, 0xD8, 0x6B, 0x32 }}
```

Protocol Interface Structure

```
typedef struct _EFI_HTTP_UTILITIES_PROTOCOL {
    EFI_HTTP_UTILS_BUILD     Build;
    EFI_HTTP_UTILS_PARSE     Parse;
} EFI_HTTP_UTILITIES_PROTOCOL;
```

Parameters

- **Build**
  Create HTTP header based on a combination of seed header, fields to delete, and fields to append.

- **Parse**
  Parses HTTP header and produces an array of key/value pairs.

Description

The EFI HTTP utility protocol is designed to be used by EFI drivers and applications to parse HTTP headers from a byte stream. This driver is neither dependent on network connectivity, nor the existence of an underlying network infrastructure.

**EFI_HTTP_UTILITIES_PROTOCOL.Build()**

Summary
Provides ability to add, remove, or replace HTTP headers in a raw HTTP message.
EFI Protocol

typedef
EFI_STATUS
(EIFIAPI *EFI_HTTP_UTILS_BUILD) (
    IN EFI_HTTP_UTILITIES_PROTOCOL *This,
    IN UINTN SeedMessageSize
    IN VOID *SeedMessage,  OPTIONAL
    IN UINTN DeleteCount
    IN CHAR8 *DeleteList[],  OPTIONAL
    IN UINTN AppendCount
    IN EFI_HTTP_HEADER [*]AppendList[],  OPTIONAL
    OUT UINTN [*]NewMessageSize,
    OUT VOID **NewMessage,
);  

Parameters

This Pointer to EFI_HTTP_UTILITIES_PROTOCOL instance.
SeedMessageSize Size of the initial HTTP header. This can be zero.
SeedMessage Initial HTTP header to be used as a base for building a new HTTP header. If NULL, SeedMessageSize is ignored.
DeleteCount Number of null-terminated HTTP header field names in DeleteList.
DeleteList List of null-terminated HTTP header field names to remove from SeedMessage. Only the field names are in this list because the field values are irrelevant to this operation.
AppendCount Number of header fields in AppendList.
AppendList List of HTTP headers to populate NewMessage with. If SeedMessage is not NULL, AppendList will be appended to the existing list from SeedMessage in NewMessage
NewMessageSize Pointer to number of header fields in NewMessage.
NewMessage Pointer to a new list of HTTP headers based on

Description

The Build() function is used to manage the headers portion of an HTTP message by providing the ability to add, remove, or replace HTTP headers.

EFI_HTTP_UTILITIES_PROTOCOL.Parse()

Summary
Parse HTTP header into array of key/value pairs.

EFI Protocol

```c
typedef EFI_STATUS
    (EFIAPI *EFI_HTTP_UTILS_PARSE) ( 
    IN EFI_HTTP_PROTOCOL *This,
    IN CHAR8 *HttpMessage,
    IN UINTN HttpHeadersSize,
    OUT EFI_HTTP_HEADER **HeaderFields,
    OUT UINTN *FieldCount 
    );
```

Parameters

- **This** Pointer to `EFI_HTTP_UTILITIES_PROTOCOL` instance.
- **HttpMessage** Contains raw unformatted HTTP header string.
- **HttpMessageSize** Size of HTTP header.
- **HeaderFields** Array of key/value header pairs.
- **FieldCount** Number of headers in `HeaderFields`.

Description

The `Parse()` function is used to transform data stored in `HttpHeader` into a list of fields paired with their corresponding values.

29.7 EFI REST Support Overview

EFI REST(EX) protocols are designed to support REST communication between EFI REST client applications/drivers and REST services. EFI REST client tool uses EFI REST(EX) protocols to send/receive resources to/from REST service to manage systems, configure systems or manipulate resources on REST service. Due to HTTP protocol is commonly used to communicate with REST service in practice, EFI REST(EX) protocols adopt HTTP as the message format to send and receive REST service resource.

EFI REST(EX) driver instance abstracts EFI REST client functionality and provides underlying interface to communicate with REST service. EFI REST(EX) driver instance knows how to communicate with REST service through certain interface after the corresponding configuration is initialized. EFI REST support provides two REST relevant protocols, one is EFI REST protocol which was introduced in UEFI spec 2.5 for providing light-weight EFI REST capability. Another one is EFI REST EX protocol, which is introduced in UEFI spec 2.8 for providing more interoperability between EFI REST client and REST service.

EFI REST and EFI REST EX protocols are not required to coexist on a platform, system integrator determines which EFI REST relevant protocol to be supported on system according to the platform demands. EFI REST support is to provide interoperability between EFI REST client and REST service. The authentication of accessing to REST service is not handled by EFI REST relevant protocols. Different REST service has its own authentication method. EFI REST client has to follow the specification defined by REST service for the authentication process.

Figure 29-1 EFI REST Support, Single Protocol
Multiple EFI REST(EX) driver instances can be installed on a platform to communicate with different types of REST services or various underlying interfaces to REST services. REST service can be located on the platform locally, or off platform in the remote server. The system integrator can implement In-band EFI REST(EX) driver instance for the on-platform REST service communications or Out-of-band EFI REST(EX) driver instance for the off-platform REST service communications.

Figure 29-2 EFI REST Support, Multiple Protocols
**EFI REST Support Scenario 1 (Platform Management)**

The following figure represents a platform which has BMC on board, with the REST service deployed like Redfish service. The In-band EFI REST(EX) protocol (right one) is used by EFI REST client to manage this platform. This platform can also be managed in out of band like from the remote OS REST client. The left one is Out of band EFI REST(EX) protocol which communicate with other REST services like Redfish service in which the resource is belong to other platforms.

![Figure 29-3 EFI REST Support, BMC on Board](image_url)
EFI REST Support Scenario 2 (Platform Management)

The following figure represents a platform which uses remote Redfish service for the platform management. If treats the resource in remote Redfish service as a part of this platform, the In-band EFI REST(EX) protocol could be implemented to communicate with remote Redfish service. This platform can also be managed in out of band from the remote OS REST client.

Figure 29-4 EFI REST Support, Redfish Service
A variety of possible EFI REST(EX) protocol usages are delineated as below. The EFI REST(EX) driver instance could communicate with REST service through underlying interface like EFI network stack, platform specific interface to BMC or others. The working model of EFI REST support depends on the implementation of EFI REST(EX) driver instance and the design of platform.

![Figure 29-5 EFI REST Support, Protocol Usages](image)
29.7.1 EFI REST Protocol

This section defines the EFI REST Protocol interface.

29.7.1.1 EFI REST Protocol Definitions

EFI_REST_PROTOCOL

Protocol GUID

```c
#define EFI_REST_PROTOCOL_GUID
0x0DB48A36, 0x4E54, 0xEA9C,
{ 0x9B, 0x09, 0x1E, 0xA5, 0xBE, 0x3A, 0x66, 0x0B }
```

Protocol Interface Structure

```c
typedef struct _EFI_REST_PROTOCOL {
    EFI_REST_SEND_RECEIVE SendReceive;
    EFI_REST_GET_TIME GetServiceTime;
} EFI_REST_PROTOCOL;
```

Parameters

- **RestSendReceive**: Provides an HTTP-like interface to send and receive resources from a REST service.
- **GetServiceTime**: Returns the current time of the REST service.

Description

The EFI REST protocol is designed to be used by EFI drivers and applications to send and receive resources from a RESTful service. This protocol abstracts REST (Representational State Transfer) client functionality. This EFI protocol could be implemented to use an underlying EFI HTTP protocol, or it could rely on other interfaces that abstract HTTP access to the resources.

**EFI_REST_PROTOCOL.SendReceive()**

Summary

Provides a simple HTTP-like interface to send and receive resources from a REST service.
EFI Protocol

typedef EFI_STATUS (EFIAPI *EFI_REST_SEND_RECEIVE)(
   IN EFI_REST_PROTOCOL *This,
   IN EFI_HTTP_MESSAGE *RequestMessage,
   OUT EFI_HTTP_MESSAGE *ResponseMessage
);

Parameters

This Pointer to EFI_REST_PROTOCOL instance for a particular REST service.
RequestMessage Pointer to the REST request data for this resource
ResponseMessage Pointer to the REST response data obtained for this requested.

Description

The SendReceive() function sends a REST request to this REST service, and returns a REST response when the data is retrieved from the service. Both of the REST request and response messages are represented in format of EFI_HTTP_MESSAGE. RequestMessage contains the request to the REST resource identified by UrlRequestMessage->Data.Request->Url. The ResponseMessage is the returned response for that request, including the final HTTP status code, headers and the REST resource represented in the message body.

The memory buffers pointed by ResponseMessage->Data.Response, ResponseMessage->Headers and ResponseMessage->Body are allocated by this function, and it is the caller's responsibility to free the buffer when the caller no longer requires the buffer's contents.

It's the REST protocol’s responsibility to handle HTTP layer details and return the REST resource to the caller, when this function is implemented by using an underlying EFI HTTP protocol. For example, if an HTTP interim response (Informational 1xx in HTTP 1.1) is received from server, the REST protocol should deal with it and keep waiting for the final response, instead of return the interim response to the caller. Same principle should be observed if the REST protocol relies on other interfaces.

Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>operation succeeded</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>This, RequestMessage, or ResponseMessage are NULL.</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>An unexpected system or network error occurred.</td>
</tr>
<tr>
<td>EFI_TIMEOUT</td>
<td>Receiving response message fail due to timeout.</td>
</tr>
</tbody>
</table>
EFI_REST_PROTOCOL.GetServiceTime()

```c
typedef EFI_STATUS (EFIAPI *EFI_REST_GET_TIME)(
    IN   EFI_REST_PROTOCOL   *This,
    OUT  EFI_TIME            *Time
);
```

**Parameters**

- **This**: Pointer to EFI_REST_PROTOCOL instance.
- **Time**: A pointer to storage to receive a snapshot of the current time of the REST service.

**Description**

The `GetServiceTime()` function is an optional interface to obtain the current time from this REST service instance. If this REST service does not support retrieving the time, this function returns EFI_UNSUPPORTED.

**Status Codes Returned**

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>

</tbody>
</table>

### 29.7.2 EFI REST EX Protocol

This section defines the EFI REST EX Protocol interfaces. It is split into the following two main sections:

- REST EX Service Binding Protocol (RESTEXSB)
- REST EX Protocol (REST EX)

#### 29.7.2.1 REST EX Service Binding Protocol

**EFI_REST_EX_SERVICE_BINDING_PROTOCOL**

**Summary**

The RESTEXSB is used to locate the REST services those are supported by a REST EX driver instances and to create and destroy instances of REST EX child protocol driver.

The EFI Service Binding Protocol in Section 11.6 defines the generic Service Binding Protocol functions. This section discusses the details that are specific to the REST EX.
**GUID**

```c
#define EFI_REST_EX_SERVICE_BINDING_PROTOCOL_GUID  
   {0x456bbe01, 0x99d0, 0x45ea,  
   {0xbb, 0x5f, 0x16, 0xd8, 0x4b, 0xed, 0xc5, 0x59}}
```

**Description**

A REST service client application (or driver) that communicates to REST service can use one of protocol handler services, such as BS->LocateHandleBuffer(), to search for devices that publish a RESTEXSB GUID. Each device with a published RESTEXSB GUID supports REST EX Service Binding Protocol and may be available for use.

After a successful call to the EFI_REST_EX_SERVICE_BINDING_PROTOCOL.CreateChild() function, the child REST EX driver is in the unconfigured state. It is not ready to communicate with REST service at this moment. The child instance is ready to use to communicate with REST service after the successful Configure() is invoked. For EFI REST drivers which don’t require additional configuration process, Configure() is unnecessary to be invoked before using its child instance. This depends on EFI REST EX driver specific implementation.

Before a REST service client application terminates execution, every successful call to the EFI_REST_EX_SERVICE_BINDING_PROTOCOL.CreateChild() function must be matched with a call to the EFI_REST_EX_SERVICE_BINDING_PROTOCOL.DestroyChild() function.

### 29.7.2.2 REST EX Protocol Specific Definitions

**EFI_REST_EX_PROTOCOL**

**Protocol GUID**

```c
#define EFI_REST_EX_PROTOCOL_GUID  
   {0x55648b91, 0xe7d, 0x40a3,  
   {0xa9, 0xb3, 0xa8, 0x15, 0xd7, 0xea, 0xdf, 0x97}}
```

**Protocol Interface Structure**

```c
typedef struct _EFI_REST_EX_PROTOCOL {
   EFI_REST_SEND_RECEIVE SendReceive;
   EFI_REST_GET_TIME GetServiceTime;
   EFI_REST_EX_GET_SERVICE GetService;
   EFI_REST_EX_GET_MODE_DATA GetDataMode;
   EFI_REST_EX_CONFIGURE Configure;
   EFI_REST_EX_ASYNC_SEND_RECEIVE AsyncSendReceive;
   EFI_REST_EX_EVENT_SERVICE EventService;
} EFI_REST_EX_PROTOCOL;
```

**Parameters**

- **SendReceive** Provides an HTTP-like interface to send and receive resources from a REST service. The functionality of this function is same as EFI_REST_PROTOCOL.SendReceive(). Refer to section Section 29.7.1.1 for more details.
**GetServiceTime**

Returns the current time of the REST service. The functionality of this function is same as EFI_REST_PROTOCOL.GetServiceTime(). Refer to Section 29.7.1.1 for the details.

**GetService**

This function returns the type and location of REST service.

**GetModeData**

This function returns operational configuration of current EFI REST EX child instance.

**Configure**

This function is used to configure EFI REST EX child instance.

**AsyncSendReceive**

Provides an HTTP-like interface to send and receive resources. The resource returned from REST service is sent to client in asynchronously.

**EventService**

Provides an interface to subscribe event of specific resource changes on REST service.

**Description**

The REST EX protocol is designed to use by REST service client applications or drivers to communicate with REST service. REST EX protocol enhances the REST protocol and provides comprehensive interfaces to REST service clients. Akin to REST protocol, REST EX driver instance uses HTTP message for the REST request and response. However, the underlying mechanism of REST EX is not necessary to be HTTP-aware. The underlying mechanism could be any protocols according to the REST service mechanism respectively. REST EX protocol could be used to communicate with In-band or Out-of-band REST service depends on the platform-specific implementation.

**EFI_REST_EX_PROTOCOL.SendReceive()**

**Summary**

Provides a simple HTTP-like interface to send and receive resources from a REST service.

**Prototype**

```c
typedef
EFI_STATUS
(EFIAPI *EFI_REST_SEND_RECEIVE)(
    IN     EFI_REST_EX_PROTOCOL    *This,
    IN     EFI_HTTP_MESSAGE        *RequestMessage,
    OUT    EFI_HTTP_MESSAGE        *ResponseMessage
);
```

**Parameters**

Refer to Section 29.7.1.1 for the details.

**Description**

Refer to Section 29.7.1.1 for the details.

EFI_REST_EX_PROTOCOL.GetService()

Summary
This function returns the information of REST service provided by this EFI REST EX driver instance.

Protocol Interface
typedef
  EFI_STATUS
  (EFIAPI *EFI_REST_EX_GET_SERVICE)(
    IN EFI_REST_EX_PROTOCOL *This,
    OUT EFI_REST_EX_SERVICE_INFO **RestExServiceInfo
  );

Parameters
This
This is the EFI_REST_EX_PROTOCOL instance.

RestExServiceInfo
Pointer to receive a pointer to EFI_REST_SERVICE_INFO structure. The format of EFI_REST_SERVICE_INFO is version controlled for the future extension. The version of EFI_REST_SERVICE_INFO structure is returned in the header within this structure. EFI REST client refers to the correct format of structure according to the version number. The pointer to EFI_REST_SERVICE_INFO is a memory block allocated by EFI REST EX driver instance. That is caller’s responsibility to free this memory when this structure is no longer needed. Refer to Related Definitions below for the definitions of EFI_REST_SERVICE_INFO structure.

Description
This function returns the information of REST service provided by this REST EX driver instance. The information such as the type of REST service and the access mode of REST EX driver instance (In-band or Out-of-band) are described in EFI_REST_SERVICE_INFO structure. For the vendor-specific REST service, vendor-specific REST service information is returned in VendorSpecificData. Besides the REST service information provided by REST EX driver instance, EFI_DEVICE_PATH_PROTOCOL of the REST service is also provided on the handle of REST EX driver instance.

EFI REST client can get the information of REST service from REST service EFI device path node in EFI_DEVICE_PATH_PROTOCOL. EFI_DEVICE_PATH_PROTOCOL which installed on REST EX driver
instance indicates where the REST service is located, such as BMC Device Path, IPV4, IPV6 or others. Refer to Section 10.3.4.32 for details of the REST service device path node, which is the sub-type (Sub-type = 32) of Messaging Device Path (type 3).

REST EX driver designer is well know what REST service this REST EX driver instance intends to communicate with. The designer also well know this driver instance is used to talk to BMC through specific platform mechanism or talk to REST server through UEFI HTTP protocol. REST EX driver is responsible to fill up the correct information in EFI_REST_EX_SERVICE_INFO. EFI_REST_EX_SERVICE_INFO is referred by EFI REST clients to pickup the proper EFI REST EX driver instance to get and set resource. GetService() is a basic and mandatory function which must be able to use even Configure() is not invoked in previously.

Related Definitions

```c
//*******************************************************
//EFI_REST_EX_SERVICE_INFO_HEADER
//*******************************************************
typedef struct {
    UINT32         Length;
    EFI_REST_EX_SERVICE_INFO_VER   RestServiceInfoVer;
} EFI_REST_EX_SERVICE_INFO_HEADER;

Length          The length of entire EFI REST_EX_SERVICE_INFO structure. Header size is included.
RestServiceInfoVer  The version of this EFI_REST_SERVICE_INFO structure. See below definitions of EFI_REST_EX_SERVICE_INFO_VER.

//*******************************************************
//EFI_REST_EX_SERVICE_INFO_VER
//*******************************************************
typedef struct {
    UINT8         Major;
    UINT8         Minor;
} EFI_REST_EX_SERVICE_INFO_VER;

Major          The major version of EFI_REST_EX_SERVICE_INFO.
Minor          The minor version of EFI_REST_EX_SERVICE_INFO.

//*******************************************************
//EFI_REST_EX_SERVICE_INFO
//*******************************************************
EFI_REST_EX_SERVICE_INFO is version controlled for the future extensions. Any new information added to this structure requires version increased. EFI REST EX driver instance must provides the correct version of structure in EFI_REST_EX_SERVICE_INFO_VER when it returns EFI_REST_EX_SERVICE_INFO to caller.
```
typedef union {
    EFI_REST_EX_SERVICE_INFO_HEADER EfiRestExServiceInfoHeader;
    EFI_REST_EX_SERVICE_INFO_V_1_0 EfiRestExServiceInfoV10;
} EFI_REST_EX_SERVICE_INFO;

typedef struct {
    EFI_REST_EX_SERVICE_INFO_HEADER EfiRestExServiceInfoHeader;
    EFI_REST_EX_SERVICE_TYPE RestExServiceType;
    EFI_REST_EX_SERVICE_ACCESS_MODE RestServiceAccessMode;
    EFI_GUID VendorRestServiceName;
    UINT32 VendorSpecificDataLength;
    UINT8 *VendorSpecificData;
    EFI_REST_EX_CONFIG_TYPE RestExConfigType;
    UINT8 RestExConfigDataLength;
} EFI_REST_EX_SERVICE_INFO_V_1_0;

EfiRestExServiceInfoHeader The header of EFI_REST_EX_SERVICE_INFO.
RestExServiceType The REST service type. See below definition.
RestServiceAccessMode The access mode of REST service. See below definition.
VendorRestServiceName The name of vendor-specific REST service. This field is only valid if RestExServiceType is EFI_REST_EX_SERVICE_VENDOR_SPECIFIC.
VendorSpecificDataLength The length of vendor-specific REST service information. This field is only valid if RestExServiceType is EFI_REST_EX_SERVICE_VENDOR_SPECIFIC.
VendorSpecificData A pointer to vendor-specific REST service information. This field is only valid if RestExServiceType is EFI_REST_EX_SERVICE_VENDOR_SPECIFIC. The memory buffer pointed by VendorSpecificData is allocated by EFI REST EX driver instance and must be freed by EFI REST client when it is no longer need.
RestExConfigType The type of configuration of REST EX driver instance. See GetModeData() and Configure() for the details.
RestExConfigDataLength The length of REST EX configuration data.
typedef enum {
  EFI_REST_EX_SERVICE_UNSPECIFIC = 1,
  EFI_REST_EX_SERVICE_REDFISH,
  EFI_REST_EX_SERVICE_ODATA,
  EFI_REST_EX_SERVICE_VENDOR_SPECIFIC = 0xff,
  EFI_REST_EX_SERVICE_TYPE_MAX
} EFI_REST_EX_SERVICE_TYPE;

EFI_REST_EX_SERVICE_UNSPECIFIC indicates this EFI REST EX driver instance is not used to communicate with any particular REST service. The EFI REST EX driver instance which reports this service type is REST service independent and only provides SendReceive() function to EFI REST client. EFI REST client uses this function to send and receive HTTP message to any target URI and handles the follow up actions by itself. The EFI REST EX driver instance in this type must returns EFI_UNSUPPORTED in below REST EX protocol interfaces, GetServiceTime(), AsyncSendReceive() and EventService().

EFI_REST_EX_SERVICE_REDFISH indicates this EFI REST EX driver instance is used to communicate with Redfish REST service.

EFI_REST_EX_SERVICE_ODATA indicates this EFI REST EX driver instance is used to communicate with Odata REST service.

EFI_REST_EX_SERVICE_VENDOR_SPECIFIC indicates this EFI REST EX driver instance is used to communicate with vendor-specific REST service.

typedef enum {
  EFI_REST_EX_SERVICE_IN_BAND_ACCESS = 1,
  EFI_REST_EX_SERVICE_OUT_OF_BAND_ACCESS = 2,
  EFI_REST_EX_SERVICE_ACCESS_MODE_MAX
} EFI_REST_EX_SERVICE_ACCESS_MODE;

EFI_REST_EX_SERVICE_IN_BAND_ACCESS mode indicates the REST service is invoked in In-band mechanism in the scope of platform. In most of cases, the In-band mechanism is used to communicate with REST service on platform through some particular devices like BMC, Embedded Controller and other infrastructures built on the platform.

EFI_REST_EX_SERVICE_OUT_OF_BAND_ACCESS mode indicates the REST service is invoked in Out-of-band mechanism. The REST service is located out of platform scope. In most of cases, the Out-of-band mechanism is used to communicate with REST service on other platforms through network or other protocols.
EDI REST EX CONFIG TYPE

typedef enum {
    EFI_REST_EX_CONFIG_TYPE_HTTP,
    EFI_REST_EX_CONFIG_TYPE_UNSPECIFIC,
    EFI_REST_EX_CONFIG_TYPE_MAX
} EFI_REST_EX_CONFIG_TYPE;

EFI_REST_EX_CONFIG_TYPE_HTTP indicates the format of the REST EX configuration is
EFI_REST_EX_HTTP_CONFIG_DATA. RestExConfigDataLength of this type is the size of
EFI_REST_EX_HTTP_CONFIG_DATA. This configuration type is used for the HTTP-aware EFI REST EX
driver instance.

EDI REST EX HTTP_CONFIG_DATA

typedef struct {
    EFI_HTTP_CONFIG_DATA HttpConfigData;
    UINT32 SendReceiveTimeout;
} EFI_REST_EX_HTTP_CONFIG_DATA;

HttpConfigData Parameters to configure the HTTP child instance.
SendReceiveTimeout Time out (in milliseconds) when blocking for response after send out
request message in EFI_REST_EX_PROTOCOL.SendReceive().

EDI REST EX_CONFIG_TYPE_UNSPECIFIC indicates the format of REST EX configuration is unspecific.
RestExConfigDataLength of this type depends on the implementation of non HTTP-aware EFI REST EX
driver instance such as BMC EFI REST EX driver instance. The format of configuration for this type refers
to the system/platform spec which is out of UEFI scope.

EFI_REST_EX_PROTOCOL.GetModeData()

Summary
This function returns operational configuration of current EFI REST EX child instance.
Protocol Interface

```c
typedef EFI_STATUS (EFIAPI *EFI_REST_EX_GET_MODE_DATA)(
    IN   EFI_REST_EX_PROTOCOL  *This,
    OUT  EFI_REST_EX_CONFIG_DATA *RestExConfigData
);
```

Parameters

- `This` This is the `EFI_REST_EX_PROTOCOL` instance.
- `RestExConfigData` Pointer to receive a pointer to `EFI_REST_EX_CONFIG_DATA`. The memory allocated for configuration data should be freed by caller. See Related Definitions for the details.

Description

This function returns the current configuration of EFI REST EX child instance. The format of operational configuration depends on the implementation of EFI REST EX driver instance. For example, HTTP-aware EFI REST EX driver instance uses EFI HTTP protocol as the underlying protocol to communicate with the REST service. In this case, the type of configuration `EFI_REST_EX_CONFIG_TYPE_HTTP` is returned from `GetService()`. `EFI_REST_EX_HTTP_CONFIG_DATA` is used as EFI REST EX configuration format and returned to the EFI REST client. For those non HTTP-aware REST EX driver instances, the type of configuration `EFI_REST_EX_CONFIG_TYPE_UNSPECIFIC` is returned from `GetService()`. In this case, the format of returning data could be non-standard. Instead, the format of configuration data is a system/platform specific definition such as a BMC mechanism used in EFI REST EX driver instance. EFI REST client and EFI REST EX driver instance have to refer to the specific system/platform spec which is out of UEFI scope.

**EFI_REST_EX_PROTOCOL.Configure()**

Summary

This function is used to configure EFI REST EX child instance.
Protocol Interface

```c
typedef EFI_STATUS (EFIAPI *EFI_REST_EX_CONFIGURE)(
    IN EFI_REST_EX_PROTOCOL *This,
    IN EFI_REST_EX_CONFIG_DATA RestExConfigData
);
```

**Parameters**

- **This**
  - This is the `EFI_REST_EX_PROTOCOL` instance.

- **RestExConfigData**
  - Pointer to `EFI_REST_EX_CONFIG_DATA`. See Related Definitions in `GetModeData()` protocol interface.

**Description**

This function is used to configure the setting of underlying protocol of REST EX child instance. The type of configuration is according to the implementation of EFI REST EX driver instance. For example, HTTP-aware EFI REST EX driver instance uses EFI HTTP protocol as the undying protocol to communicate with REST service. The type of configuration is `EFI_REST_EX_CONFIG_TYPE_HTTP` and `RestExConfigData` is in the format of `EFI_REST_EX_HTTP_CONFIG_DATA`.

Akin to HTTP configuration, REST EX child instance can be configure to use different HTTP local access point for the data transmission. Multiple REST clients may use different configuration of HTTP to distinguish themselves, such as to use the different TCP port. For those non HTTP-aware REST EX driver instance, the type of configuration is `EFI_REST_EX_CONFIG_TYPE_UNSPECIFIC`. `RestExConfigData` refers to the non industrial standard. Instead, the format of configuration data is system/platform specific definition such as BMC. In this case, EFI REST client and EFI REST EX driver instance have to refer to the specific system/platform spec which is out of the UEFI scope. Besides `GetService()` function, no other EFI REST EX functions can be executed by this instance until `Configure()` is executed and returns successfully. All other functions must returns `EFI_NOT_READY` if this instance is not configured yet. Set `RestExConfigData` to NULL means to put EFI REST EX child instance into the unconfigured state.

**Status Code Returned**

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td><code>EFI_REST_EX_CONFIG_DATA</code> is set in successfully.</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>Configuration for this REST EX child instance is failed with the given <code>EFI_REST_EX_CONFIG_DATA</code>.</td>
</tr>
<tr>
<td>EFI_UNSUPPORTED</td>
<td>This function is not supported in this REST EX Protocol driver instance.</td>
</tr>
</tbody>
</table>
**Usage Example**

Below illustrations show the usage cases of using different EFI REST EX child instances to communicate with REST service.

In the above case, EFI REST Client A and B use HTTP-aware EFI REST EX driver instance to get and send resource. These two EFI REST clients configure the child instance with specific TCP port. Therefore the data transmission through HTTP can delivered to the proper EFI REST clients.

In the above case, EFI REST Client A creates two EFI REST EX child instances and configures those child instances to connect to two BMCs respectively.

**EFI_REST_EX_PROTOCOL.AsyncSendReceive()**

**Summary**

This function sends REST request to REST service and signal caller’s event asynchronously when the final response is received by REST EX Protocol driver instance. The essential design of this function is to handle asynchronous send/receive implicitly according to REST service asynchronous request mechanism. Caller will get the notification once the final response is returned from the REST service.
Protocol Interface

```c
typedef EFI_STATUS (EFIAPIC *EFI_REST_EX_ASYNC_SEND_RECEIVE)(
    IN EFI_REST_EX_PROTOCOL *This,
    IN EFI_HTTP_MESSAGE *RequestMessage OPTIONAL,
    IN EFI_REST_EX_TOKEN *RestExToken,
    IN UINTN *TimeOutInMilliSeconds OPTIONAL);
```

Parameters

- `This` is the `EFI_REST_EX_PROTOCOL` instance.
- `RequestMessage` is the REST request message sent to the REST service. Set `RequestMessage` to NULL to cancel the previous asynchronous request associated with the corresponding `RestExToken`. See descriptions for the details.
- `RestExToken` is the REST EX token which REST EX Protocol instance uses to notify REST client the status of response of asynchronous REST request. See related definition of `EFI_REST_EX_TOKEN`.
- `TimeOutInMilliSeconds` is the pointer to the timeout in milliseconds which REST EX Protocol driver instance refers as the duration to drop asynchronous REST request. NULL pointer means no timeout for this REST request. REST EX Protocol driver signals caller's event with `EFI_STATUS` set to `EFI_TIMEOUT` in `RestExToken` if REST EX Protocol can't get the response from REST service within `TimeOutInMilliSeconds`.

Description

This function is used to send REST request with asynchronous REST service response within certain timeout declared. REST service sometime takes long time to create resource. Sometimes REST service returns response to REST client late because of the shortage of bandwidth or bad network quality. To prevent from unfriendly user experience due to system stuck while waiting for the response from REST service, `EFI_REST_EX_PROTOCOL.AsyncSendReceive()` provides the capability to send asynchronous REST request. Caller sends the REST request and still can execute some other processes on background while waiting the event signaled by REST EX Protocol driver instance.

The implementation of underlying mechanism of asynchronous REST request depends on the mechanism of REST service. HTTP protocol, In-Band management protocol and other protocols has its own way to support asynchronous REST request. Similar to `EFI_REST_EX_PROTOCOL.SendReceive()`, it’s the REST EX protocol’s responsibility to handle the implementation details and return only the REST resource to the caller. REST EX Protocol driver instance which doesn’t support asynchronous REST request can just return `EFI_UNSUPPORTED` to caller. Also, this function must returns `EFI_UNSUPPORTED` if `EFI_REST_EX_SERVICE_TYPE` returned in `EFI_REST_EX_SERVICE_INFO` from `GetService()` is `EFI_REST_EX_SERVICE_UNSPECIFIC`.

REST clients do not have to know the preprocessors of asynchronous REST request between REST EX Protocol driver instance and REST service. The responsibility of REST EX Protocol driver instance is to monitor the status of resource readiness and to signal caller’s `RestExToken` when the status of returning
resource is ready. REST EX Protocol driver instance sets Status field in RestExToken to EFI_SUCCESS and sets ResponseMessage pointer to the final response from REST service. Then signal caller’s event to notify REST client the desired REST resource is received. REST EX Protocol driver instance also has to create an EFI timer to handle the timeout situation. REST EX Protocol driver must drops the asynchronous REST request once the timeout is expired. In this case, REST EX Protocol driver instance sets Status field in RestExToken to EFI_TIMEOUT and signal caller’s event token.

REST EX Protocol driver instance must has capability to cancel the in process asynchronous REST request when caller asks to terminate specific asynchronous REST request. REST EX Protocol driver instance may not have capability to force REST service to cancel the specific request, however, REST EX Protocol driver instance at least least can clean up its own internal resource of asynchronous REST request. Caller has to set RequestMessage to NULL with RestExToken set to EFI_REST_EX_TOKEN which was successfully sent to this function previously. REST EX Protocol driver instance finds the given EFI_REST_EX_TOKEN from its private database and clean up the associated resource if EFI_REST_EX_TOKEN is an in-process asynchronous REST request. REST EX Protocol driver instance then sets Status field in RestExToken to EFI_ABORT and signal caller’s event to indicate the asynchronous REST request has been canceled.

REST EX Protocol driver instance maintains the internal property, state machine, status of transfer of each asynchronous REST request. REST EX Protocol driver instance has to clean up the internal resource associated with each asynchronous REST request no matter the transfer is ended with success or fail.

There are two phases of asynchronous REST request. One is the preprocessor of establishing asynchronous REST request between REST EX Protocol driver instance and REST service. Another phase is to retrieve the final response from REST service and send to REST client.

**Related Definitions**

```c
typedef struct {
  EFI_EVENT Event;
  EFI_STATUS Status;
  EFI_HTTP_MESSAGE *ResponseMessage;
} EFI_REST_EX_TOKEN;
```

This event will be signaled after the Status field is updated by the EFI REST EX Protocol driver instance. The type of Event must be EFI_NOTIFY_SIGNAL. The Task Priority Level (TPL) of Event must be lower than or equal to TPL_CALLBACK, which allows other events to be notified.
**Status**

Status will be set to one of the following values if the REST EX Protocol driver instance gets the response from the REST service successfully, or if an unexpected error occurs:

**EFI_SUCCESS**: The resource gets a response from REST service successfully. **ResponseMessage** points to the response in HTTP message structure.

**EFI_ABORTED**: The asynchronous REST request was canceled by the caller.

**EFI_TIMEOUT**: The asynchronous REST request timed out before receiving a response from the REST service.

**EFI_DEVICE_ERROR**: An unexpected error occurred.

**ResponseMessage**

The REST response message pointed to by this pointer is only valid when **Status** is **EFI_SUCCESS**. The memory buffers pointed to by **ResponseMessage**, **ResponseMessage->Data.Response**, **ResponseMessage->Headers** and **ResponseMessage->Body** are allocated by the EFI REST EX driver instance, and it is the caller's responsibility to free the buffer when the caller no longer requires the buffer's contents.

</tbody>
</table>

### EFI_REST_EX_PROTOCOL.EventService()

**Summary**

This function sends REST request to a REST Event service and signals caller’s event token asynchronously when the URI resource change event is received by REST EX Protocol driver instance. The essential design of this function is to monitor event implicitly according to REST service event service mechanism. Caller will get the notification if certain resource is changed.
EFI Protocol

```c
typedef EFI_STATUS
(EFIAPI *EFI_REST_EX_EVENT_SERVICE)(
    IN EFI_REST_EX_PROTOCOL *This,
    IN EFI_HTTP_MESSAGE *RequestMessage OPTIONAL,
    IN EFI_REST_EX_TOKEN *RestExToken
);
```

**Parameters**

- **This**
  This is the EFI_REST_EX_PROTOCOL instance.

- **RequestMessage**
  This is the HTTP request message sent to REST service. Set RequestMessage to NULL to cancel the previous event service associated with the corresponding RestExToken. See descriptions for the details.

- **RestExToken**
  REST EX token which REST EX Protocol driver instance uses to notify REST client the URI resource which monitored by REST client has been changed. See the related definition of `EFI_REST_EX_TOKEN` in `EFI_REST_EX_PROTOCOL.AsyncSendReceive()`.

**Description**

This function is used to subscribe an event through REST Event service if REST service supports event service. This function listens on resource change of specific REST URI resource. The type of URI resource change event is varied and REST service specific, such as URI resource updated, resource added, resource removed, alert, etc. The way to subscribe REST Event service is also REST service specific, usually described in HTTP body. With the implementation of `EFI_REST_EX_PROTOCOL.EventService()`, REST client can register an REST EX token of particular URI resource change, usually of a time critical nature, until subscription is deleted from REST Event service.

The implementation of underlying mechanism of REST Event service depends on the interface of REST EX Protocol driver instance. HTTP protocol, In-Band management protocols or other protocols can have its own implementation to support REST Event Service request. REST EX Protocol driver instance has knowledge of how to handle the REST Event service. The REST client creates and submits an HTTP-like header/body content in `RequestMessage` which required by REST Event services. How does REST EX Protocol driver instance handle REST Event service and monitor event is REST service-specific. REST EX driver instance can just returns `EFI_UNSUPPORTED` if REST service has no event capability. Also, this function must returns `EFI_UNSUPPORTED` if `EFI_REST_EX_SERVICE_TYPE` returned in `EFI_REST_EX_SERVICE_INFO` from GetService() is `EFI_REST_EX_SERVICE_UNSPECIFIC`.

The REST EX Protocol driver instance is responsible to monitor the resource change event pushed from REST service. REST EX Protocol driver instance signals caller’s `RestExToken` when the event of resource change is pushed to REST EX Protocol driver instance. The way how REST service pushes event to REST EX Protocol driver instance is implementation-specific and transparent to REST client. REST EX Protocol driver instance sets Status field in `RestExToken` to `EFI_SUCCESS` and sets `ResponseMessage` pointer to the event resource returned from REST Event service. Then REST EX Protocol driver instance signals caller’s event to notify REST client a new REST event is received. REST EX Protocol driver instance also responsible to terminate event subscription and clear up the internal resource associated with REST Event service if the status of subscription resource is returned error.
REST EX Protocol driver instance must has capability to remove event subscription created by REST client. Caller has to set RequestMessage to NULL with RestExToken set to `EFI_REST_EX_TOKEN` which was successfully sent to this function previously. REST EX Protocol driver instance finds the given `EFI_REST_EX_TOKEN` from its private database and delete the associated event from REST service.

### 29.7.2.3 Usage Example (HTTP-aware REST EX Protocol Driver Instance)

The following code example shows how a consumer of REST EX driver would use EFI REST EX ServiceBinding Protocol and EFI REST EX Protocol to send and receive the resources from a REST service.

```c
EFI_HANDLE ImageHandle;
EFI_HANDLE *HandleBuffer;
UINTN HandleNum;
UINTN Index;
EFI_REST_EX_SERVICE_BINDING_PROTOCOL *RestExService;
EFI_HANDLE RestExChild;
EFI_HANDLE *RestEx;
EFI_REST_EX_SERVICE_INFO *RestExServiceInfo;
EFI_REST_EX_CONFIG_DATA RestExConfigData;
EFI_HTTP_MESSAGE RequestMessage;
EFI_HTTP_MESSAGE ResponseMessage;

// Locate all the handles with RESTEX ServiceBinding Protocol.
//
Status = gBS->LocateHandleBuffer (  
    ByProtocol,  
    &gEfiRestExServiceBindingProtocolGuid,  
    NULL,  
    &HandleNum,  
    &HandleBuffer  
);  
if (EFI_ERROR (Status) || (HandleNum == 0)) {  
    return EFI_ABORTED;
}  
```
for (Index = 0; Index < HandleNum; Index++) {
    //
    // Get the RESTEX ServiceBinding Protocol
    //
    Status = gBS->OpenProtocol (HandleBuffer[Index],
        &gEfiRestExServiceBindingProtocolGuid,
        (VOID **) &RestExService,
        ImageHandle,
        NULL,
        EFI_OPEN_PROTOCOL_GET_PROTOCOL);
    if (EFI_ERROR (Status)) {
        return Status;
    }
    //
    // Create the corresponding REST EX child
    //
    Status = RestExService->CreateChild (RestExService, &RestExChild);
    if (EFI_ERROR (Status)) {
        return Status;
    }
    //
    // Retrieve the REST EX Protocol from child handle
    //
    Status = gBS->OpenProtocol (RestExChild,
        &gEfiRestExProtocolGuid,
        (VOID **) &RestEx,
        ImageHandle,
        NULL,
        EFI_OPEN_PROTOCOL_GET_PROTOCOL);
    if (EFI_ERROR (Status)) {
        goto ON_EXIT;
    }
    //
    // Get the information of REST service provided by this EFI REST EX driver
    //
    Status = RestEx->GetService (RestEx,
        &RestExServiceInfo);
    if (EFI_ERROR (Status)) {
        return Status;
    }
}

ON_EXIT:
goto ON_EXIT;
}

// Check whether this REST EX service is preferred by consumer:
// 1. RestServiceAccessMode is EFI_REST_EX_SERVICE_OUT_OF_BAND_ACCESS.
// 2. RestServiceType is EFI_REST_EX_SERVICE_REDFISH.
// 3. RestExConfigType is EFI_REST_EX_CONFIG_TYPE_HTTP.
//
// if ((RestExServiceInfo->ReFiRestExServiceInfoV10.estServiceAccessMode ==
//        EFI_REST_EX_SERVICE_OUT_OF_BAND_ACCESS &&
//        RestExServiceInfo->EfiRestExServiceInfoV10.RestServiceType ==
//        EFI_REST_EX_SERVICE_REDFISH &&
//        RestExServiceInfo->EfiRestExServiceInfoV10.RestExConfigType ==
//        EFI_REST_EX_CONFIG_TYPE_HTTP) {
//    break;
// }
//
// Make sure we have found the preferred REST EX driver.
//
// if (Index == HandleNum) {
//    goto ON_EXIT;
// }

// Configure the RESTEX instance.
//
// Status = RestEx->Configure ( RestEx,
//    RestExConfigData
// );
//
// if (EFI_ERROR (Status)) {
//    goto ON_EXIT;
// }

// Send and receive the resources from a REST service.
//
// Status = RestEx->SendReceive ( RestEx,
//    &RequestMessage,
//    &ResponseMessage
// );
//
// if (EFI_ERROR (Status)) {
//    goto ON_EXIT;
// }
29.7.2.3.1 EFI_REST_EX_PROTOCOL.AsyncSendReceive()

To those HTTP-aware underlying mechanisms of the REST EX Protocol driver instance and “respond-async” prefer header aware REST service, REST EX Protocol driver instance adds additional HTTP Prefer header field (Refer to IETF RFC7240) which is set to “respond-async” in the RequestMessage. HTTP 202 Accepted Status Code is returned from REST service which indicates the REST request is accepted by REST service, however, the final result is left unknown. The way how REST service returns final response to REST EX Protocol driver instance is REST service implementation-specific and transparent to the REST client. Whether or not the REST service has a proper response to “respond-async” is REST service implementation-specific. AsyncSendReceive() must returns EFI_UNSUPPORTED if the REST service that the REST EX instance communicates with is incapable of asynchronous response.

REST EX Protocol driver instance must returns EFI_SUCCESS to caller once it gets HTTP 202 Accepted Status Code from REST service. The HTTP Location header field can be returned in HTTP 202 Accepted Status Code. REST EX Protocol driver instance may create an EFI timer to poll the status of URI returned in HTTP Location header field. The content of URI which pointed by HTTP Location header is REST service implementation-specific and not defined in REST EX Protocol specification. REST EX Protocol driver instance provider should have knowledge about how to poll the status of returning resource from given HTTP Location header.
The following flowchart describes the flow of establishing asynchronous REST request on HTTP-aware infrastructure:

Once the asynchronous REST request is established, REST EX Protocol driver instance starts to poll the status of final response on the URI returned in HTTP Location header in HTTP 202 Accepted Status code.
29.7.2.3.2 **EFI_REST_EX_PROTOCOL.EventService()**

The REST client creates and submits an HTTP-like header/body content in RequestMessage which are required by REST Event services. The REST Event Service will return an HTTP 201 (CREATED) and the Location header in the response shall contain a URI giving the location of newly created subscription resource.

The following flowchart describes the flow of subscribing to a REST Event service on HTTP-aware infrastructure:

![Flowchart](image)

Once the REST request is submitted successfully and REST EX Protocol driver instance gets the HTTP 201, REST EX Protocol driver instance starts to monitor whether resource event change is pushed to REST EX Protocol driver instance from REST service.
**EFI_REST_EX_PROTOCOL.EventQueueService()**

The REST client creates and submits an HTTP-like header/body content in RequestMessage which are required by REST Event services. The REST Event Service will return an HTTP 201 (CREATED) and the Location header in the response shall contain a URI giving the location of newly created subscription resource.

The following flowchart describes the flow of subscribing to a REST Event service on HTTP-aware infrastructure:
Once the REST request is submitted successfully and REST EX Protocol driver instance gets the HTTP 201, REST EX Protocol driver instance starts to monitor whether resource event change is pushed to REST EX Protocol driver instance from REST service.
29.7.3 EFI REST JSON Resource to C Structure Converter

29.7.3.1 Overview

EFI REST JSON Structure Protocol is designed as the centralized REST JSON Resource IN-Structure OUT (JSON-IN Structure-OUT in short) and vice versa converter for EFI REST client drivers or EFI REST client applications. This protocol provides the registration function which is invoked by upper layer EFI driver to register converter as the plug-in converter for the well-known REST JSON resource. The EFI driver which provide REST JSON resource to structure converter is EFI REST JSON structure converter producer. In the other hand, EFI drivers or applications which utilize EFI REST JSON Structure protocol is the consumer of EFI REST JSON structure converter. The convert producer is required to register its converter functions with predefined REST JSON resource namespace and data type. EFI REST JSON Structure Protocol maintains the database of all plug-in converter and dispatches the consumer request to proper REST JSON resource structure converter. EFI REST JSON Structure Protocol doesn’t have knowledge about the exact structure for the particular REST JSON resource. It just dispatches JSON resource to the correct convert functions and returns the pointer of structure generated by convert producer. This protocol reduces the burdens of JSON resource parsing effort. This also provides the easier way to refer to specific REST JSON property using native C structure reference. Below figure delineates the software stack of EFI REST JSON resource to structure converter architecture.

29.7.3.2 EFI REST JSON Structure Protocol

Summary

EFI REST JSON Structure Protocol provides function to converter producer for the registration of REST JSON resource structure converter. This protocol also provides functions of JSON-IN Structure-OUT and vice versa to converter consumer.
Protocol GUID

```c
#define EFI_REST_JSON_STRUCTURE_PROTOCOL_GUID \
  { 0xa9a048f6, 0x48a0, 0x4714, {0xb7, 0xda, 0xa9, 0xad, 0x87, 0xd4, 0xda, 0xc9}}
```

Protocol Interface Structure

```c
typedef struct _EFI_REST_JSON_STRUCTURE_PROTOCOL {
  EFI_REST_JSON_STRUCTURE_REGISTER Register;
  EFI_REST_JSON_STRUCTURE_TO_STRUCTURE ToStructure;
  EFI_REST_JSON_STRUCTURE_TO_JSON ToJson;
  EFI_REST_JSON_STRUCTURE_DESTORY_STRUCTURE DestroyStructure;
} EFI_REST_JSON_STRUCTURE_PROTOCOL;
```

Parameters

- **Register**: Register REST JSON structure converter producer.
- **ToStructure**: JSON-IN Structure-OUT function.
- **ToJson**: Structure-IN JSON-OUT function.
- **DestoryStructure**: Destroy JSON structure returned from `ToStructure` function.

Description

Each plug-in JSON resource to structure converter is required to register itself into `EFI_REST_JSON_STRUCTURE_PROTOCOL`. The plug-in JSON resource to structure converter has to provide corresponding functions for `ToStructure()`, `ToJson()` and `DestroyStructure()` for the specific REST JSON resource. `EFI_REST_JSON_STRUCTURE_PROTOCOL` maintains converter producer using the JSON resource type and version information when registration. The `ToStructure()`, `ToJson()` and `DestroyStructure()` provided by `EFI_REST_JSON_STRUCTURE_PROTOCOL` is published to converter consumer for JSON-IN Structure-OUT and vice versa conversion. `EFI_REST_JSON_STRUCTURE_PROTOCOL` is responsible for dispatching consumer request to the proper converter producer.

**EFI_REST_JSON_STRUCTURE.Register ()**

Summary

This function provides REST JSON resource to structure converter registration.

Protocol Interface

```c
typedef
  EFI_STATUS
  (EFIAPI *EFI_REST_JSON_STRUCTURE_REGISTER)(
    IN EFI_REST_JSON_STRUCTURE_PROTOCOL  *This,
    IN EFI_REST_JSON_STRUCTURE_SUPPORTED  *JsonStructureSupported,
    IN EFI_REST_JSON_STRUCTURE_TO_STRUCTURE ToStructure,
    IN EFI_REST_JSON_STRUCTURE_TO_JSON ToJson,
    IN EFI_REST_JSON_STRUCTURE_DESTORY_STRUCTURE DestroyStructure)
```

Parameters

This

JsonStructureSupported

ToStructure

ToJson

DestroyStructure

Description

This function is invoked by REST JSON resource to structure converter to register JSON-IN Structure-OUT, Structure-IN JSON-OUT and destroy JSON structure functionalities. The converter producer has to correctly specify REST resource supporting information in EFI_REST_JSON_STRUCTURE_SUPPORTED. The information includes the type name, revision and data type of REST resource. Multiple REST JSON resource to structure converters may supported in one drive, refer to below related definition.

Related Description

typedef CHAR8 *EFI_REST_JSON_RESOURCE_TYPE_DATATYPE;

//******************************************************************************
// EFI_REST_JSON_RESOURCE_TYPE_NAMESPACE
//******************************************************************************
typedef struct _EFI_REST_JSON_RESOURCE_TYPE_NAMESPACE {
    CHAR8    *ResourceTypeName;
    CHAR8    *MajorVersion;
    CHAR8    *MinorVersion;
    CHAR8    *ErrataVersion;
} EFI_REST_JSON_RESOURCE_TYPE_NAMESPACE;

Parameters

ResourceTypeName    CHAR8 pointer to the name of this REST JSON Resource.
MajorVersion        CHAR8 pointer to the string of REST JSON Resource major version.
MinorVersion        CHAR8 pointer to the string of REST JSON Resource minor version.
ErrataVersion       CHAR8 pointer to the string of REST JSON Resource errata version.

//******************************************************************************
// EFI_REST_JSON_RESOURCE_TYPE_IDENTIFIER
//******************************************************************************
typedef struct _EFI_REST_JSON_RESOURCE_TYPE_IDENTIFIER {
    EFI_REST_JSON_RESOURCE_TYPE_NAMESPACE   Namespace;
    EFI_REST_JSON_RESOURCE_TYPE_DATATYPE   Datatype;
} EFI_REST_JSON_RESOURCE_TYPE_IDENTIFIER;

Parameters

Namespace Name space of this REST JSON resource.
Datatype **CHAR8**  pointer to the string of data type, could be NULL if there is no data type for this REST JSON resource.

```
//*******************************************************************************
// EFI_REST_JSON_STRUCTURE_SUPPORTED
//*******************************************************************************
typedef struct _EFI_REST_JSON_STRUCTURE_SUPPORTED{
  EFI_REST_JSON_STRUCTURE_SUPPORTED *Next;
  EFI_REST_JSON_RESOURCE_TYPE_IDENTIFIER JsonResourceType;
  } EFI_REST_JSON_STRUCTURE_SUPPORTED;
```

**Parameters**
- **Next**  Pointer to next `EFI_REST_JSON_STRUCTURE_SUPPORTED`.
- **JsonResourceType**  Information of REST JSON resource this converter supports.

**EFI_REST_JSON_STRUCTURE.ToStructure ()**

**Summary**

JSON-IN Structure-OUT function. Convert the given REST JSON resource into structure.

**Protocol Interface**

```
typedef
  EFI_STATUS
  (EFIAPI *EFI_REST_JSON_STRUCTURE_TO_STRUCTURE)(
    IN   EFI_REST_JSON_STRUCTURE_PROTOCOL   *This,
    IN   EFI_REST_JSON_RESOURCE_TYPE_IDENTIFIER *JsonSrcIdentifier
    OPTIONAL,
    IN   CHAR8                               *ResourceJsonText,
    OUT  EFI_REST_JSON_STRUCTURE_HEADER      **JsonStructure
  )
```

UEFI Forum, Inc.  March 2021  1579
Parameters

- **This**: This is the **EFI_REST_JSON_STRUCTURE_PROTOCOL** instance.
- **JsonRsncIdentifier**: This indicates the resource type and version is given in **ResourceJsonText**. If **JsonRsncIdentifier** is NULL, means the JSON resource type and version information of given **ResourceJsonText** is unsure. User would like to have **EFI_REST_JSON_STRUCTURE_PROTOCOL** to look for the proper JSON structure converter.
- **ResourceJsonText**: REST JSON resource in text format.
- **JsonStructure**: Pointer to receive the pointer to **EFI_REST_JSON_STRUCTURE_HEADER**, refer to related definition for the details.

Description

This function converts the given JSON resource in text format into predefined structure. The definition of structure format is not the scope of **EFI_REST_JSON_STRUCTURE_PROTOCOL**. **EFI_REST_JSON_STRUCTURE_PROTOCOL** is a centralized JSON-IN Structure-OUT converter which maintain the registration of a variety of JSON resource to structure converters. The structure definition and the corresponding C header file are written and released by 3rd party, OEM, organization or any open source communities. The JSON resource to structure converter (convert producer) may be released in the source format or binary format. The convert producer registers itself to **EFI_REST_JSON_STRUCTURE_PROTOCOL** uses Register() and provides EFI JSON resource to structure and vice versa conversion. Consumer has to destroy **JsonStructure** using DestroyStructure() function. Resource allocated for **JsonStructure** will be released and cleaned up by converter producer.

When **JsonRsncIdentifier** is a non NULL pointer, **ResourceTypeName** in **EFI_REST_JSON_RESOURCE_TYPE_NAMESPACE** must be a non NULL string, however the revision in **EFI_REST_JSON_RESOURCE_TYPE_NAMESPACE** and data type in **EFI_REST_JSON_RESOURCE_TYPE** could be NULL string if REST JSON resource is non version controlled or no data type is defined. If **JsonRsncIdentifier** is a non NULL pointer, **EFI_REST_JSON_STRUCTURE_PROTOCOL** looks for the proper converter from its database. Invokes the ToStructure() provided by the converter to convert JSON resource to structure.

Another scenario is **JsonRsncIdentifier** may passed in as NULL, this means the JSON resource type and version information of given **ResourceJsonText** is unsure. In this case, **EFI_REST_JSON_STRUCTURE_PROTOCOL** invokes and passes **ResourceJsonText** to ToStructure() of each registered converter with **JsonRsncIdentifier** set to NULL. Converter producer may or may not automatically determine REST JSON resource type and version. Converter producer should return **EFI_UNSUPPORTED** if it doesn’t support automatically recognition of REST JSON resource. Or converter producer can recognize the given REST JSON resource by parsing the certain properties. This depends on the implementation of JSON resource to structure converter. If one of the registered converter producers can recognize the given **ResourceJsonText**, the **JsonRsncIdentifier** in **EFI_REST_JSON_STRUCTURE_HEADER** is filled up with the proper REST JSON resource type, version and data type. With the information provided in **EFI_REST_JSON_STRUCTURE_HEADER**, consumer has idea about what the exact type of REST JSON structure is.
Related Description

```c
typedef struct _EFI_REST_JSON_STRUCTURE_HEADER {
  EFI_REST_JSON_RESOURCE_TYPE_IDENTIFIER JsonRsrcIdentifier;
  // Follow by a pointer points to JSON structure, the content in the
  // JSON structure is implementation-specific according to converter
  // producer.
  // VOID                                    *JsonStructurePointer;
} EFI_REST_JSON_STRUCTURE_HEADER;
```

Parameters

- **JsonRsrcIdentifier**: Information of REST JSON structure returned from this converter.
- **JsonStructurePointer**: Pointers to JSON structure, the content in the JSON structure is implementation-specific according to the converter producer.

**EFI_REST_JSON_STRUCTURE.ToJson ()**

Summary

Structure-IN JSON-OUT function. Convert the given REST JSON structure into JSON text. The definition of structure format is not the scope of **EFI_REST_JSON_STRUCTURE_PROTOCOL**. The structure definition and the corresponding C header file are written and released by 3rd party, OEM, organization or any open source communities. Consumer has to free the memory block allocated for ResourceJsonText if the JSON resource is no longer needed.
Protocol Interface

typedef
EFI_STATUS
(EFI_API *EFI_REST_JSON_STRUCTURE_TO_JSON)(
    IN EFI_REST_JSON_STRUCTURE_PROTOCOL *This,
    IN EFI_REST_JSON_STRUCTURE_HEADER *JsonStructureHeader,
    OUTCHAR8 **ResourceJsonText
);

Parameters

This This is the EFI_REST_JSON_STRUCTURE_PROTOCOL instance.

JsonStructureHeader The point to EFI_REST_JSON_STRUCTURE_HEADER structure. The
EFI_REST_JSON_RESOURCE_TYPE_IDENTIFIER in
EFI_REST_JSON_STRUCTURE_HEADER must exactly describes the
JSON resource type and revision referred by this JSON structure.

ResourceTypeName in JsonRsrcIdentifier must be non NULL
pointer points to string. Revision and data type in
JsonRsrcIdentifier could be NULL if REST JSON resource is not
version controlled and or data type definition.

ResourceJsonText Pointer to receive REST JSON resource in text format.

Description

This functions converts the given REST JSON structure into REST JSON text format resource.

Status Codes Returned

</tr>
<tr>
<td>EFI_NOT_FOUND</td>
<td>No proper JSON structure convert found to convert JSON structure to JSON text format.</td>
</tr>
</tbody>
</table>
**EFI_REST_JSON_STRUCTURE.DestroyStructure ()**

**Summary**
This function destroys the REST JSON structure.

**Protocol Interface**
```c
typedef EFI_STATUS (EFIAPIC *EFI_REST_JSON_STRUCTURE_DESTORY_STRUCTURE)(
   IN EFI_REST_JSON_STRUCTURE_PROTOCOL *This,
   IN EFI_REST_JSON_STRUCTURE_HEADER *JsonStructureHeader
);
```

**Description**
This function destroys the JSON structure generated by `ToStructure()` function. REST JSON resource structure converter is responsible for freeing and cleaning up all resource associated with the give JSON structure.

**Status Codes Returned**

<table>
<thead>
<tr>

**29.7.3.3 EFI Redfish JSON Structure Converter**
Refer to Section 31.2 for writing and using an EFI Redfish JSON Structure Converter, using the `EFI_REST_JSON_STRUCTURE_PROTOCOL` protocol.
30 - Network Protocols — UDP and MTFTP

30.1 EFI UDP Protocol

This chapter defines the EFI UDP (User Datagram Protocol) Protocol that interfaces over the EFI IP Protocol, and the EFI MTFTP Protocol interface that is built upon the EFI UDP Protocol. Protocols for version 4 and version 6 of UDP and MTFTP are included.

30.1.1 UDP4 Service Binding Protocol

EFI_UDP4_SERVICE_BINDING_PROTOCOL

Summary
The EFI UDPv4 Service Binding Protocol is used to locate communication devices that are supported by an EFI UDPv4 Protocol driver and to create and destroy instances of the EFI UDPv4 Protocol child protocol driver that can use the underlying communications device.

GUID
#define EFI_UDP4_SERVICE_BINDING_PROTOCOL_GUID \
  {0x83f01464,0x99bd,0x45e5,\ 
   {0xb3,0x83,0xaf,0x63,0x05,0xd8,0xe9,0xe6}}

Description
A network application that requires basic UDPv4 I/O services can use one of the protocol handler services, such as BS->LocateHandleBuffer(), to search for devices that publish a EFI UDPv4 Service Binding Protocol GUID. Each device with a published EFI UDPv4 Service Binding Protocol GUID supports the EFI UDPv4 Protocol and may be available for use.

After a successful call to the EFI_UDP4_SERVICE_BINDING_PROTOCOL.CreateChild() function, the newly created child EFI UDPv4 Protocol driver is in an unconfigured state; it is not ready to send and receive data packets.

Before a network application terminates execution every successful call to the EFI_UDP4_SERVICE_BINDING_PROTOCOL.CreateChild() function must be matched with a call to the EFI_UDP4_SERVICE_BINDING_PROTOCOL.DestroyChild() function.

30.1.2 UDP4 Protocol

EFI_UDP4_PROTOCOL

Summary
The EFI UDPv4 Protocol provides simple packet-oriented services to transmit and receive UDP packets.
GUID

```c
#define EFI_UDP4_PROTOCOL_GUID \
{0x3ad9df29,0x4501,0x478d,\ 
{0xb1,0xf8,0x7f,0x7f,0xe7,0x0e,0x50,0xf3}}
```

Protocol Interface Structure

```c
typedef struct _EFI_UDP4_PROTOCOL {
    EFI_UDP4_GET_MODE_DATA    GetModeData;
    EFI_UDP4_CONFIGURE        Configure;
    EFI_UDP4_GROUPS           Groups;
    EFI_UDP4_ROUTES           Routes;
    EFI_UDP4_TRANSMIT         Transmit;
    EFI_UDP4_RECEIVE          Receive;
    EFI_UDP4_CANCEL           Cancel;
    EFI_UDP4_POLL             Poll;
} EFI_UDP4_PROTOCOL;
```

Parameters

- **GetModeData**: Reads the current operational settings. See the `GetModeData()` function description.
- **Configure**: Initializes, changes, or resets operational settings for the EFI UDPv4 Protocol. See the `Configure()` function description.
- **Groups**: Joins and leaves multicast groups. See the `Groups()` function description.
- **Routes**: Add and deletes routing table entries. See the `Routes()` function description.
- **Transmit**: Queues outgoing data packets into the transmit queue. This function is a nonblocked operation. See the `Transmit()` function description.
- **Receive**: Places a receiving request token into the receiving queue. This function is a nonblocked operation. See the `Receive()` function description.
- **Cancel**: Aborts a pending transmit or receive request. See the `Cancel()` function description.
- **Poll**: Polls for incoming data packets and processes outgoing data packets. See the `Poll()` function description.

Description

The `EFI_UDP4_PROTOCOL` defines an EFI UDPv4 Protocol session that can be used by any network drivers, applications, or daemons to transmit or receive UDP packets. This protocol instance can either be bound to a specified port as a service or connected to some remote peer as an active client. Each instance has its own settings, such as the routing table and group table, which are independent from each other.
Note: In this document, all IPv4 addresses and incoming/outgoing packets are stored in network byte order. All other parameters in the functions and data structures that are defined in this document are stored in host byte order.

**EFI_UDP4_PROTOCOL.GetModeData()**

**Summary**

Reads the current operational settings.

** Prototype **

```c
typedef
EFI_STATUS
(EFI_API *EFI_UDP4_GET_MODE_DATA) (  
    IN EFI_UDP4_PROTOCOL *This,  
    OUT EFI_UDP4_CONFIG_DATA *Udp4ConfigData OPTIONAL,  
    OUT EFI_IP4_MODE_DATA *Ip4ModeData OPTIONAL,  
    OUT EFI_MANAGED_NETWORK_CONFIG_DATA *MnpConfigData OPTIONAL,  
    OUT EFI_SIMPLE_NETWORK_MODE *SnpModeData OPTIONAL
);
```

** Parameters **

- `This`: Pointer to the ` EFI_UDP4_PROTOCOL ` instance.
- `Udp4ConfigData`: Pointer to the buffer to receive the current configuration data. Type ` EFI_UDP4_CONFIG_DATA ` is defined in “Related Definitions” below.
- `Ip4ModeData`: Pointer to the EFI IPv4 Protocol mode data structure. Type ` EFI_IP4_MODE_DATA ` is defined in ` EFI_IP4_PROTOCOL.GetModeData() `. 
- `MnpConfigData`: Pointer to the managed network configuration data structure. Type ` EFI_MANAGED_NETWORK_CONFIG_DATA ` is defined in ` EFI_MANAGED_NETWORK_PROTOCOL.GetModeData() `. 
- `SnpModeData`: Pointer to the simple network mode data structure. Type ` EFI_SIMPLE_NETWORK_MODE ` is defined in the ` EFI_SIMPLE_NETWORK_PROTOCOL `. 

** Description **

The `GetModeData()` function copies the current operational settings of this EFI UDPv4 Protocol instance into user-supplied buffers. This function is used optionally to retrieve the operational mode data of underlying networks or drivers.
Related Definition

```c
typedef struct {
    //Receiving Filters
    BOOLEAN AcceptBroadcast;
    BOOLEAN AcceptPromiscuous;
    BOOLEAN AcceptAnyPort;
    BOOLEAN AllowDuplicatePort;
    // I/O parameters
    UINT8 TypeOfService;
    UINT8 TimeToLive;
    BOOLEAN DoNotFragment;
    UINT32 ReceiveTimeout;
    UINT32 TransmitTimeout;
    // Access Point
    BOOLEAN UseDefaultAddress;
    EFI_IPv4_ADDRESS StationAddress;
    EFI_IPv4_ADDRESS SubnetMask;
    UINT16 StationPort;
    EFI_IPv4_ADDRESS RemoteAddress;
    UINT16 RemotePort;
} EFI_UDP4_CONFIG_DATA;
```

- **AcceptBroadcast**: Set to `TRUE` to accept broadcast UDP packets.
- **AcceptPromiscuous**: Set to `TRUE` to accept UDP packets that are sent to any address.
- **AcceptAnyPort**: Set to `TRUE` to accept UDP packets that are sent to any port.
- **AllowDuplicatePort**: Set to `TRUE` to allow this EFI UDPv4 Protocol child instance to open a port number that is already being used by another EFI UDPv4 Protocol child instance.
- **TypeOfService**: `TypeOfService` field in transmitted IPv4 packets.
- **TimeToLive**: `TimeToLive` field in transmitted IPv4 packets.
- **DoNotFragment**: Set to `TRUE` to disable IP transmit fragmentation.
- **ReceiveTimeout**: The receive timeout value (number of microseconds) to be associated with each incoming packet. Zero means do not drop incoming packets.
- **TransmitTimeout**: The transmit timeout value (number of microseconds) to be associated with each outgoing packet. Zero means do not drop outgoing packets.
- **UseDefaultAddress**: Set to `TRUE` to use the default IP address and default routing table. If the default IP address is not available yet, then the underlying EFI IPv4 Protocol driver will use
**EFI_IP4_CONFIG2_PROTOCOL** to retrieve the IP address and subnet information. Ignored for incoming filtering if **AcceptPromiscuous** is set to **TRUE**.

**StationAddress** The station IP address that will be assigned to this EFI UDIPv4 Protocol instance. The EFI UDIPv4 and EFI IPv4 Protocol drivers will only deliver incoming packets whose destination matches this IP address exactly. Address 0.0.0.0 is also accepted as a special case in which incoming packets destined to any station IP address are always delivered. Not used when **UseDefaultAddress** is **TRUE**. Ignored for incoming filtering if **AcceptPromiscuous** is **TRUE**.

**SubnetMask** The subnet address mask that is associated with the station address. Not used when **UseDefaultAddress** is **TRUE**.

**StationPort** The port number to which this EFI UDIPv4 Protocol instance is bound. If a client of the EFI UDIPv4 Protocol does not care about the port number, set **StationPort** to zero. The EFI UDIPv4 Protocol driver will assign a random port number to transmitted UDP packets. Ignored if **AcceptAnyPort** is set to **TRUE**.

**RemoteAddress** The IP address of remote host to which this EFI UDIPv4 Protocol instance is connecting. If **RemoteAddress** is not 0.0.0.0, this EFI UDIPv4 Protocol instance will be connected to **RemoteAddress**; i.e., outgoing packets of this EFI UDIPv4 Protocol instance will be sent to this address by default and only incoming packets from this address will be delivered to client. Ignored for incoming filtering if **AcceptPromiscuous** is **TRUE**.

**RemotePort** The port number of the remote host to which this EFI UDIPv4 Protocol instance is connecting. If it is not zero, outgoing packets of this EFI UDIPv4 Protocol instance will be sent to this port number by default and only incoming packets from this port will be delivered to client. Ignored if **RemoteAddress** is 0.0.0.0 and ignored for incoming filtering if **AcceptPromiscuous** is **TRUE**.

</tbody>
</table>

**EFI_UDPV4_PROTOCOL**.**Configure()**

**Summary**

- Initializes, changes, or resets the operational parameters for this instance of the EFI UDIPv4 Protocol.
Prototype

```c
typedef EFI_STATUS
(EFIAPI *EFI_UDP4_CONFIGURE) (
    IN EFI_UDP4_PROTOCOL *This,
    IN EFI_UDP4_CONFIG_DATA *UdpConfigData OPTIONAL
);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>This</td>
<td>Pointer to the EFI_UDP4_PROTOCOL instance.</td>
</tr>
<tr>
<td>UdpConfigData</td>
<td>Pointer to the buffer to receive the current mode data.</td>
</tr>
</tbody>
</table>

Description

The **Configure()** function is used to do the following:

- Initialize and start this instance of the EFI UDPv4 Protocol.
- Change the filtering rules and operational parameters.
- Reset this instance of the EFI UDPv4 Protocol.

Until these parameters are initialized, no network traffic can be sent or received by this instance. This instance can be also reset by calling **Configure()** with **UdpConfigData** set to **NULL**. Once reset, the receiving queue and transmitting queue are flushed and no traffic is allowed through this instance.

With different parameters in **UdpConfigData**, **Configure()** can be used to bind this instance to specified port.
### Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The configuration settings were set, changed, or reset successfully.</td>
</tr>
<tr>
<td>EFI_NO_MAPPING</td>
<td>When using a default address, configuration (DHCP, BOOTP, RARP, etc.) is not finished yet.</td>
</tr>
</tbody>
</table>
| EFI_INVALID_PARAMETER| One or more following conditions are **TRUE**:  
  - **This** is **NULL**.  
  - **UdpConfigData.StationAddress** is not a valid unicast IPv4 address.  
  - **UdpConfigData.SubnetMask** is not a valid IPv4 address mask. The subnet mask must be contiguous.  
  - **UdpConfigData.RemoteAddress** is not a valid unicast IPv4 address if it is not zero. |
| EFI_ALREADY_STARTED  | The EFI UDPv4 Protocol instance is already started/configured and must be stopped/reset before it can be reconfigured. Only **TypeOfService**, **TimeToLive**, **DoNotFragment**, **ReceiveTimeout**, and **TransmitTimeout** can be reconfigured without stopping the current instance of the EFI UDPv4 Protocol. |
| EFI_ACCESS_DENIED    | **UdpConfigData.AllowDuplicatePort** is **FALSE** and **UdpConfigData.StationPort** is already used by other instance.                           |
| EFI_OUT_OF_RESOURCES | The EFI UDPv4 Protocol driver cannot allocate memory for this EFI UDPv4 Protocol instance.                                                   |
| EFI_DEVICE_ERROR     | An unexpected network or system error occurred and this instance was not opened.                                                             |

### EFI_UDP4_PROTOCOL.Groups()

**Summary**

Joins and leaves multicast groups.

**Prototype**

```c
typedef EFI_STATUS
(EIFIAPI *EFI_UDP4_GROUPS) (  
    IN EFI_UDP4_PROTOCOL *This,  
    IN BOOLEAN JoinFlag,  
    IN EFI_IPv4_ADDRESS *MulticastAddress OPTIONAL  
);
```

**Parameters**

- **This**
  - Pointer to the **EFI_UDP4_PROTOCOL** instance.

- **JoinFlag**
  - Set to **TRUE** to join a multicast group. Set to **FALSE** to leave one or all multicast groups.

- **MulticastAddress**
  - Pointer to multicast group address to join or leave.
Description

The Groups() function is used to enable and disable the multicast group filtering. If the JoinFlag is FALSE and the MulticastAddress is NULL, then all currently joined groups are left.

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The operation completed successfully.</td>
</tr>
<tr>
<td>EFI_NOT_STARTED</td>
<td>The EFI UDPv4 Protocol instance has not been started.</td>
</tr>
<tr>
<td>EFI_NO_MAPPING</td>
<td>When using a default address, configuration (DHCP, BOOTP, RARP, etc.) is not finished yet.</td>
</tr>
<tr>
<td>EFI_OUT_OF_RESOURCES</td>
<td>Could not allocate resources to join the group.</td>
</tr>
</tbody>
</table>
| EFI_INVALID_PARAMETER | One or more of the following conditions is TRUE:  
  - This is NULL.  
  - JoinFlag is TRUE and MulticastAddress is NULL.  
  - JoinFlag is TRUE and *MulticastAddress is not a valid multicast address. |
| EFI_ALREADY_STARTED | The group address is already in the group table (when JoinFlag is TRUE). |
| EFI_NOT_FOUND | The group address is not in the group table (when JoinFlag is FALSE). |
| EFI_DEVICE_ERROR | An unexpected system or network error occurred. |

EFI_UDP4_PROTOCOL.Routes()

Summary

Adds and deletes routing table entries.

Prototype

```
typedef EFI_STATUS
  (EFIAPI *EFI_UDP4_ROUTES) (  
  IN EFI_UDP4_PROTOCOL  *This,
  IN BOOLEAN             DeleteRoute,
  IN EFI_IPv4_ADDRESS    *SubnetAddress,
  IN EFI_IPv4_ADDRESS    *SubnetMask,
  IN EFI_IPv4_ADDRESS    *GatewayAddress
  );
```

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>This</td>
<td>Pointer to the EFI_UDP4_PROTOCOL instance.</td>
</tr>
<tr>
<td>DeleteRoute</td>
<td>Set to TRUE to delete this route from the routing table. Set to FALSE to add this route to the routing table.</td>
</tr>
<tr>
<td>DestinationAddress and SubnetMask</td>
<td>are used as the key to each route entry.</td>
</tr>
</tbody>
</table>
SubnetAddress | The destination network address that needs to be routed.
SubnetMask | The subnet mask of SubnetAddress.
GatewayAddress | The gateway IP address for this route.

Description
The **Routes()** function adds a route to or deletes a route from the routing table.

Routes are determined by comparing the SubnetAddress with the destination IP address and arithmetically **AND-ing** it with the SubnetMask. The gateway address must be on the same subnet as the configured station address.

The default route is added with SubnetAddress and SubnetMask both set to 0.0.0.0. The default route matches all destination IP addresses that do not match any other routes.

A zero GatewayAddress is a nonroute. Packets are sent to the destination IP address if it can be found in the Address Resolution Protocol (ARP) cache or on the local subnet. One automatic nonroute entry will be inserted into the routing table for outgoing packets that are addressed to a local subnet (gateway address of 0.0.0.0).

Each instance of the EFI UDPv4 Protocol has its own independent routing table. Instances of the EFI UDPv4 Protocol that use the default IP address will also have copies of the routing table provided by the **EFI_IP4_CONFIG2_PROTOCOL**. These copies will be updated automatically whenever the IP driver reconfigures its instances; as a result, the previous modification to these copies will be lost.

Note: There is no way to set up routes to other network interface cards (NICs) because each NIC has its own independent network stack that shares information only through **EFI UDP4 Variable**.

EFI_UDP4_PROTOCOL.Transmit()

Summary
Queues outgoing data packets into the transmit queue.

Prototype

typedef
EFI_STATUS
(EIFIAPI *EFI_UDP4_TRANSMIT) (
    IN EFI_UDP4_PROTOCOL *This,
    IN EFI_UDP4_COMPLETION_TOKEN *Token
);

Parameters
This Pointer to the EFI_UDP4_PROTOCOL instance.
Token Pointer to the completion token that will be placed into the transmit queue. Type EFI_UDP4_COMPLETION_TOKEN is defined in “Related Definitions” below.

Description
The Transmit() function places a sending request to this instance of the EFI UDPv4 Protocol, alongside the transmit data that was filled by the user. Whenever the packet in the token is sent out or some errors occur, the Token.Event will be signaled and Token.Status is updated. Providing a proper notification function and context for the event will enable the user to receive the notification and transmitting status.

Related Definitions

//***************************************************************
// EFI_UDP4_COMPLETION_TOKEN
//***************************************************************
typedef struct {
    EFI_EVENT Event;
    EFI_STATUS Status;
    union {
        EFI_UDP4_RECEIVE_DATA *RxData;
        EFI_UDP4_TRANSMIT_DATA *TxData;
    }
} EFI_UDP4_COMPLETION_TOKEN;

Event This Event will be signaled after the Status field is updated by the EFI UDv4 Protocol driver. The type of Event must be EVT_NOTIFY_SIGNAL. The Task Priority Level (TPL) of Event must be lower than or equal to TPL_CALLBACK.

Status Will be set to one of the following values:
**EFI_SUCCESS.** The receive or transmit operation completed successfully.

**EFI_ABORTED.** The receive or transmit was aborted.

**EFI_TIMEOUT.** The transmit timeout expired.

**EFI_NETWORK_UNREACHABLE.** The destination network is unreachable. RxData is set to **NULL** in this situation.

**EFI_HOST_UNREACHABLE.** The destination host is unreachable. RxData is set to **NULL** in this situation.

**EFI_PROTOCOL_UNREACHABLE.** The UDP protocol is unsupported in the remote system. RxData is set to **NULL** in this situation.

**EFI_PORT_UNREACHABLE.** No service is listening on the remote port. RxData is set to **NULL** in this situation.

**EFI_ICMP_ERROR.** Some other Internet Control Message Protocol (ICMP) error report was received. For example, packets are being sent too fast for the destination to receive them and the destination sent an ICMP source quench report. RxData is set to **NULL** in this situation.

**EFI_DEVICE_ERROR.** An unexpected system or network error occurred.

**EFI_NO_MEDIA.** There was a media error.

RxData

When this token is used for receiving, RxData is a pointer to **EFI_UDP4_RECEIVE_DATA**. Type **EFI_UDP4_RECEIVE_DATA** is defined below.

TxData

When this token is used for transmitting, TxData is a pointer to **EFI_UDP4_TRANSMIT_DATA**. Type **EFI_UDP4_TRANSMIT_DATA** is defined below.

The **EFI_UDP4_COMPLETION_TOKEN** structures are used for both transmit and receive operations. When used for transmitting, the Event and TxData fields must be filled in by the EFI UD Pv4 Protocol client. After the transmit operation completes, the Status field is updated by the EFI UD Pv4 Protocol and the Event is signaled.

- When used for receiving, only the Event field must be filled in by the EFI UD Pv4 Protocol client. After a packet is received, RxData and Status are filled in by the EFI UD Pv4 Protocol and the Event is signaled.

- The ICMP related status codes filled in Status are defined as follows:
  ```
  #define EFI_NETWORK_UNREACHABLE  EFIERR(100)
  #define EFI_HOST_UNREACHABLE    EFIERR(101)
  #define EFI_PROTOCOL_UNREACHABLE  EFIERR(102)
  #define EFI_PORT_UNREACHABLE    EFIERR(103)
  ```
//EFI_UDP4_RECEIVE_DATA

typedef struct {
    EFI_TIME      TimeStamp;
    EFI_EVENT     RecycleSignal;
    EFI_UDP4_SESSION_DATA   UdpSession;
    UINT32       DataLength;
    UINT32       FragmentCount;
    EFI_UDP4_FRAGMENT_DATA  FragmentTable[1];
} EFI_UDP4_RECEIVE_DATA;

TimeStamp
    Time when the EFI UDPv4 Protocol accepted the packet. TimeStamp is zero filled if timestamps are disabled or unsupported.

RecycleSignal
    Indicates the event to signal when the received data has been processed.

UdpSession
    The UDP session data including SourceAddress, SourcePort, DestinationAddress, and DestinationPort. Type EFI_UDP4_SESSION_DATA is defined below.

DataLength
    The sum of the fragment data length.

FragmentCount
    Number of fragments. May be zero.

FragmentTable
    Array of fragment descriptors. IP and UDP headers are included in these buffers if ConfigData.RawData is TRUE. Otherwise they are stripped. May be zero. Type EFI_UDP4_FRAGMENT_DATA is defined below.

EFI_UDP4_RECEIVE_DATA is filled by the EFI UDPv4 Protocol driver when this EFI UDPv4 Protocol instance receives an incoming packet. If there is a waiting token for incoming packets, the CompletionToken.Packet.RxData field is updated to this incoming packet and the CompletionToken.Event is signaled. The EFI UDPv4 Protocol client must signal the RecycleSignal after processing the packet.

- FragmentTable could contain multiple buffers that are not in the continuous memory locations. The EFI UDPv4 Protocol client might need to combine two or more buffers in FragmentTable to form their own protocol header.
typedef struct {
    EFI_IPv4_ADDRESS SourceAddress;
    UINT16 SourcePort;
    EFI_IPv4_ADDRESS DestinationAddress;
    UINT16 DestinationPort;
} EFI_UDP4_SESSION_DATA;

SourceAddress  Address from which this packet is sent. If this field is set to zero when sending packets, the address that is assigned in EFI_UDP4_PROTOCOL.Configure() is used.
SourcePort  Port from which this packet is sent. It is in host byte order. If this field is set to zero when sending packets, the port that is assigned in EFI_UDP4_PROTOCOL.Configure() is used. If this field is set to zero and unbound, a call to EFI_UDP4_PROTOCOL.Transmit() will fail.
DestinationAddress  Address to which this packet is sent.
DestinationPort  Port to which this packet is sent. It is in host byte order. If this field is set to zero and unconnected, the call to EFI_UDP4_PROTOCOL.Transmit() will fail.

The EFI_UDP4_SESSION_DATA is used to retrieve the settings when receiving packets or to override the existing settings of this EFI UDPv4 Protocol instance when sending packets.

typedef struct {
    UINT32 FragmentLength;
    VOID *FragmentBuffer;
} EFI_UDP4_FRAGMENT_DATA;

FragmentLength  Length of the fragment data buffer.
FragmentBuffer  Pointer to the fragment data buffer.

EFI_UDP4_FRAGMENT_DATA allows multiple receive or transmit buffers to be specified. The purpose of this structure is to avoid copying the same packet multiple times.
typedef struct {
    EFI_UDP4_SESSION_DATA  *UdpSessionData;
    EFI_IPv4_ADDRESS      *GatewayAddress;
    UINT32                DataLength;
    UINT32                FragmentCount;
    EFI_UDP4_FRAGMENT_DATA FragmentTable[1];
} EFI_UDP4_TRANSMIT_DATA;

UdpSessionData  If not NULL, the data that is used to override the transmitting settings. Type EFI_UDP4_SESSION_DATA is defined above.
GatewayAddress  The next-hop address to override the setting from the routing table.
DataLength      Sum of the fragment data length. Must not exceed the maximum UDP packet size.
FragmentCount   Number of fragments.
FragmentTable   Array of fragment descriptors. Type EFI_UDP4_FRAGMENT_DATA is defined above.

The EFI UDPv4 Protocol client must fill this data structure before sending a packet. The packet may contain multiple buffers that may be not in a continuous memory location.

</tr>
</tbody>
</table>

### EFI_UDP4_PROTOCOL.Receive()

**Summary**

Places an asynchronous receive request into the receiving queue.
Prototype

```c
typedef
EFI_STATUS
(EIFIAPI *EFI_UDP4_RECEIVE) (  
  IN EFI_UDP4_PROTOCOL *This,
  IN EFI_UDP4_COMPLETION_TOKEN *Token
);
```

Parameters

- **This**: Pointer to the `EFI_UDP4_PROTOCOL` instance.
- **Token**: Pointer to a token that is associated with the receive data descriptor. Type `EFI_UDP4_COMPLETION_TOKEN` is defined in `EFI_UDP4_PROTOCOL.Transmit()`.

Description

The `Receive()` function places a completion token into the receive packet queue. This function is always asynchronous.

The caller must fill in the `Token.Event` field in the completion token, and this field cannot be `NULL`. When the receive operation completes, the EFI UDPv4 Protocol driver updates the `Token.Status` and `Token.Packet.RxData` fields and the `Token.Event` is signaled. Providing a proper notification function and context for the event will enable the user to receive the notification and receiving status. That notification function is guaranteed to not be re-entered.

Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The receive completion token was cached.</td>
</tr>
<tr>

</tbody>
</table>
**EFI_UDP4_PROTOCOL.Cancel()**

**Summary**
Aborts an asynchronous transmit or receive request.

**Prototype**
```c
typedef EFI_STATUS (EFIAPI *EFI_UDP4_CANCEL)(
    IN EFI_UDP4_PROTOCOL *This,
    IN EFI_UDP4_COMPLETION_TOKEN *Token  OPTIONAL
);
```

**Parameters**
- **This**: Pointer to the EFI_UDP4_PROTOCOL instance.
- **Token**: Pointer to a token that has been issued by EFI_UDP4_PROTOCOL.Transmit() or EFI_UDP4_PROTOCOL.Receive(). If NULL, all pending tokens are aborted. Type EFI_UDP4_COMPLETION_TOKEN is defined in EFI_UDP4_PROTOCOL.Transmit().

**Description**
The Cancel() function is used to abort a pending transmit or receive request. If the token is in the transmit or receive request queues, after calling this function, Token.Status will be set to EFI_ABORTED and then Token.Event will be signaled. If the token is not in one of the queues, which usually means that the asynchronous operation has completed, this function will not signal the token and EFI_NOT_FOUND is returned.

**Status Codes Returned**

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The asynchronous I/O request was aborted and Token.Event was signaled. When Token is NULL, all pending requests are aborted and their events are signaled.</td>

</tr>
</tbody>
</table>

**EFI_UDP4_PROTOCOL.Poll()**

**Summary**
Polls for incoming data packets and processes outgoing data packets.
Prototype

```c
typedef
EFI_STATUS
(EFIAPI *EFI_UDP4_POLL) (   
    IN EFI_UDP4_PROTOCOL   *This
);
```

Parameters

This Pointer to the EFI_UDP4_PROTOCOL instance.

Description

The Poll() function can be used by network drivers and applications to increase the rate that data packets are moved between the communications device and the transmit and receive queues.

In some systems, the periodic timer event in the managed network driver may not poll the underlying communications device fast enough to transmit and/or receive all data packets without missing incoming packets or dropping outgoing packets. Drivers and applications that are experiencing packet loss should try calling the Poll() function more often.

Status Codes Returned

</table>

30.2 EFI UDPv6 Protocol

This section defines the EFI UDPv6 (User Datagram Protocol version 6) Protocol that interfaces over the EFI IPv6 Protocol.

30.2.1 UDP6 Service Binding Protocol

EFI_UDP6_SERVICE_BINDING_PROTOCOL

Summary

The EFI UDPv6 Service Binding Protocol is used to locate communication devices that are supported by an EFI UDPv6 Protocol driver and to create and destroy instances of the EFI UDPv6 Protocol child instance that uses the underlying communications device.
GUID
#define EFI_UDP6_SERVICE_BINDING_PROTOCOL_GUID \
{0x66ed4721, 0x3c98, 0x4d3e,\ 
 {0x81, 0xe3, 0xd0, 0x3d, 0xd3, 0x9a, 0x72, 0x54}}

Description
A network application that requires basic UDPv6 I/O services can use one of the protocol handler services, such as BS->LocateHandleBuffer(), to search for devices that publish a EFI UDPv6 Service Binding Protocol GUID. Each device with a published EFI UDPv6 Service Binding Protocol GUID supports the EFI UDPv6 Protocol and may be available for use.

After a successful call to the EFI_UDP6_SERVICE_BINDING_PROTOCOL.CreateChild() function, the newly created child EFI UDPv6 Protocol driver is in an un-configured state; it is not ready to send and receive data packets.

Before a network application terminates execution, every successful call to the EFI_UDP6_SERVICE_BINDING_PROTOCOL.CreateChild() function must be matched with a call to the EFI_UDP6_SERVICE_BINDING_PROTOCOL.DestroyChild() function.

30.2.2 EFI UDP6 Protocol

EFI_UDP6_PROTOCOL

Summary
The EFI UDPv6 Protocol provides simple packet-oriented services to transmit and receive UDP packets.

GUID
#define EFI_UDP6_PROTOCOL_GUID \
{0x4f948815, 0xb4b9, 0x43cb,\ 
 {0x8a, 0x33, 0x90, 0xe0, 0x60, 0xb3, 0x49, 0x55}}

Protocol Interface Structure

typedef struct _EFI_UDP6_PROTOCOL  {
 EFI_UDP6_GET_MODE_DATA GetModeData;
 EFI_UDP6_CONFIGURE Configure;
 EFI_UDP6_GROUPS Groups;
 EFI_UDP6_TRANSMIT Transmit;
 EFI_UDP6_RECEIVE Receive;
 EFI_UDP6_CANCEL Cancel;
 EFI_UDP6_POLL Poll;
 } EFI_UDP6_PROTOCOL;

Parameters
GetModeData  Reads the current operational settings. See the GetModeData() function description.
Configure

Initializes, changes, or resets operational settings for the EFI UDPv6 Protocol. See the `Configure()` function description.

Groups

Joins and leaves multicast groups. See the `Groups()` function description.

Transmit

Queues outgoing data packets into the transmit queue. This function is a non-blocked operation. See the `Transmit()` function description.

Receive

Places a receiving request token into the receiving queue. This function is a non-blocked operation. See the `Receive()` function description.

Cancel

Aborts a pending transmit or receive request. See the `Cancel()` function description.

Poll

Polls for incoming data packets and processes outgoing data packets. See the `Poll()` function description.

Description

The `EFI_UDP6_PROTOCOL` defines an EFI UDPv6 Protocol session that can be used by any network drivers, applications, or daemons to transmit or receive UDP packets. This protocol instance can either be bound to a specified port as a service or connected to some remote peer as an active client. Each instance has its own settings, such as group table, that are independent from each other.

Note:  
Byte Order: In this document, all IPv6 addresses and incoming/outgoing packets are stored in network byte order. All other parameters in the functions and data structures that are defined in this document are stored in host byte order.

`EFI_UDP6_PROTOCOL.GetModeData()`

Summary

Read the current operational settings.

Prototype

```c
typedef EFI_STATUS
(EFIAPI *EFI_UDP6_GET_MODE_DATA) ( 
    IN EFI_UDP6_PROTOCOL *This, 
    OUT EFI_UDP6_CONFIG_DATA *Udp6ConfigData OPTIONAL, 
    OUT EFI_IP6_MODE_DATA *Ip6ModeData OPTIONAL, 
    OUT EFI_MANAGED_NETWORK_CONFIG_DATA *MnpConfigData OPTIONAL, 
    OUT EFI_SIMPLE_NETWORK_MODE *SnpModeData OPTIONAL );
```

Parameters

- **This**
  Pointer to the `EFI_UDP6_PROTOCOL` instance.
- **Udp6ConfigData**
  The buffer in which the current UDP configuration data is returned. Type `EFI_UDP6_CONFIG_DATA` is defined in "Related Definitions" below.
Ip6ModeData  The buffer in which the current EFI IPv6 Protocol mode data is returned. Type EFI_IP6_MODE_DATA is defined in EFI_IP6_PROTOCOL.GetModeData().

MnpConfigData The buffer in which the current managed network configuration data is returned. Type EFI_MANAGED_NETWORK_CONFIG_DATA is defined in EFI_MANAGED_NETWORK_PROTOCOL.GetModeData().

SnpModeData The buffer in which the simple network mode data is returned. Type EFI_SIMPLE_NETWORK_MODE is defined in the EFI_SIMPLE_NETWORK Protocol.

Description
The GetModeData() function copies the current operational settings of this EFI UDPv6 Protocol instance into user-supplied buffers. This function is used optionally to retrieve the operational mode data of underlying networks or drivers.

Related Definition
***************************************************************
// EFI_UDP6_CONFIG_DATA
//
***************************************************************
typedef struct {
  //Receiving Filters
  BOOLEAN AcceptPromiscuous;
  BOOLEAN AcceptAnyPort;
  BOOLEAN AllowDuplicatePort;
  //I/O parameters
;
  UINT8  TrafficClass;
  UINT8  HopLimit;
;
  UINT32 ReceiveTimeout;
  UINT32 TransmitTimeout;
  //Access Point
  EFI_IPv6_ADDRESS StationAddress;
  UINT16  StationPort;
  EFI_IPv6_ADDRESS RemoteAddress;
  UINT16  RemotePort;
} EFI_UDP6_CONFIG_DATA;

AcceptPromiscuous  Set to TRUE to accept UDP packets that are sent to any address.
AcceptAnyPort  Set to TRUE to accept UDP packets that are sent to any port.
AllowDuplicatePort

Set to **TRUE** to allow this EFI UDPv6 Protocol child instance to open a port number that is already being used by another EFI UDPv6 Protocol child instance.

TrafficClass

TrafficClass field in transmitted IPv6 packets.

HopLimit

HopLimit field in transmitted IPv6 packets.

ReceiveTimeout

The receive timeout value (number of microseconds) to be associated with each incoming packet. Zero means do not drop incoming packets.

TransmitTimeout

The transmit timeout value (number of microseconds) to be associated with each outgoing packet. Zero means do not drop outgoing packets.

StationAddress

The station IP address that will be assigned to this EFI UDPv6 Protocol instance. The EFI UDPv6 and EFI IPv6 Protocol drivers will only deliver incoming packets whose destination matches this IP address exactly. Address 0::/128 is also accepted as a special case. Under this situation, underlying IPv6 driver is responsible for binding a source address to this EFI IPv6 protocol instance according to source address selection algorithm. Only incoming packet from the selected source address is delivered. This field can be set and changed only when the EFI IPv6 driver is transitioning from the stopped to the started states. If no address is available for selecting, the EFI IPv6 Protocol driver will use **EFI_IP6_CONFIG_PROTOCOL** to retrieve the IPv6 address.

StationPort

The port number to which this EFI UDPv6 Protocol instance is bound. If a client of the EFI UDPv6 Protocol does not care about the port number, set **StationPort** to zero. The EFI UDPv6 Protocol driver will assign a random port number to transmitted UDP packets. Ignored if **AcceptAnyPort** is **TRUE**.

RemoteAddress

The IP address of remote host to which this EFI UDPv6 Protocol instance is connecting. If **RemoteAddress** is not 0::/128, this EFI UDPv6 Protocol instance will be connected to **RemoteAddress**; i.e., outgoing packets of this EFI UDPv6 Protocol instance will be sent to this address by default and only incoming packets from this address will be delivered to client. Ignored for incoming filtering if **AcceptPromiscuous** is **TRUE**.

RemotePort

The port number of the remote host to which this EFI UDPv6 Protocol instance is connecting. If it is not zero, outgoing packets of this EFI UDPv6 Protocol instance will be sent to this port number by default and only incoming packets from this port will be delivered to client. Ignored if **RemoteAddress** is 0::/128 and ignored for incoming filtering if **AcceptPromiscuous** is **TRUE**.

**EFI_UDP6_PROTOCOL.Configure()**

**Summary**
Initializes, changes, or resets the operational parameters for this instance of the EFI UDPv6 Protocol.

**Prototype**
```c
typedef EFI_STATUS (EFIAPI *EFI_UDP6_CONFIGURE) (
    IN EFI_UDP6_PROTOCOL *This,
    IN EFI_UDP6_CONFIG_DATA *UdpConfigData OPTIONAL
);
```

**Parameters**
- **This** Pointer to the `EFI_UDP6_PROTOCOL` instance.
- **UdpConfigData** Pointer to the buffer contained the configuration data.

**Description**
The `Configure()` function is used to do the following:

- Initialize and start this instance of the EFI UDPv6 Protocol.
- Change the filtering rules and operational parameters.
- Reset this instance of the EFI UDPv6 Protocol.

Until these parameters are initialized, no network traffic can be sent or received by this instance. This instance can be also reset by calling `Configure()` with `UdpConfigData` set to NULL. Once reset, the receiving queue and transmitting queue are flushed and no traffic is allowed through this instance.

With different parameters in `UdpConfigData`, `Configure()` can be used to bind this instance to specified port.

</table>
| EFI_INVALID_PARAMETER | One or more following conditions are **TRUE**.  
                      **This** is **NULL**  
                      UdpConfigData.StationAddress neither zero nor one of the configured IP addresses in the underlying IPv6 driver.  
                      UdpConfigData.RemoteAddress is not a valid unicast IPv6 address if it is not zero. |
| EFI_ALREADY_STARTED | The EFI UDPv6 Protocol instance is already started/configured and must be stopped/reset before it can be reconfigured. Only TrafficClass, HopLimit, ReceiveTimeout, and TransmitTimeout can be reconfigured without stopping the current instance of the EFI UDPv6 Protocol. |
| EFI_ACCESS_DENIED | UdpConfigData. AllowDuplicatePort is **FALSE** and UdpConfigData.StationPort is already used by other instance. |
| EFI_OUT_OF_RESOURCES | The EFI UDPv6 Protocol driver cannot allocate memory for this EFI UDPv6 Protocol instance. |
| EFI_DEVICE_ERROR | An unexpected network or system error occurred and this instance was not opened. |

**EFI_UDP6_PROTOCOL.Groups()**

**Summary**
Joins and leaves multicast groups.

**Prototype**
```
typedef
EFI_STATUS
(EIFIAPI *EFI_UDP6_GROUPS) (  
    IN EFI_UDP6_PROTOCOL *This,  
    IN BOOLEAN JoinFlag,  
    IN EFI_IPv6_ADDRESS *MulticastAddress OPTIONAL
);
```

**Parameters**
- **This**  
  Pointer to the **EFI_UDP6_PROTOCOL** instance.
- **JoinFlag**  
  Set to **TRUE** to join a multicast group. Set to **FALSE** to leave one or all multicast groups.
- **MulticastAddress**  
  Pointer to multicast group address to join or leave.
Description

The **Groups()** function is used to join or leave one or more multicast group.

If the **JoinFlag** is **FALSE** and the **MulticastAddress** is **NULL**, then all currently joined groups are left.

**EFI_UDP6_PROTOCOL.Transmit()**

**Summary**

Queues outgoing data packets into the transmit queue.

**Prototype**

```c
typedef
EFI_STATUS
(EIFIAPI *EFI_UDP6_TRANSMIT) (  
    IN EFI_UDP6_PROTOCOL    *This,
    IN EFI_UDP6_COMPLETION_TOKEN *Token
);
```

**Parameters**

- **This**  
  Pointer to the **EFI_UDP6_PROTOCOL** instance.

- **Token**  
  Pointer to the completion token that will be placed into the transmit queue. Type **EFI_UDP6_COMPLETION_TOKEN** is defined in "Related Definitions" below.

**Description**

The **Transmit()** function places a sending request to this instance of the EFI UDPv6 Protocol, alongside the transmit data that was filled by the user. Whenever the packet in the token is sent out or some errors occur, the **Token.Event** will be signaled and **Token.Status** is updated. Providing a proper notification function and context for the event will enable the user to receive the notification and transmitting status.
Related Definitions

```c
typedef struct {
    EFI_EVENT Event;
    EFI_STATUS Status;
    union {
        EFI_UDP6_RECEIVE_DATA *RxData;
        EFI_UDP6_TRANSMIT_DATA *TxData;
    }
} EFI_UDP6_COMPLETION_TOKEN;
```

- **Event**: This event will be signaled after the Status field is updated by the EFI UDPv6 Protocol driver. The type of Event must be `EVT_NOTIFY_SIGNAL`.
- **Status**: Will be set to one of the following values:
  - `EFI_SUCCESS`: The receive or transmit operation completed successfully.
  - `EFI_ABORTED`: The receive or transmit was aborted.
  - `EFI_TIMEOUT`: The transmit timeout expired.
  - `EFI_NETWORK_UNREACHABLE`: The destination network is unreachable. `RxData` is set to `NULL` in this situation.
  - `EFI_HOST_UNREACHABLE`: The destination host is unreachable. `RxData` is set to `NULL` in this situation.
  - `EFI_PROTOCOL_UNREACHABLE`: The UDP protocol is unsupported in the remote system. `RxData` is set to `NULL` in this situation.
  - `EFI_PORT_UNREACHABLE`: No service is listening on the remote port. `RxData` is set to `NULL` in this situation.
  - `EFI_ICMP_ERROR`: Some other Internet Control Message Protocol (ICMP) error report was received. For example, packets are being sent too fast for the destination to receive them and the destination sent an ICMP source quench report. `RxData` is set to `NULL` in this situation.
  - `EFI_DEVICE_ERROR`: An unexpected system or network error occurred.
  - `EFI_SECURITY_VIOLATION`: The transmit or receive was failed because of IPsec policy check.
- **RxData**: When this token is used for receiving, `RxData` is a pointer to `EFI_UDP6_RECEIVE_DATA`. Type `EFI_UDP6_RECEIVE_DATA` is defined below.
- **TxData**: When this token is used for transmitting, `TxData` is a pointer to `EFI_UDP6_TRANSMIT_DATA`. Type `EFI_UDP6_TRANSMIT_DATA` is defined below.
The **EFI_UDP6_COMPLETION_TOKEN** structures are used for both transmit and receive operations. When used for transmitting, the `Event` and `TxData` fields must be filled in by the EFI UDPv6 Protocol client. After the transmit operation completes, the `Status` field is updated by the EFI UDPv6 Protocol and the `Event` is signaled.

When used for receiving, only the `Event` field must be filled in by the EFI UDPv6 Protocol client. After a packet is received, `RxData` and `Status` are filled in by the EFI UDPv6 Protocol and the `Event` is signaled.

```c
//***************************************************************
// EFI_UDP6_RECEIVE_DATA
//***************************************************************
typedef struct {
    EFI_TIME           TimeStamp;
    EFI_EVENT          RecycleSignal;
    EFI_UDP6_SESSION_DATA   UdpSession;
    UINT32              DataLength;
    UINT32              FragmentCount;
    EFI_UDP6_FRAGMENT_DATA  FragmentTable[1];
} EFI_UDP6_RECEIVE_DATA;
```

- **TimeStamp**: Time when the EFI UDPv6 Protocol accepted the packet. `TimeStamp` is zero filled if timestamps are disabled or unsupported.
- **RecycleSignal**: Indicates the event to signal when the received data has been processed.
- **UdpSession**: The UDP session data including `SourceAddress`, `SourcePort`, `DestinationAddress`, and `DestinationPort`. Type `EFI_UDP6_SESSION_DATA` is defined below.
- **DataLength**: The sum of the fragment data length.
- **FragmentCount**: Number of fragments. Maybe zero.
- **FragmentTable**: Array of fragment descriptors. Maybe zero. Type `EFI_UDP6_FRAGMENT_DATA` is defined below.

**EFI_UDP6_RECEIVE_DATA** is filled by the EFI UDPv6 Protocol driver when this EFI UDPv6 Protocol instance receives an incoming packet. If there is a waiting token for incoming packets, the `CompletionToken.Packet.RxData` field is updated to this incoming packet and the `CompletionToken.Event` is signaled. The EFI UDPv6 Protocol client must signal the `RecycleSignal` after processing the packet.

**FragmentTable** could contain multiple buffers that are not in the continuous memory locations. The EFI UDPv6 Protocol client might need to combine two or more buffers in **FragmentTable** to form their own protocol header.
typedef struct {
    EFI_IPv6_ADDRESS SourceAddress;
    UINT16 SourcePort;
    EFI_IPv6_ADDRESS DestinationAddress;
    UINT16 DestinationPort;
} EFI_UDP6_SESSION_DATA;

SourceAddress Address from which this packet is sent. This field should not be used when sending packets.
SourcePort Port from which this packet is sent. It is in host byte order. This field should not be used when sending packets.
DestinationAddress Address to which this packet is sent. When sending packet, it’ll be ignored if it is zero.
DestinationPort Port to which this packet is sent. When sending packet, it’ll be ignored if it is zero.

The EFI_UDP6_SESSION_DATA is used to retrieve the settings when receiving packets or to override the existing settings (only DestinationAddress and DestinationPort can be overridden) of this EFI UDPv6 Protocol instance when sending packets.

typedef struct {
    UINT32 FragmentLength;
    VOID *FragmentBuffer;
} EFI_UDP6_FRAGMENT_DATA;

FragmentLength Length of the fragment data buffer.
FragmentBuffer Pointer to the fragment data buffer.

EFI_UDP6_FRAGMENT_DATA allows multiple receive or transmit buffers to be specified. The purpose of this structure is to avoid copying the same packet multiple times.
 typedef struct {
    EFI_UDP6_SESSION_DATA *UdpSessionData;
    UINT32 DataLength;
    UINT32 FragmentCount;
    EFI_UDP6_FRAGMENT_DATA FragmentTable[1];
} EFI_UDP6_TRANSMIT_DATA;

UdpSessionData is not NULL, the data that is used to override the transmitting settings. Only the two fields UdpSessionData.DestinationAddress and UdpSessionData.DestionPort can be used as the transmitting setting filed. Type EFI_UDP6_SESSION_DATA is defined above.

- **DataLength**: Sum of the fragment data length. Must not exceed the maximum UDP packet size.
- **FragmentCount**: Number of fragments.
- **FragmentTable**: Array of fragment descriptors. Type EFI_UDP6_FRAGMENT_DATA is defined above.

The EFI UDPv6 Protocol client must fill this data structure before sending a packet. The packet may contain multiple buffers that may not be in a continuous memory location.

**EFI_UDP6_PROTOCOL.Receive()**

**Summary**
Places an asynchronous receive request into the receiving queue.

**Prototype**
```c
typedef EFI_STATUS (EFIAPI *EFI_UDP6_RECEIVE) (
    IN EFI_UDP6_PROTOCOL *This,
    IN EFI_UDP6_COMPLETION_TOKEN *Token
);
```

**Parameters**
- **This**: Pointer to the EFI_UDP6_PROTOCOL instance.
- **Token**: Pointer to a token that is associated with the receive data descriptor. Type EFI_UDP6_COMPLETION_TOKEN is defined in EFI_UDP6_PROTOCOL.Transmit().

**Description**
The `Receive()` function places a completion token into the receive packet queue. This function is always asynchronous.

The caller must fill in the **Token.Event** field in the completion token, and this field cannot be **NULL**. When the receive operation completes, the EFI UDPv6 Protocol driver updates the **Token.Status** and **Token.Packet.RxData** fields and the **Token.Event** is signaled. Providing a proper notification function and context for the event will enable the user to receive the notification and receiving status. That notification function is guaranteed to not be re-entered.

EFI_UDP6_PROTOCOL.Cancel()

Summary
Aborts an asynchronous transmit or receive request.

Prototype

```c
typedef EFI_STATUS
(EFIAPI *EFI_UDP6_CANCEL)(
    IN EFI_UDP6_PROTOCOL *This,
    IN EFI_UDP6_COMPLETION_TOKEN *Token
);
```

Parameters

- **This** Pointer to the EFI_UDP6_PROTOCOL instance.
- **Token** Pointer to a token that has been issued by EFI_UDP6_PROTOCOL.Transmit() or EFI_UDP6_PROTOCOL.Receive(). If NULL, all pending tokens are aborted. Type EFI_UDP6_COMPLETION_TOKEN is defined in EFI_UDP6_PROTOCOL.Transmit().

Description

The Cancel() function is used to abort a pending transmit or receive request. If the token is in the transmit or receive request queues, after calling this function, Token.Status will be set to EFI_ABORTED and then Token.Event will be signaled. If the token is not in one of the queues, which usually means that the asynchronous operation has completed, this function will not signal the token and EFI_NOT_FOUND is returned.

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>

</tr>
</tbody>
</table>

EFI_UDP6_PROTOCOL.Poll()

Summary
Polls for incoming data packets and processes outgoing data packets.
Prototype

```
typedef
    EFI_STATUS
    (EFIAPI *EFI_UDP6_POLL) (IN EFI_UDP6_PROTOCOL *This);
```

Parameters

- `This`: Pointer to the `EFI_UDP6_PROTOCOL` instance.

Description

The `Poll()` function can be used by network drivers and applications to increase the rate that data packets are moved between the communications device and the transmit and receive queues.

In some systems, the periodic timer event in the managed network driver may not poll the underlying communications device fast enough to transmit and/or receive all data packets without missing incoming packets or dropping outgoing packets. Drivers and applications that are experiencing packet loss should try calling the `Poll()` function more often.

Status Codes Returned

30.3 EFI MTFTPv4 Protocol

The following sections defines the EFI MTFTPv4 Protocol interface that is built upon the EFI UDPv4 Protocol.

**EFI_MTFTP4_SERVICE_BINDING_PROTOCOL**

Summary

The EFI MTFTPv4 Service Binding Protocol is used to locate communication devices that are supported by an EFI MTFTPv4 Protocol driver and to create and destroy instances of the EFI MTFTPv4 Protocol child protocol driver that can use the underlying communications device.
GUID
#define EFI_MTFTP4_SERVICE_BINDING_PROTOCOL_GUID \ 
{0x2e800be,0x8f01,0x4aa6,\ 
{0x94,0x6b,0xd7,0x13,0x88,0xe1,0x83,0x3f}}

Description
A network application or driver that requires MTFTPv4 I/O services can use one of the protocol handler services, such as BS->LocateHandleBuffer(), to search for devices that publish an EFI MTFTPv4 Service Binding Protocol GUID. Each device with a published EFI MTFTPv4 Service Binding Protocol GUID supports the EFI MTFTPv4 Protocol service and may be available for use.

After a successful call to the EFI_MTFTP4_SERVICE_BINDING_PROTOCOL.CreateChild() function, the newly created child EFI MTFTPv4 Protocol driver instance is in an unconfigured state; it is not ready to transfer data.

Before a network application terminates execution, every successful call to the EFI_MTFTP4_SERVICE_BINDING_PROTOCOL.CreateChild() function must be matched with a call to the EFI_MTFTP4_SERVICE_BINDING_PROTOCOL.DestroyChild() function.

Each instance of the EFI MTFTPv4 Protocol driver can support one file transfer operation at a time. To download two files at the same time, two instances of the EFI MTFTPv4 Protocol driver will need to be created.

EFI_MTFTP4_PROTOCOL

Summary
The EFI MTFTPv4 Protocol provides basic services for client-side unicast and/or multicast TFTP operations.

GUID
#define EFI_MTFTP4_PROTOCOL_GUID \ 
{0x78247c57,0x63db,0x4708,\ 
{0x99,0xc2,0xa8,0xb4,0xa9,0xa6,0x1f,0x6b}}

Protocol Interface Structure
typedef struct _EFI_MTFTP4_PROTOCOL {
    EFI_MTFTP4_GET_MODE_DATA  GetModeData;
    EFI_MTFTP4_CONFIGURE     Configure;
    EFI_MTFTP4_GET_INFO      GetInfo;
    EFI_MTFTP4_PARSE_OPTIONS ParseOptions;
    EFI_MTFTP4_READ_FILE     ReadFile;
    EFI_MTFTP4_WRITE_FILE    WriteFile;
    EFI_MTFTP4_READ_DIRECTORY ReadDirectory;
    EFI_MTFTP4_POLL          Poll;
} EFI_MTFTP4_PROTOCOL;

Parameters
UEFI Specification, Version 2.9

Network Protocols — UDP and MTFTP

GetModeData
Reads the current operational settings. See the GetModeData() function description.

Configure
Initializes, changes, or resets the operational settings for this instance of the EFI MTFTPv4 Protocol driver. See the Configure() function description.

GetInfo
Retrieves information about a file from an MTFTPv4 server. See the GetInfo() function description.

ParseOptions
Parses the options in an MTFTPv4 OACK (options acknowledgement) packet. See the ParseOptions() function description.

ReadFile
Downloads a file from an MTFTPv4 server. See the ReadFile() function description.

WriteFile
Uploads a file to an MTFTPv4 server. This function may be unsupported in some EFI implementations. See the WriteFile() function description.

ReadDirectory
Downloads a related file “directory” from an MTFTPv4 server. This function may be unsupported in some EFI implementations. See the ReadDirectory() function description.

Poll
Polls for incoming data packets and processes outgoing data packets. See the Poll() function description.

Description
The EFI_MTFTP4_PROTOCOL is designed to be used by UEFI drivers and applications to transmit and receive data files. The EFI MTFTPv4 Protocol driver uses the underlying EFI UDPv4 Protocol driver and EFI IPv4 Protocol driver.

EFI_MTFTP4_PROTOCOL.GetModeData()

Summary
Reads the current operational settings.

Prototype
typedef
    EFI_STATUS
    (EFIAPI *EFI_MTFTP4_GET_MODE_DATA)(
    IN EFI_MTFTP4_PROTOCOL *This,
    OUT EFI_MTFTP4_MODE_DATA *ModeData
    );

Parameters
This
    Pointer to the EFI_MTFTP4_PROTOCOL instance.

ModeData
    Pointer to storage for the EFI MTFTPv4 Protocol driver mode data. Type EFI_MTFTP4_MODE_DATA is defined in “Related Definitions” below.
Description
The GetModeData() function reads the current operational settings of this EFI MTFTPv4 Protocol driver instance.

Related Definitions

```c
typedef struct {
  EFI_MTFTP4_CONFIG_DATA   ConfigData;
  UINT8                     SupportedOptionCount;
  **SupportedOptions;
  UINT8                     UnsupportedOptionCount;
  **UnsupportedOptions;
} EFI_MTFTP4_MODE_DATA;
```

- **ConfigData**: The configuration data of this instance. Type EFI_MTFTP4_CONFIG_DATA is defined below.
- **SupportedOptionCount**: The number of option strings in the following SupportedOptions array.
- **SupportedOptions**: An array of pointers to null-terminated ASCII option strings that are recognized and supported by this EFI MTFTPv4 Protocol driver implementation.
- **UnsupportedOptionCount**: An array of pointers to null-terminated ASCII option strings that are recognized but not supported by this EFI MTFTPv4 Protocol driver implementation.
- **UnsupportedOptions**: An array of option strings that are recognized but are not supported by this EFI MTFTPv4 Protocol driver implementation.

The EFI_MTFTP4_MODE_DATA structure describes the operational state of this instance.
typedef struct {
  BOOLEAN UseDefaultSetting;
  EFI_IPv4_ADDRESS StationIp;
  EFI_IPv4_ADDRESS SubnetMask;
  UINT16 LocalPort;
  EFI_IPv4_ADDRESS GatewayIp;
  EFI_IPv4_ADDRESS ServerIp;
  UINT16 InitialServerPort;
  UINT16 TryCount;
  UINT16 TimeoutValue;
} EFI_MTFTP4_CONFIG_DATA;

UseDefaultSetting  Set to TRUE to use the default station address/subnet mask and the default route table information.
StationIp  If UseDefaultSetting is FALSE, indicates the station address to use.
SubnetMask  If UseDefaultSetting is FALSE, indicates the subnet mask to use.
LocalPort  Local port number. Set to zero to use the automatically assigned port number.
GatewayIp  if UseDefaultSetting is FALSE, indicates the gateway IP address to use.
ServerIp  The IP address of the MTFTPv4 server.
InitialServerPort  The initial MTFTPv4 server port number. Request packets are sent to this port. This number is almost always 69 and using zero defaults to 69.
TryCount  The number of times to transmit MTFTPv4 request packets and wait for a response.
TimeoutValue  The number of seconds to wait for a response after sending the MTFTPv4 request packet.

The EFI_MTFTP4_CONFIG_DATA structure is used to report and change MTFTPv4 session parameters.

**EFI_MTFTP4_PROTOCOL.Configure()**

**Summary**
Initializes, changes, or resets the default operational setting for this EFI MTFTPv4 Protocol driver instance.

**Prototype**

```c
typedef
EFI_STATUS
(EIFIAPI *EFI_MTFTP4_CONFIGURE)(
    IN EFI_MTFTP4_PROTOCOL *This,
    IN EFI_MTFTP4_CONFIG_DATA *MftpConfigData OPTIONAL
);
```

**Parameters**
- *This* Pointer to the EFI_MTFTP4_PROTOCOL instance.
- *MftpConfigData* Pointer to the configuration data structure. Type EFI_MTFTP4_CONFIG_DATA is defined in EFI_MTFTP4_PROTOCOL.GetModeData().

**Description**
The `Configure()` function is used to set and change the configuration data for this EFI MTFTPv4 Protocol driver instance. The configuration data can be reset to startup defaults by calling `Configure()` with *MftpConfigData* set to NULL. Whenever the instance is reset, any pending operation is aborted. By changing the EFI MTFTPv4 Protocol driver instance configuration data, the client can connect to different MTFTPv4 servers. The configuration parameters in *MftpConfigData* are used as the default parameters in later MTFTPv4 operations and can be overridden in later operations.

**EFI_MTFTP4_PROTOCOL.GetInfo()**

**Summary**

Gets information about a file from an MTFTPv4 server.

**Prototype**

```c
typedef
EFI_STATUS
(EIFIAPI *EFI_MTFTP4_GET_INFO)(
    IN EFI_MTFTP4_PROTOCOL *This,
    IN EFI_MTFTP4_OVERRIDE_DATA *OverrideData OPTIONAL,
    IN UINT8 *Filename,
    IN UINT8 *ModeStr OPTIONAL,
    IN UINT8 OptionCount,
    IN EFI_MTFTP4_OPTION *OptionList OPTIONAL,
    OUT UINT32 *PacketLength,
    OUT EFI_MTFTP4_PACKET **Packet OPTIONAL
    )
```

**Parameters**

- **This** Pointer to the **EFI_MTFTP4_PROTOCOL** instance.
OverrideData

Data that is used to override the existing parameters. If NULL, the default parameters that were set in the
\texttt{EFI\_MTFTP4\_PROTOCOL\_Configure()} function are used. Type \texttt{EFI\_MTFTP4\_OVERRIDE\_DATA} is defined in “Related
Definitions” below.

Filename

Pointer to a null-terminated ASCII file name string.

ModeStr

Pointer to a null-terminated ASCII mode string. If NULL, “octet”
will be used.

OptionCount

Number of option/value string pairs in \texttt{OptionList}.

OptionList

Pointer to array of option/value string pairs. Ignored if
\texttt{OptionCount} is zero. Type \texttt{EFI\_MTFTP4\_OPTION} is defined in
“Related Definitions” below.

PacketLength

The number of bytes in the returned packet.

Packet

The pointer to the received packet. This buffer must be freed
by the caller. Type \texttt{EFI\_MTFTP4\_PACKET} is defined in “Related
Definitions” below.

Description

The \texttt{GetInfo()} function assembles an MTFTPv4 request packet with options; sends it to the MTFTPv4
server; and may return an MTFTPv4 OACK, MTFTPv4 ERROR, or ICMP ERROR packet. Retries occur only if
no response packets are received from the MTFTPv4 server before the timeout expires.

Related Definitions

```c
//**************************************************************
// EFI_MTFTP_OVERRIDE_DATA
//**************************************************************
typedef struct {
  EFI_IPv4_ADDRESS GatewayIp;
  EFI_IPv4_ADDRESS ServerIp;
  UINT16 ServerPort;
  UINT16 TryCount;
  UINT16 TimeoutValue;
} EFI_MTFTP4_OVERRIDE_DATA;
```

GatewayIp

IP address of the gateway. If set to 0.0.0.0, the default gateway
address that was set by the
\texttt{EFI\_MTFTP4\_PROTOCOL\_Configure()} function will not be
 overridden.

ServerIp

IP address of the MTFTPv4 server. If set to 0.0.0.0, it will use
the value that was set by the
\texttt{EFI\_MTFTP4\_PROTOCOL\_Configure()} function.

ServerPort

MTFTPv4 server port number. If set to zero, it will use the
value that was set by the
\texttt{EFI\_MTFTP4\_PROTOCOL\_Configure()} function.
TryCount
Number of times to transmit MTFTPv4 request packets and wait for a response. If set to zero, it will use the value that was set by the `EFI_MTFTP4_PROTOCOL.Configure()` function.

TimeoutValue
Number of seconds to wait for a response after sending the MTFTPv4 request packet. If set to zero, it will use the value that was set by the `EFI_MTFTP4_PROTOCOL.Configure()` function.

The `EFI_MTFTP4_OVERRIDE_DATA` structure is used to override the existing parameters that were set by the `EFI_MTFTP4_PROTOCOL.Configure()` function.

// EFI_MTFTP4_OPTION
//***************************************************************
typedef struct {
    UINT8    *OptionStr;
    UINT8    *ValueStr;
} EFI_MTFTP4_OPTION;
```

OptionStr Pointer to the null-terminated ASCII MTFTPv4 option string.
ValueStr Pointer to the null-terminated ASCII MTFTPv4 value string.

```c

**EFI_MTFTP4_PROTOCOL.ParseOptions()**

**Summary**
Parses the options in an MTFTPv4 OACK packet.

**Prototype**

```c
typedef
EFI_STATUS
(EIFIAPI *EFI_MTFTP4_PARSE_OPTIONS)(
    IN EFI_MTFTP4_PROTOCOL *This,
    IN UINT32 PacketLen,
    IN EFI_MTFTP4_PACKET *Packet,
    OUT UINT32 *OptionCount,
    OUT EFI_MTFTP4_OPTION **OptionList OPTIONAL
);
```

**Parameters**

- **This**
  Pointer to the **EFI_MTFTP4_PROTOCOL** instance.

- **PacketLen**
  Length of the OACK packet to be parsed.

- **Packet**
  Pointer to the OACK packet to be parsed. Type **EFI_MTFTP4_PACKET** is defined in **EFI_MTFTP4_PROTOCOL.GetInfo()**.

OptionCount
OptionList

Pointer to the number of options in following OptionList.
Pointer to EFI_MTFTP4_OPTION storage. Call the EFI Boot Service FreePool() to release the OptionList if the options in this OptionList are not needed any more. Type EFI_MTFTP4_OPTION is defined in EFI_MTFTP4_PROTOCOL.GetInfo().

Description
The ParseOptions() function parses the option fields in an MTFTPv4 OACK packet and returns the number of options that were found and optionally a list of pointers to the options in the packet.

If one or more of the option fields are not valid, then EFI_PROTOCOL_ERROR is returned and *OptionCount and *OptionList stop at the last valid option.

EFI_MTFTP4_PROTOCOL.ReadFile()

Summary
Downloads a file from an MTFTPv4 server.

Prototype
typedef

EFI_STATUS
(EFIAPI *EFI_MTFTP4_READ_FILE)(
    IN EFI_MTFTP4_PROTOCOL   *This,
    IN EFI_MTFTP4_TOKEN      *Token
);

Parameters
This
Token

Pointer to the EFI_MTFTP4_PROTOCOL instance.
Pointer to the token structure to provide the parameters that are used in this operation. Type EFI_MTFTP4_TOKEN is defined in “Related Definitions” below.
Description

The **ReadFile()** function is used to initialize and start an MTFTPv4 download process and optionally wait for completion. When the download operation completes, whether successfully or not, the **Token.Status** field is updated by the EFI MTFTPv4 Protocol driver and then **Token.Event** is signaled (if it is not **NULL**).

Data can be downloaded from the MTFTPv4 server into either of the following locations:

- A fixed buffer that is pointed to by **Token.Buffer**
- A download service function that is pointed to by **Token.CheckPacket**

If both **Token.Buffer** and **Token.CheckPacket** are used, then **Token.CheckPacket** will be called first. If the call is successful, the packet will be stored in **Token.Buffer**.

Related Definitions

```c
typedef struct {
    EFI_STATUS Status;
    EFI_EVENT Event;
    EFI_MTFTP4_OVERRIDE_DATA *OverrideData;
    UINT8 *Filename;
    UINT8 *ModeStr;

    VOID *Context;
    EFI_MTFTP4_CHECK_PACKET CheckPacket;
    EFI_MTFTP4_TIMEOUT_CALLBACK TimeoutCallback;
    EFI_MTFTP4_PACKET_NEEDED PacketNeeded;
} EFI_MTFTP4_TOKEN;
```

**Status**

The status that is returned to the caller at the end of the operation to indicate whether this operation completed successfully. Defined **Status** values are listed below.

**Event**

The event that will be signaled when the operation completes. If set to **NULL**, the corresponding function will wait until the read or write operation finishes. The type of **Event** must be **EVT_NOTIFY_SIGNAL**. The Task Priority Level (TPL) of **Event** must be lower than or equal to **TPL_CALLBACK**.

**OverrideData**

If not **NULL**, the data that will be used to override the existing configure data. Type **EFI_MTFTP4_OVERRIDE_DATA** is defined in **EFI_MTFTP4_PROTOCOL.GetInfo()**.

**Filename**

Pointer to the null-terminated ASCII file name string.
<table>
<thead>

</tbody>
</table>

The **EFI_MTFTP4_TOKEN** structure is used for both the MTFTPv4 reading and writing operations. The caller uses this structure to pass parameters and indicate the operation context. After the reading or writing operation completes, the EFI MTFTPv4 Protocol driver updates the **Status** parameter and the **Event** is signaled if it is not **NULL**. The following table lists the status codes that are returned in the **Status** parameter.
Status Codes Returned in the Status Parameter

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The data file has been transferred successfully.</td>
</tr>
<tr>
<td>EFI_OUT_OF_RESOURCES</td>
<td>Required system resources could not be allocated.</td>
</tr>
<tr>
<td>EFIBUFFER_TOO_SMALL</td>
<td>BufferSize is not large enough to hold the downloaded data in downloading process.</td>
</tr>
<tr>
<td>EFI_ABORTED</td>
<td>Current operation is aborted by user.</td>
</tr>
<tr>
<td>EFI_NETWORK_UNREACHABLE</td>
<td>An ICMP network unreachable error packet was received.</td>
</tr>
<tr>
<td>EFI_PROTOCOL_UNREACHABLE</td>
<td>An ICMP host unreachable error packet was received.</td>
</tr>
<tr>
<td>EFI_NETWORK_UNREACHABLE</td>
<td>An ICMP protocol unreachable error packet was received.</td>
</tr>
<tr>
<td>EFI_NETWORK_UNREACHABLE</td>
<td>An ICMP port unreachable error packet was received.</td>
</tr>
<tr>
<td>EFI_ICMP_ERROR</td>
<td>Some other ICMP ERROR packet was received.</td>
</tr>
<tr>
<td>EFI_TIMEOUT</td>
<td>No responses were received from the MTFTPv4 server.</td>
</tr>
<tr>
<td>EFI_TFTP_ERROR</td>
<td>An MTFTPv4 ERROR packet was received.</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>An unexpected network error or system error occurred.</td>
</tr>
<tr>
<td>EFI_NO_MEDIA</td>
<td>There was a media error.</td>
</tr>
</tbody>
</table>

EFI_MTFTP4_CHECK_PACKET is a callback function that is provided by the caller to intercept the EFI_MTFTP_OPCODE_DATA or EFI_MTFTP_OPCODE_DATA8 packets processed in the EFI_MTFTP_PROTOCOL.ReadFile() function, and alternatively to intercept EFI_MTFTP_OPCODE_OACK or EFI_MTFTP_OPCODE_ERROR packets during a call to EFI_MTFTP_PROTOCOL.ReadFile(), WriteFile() or ReadDirectory(). Whenever an MTFTPv4 packet with the type described above is received from a server, the EFI MTFTPv4 Protocol driver will call
**EFI_MTFTP4_CHECK_PACKET** function to let the caller have an opportunity to process this packet. Any status code other than **EFI_SUCCESS** that is returned from this function will abort the transfer process.

```c
EFI_MTFTP4_TIMEOUT_CALLBACK
```

This Pointer to the **EFI_MTFTP4_PROTOCOL** instance.

Token The token that is provided in the

**EFI_MTFTP4_PROTOCOL.ReadFile()** or **EFI_MTFTP4_PROTOCOL.WriteFile()** or **EFI_MTFTP4_PROTOCOL.ReadDirectory()** functions by the caller. Type **EFI_MTFTP4_TOKEN** is defined in **EFI_MTFTP4_PROTOCOL.ReadFile()**.

**EFI_MTFTP4_TIMEOUT_CALLBACK** is a callback function that the caller provides to capture the timeout event in the **EFI_MTFTP4_PROTOCOL.ReadFile()**, **EFI_MTFTP4_PROTOCOL.WriteFile()** or **EFI_MTFTP4_PROTOCOL.ReadDirectory()** functions. Whenever a timeout occurs, the EFI MTFTPv4 Protocol driver will call the **EFI_MTFTP4_TIMEOUT_CALLBACK** function to notify the caller of the timeout event. Any status code other than **EFI_SUCCESS** that is returned from this function will abort the current download process.

```c
EFI_MTFTP4_PACKET_NEEDED
```

This Pointer to the **EFI_MTFTP4_PROTOCOL** instance.

Token The token provided in the

**EFI_MTFTP4_PROTOCOL.WriteFile()** by the caller.

Length Indicates the length of the raw data wanted on input, and the length the data available on output.

Buffer Pointer to the buffer where the data is stored.
EFI_MTFTP4_PACKET_NEEDED is a callback function that the caller provides to feed data to the EFI_MTFTP4_PROTOCOL.WriteFile() function. EFI_MTFTP4_PACKET_NEEDED provides another mechanism for the caller to provide data to upload other than a static buffer. The EFI MTFTP4 Protocol driver always calls EFI_MTFTP4_PACKET_NEEDED to get packet data from the caller if no static buffer was given in the initial call to EFI_MTFTP4_PROTOCOL.WriteFile() function. Setting *Length to zero signals the end of the session. Returning a status code other than EFI_SUCCESS aborts the session.

</tbody>
</table>

EFI_MTFTP4_PROTOCOL.WriteFile()

Summary

Sends a data file to an MTFTPv4 server. May be unsupported in some EFI implementations.
Prototype

```c
typedef EFI_STATUS
(EFI_API *EFI_MTFTP4_WRITE_FILE)(
    IN EFI_MTFTP4_PROTOCOL *This,
    IN EFI_MTFTP4_TOKEN *Token
);
```

Parameters

- **This**: Pointer to the `EFI_MTFTP4_PROTOCOL` instance.
- **Token**: Pointer to the token structure to provide the parameters that are used in this function. Type `EFI_MTFTP4_TOKEN` is defined in `EFI_MTFTP4_PROTOCOL.ReadFile()`.

Description

The `WriteFile()` function is used to initialize an uploading operation with the given option list and optionally wait for completion. If one or more of the options is not supported by the server, the unsupported options are ignored and a standard TFTP process starts instead. When the upload process completes, whether successfully or not, `Token.Event` is signaled, and the EFI MTFTPv4 Protocol driver updates `Token.Status`.

The caller can supply the data to be uploaded in the following two modes:

- Through the user-provided buffer
- Through a callback function

With the user-provided buffer, the `Token.BufferSize` field indicates the length of the buffer, and the driver will upload the data in the buffer. With an `EFI_MTFTP4_PACKET_NEEDED` callback function, the driver will call this callback function to get more data from the user to upload. See the definition of `EFI_MTFTP4_PACKET_NEEDED` for more information. These two modes cannot be used at the same time. The callback function will be ignored if the user provides the buffer.

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>

<td>- One or more IPv4 addresses in <strong>Token.OverrideData</strong> are not valid unicast IPv4 addresses if <strong>Token.OverrideData</strong> is not <strong>NULL</strong> and the addresses are not set to all zero.</td>
</tr>
</tbody>
</table>
**EFI_MTFTP4_PROTOCOL.ReadDirectory()**

**Summary**
Downloads a data file “directory” from an MTFTPv4 server. May be unsupported in some EFI implementations.

**Prototype**
```c
typedef EFI_STATUS
(EIFIAPI *EFI_MTFTP4_READ_DIRECTORY)(
  IN EFI_MTFTP4_PROTOCOL *This,
  IN EFI_MTFTP4_TOKEN *Token);
```

**Parameters**
- **This** Pointer to the EFI_MTFTP4_PROTOCOL instance.
- **Token** Pointer to the token structure to provide the parameters that are used in this function. Type EFI_MTFTP4_TOKEN is defined in EFI_MTFTP4_PROTOCOL.ReadFile().

**Description**
The **ReadDirectory()** function is used to return a list of files on the MTFTPv4 server that are logically (or operationally) related to **Token.Filename**. The directory request packet that is sent to the server is built with the option list that was provided by caller, if present.

The file information that the server returns is put into either of the following locations:
- A fixed buffer that is pointed to by **Token.Buffer**
- A download service function that is pointed to by **Token.CheckPacket**

If both **Token.Buffer** and **Token.CheckPacket** are used, then **Token.CheckPacket** will be called first. If the call is successful, the packet will be stored in **Token.Buffer**.

The returned directory listing in the **Token.Buffer** or **EFI_MTFTP4_PACKET** consists of a list of two or three variable-length ASCII strings, each terminated by a null character, for each file in the directory. If the multicast option is involved, the first field of each directory entry is the static multicast IP address and
UDP port number that is associated with the file name. The format of the field is ip:ip:ip:port. If the multicast option is not involved, this field and its terminating null character are not present.

The next field of each directory entry is the file name and the last field is the file information string. The information string contains the file size and the create/modify timestamp. The format of the information string is filesize yyyy-mm-dd hh:mm:ss:ffff. The timestamp is Coordinated Universal Time (UTC; also known as Greenwich Mean Time [GMT]).

**Status Codes Returned**

**EFI_MTFTP4_PROTOCOL.POLL()**

**Summary**

Polls for incoming data packets and processes outgoing data packets.
Prototype

```c
typedef
EFI_STATUS
(EFIAPI *EFI_MTFTP4_POLL) (
    IN EFI_MTFTP4_PROTOCOL *This
);
```

Parameters

- **This**: Pointer to the `EFI_MTFTP4_PROTOCOL` instance.

Description

The `Poll()` function can be used by network drivers and applications to increase the rate that data packets are moved between the communications device and the transmit and receive queues.

In some systems, the periodic timer event in the managed network driver may not poll the underlying communications device fast enough to transmit and/or receive all data packets without missing incoming packets or dropping outgoing packets. Drivers and applications that are experiencing packet loss should try calling the `Poll()` function more often.

Status Codes Returned

30.4 EFI MTFTPv6 Protocol

This section defines the EFI MTFTPv6 Protocol interface that is built upon the EFI UDPv6 Protocol.

30.4.1 MTFTP6 Service Binding Protocol

**EFI_MTFTP6_SERVICE_BINDING_PROTOCOL**

Summary

The EFI MTFTPv6 Service Binding Protocol is used to locate communication devices that are supported by an EFI MTFTPv6 Protocol driver and to create and destroy instances of the EFI MTFTPv6 Protocol child instance that can use the underlying communications device.
GUID

```c
#define EFI_MTFTP6_SERVICE_BINDING_PROTOCOL_GUID \
{0xd9760ff3,0x3cca,0x4267,\ 
{0x80,0xf9,0x75,0x27,0xfa,0xfa,0x42,0x23}}
```

Description

A network application or driver that requires MTFTPv6 I/O services can use one of the protocol handler services, such as `BS->LocateHandleBuffer()`, to search for devices that publish an EFI MTFTPv6 Service Binding Protocol GUID. Each device with a published EFI MTFTPv6 Service Binding Protocol GUID supports the EFI MTFTPv6 Protocol service and may be available for use.

After a successful call to the `EFI_MTFTP6_SERVICE_BINDING_PROTOCOL.CreateChild()` function, the newly created child EFI MTFTPv6 Protocol driver instance is in the un-configured state; it is not ready to transfer data.

Before a network application terminates execution, every successful call to the `EFI_MTFTP6_SERVICE_BINDING_PROTOCOL.CreateChild()` function must be matched with a call to the `EFI_MTFTP6_SERVICE_BINDING_PROTOCOL.DestroyChild()` function.

Each instance of the EFI MTFTPv6 Protocol driver can support one file transfer operation at a time. To download two files at the same time, two instances of the EFI MTFTPv6 Protocol driver need to be created.

30.4.2 MTFTP6 Protocol

**EFI_MTFTP6_PROTOCOL**

Summary

The EFI MTFTPv6 Protocol provides basic services for client-side unicast and/or multicast TFTP operations.

GUID

```c
#define EFI_MTFTP6_PROTOCOL_GUID \
{0xbf0a78ba,0xec29,0x49cf,\ 
{0xa1,0xc9,0x7a,0xe5,0x4e,0xab,0x6a,0x51}}
```

Protocol Interface Structure

```c
typedef struct _EFI_MTFTP6_PROTOCOL {
  EFI_MTFTP6_GET_MODE_DATA     GetModeData;
  EFI_MTFTP6_CONFIGURE         Configure;
  EFI_MTFTP6_GET_INFO          GetInfo;
  EFI_MTFTP6_PARSE_OPTIONS     ;
  EFI_MTFTP6_READ_FILE         ReadFile;
  EFI_MTFTP6_WRITE_FILE        WriteFile;
  EFI_MTFTP6_READ_DIRECTORY    ReadDirectory;
  EFI_MTFTP6_POLL              Poll;
} EFI_MTFTP6_PROTOCOL;
```
Parameters

**GetModeData**
Reads the current operational settings. See the `GetModeData()` function description.

**Configure**
Initializes, changes, or resets the operational settings for this instance of the EFI MTFTPv6 Protocol driver. See the `Configure()` function description.

**GetInfo**
Retrieves information about a file from an MTFTPv6 server. See the `GetInfo()` function description.

Parses the options in an MTFTPv6 OACK (options acknowledgement) packet. See the () function description.

**ReadFile**
Downloads a file from an MTFTPv6 server. See the `ReadFile()` function description.

**WriteFile**
Uploads a file to an MTFTPv6 server. This function may be unsupported in some EFI implementations. See the `WriteFile()` function description.

**ReadDirectory**
Downloads a related file directory from an MTFTPv6 server. This function may be unsupported in some EFI implementations. See the `ReadDirectory()` function description.

**Poll**
Polls for incoming data packets and processes outgoing data packets. See the `Poll()` function description.

Description

The `EFI_MTFTP6_PROTOCOL` is designed to be used by UEFI drivers and applications to transmit and receive data files. The EFI MTFTPv6 Protocol driver uses the underlying EFI UDPv6 Protocol driver and EFI IPv6 Protocol driver.

**EFI_MTFTP6_PROTOCOL.GetModeData()**

**Summary**
Read the current operational settings.

**Prototype**

```c
typedef
EFI_STATUS
(EIFIAPI *EFI_MTFTP6_GET_MODE_DATA)(
   IN EFI_MTFTP6_PROTOCOL   *This,
   OUT EFI_MTFTP6_MODE_DATA   *ModeData
);
```

**Parameters**

*This*

Pointer to the `EFI_MTFTP6_PROTOCOL` instance.
**ModeData**

The buffer in which the EFI MTFTPv6 Protocol driver mode data is returned. Type `EFI_MTFTP6_MODE_DATA` is defined in "Related Definitions" below.

**Description**

The `GetModeData()` function reads the current operational settings of this EFI MTFTPv6 Protocol driver instance.

**Related Definitions**

```c
//******************************************************************************
// EFI_MTFTP6_MODE_DATA
//******************************************************************************
typedef struct {
  EFI_MTFTP6_CONFIG_DATA ConfigData;
  UINT8 SupportedOptionCount;
  UINT8 **SupportedOptions;
} EFI_MTFTP6_MODE_DATA;
```

`ConfigData` The configuration data of this instance. Type `EFI_MTFTP6_CONFIG_DATA` is defined below.

`SupportedOptionCount` The number of option strings in the following `SupportedOptions` array.

`SupportedOptions` An array of null-terminated ASCII option strings that are recognized and supported by this EFI MTFTPv6 Protocol driver implementation. The buffer is read only to the caller and the caller should NOT free the buffer.

The `EFI_MTFTP6_MODE_DATA` structure describes the operational state of this instance.

```c
//******************************************************************************
// EFI_MTFTP6_CONFIG_DATA
//******************************************************************************
typedef struct {
  EFI_IPv6_ADDRESS StationIp;
  UINT16 LocalPort;
  EFI_IPv6_ADDRESS ServerIp;
  UINT16 InitialServerPort;
  UINT16 TryCount;
  UINT16 TimeoutValue;
} EFI_MTFTP6_CONFIG_DATA;
```

`StationIp` The local IP address to use. Set to zero to let the underlying IPv6 driver choose a source address. If not zero it must be one of the configured IP addresses in the underlying IPv6 driver.
LocalPort
Local port number. Set to zero to use the automatically assigned port number.

ServerIp
The IP address of the MTFTPv6 server.

InitialServerPort
The initial MTFTPv6 server port number. Request packets are sent to this port. This number is almost always 69 and using zero defaults to 69.

TryCount
The number of times to transmit MTFTPv6 request packets and wait for a response.

TimeoutValue
The number of seconds to wait for a response after sending the MTFTPv6 request packet.

The **EFI_MTFTP6_CONFIG_DATA** structure is used to retrieve and change MTFTPv6 session parameters.

### Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The configuration data was successfully returned.</td>
</tr>
<tr>
<td>EFI_OUT_OF_RESOURCES</td>
<td>The required mode data could not be allocated.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>This is <strong>NULL</strong> or <strong>ModeData</strong> is <strong>NULL</strong>.</td>
</tr>
</tbody>
</table>

**EFI_MTFTP6_PROTOCOL.Configure()**

**Summary**

Initializes, changes, or resets the default operational setting for this EFI MTFTPv6 Protocol driver instance.

**Prototype**

```c
typedef
EFI_STATUS
(EFIAPI *EFI_MTFTP6_CONFIGURE)(
    IN EFI_MTFTP6_PROTOCOL *This,
    IN EFI_MTFTP6_CONFIG_DATA *MtftpConfigData OPTIONAL
);
```

**Parameters**

- **This**
  Pointer to the **EFI_MTFTP6_PROTOCOL** instance.
- **MtftpConfigData**
  Pointer to the configuration data structure. Type **EFI_MTFTP6_CONFIG_DATA** is defined in **EFI_MTFTP6_PROTOCOL.GetModeData()**.

**Description**

The **Configure()** function is used to set and change the configuration data for this EFI MTFTPv6 Protocol driver instance. The configuration data can be reset to startup defaults by calling **Configure()** with **MtftpConfigData** set to **NULL**. Whenever the instance is reset, any pending operation is aborted. By changing the EFI MTFTPv6 Protocol driver instance configuration data, the client can connect to different MTFTPv6 servers. The configuration parameters in **MtftpConfigData** are used as the default parameters in later MTFTPv6 operations and can be overridden in later operations.
### Status Codes Returned

</tbody>
</table>

### EFI_MTFTP6_PROTOCOL.GetInfo()

**Summary**

Get information about a file from an MTFTPv6 server.

**Prototype**

```c
typedef
EFI_STATUS
(EFIAPI *EFI_MTFTP6_GET_INFO)(
  IN EFI_MTFTP6_PROTOCOL    *This,
  IN EFI_MTFTP6_OVERRIDE_DATA  *OverrideData  OPTIONAL,
  IN UINT8           *Filename,
  IN UINT8           *ModeStr     OPTIONAL,
  IN UINT8          OptionCount,
  IN EFI_MTFTP6_OPTION      *OptionList OPTIONAL,
  OUT UINT32           *PacketLength,
  OUT EFI_MTFTP6_PACKET     **Packet OPTIONAL
);
```

**Parameters**

- **This**
  - Pointer to the **EFI_MTFTP6_PROTOCOL** instance.

- **OverrideData**
  - Data that is used to override the existing parameters. If **NULL**, the default parameters that were set in the **EFI_MTFTP6_PROTOCOL.Configure()** function are used. Type **EFI_MTFTP6_OVERRIDE_DATA** is defined in "Related Definitions" below.

- **Filename**
  - Pointer to an null-terminated ASCII file name string.
ModeStr  
Pointer to an null-terminated ASCII mode string. If NULL, octet will be used.

OptionCount  
Number of option/value string pairs in OptionList.

OptionList  
Pointer to array of option/value string pairs. Ignored if OptionCount is zero. Type EFI_MTFTP6_OPTION is defined in "Related Definitions" below.

PacketLength  
The number of bytes in the returned packet.

Packet  
The pointer to the received packet. This buffer must be freed by the caller. Type EFI_MTFTP6_PACKET is defined in "Related Definitions" below.

Description
The GetInfo() function assembles an MTFTPv6 request packet with options, sends it to the MTFTPv6 server, and may return an MTFTPv6 OACK, MTFTPv6 ERROR, or ICMP ERROR packet. Retries occur only if no response packets are received from the MTFTPv6 server before the timeout expires.

Related Definitions

```c
typedef struct {
    EFI_IPv6_ADDRESS ServerIp;
    UINT16 ServerPort;
    UINT16 TryCount;
    UINT16 TimeoutValue;
} EFI_MTFTP6_OVERRIDE_DATA;
```

ServerIp  
IP address of the MTFTPv6 server. If set to all zero, the value that was set by the EFI_MTFTP6_PROTOCOL.Configure() function will be used.

ServerPort  
MTFTPv6 server port number. If set to zero, it will use the value that was set by the EFI_MTFTP6_PROTOCOL.Configure() function.

TryCount  
Number of times to transmit MTFTPv6 request packets and wait for a response. If set to zero, the value that was set by the EFI_MTFTP6_PROTOCOL.Configure() function will be used.

TimeoutValue  
Number of seconds to wait for a response after sending the MTFTPv6 request packet. If set to zero, the value that was set by the EFI_MTFTP6_PROTOCOL.Configure() function will be used.

The EFI_MTFTP6_OVERRIDE_DATA structure is used to override the existing parameters that were set by the EFI_MTFTP6_PROTOCOL.Configure() function.
typedef struct {
    UINT8 *OptionStr;
    UINT8 *ValueStr;
} EFI_MTFTP6_OPTION;

OptionStr
Pointer to the null-terminated ASCII MTFTPv6 option string.

ValueStr
Pointer to the null-terminated ASCII MTFTPv6 value string.

#pragma pack(1)

EFI_MTFTP6_PROTOCOL.ParseOptions()

Summary

Parse the options in an MTFTPv6 OACK packet.
Prototype

```c
typedef EFI_STATUS
(EIFI_API *EFI_MTFTP6_PARSE_OPTIONS)(
    IN EFI_MTFTP6_PROTOCOL *This,
    IN UINT32 PacketLen,
    IN EFI_MTFTP6_PACKET  *Packet,
    OUT UINT32       *OptionCount,
    OUT EFI_MTFTP6_OPTION  **OptionList OPTIONAL
);
```

Parameters

- **This**
  Pointer to the EFI_MTFTP6_PROTOCOL instance.
- **PacketLen**
  Length of the OACK packet to be parsed.
- **Packet**
  Pointer to the OACK packet to be parsed. Type EFI_MTFTP6_PACKET is defined in EFI_MTFTP6_PROTOCOL.GetInfo().
- **OptionCount**
  Pointer to the number of options in the following OptionList.
- **OptionList**
  Pointer to EFI_MTFTP6_OPTION storage. Each pointer in the OptionList points to the corresponding MTFTP option buffer in the Packet. Call the EFI Boot Service FreePool() to release the OptionList if the options in this OptionList are not needed any more. Type EFI_MTFTP6_OPTION is defined in EFI_MTFTP6_PROTOCOL.GetInfo().

Description

The ParseOptions() function parses the option fields in an MTFTPv6 OACK packet and returns the number of options that were found and optionally a list of pointers to the options in the packet.

If one or more of the option fields are not valid, then EFI_PROTOCOL_ERROR is returned and *OptionCount and *OptionList stop at the last valid option.

Status Codes Returned

<table>

</tr>
<tr>
<td>EFI_NOT_FOUND</td>
<td>No options were found in the OACK packet.</td>
</tr>
<tr>
<td>EFI_OUT_OF_RESOURCES</td>
<td>Storage for the OptionList array can not be allocated.</td>
</tr>
<tr>
<td>EFI_PROTOCOL_ERROR</td>
<td>One or more of the option fields is invalid.</td>
</tr>
</tbody>
</table>
EFI_MTFTP6_PROTOCOL.ReadFile()

Summary
Download a file from an MTFTPv6 server.

Prototype

typedef
  EFI_STATUS
(EFIAPI *EFI_MTFTP6_READ_FILE)(
    IN EFI_MTFTP6_PROTOCOL     *This,
    IN EFI_MTFTP6_TOKEN      *Token
  );

Parameters
This          Pointer to the EFI_MTFTP6_PROTOCOL instance.
Token         Pointer to the token structure to provide the parameters that
              are used in this operation. Type EFI_MTFTP6_TOKEN is defined
              in "Related Definitions" below.

Description
The ReadFile() function is used to initialize and start an MTFTPv6 download process and optionally
wait for completion. When the download operation completes, whether successfully or not, the
Token.Status field is updated by the EFI MTFTPv6 Protocol driver and then Token.Event is signaled if
it is not NULL.

Data can be downloaded from the MTFTPv6 server into either of the following locations:

- A fixed buffer that is pointed to by Token.Buffer
- A download service function that is pointed to by Token.CheckPacket

If both Token.Buffer and Token.CheckPacket are used, then Token.CheckPacket will be called
first. If the call is successful, the packet will be stored in Token.Buffer.

Related Definitions

//***************************************************************
// EFI_MTFTP6_TOKEN
//***************************************************************
typedef struct {
  EFI_STATUS           Status;
  EFI_EVENT            Event;
  EFI_MTFTP6_OVERRIDE_DATA OverrideData;
  UINT8                *Filename;
  UINT8                *ModeStr;
  UINT32               OptionCount;
  EFI_MTFTP6_OPTION*   OptionList;
  UINT64               BufferSize;
  VOID                 *Buffer;
} EFI_MTFTP6_TOKEN;
VOID     *Context;
EFI_MTFTP6_CHECK_PACKET CheckPacket;
EFI_MTFTP6_TIMEOUT_CALLBACK TimeoutCallback;
EFI_MTFTP6_PACKET_NEEDED PacketNeeded;
} EFI_MTFTP6_TOKEN;

status The status that is returned to the caller at the end of the
operation to indicate whether this operation completed
successfully. Defined Status values are listed below.

Event The event that will be signaled when the operation completes.
If set to NULL, the corresponding function will wait until the
read or write operation finishes. The type of Event must be
EVT_NOTIFY_SIGNAL.

OverrideData If not NULL, the data that will be used to override the existing
configure data. Type EFI_MTFTP6_OVERRIDE_DATA is defined in
EFI_MTFTP6_PROTOCOL.GetInfo().

Filename Pointer to the null-terminated ASCII file name string.

ModeStr Pointer to the null-terminated ASCII mode string. If NULL,
octet is used.

OptionCount Number of option/value string pairs.

OptionList Pointer to an array of option/value string pairs. Ignored if
OptionCount is zero. Both a remote server and this driver
implementation should support these options. If one or more
options are unrecognized by this implementation, it is sent to
the remote server without being changed. Type
EFI_MTFTP6_OPTION is defined in
EFI_MTFTP6_PROTOCOL.GetInfo().

BufferSize On input, the size, in bytes, of Buffer. On output, the number
of bytes transferred.

Buffer Pointer to the data buffer. Data that is downloaded from the
MTFTPv6 server is stored here. Data that is uploaded to the
MTFTPv6 server is read from here. Ignored if BufferSize is
zero.

Context Pointer to the context that will be used by CheckPacket,
TimeoutCallback and PacketNeeded.

CheckPacket Pointer to the callback function to check the contents of the
received packet. Type EFI_MTFTP6_CHECK_PACKET is defined
below.

TimeoutCallback Pointer to the function to be called when a timeout occurs.
Type EFI_MTFTP6_TIMEOUT_CALLBACK is defined below.

PacketNeeded Pointer to the function to provide the needed packet
contents. Only used in WriteFile() operation. Type
EFI_MTFTP6_PACKET_NEEDED is defined below.

The EFI_MTFTP6_TOKEN structure is used for both the MTFTPv6 reading and writing operations.
The caller uses this structure to pass parameters and indicate the operation context. After the reading or writing operation completes, the EFI MTFTPv6 Protocol driver updates the Status parameter and the Event is signaled if it is not NULL. The following table lists the status codes that are returned in the Status parameter.

### Status Codes Returned in the Status Parameter

<table>

<td>An MTFTPv6 ERROR packet was received.</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>An unexpected network error or system error occurred.</td>
</tr>
</tbody>
</table>

```
typedef EFI_STATUS (EFIAPI *EFI_MTFTP6_CHECK_PACKET)(
    IN EFI_MTFTP6_PROTOCOL *This,
    IN EFI_MTFTP6_TOKEN *Token,
    IN UINT16 PacketLen,
    IN EFI_MTFTP6_PACKET *Packet
);
```

- **This**: Pointer to the EFI_MTFTP6_PROTOCOL instance.
- **Token**: The token that the caller provided in the EFI_MTFTP6_PROTOCOL.ReadFile(), WriteFile() or ReadDirectory() function. Type EFI_MTFTP6_TOKEN is defined in EFI_MTFTP6_PROTOCOL.ReadFile().
- **PacketLen**: Indicates the length of the packet.
- **Packet**: Pointer to an MTFTPv6 packet. Type EFI_MTFTP6_PACKET is defined in EFI_MTFTP6_PROTOCOL.GetInfo().
EFI_MTFTP6_CHECK_PACKET is a callback function that is provided by the caller to intercept the EFI_MTFTP6_OPCODE_DATA or EFI_MTFTP6_OPCODE_DATA8 packets processed in the EFI_MTFTP6_PROTOCOL.ReadFile() function, and alternatively to intercept EFI_MTFTP6_OPCODE_OACK or EFI_MTFTP6_OPCODE_ERROR packets during a call to EFI_MTFTP6_PROTOCOL.ReadFile(), WriteFile() or ReadDirectory(). Whenever an MTFTPv6 packet with the type described above is received from a server, the EFI MTFTPv6 Protocol driver will call EFI_MTFTP6_CHECK_PACKET function to let the caller have an opportunity to process this packet. Any status code other than EFI_SUCCESS that is returned from this function will abort the transfer process.

```c
typedef
EFI_STATUS
(EFIAPI *EFI_MTFTP6_TIMEOUT_CALLBACK)(
    IN EFI_MTFTP6_PROTOCOL  *This,
    IN EFI_MTFTP6_TOKEN   *Token
);
```

This Pointer to the EFI_MTFTP6_PROTOCOL instance.
Token The token that is provided in the EFI_MTFTP6_PROTOCOL.ReadFile() or EFI_MTFTP6_PROTOCOL.WriteFile() or EFI_MTFTP6_PROTOCOL.ReadDirectory() functions by the caller. Type EFI_MTFTP6_TOKEN is defined in EFI_MTFTP6_PROTOCOL.ReadFile().

EFI_MTFTP6_TIMEOUT_CALLBACK is a callback function that the caller provides to capture the timeout event in the EFI_MTFTP6_PROTOCOL.ReadFile(), EFI_MTFTP6_PROTOCOL.WriteFile() or EFI_MTFTP6_PROTOCOL.ReadDirectory() functions. Whenever a timeout occurs, the EFI MTFTPv6 Protocol driver will call the EFI_MTFTP6_TIMEOUT_CALLBACK function to notify the caller of the timeout event. Any status code other than EFI_SUCCESS that is returned from this function will abort the current download process.
typedef EFI_STATUS
(EIFIAPI *EFI_MTFTP6_PACKET_NEEDED)(
    IN EFI_MTFTP6_PROTOCOL  *This,
    IN EFI_MTFTP6_TOKEN     Token,
    IN OUT UINT16           *Length,
    OUT VOID                **Buffer
);

This Pointer to the EFI_MTFTP6_PROTOCOL instance.
Token The token provided in the EFI_MTFTP6_PROTOCOL.WriteFile() by the caller.
Length Indicates the length of the raw data wanted on input, and the length the data available on output.
Buffer Pointer to the buffer where the data is stored.

EFI_MTFTP6_PACKET_NEEDED is a callback function that the caller provides to feed data to the EFI_MTFTP6_PROTOCOL.WriteFile() function. EFI_MTFTP6_PACKET_NEEDED provides another mechanism for the caller to provide data to upload other than a static buffer. The EFI MTFTP6 Protocol driver always calls EFI_MTFTP6_PACKET_NEEDED to get packet data from the caller if no static buffer was given in the initial call to EFI_MTFTP6_PROTOCOL.WriteFile() function. Setting *Length to zero signals the end of the session. Returning a status code other than EFI_SUCCESS aborts the session.

EFI_MTFTP6_PROTOCOL.WriteFile()

Summary
Send a file to an MTFTPv6 server. May be unsupported in some implementations.

Prototype
```c
typedef
EFI_STATUS
(EFI_API *EFI_MTFTP6_WRITE_FILE)(
    IN EFI_MTFTP6_PROTOCOL *This,
    IN EFI_MTFTP6_TOKEN   *Token
);
```

Parameters
- **This** Pointer to the EFI_MTFTP6_PROTOCOL instance.
- **Token** Pointer to the token structure to provide the parameters that are used in this function. Type EFI_MTFTP6_TOKEN is defined in EFI_MTFTP6_PROTOCOL.ReadFile().

Description
The WriteFile() function is used to initialize an uploading operation with the given option list and optionally wait for completion. If one or more of the options is not supported by the server, the unsupported options are ignored and a standard TFTP process starts instead. When the upload process completes, whether successfully or not, Token.Event is signaled, and the EFI MTFTPv6 Protocol driver updates Token.Status.

The caller can supply the data to be uploaded in the following two modes:
- Through the user-provided buffer
- Through a callback function

With the user-provided buffer, the Token.BufferSize field indicates the length of the buffer, and the driver will upload the data in the buffer. With an EFI_MTFTP6_PACKET_NEEDED callback function, the driver will call this callback function to get more data from the user to upload. See the definition of EFI_MTFTP6_PACKET_NEEDED for more information. These two modes cannot be used at the same time. The callback function will be ignored if the user provides the buffer.

\texttt{EFI_MTFTP6_PROTOCOL.ReadDirectory()}

Summary
Download a data file directory from an MTFTPv6 server. May be unsupported in some implementations.

Prototype

\begin{verbatim}
typedef
EFI_STATUS
(EIFIAPI *EFI_MTFTP6_READ_DIRECTORY)(
    IN EFI_MTFTP6_PROTOCOL *This,
    IN EFI_MTFTP6_TOKEN       *Token
);
\end{verbatim}

Parameters
\begin{itemize}
    \item \texttt{This} Pointer to the \texttt{EFI_MTFTP6_PROTOCOL} instance.
\end{itemize}
Token

Pointer to the token structure to provide the parameters that are used in this function. Type `EFI_MTFTP6_TOKEN` is defined in `EFI_MTFTP6_PROTOCOL.ReadFile()`.

Description

The `ReadDirectory()` function is used to return a list of files on the MTFTPv6 server that are logically (or operationally) related to `Token.Filename`. The directory request packet that is sent to the server is built with the option list that was provided by caller, if present.

The file information that the server returns is put into either of the following locations:

- A fixed buffer that is pointed to by `Token.Buffer`
- A download service function that is pointed to by `Token.CheckPacket`

If both `Token.Buffer` and `Token.CheckPacket` are used, then `Token.CheckPacket` will be called first. If the call is successful, the packet will be stored in `Token.Buffer`.

The returned directory listing in the `Token.Buffer` or `EFI_MTFTP6_PACKET` consists of a list of two or three variable-length ASCII strings, each terminated by a null character, for each file in the directory. If the multicast option is involved, the first field of each directory entry is the static multicast IP address and UDP port number that is associated with the file name. The format of the field is `ip:ip:ip:port`. If the multicast option is not involved, this field and its terminating null character are not present.

The next field of each directory entry is the file name and the last field is the file information string. The information string contains the file size and the create/modify timestamp. The format of the information string is `filesize yyyy-mm-dd hh:mm:ss:ffff`. The timestamp is Coordinated Universal Time (UTC; also known as Greenwich Mean Time [GMT]).

### EFI_MTFTP6_PROTOCOL.Poll()

**Summary**

Polls for incoming data packets and processes outgoing data packets.

**Prototype**

```c
typedef
EFI_STATUS
(EIFIAPI *EFI_MTFTP6_POLL) (  
    IN EFI_MTFTP6_PROTOCOL *This
);
```

**Parameters**

*This*

Pointer to the EFI_MTFTP6_PROTOCOL instance.

**Description**

The Poll() function can be used by network drivers and applications to increase the rate that data packets are moved between the communications device and the transmit and receive queues.
In some systems, the periodic timer event in the managed network driver may not poll the underlying communications device fast enough to transmit and/or receive all data packets without missing incoming packets or dropping outgoing packets. Drivers and applications that are experiencing packet loss should try calling the `Poll()` function more often.

31 - EFI Redfish Service Support

31.1 EFI Redfish Discover Protocol

31.1.1 Overview

The purpose of the EFI Redfish Discover is to provide a mechanism for EFI Redfish clients to acquire the DMTF Redfish® services provided on the platform or network. See the Redfish Developer Hub at https://redfish.dmtf.org/ for official Redfish schema and specifications.

Redfish services can be discovered according to Redfish Host Interface (SMBIOS type 42) reported on platform, or optionally using Simple Service Discovery Protocol (SSDP) message over UDP port 1900 to search Redfish services which were joined well-known multicast group addresses. EFI Redfish Discover driver discovers Redfish services and creates EFI REST EX protocol instance for each Redfish service it found. It also configures EFI REST EX protocol instance according to the Redfish service information described in Redfish Host Interface or the response of UPnP M-SEARCH request (defined in UPnP Device Architecture, which can be obtained at “Links to UEFI-Related Documents” http://uefi.org/uefi).

EFI Redfish Discover Protocol behaves as a middle protocol which abstracts the creation and configuration of EFI REST EX instance from EFI Redfish clients.

- EFI Redfish Discover Protocol uses EFI UDP protocol to send SSDP message to verify or discover Redfish services. For the Redfish service reported by SMBIOS type 42h, EFI Redfish Discover Protocol can optionally unicast M-SEARCH request to Redfish service in order to verify the existence of service.

- EFI Redfish Discover Protocol can optionally provide the functionality of discovering Redfish services through each network interface installed on platform. Prior to acquiring the list of ready-to-use EFI REST EX protocol instances, the consumer of this protocol can get the network interface list and decide which interface is used for the multicast transmission. EFI Redfish Discover Protocol multicasts M-SEARCH request to multicast group addresses then collects M-SEARCH responses from Redfish services in asynchronous or synchronous manner.

- EFI Redfish Discover Protocol provides the information of each network interface installed on platform through GetNetworkInterfaceList() function. The information such as MAC address, subnet ID, subnet mask and VLAN ID of network interface could be utilized by upper-layer EFI application or driver to identify network interface used for Redfish service discovery. EFI Redfish Discover Protocol abstracts EFI network stack to user which means this protocol should not require user to configure UDP before utilizing services. Network configuration of network interface such as station IP address, subnet ID, subnet mask and other operational parameters should be configured through system firmware specific implementation (for example system utility). This protocol should simply use UDP default station properties.

Multicast across internetworks is handled by multicast router and is not in the scope of EFI Redfish Discover Protocol. The implementation of upper-layer user interface is system firmware design-specific.

- EFI Redfish Discovery Protocol is the helper driver to discover Redfish services on platform or network. The upper level EFI Redfish client could provide its own implementation of how to utilize information returned from this protocol. Such as network interface selection UI, create...
Redfish host interface (SMBIOS type 42h) according to Redfish services information, configure system BIOS setting using Redfish service or etc.

31.1.2 EFI Redfish Discover Driver

A Redfish Discover Driver installs the Redfish Discover Protocol and EFI Driver Binding Protocol in its driver entry point.

The Driver Binding Protocol contains three services. These are `Supported()`, `Start()`, and `Stop()`.

- `Supported()` tests to see if the Redfish Discover Driver can manage a device handle. A Redfish Discover Driver can manage device handle that contain the EFI REST EX Service Binding Protocol, EFI UDP4 Service Binding Protocol or EFI UDP6 Service Binding Protocol, so a Redfish Discover Driver must look for these three protocols on the device handle that is being tested, and return success if any of them is presented.

- The `Start()` function tells the Redfish Discover Driver to start managing a device driver. The device handle should support at least one of the service binding protocols checked in `Supported()`. The Redfish Discover Driver should create a child handle for each service binding protocol, and open these children with `BY_DRIVER` attribute.

- The `Stop()` function tells the Redfish Discover Driver to stop managing a device driver. The `Stop()` function can destroy one or more of the device handles (or its child handles) that being managed by Redfish Discover Driver. A Redfish Discover Driver should stop the in-process discovery and destroy corresponding child handle which was created in a previous call to `Start()`, or in `AcquireRedfishService()`.
31.1.3 EFI Redfish Discover Client

An EFI Redfish client invokes EFI Redfish Discover Protocol to acquire the ready-to-use EFI REST EX protocol instance.

Below is the conceptual figure of mechanism of EFI Redfish Discover Protocol. The first scenario is unicast M-SEARCH to verify Redfish service reported in SMBIOS type 42h.

1. EFI Redfish client invokes EFI Redfish Discover Protocol to acquire ready-to-use EFI REST EX for communicating with Redfish services reported in Redfish Host Interface (SMBIOS type 42h).
2. EFI Redfish Discover Protocol optionally verifies the existence of Redfish service by unicasting M-SEARCH to Redfish service according to the Redfish service information provided in Redfish Host Interface.
3. EFI Redfish Discover Protocol creates and configures REST EX instance for Redfish service according to the Redfish service information provided in Redfish Host Interface.
4. EFI Redfish clients communicate with Redfish service using EFI REST EX instance returned from EFI Redfish Discover protocol.

EFI Redfish client passes EFI_REDFISH_DISCOVERED_TOKEN and the discovery options to EFI Redfish Discover Protocol. EFI_EVENT is created by EFI Redfish client for retrieving EFI_REDFISH_DISCOVERED_LIST once EFI Redfish Discover Protocol optionally verifies Redfish service reported by Redfish Host Interface. EFI Redfish client can listen to the notification of verified...
Redfish service in asynchronous or synchronous according to the setting of options indicated in `EFI_REDFISH_DISCOVER_FLAG`.

The second scenario is optionally provided by EFI Redfish Discover Protocol, which is multicast M-SEARCH to discover Redfish services.

1. EFI Redfish client gets the list of network interfaces if it would like to discover Redfish services on the certain network.
2. EFI Redfish client invokes EFI Redfish Discover Protocol to acquire ready-to-use EFI REST EX for communicating with Redfish services.
3. EFI Redfish Discover Protocol discovers Redfish services through SSDP over UDP.
4. EFI Redfish clients communicate with Redfish service using EFI REST EX instance returned from EFI Redfish Discover protocol.

EFI Redfish client passes `EFI_REDFISH_DISCOVERED_TOKEN` and the discovery options to EFI Redfish Discover Protocol. `EFI_EVENT` is created by EFI Redfish client for retrieving `EFI_REDFISH_DISCOVERED_LIST` when any time EFI Redfish Discover Protocol discovers new Redfish service. EFI Redfish client can listen to the notification of new found Redfish service in asynchronous or synchronous according to the setting of options indicated in `EFI_REDFISH_DISCOVER_FLAG`. Setting `Timeout` to zero in `EFI_REDFISH_DISCOVERED_TOKEN` to waiting for the new discovered Redfish service in synchronously, otherwise asynchronous notification happens when new Redfish service is discovered by EFI Redfish Discover Protocol.
31.1.4 EFI Redfish Discover Protocol

Summary
This protocol is utilized by EFI Redfish clients to acquire the list of Redfish services provided on platform or network.

Protocol GUID
#define EFI_REDFISH_DISCOVER_PROTOCOL_GUID \
{0x5db12509, 0x4550, 0x4347, \
 {0x96, 0xb3, 0x73, 0xc0, 0xff, 0x6e, 0x86, 0x9f}}

Protocol Interface Structure
typedef struct _EFI_REDFISH_DISCOVER_PROTOCOL {
    EFI_REDFISH_DISCOVER_NETWORK_LIST    GetNetworkInterfaceList;
    EFI_REDFISH_DISCOVER_ACQUIRE_SERVICE AcquireRedfishService;
    EFI_REDFISH_DISCOVER_ABORT_ACQUIRE   AbortAcquireRedfishService;
    EFI_REDFISH_DISCOVER_RELEASE_SERVICE ReleaseRedfishService;
} EFI_REDFISH_DISCOVER_PROTOCOL;

Parameters
    GetNetworkInterfaceList Get the list of network interfaces on which Redfish services could be discovered.
    AcquireRedfishService   Acquire the list of Redfish services.
    AbortAcquireRedfishService Abort Redfish services acquire process.
    ReleaseRedfishService   Release Redfish services acquired from AcquireRedfishService().

Description
EFI Redfish Discover Protocol provides a mechanism for EFI Redfish clients to acquire the Redfish services provided on the platform or network as described before.

EFI_REDFISH_DISCOVER_PROTOCOL.GetNetworkInterfaceList ()

Summary
Get the currently available list of network interfaces on which Redfish services could be discovered.
Protocol Interface

```c
typedef
EFI_STATUS
(EFIAPI  *EFI_REDFISH_DISCOVER_NETWORK_LIST)(
    IN     EFI_REDFISH_DISCOVER_PROTOCOL *This,
    IN     EFI_HANDLE              ImageHandle,
    OUT    UINTN                  *NumberOfNetworkInterfaces,
    OUT    EFI_REDFISH_DISCOVER_NETWORK_INTERFACE **NetworkInterfaces
);
```

Parameters

- **This**: This is the `EFI_REDFISH_DISCOVER_PROTOCOL` instance.
- **ImageHandle**: EFI image to get network list. The image handle is caller’s image handle.
- **NumberOfNetworkInterfaces**: Number of network interfaces in `NetworkInterfaces`.
- **NetworkInterfaces**: It's an array of instances. The number of entries in `NetworkInterfaces` is indicated by `NumberOfNetworkInterfaces`. Caller has to release the memory allocated by Redfish discover protocol with a call to `EFI_BOOT_SERVICES.FreePool()`.

Description

This function is used to get the list of network interfaces which can be used to send SSDP message over UDP protocol for the Redfish services discovery. The entry in `NetworkInterfaces` could be used as the parameter to `EFI_REDFISH_DISCOVER_PROTOCOL.AcquireRedfishService` function for discovering Redfish service on specific network interface.

Related Description

```c
//*******************************************************
// EFI_REDFISH_DISCOVER_NETWORK_INTERFACE
//*******************************************************
typedef struct {
    EFI_MAC_ADDRESS           MacAddress;
    BOOLEAN                   IsIpv6;
    EFI_IP_ADDRESS            SubnetId;
    UINT8                      SubnetPrefixLength;
    UINT16                     VlanId;
} EFI_REDFISH_DISCOVER_NETWORK_INTERFACE;
```

Parameters

- **MacAddress**: MAC address of this network interface.
- **IsIpv6**: If TRUE, indicates the network interface is running IPv6. Otherwise the network interface is running IPv4.
- **SubnetId**: Subnet of this network.
- **SubnetPrefixLength**: Subnet prefix-length for IPv4 and IPv6.
- **VlanId**: VLAN ID of this network interface.

** EFI_REDFISH_DISCOVER_PROTOCOL.AcquireRedfishService ()

**Summary**
This function acquires the list of discovered Redfish services.

**Protocol Interface**

```c
typedef
EFI_STATUS
(EIFIAPI *EFI_REDFISH_DISCOVER_ACQUIRE_SERVICE)(
    INEFI_REDFISH_DISCOVER_PROTOCOL *This,
    INEFI_HANDLE ImageHandle,
    INEFI_REDFISH_DISCOVER_NETWORK_INTERFACE *TargetNetworkInterface
    OPTIONAL,
    INEFI_REDFISH_DISCOVER_FLAG Flags,
    INEFI_REDFISH_DISCOVERED_TOKEN *Token
)
```

**Parameters**

- **This**
  This is the EFI_REDFISH_DISCOVER_PROTOCOL instance.
- **ImageHandle**
  EFI image acquires Redfish service discovery. The image handle is caller’s image handle.
- **TargetNetworkInterface**
  The target Network Interface which is used to discover Redfish services. Set to NULL to discover Redfish services on all network interfaces.
- **Flags**
  Options of Redfish service discovery.
- **Token**
  EFI_REDFISH_DISCOVERED_TOKEN instance. The memory of EFI_REDFISH_DISCOVERED_LIST and the strings in EFI_REDFISH_DISCOVERED_INFORMATION are all allocated by AcquireRedfishService() and must be freed when caller invokes ReleaseRedfishService().

**Description**

This function is used to acquire the list of Redfish services which are discovered according to Redfish Host Interface or through SSDP over UDP. Redfish services discovery through SSDP over UDP could be
achieved via network interface specified in TargetNetworkInterface or via all network interfaces if TargetNetworkInterface is specified as NULL. **EFI_REDFISH_DISCOVERED_LIST** is returned to EFI Redfish client by signaling the EFI event created by client. Each of EFI handle in **EFI_REDFISH_DISCOVERED_LIST** has the corresponding EFI REST EX instance installed on it. Each REST EX instance is a child instance which is created through EFI REST EX service binding protocol and used by EFI Redfish client for communicating with specific Redfish service. In AcquireRedfishService(), UDP child is created and opened to do SSDP discovery. This UDP child will be destroyed right away after the discovery is done. AcquireRedfishService() also creates and opens REST EX child to configures REST EX instance according to Redfish service information retuned in M-SEARCH response or Redfish Host Interface. REST EX child must be closed after REST EX child is configured. EFI Redfish client must open REST EX instance from RedfishRestExHandle returned in **EFI_REDFISH_DISCOVERED_INFORMATION** and close REST EX instance once EFI Redfish client is no longer communicating with Redfish service.

**Related Description**

```
//***************************************************************
// EFI_REDFISH_DISCOVER_FLAG
//***************************************************************
#define EFI_REDFISH_DISCOVER_HOST_INTERFACE   0x00000001
#define EFI_REDFISH_DISCOVER_SSDP             0x00000002
#define EFI_REDFISH_DISCOVER_SSDP_UDP6        0x00000004
#define EFI_REDFISH_DISCOVER_KEEP_ALIVE       0x00000008
#define EFI_REDFISH_DISCOVER_RENEW            0x00000010
#define EFI_REDFISH_DISCOVER_VALIDATION       0x80000000
#define EFI_REDFISH_DISCOVER_DURATION_MASK    0x0f000000
```

**EFI_REDFISH_DISCOVER_FLAG** is used to indicate the options when EFI Redfish clients acquire Redfish discover list through this protocol. Redfish Discover Protocol discovers Redfish service according to Redfish Host Interface when **EFI_REDFISH_DISCOVER_HOST_INTERFACE** is set to **TRUE**. Redfish Discover Protocol also optionally discovers Redfish services using SSDP UPnP M-SEARCH request through UDP Port 1900. Redfish Discover Protocol returns **EFI_INVALID_PARAMETER** if none of **EFI_REDFISH_DISCOVER_HOST_INTERFACE** and **EFI_REDFISH_DISCOVER_SSDP** is set to **TRUE**. Set **EFI_REDFISH_DISCOVER_SSDP_UDP6** to indicate using IPv6 as internet protocol. For the Redfish service discovery according to Redfish Host Interface, Redfish service information like IP address is described in Redfish Host Interface. EFI Redfish client can set **EFI_REDFISH_DISCOVER_VALIDATION** to **TRUE** to ask Redfish Discover Protocol to validate this Redfish service using IP address described in Redfish Host Interface. Redfish Discover Protocol unicasts UPnP M-SEARCH request to the target Redfish service and verify the response message to determine if the target Redfish service is existing or not. **EFI_REDFISH_DISCOVER_VALIDATION** doesn’t affect the SSDP discovery. For Redfish SSDP discovery, the responses of the multicast UPnP M-SEARCH request imply the valid Redfish services are existing.

According to UPnP device architecture, the maximum waiting time of the response to UPnP M-SEARCH request is indicated in MX message header. The value is greater or equal to 1 to less than 5 inclusive in second. In order to give the chance to those Redfish services which do not respond to M-SEARCH in time, set **EFI_REDFISH_DISCOVER_KEEP_ALIVE** to **TRUE** to tell Redfish Discover Protocol keeps to sending multicast M-SEARCH request. The duration of periodical multicast request is declared in **EFI_REDFISH_DISCOVER_DURATION_MASK**. The value indicated in
**EFI_REDFISH_DISCOVER_DURATION_MASK** means 2 to the power of duration. The valid value of duration is greater or equal to 3 and less or equal to 15. The corresponding duration is 8 to $2^{15}$ seconds. Minimum duration is set to 8 seconds in order to keep the duration out of scope of MX value defined in UPnP device architecture. Duration is only valid when **EFI_REDFISH_DISCOVER_KEEP_ALIVE** is set to TRUE and **EFI_REDFISH_DISCOVER_SSDP** is set to TRUE.

Redfish Discover Protocol maintains an internal database of Redfish services it found. It also maintains the EFI image which owns the EFI REST EX instance of discovered Redfish services. Redfish Discover Protocol only signals EFI Redfish client with new found of Redfish services instead of notifying EFI Redfish client the duplicate Redfish services found earlier, unless **EFI_REDFISH_DISCOVER_RENEW** is set to TRUE. Set **EFI_REDFISH_DISCOVER_RENEW** to TRUE forces Redfish Discover Protocol to notify EFI Redfish clients all found Redfish services, even the Redfish service which was already discovered and notified previously.

```c
//******************************************************************************
//  EFI_REDFISH_DISCOVERED_TOKEN
//******************************************************************************
#define REDFISH_DISCOVER_TOKEN_SIGNATURE SIGNATURE_32 ('R', 'F', 'T', 'S')

typedef struct {
    UINT32 Signature;
    EFI_REDFISH_DISCOVERED_LIST DiscoveredList;
    EFI_EVENT Event;
    UINTN Timeout;
} EFI_REDFISH_DISCOVERED_TOKEN;

Description

**EFI_REDFISH_DISCOVERED_TOKEN** is created by EFI Redfish client and passed to AcquireRedfishService().

Parameters

- **Signature**
  - The token signature should be the value of REDFISH_DISCOVER_TOKEN_SIGNATURE defined above.

- **DiscoveredList**
  - Structure of **EFI_REDFISH_DISCOVERED_LIST** to retrieve the discovered Redfish services.

- **Event**
  - EFI event at the TPL_CALLBACK level created by EFI Redfish client, which is used to be notified when Redfish services are discovered or any errors occurred during discovery.

- **Timeout**
  - The timeout value declared in **EFI_REDFISH_DISCOVERED_TOKEN** determines the seconds to drop discovery process. Basically, the nearby Redfish services must give the response in $>=1$ and $<=5$ seconds. The valid timeout value used for the asynchronous discovery is $>=1$ and $<=5$ seconds. Set the timeout to zero means to discover Redfish service synchronously.
//*******************************************************************************
// EFI_REDFISH_DISCOVERED_LIST
//*******************************************************************************
typedef struct {
    UINTN NumberOfServiceFound;
    EFI_REDFISH_DISCOVERED_INSTANCE *RedfishInstances;
} EFI_REDFISH_DISCOVERED_LIST;

Description
The content of **EFI_REDFISH_DISCOVERED_LIST** is filled by *AcquireRedfishService()* before signaling Event. NumberOfServiceFound must be set to 0 and RedfishInstances must be NULL when client invokes *AcquireRedfishService()* . The memory block for RedfishInstances is allocated by the EFI Redfish Discover Protocol, and will be freed by the EFI Redfish Discover Protocol as well in *ReleaseRedfishService()*.

Parameters
- **NumberOfServiceFound**: Number of Redfish services are discovered.
- **RedfishInstances**: Pointer to **EFI_REDFISH_DISCOVERED_INSTANCE**, number of Redfish services are discovered is indicated in NumberOfServiceFound.

//*******************************************************************************
// EFI_REDFISH_DISCOVERED_INSTANCE
//*******************************************************************************
typedef struct {
    EFI_STATUS Status;
    EFI_REDFISH_DISCOVERED_INFORMATION Information;
} EFI_REDFISH_DISCOVERED_INSTANCE;

Description
This structure describes the status and the information of discovered Redfish service.

Parameters
- **Status**: EFI status code of Redfish service discovery.
- **Information**: The information of Redfish service discovered. The information is only valid when Status is EFI_SUCCESS. Refer to below description of **EFI_REDFISH_DISCOVERED_INSTANCE**.
typedef struct {
    EFI_HANDLE RedfishRestExHandle;
    BOOLEAN IsIPv6;
    EFI_IP_ADDRESS RedfishHostIpAddress;
    UINT16 RedfishVersion;
    CHAR16 *Location;
    CHAR16 *Uuid;
    CHAR16 *Os;
    CHAR16 *OsVersion;
    CHAR16 *Product;
    CHAR16 *ProductVersion;
    BOOLEAN UseHttps;
} EFI_REDFISH_DISCOVERED_INFORMATION;

Description
This structure describes each Redfish service information. The corresponding EFI REST EX protocol instance is also created and configured by EFI Redfish Discover Protocol for EFI Redfish client. The memory allocated for the information in this structure will be freed by EFI Redfish Discover Protocol in ReleaseRedfishService().

Parameters
RedfishRestExHandle EFI handle which has EFI REST EX protocol instance installed on it. The EFI REST EX protocol instance is already configured by EFI Redfish Discover Protocol through EFI_REST_EX_PROTOCOL.Configure() according to the Redfish host information discovered through Redfish Host Interface or SSDP.
IsIPv6 Indicates the Redfish service is reached via IPv6 protocol.
RedfishHostIpAddress Redfish service host IP address.
RedfishVersion Redfish service version. The high byte of RedfishVersion is the major Redfish service version, low byte is the minor Redfish version. For example 0x100 is Redfish service. Redfish service version is acquired from “ST” header in the response of M-SEARCH request.
Location Redfish service host location, this information is acquired from “Server” header returned in the response of M-SEARCH request.
Uuid The UUID of Redfish service, this information is acquired from “USN” header defined in UPnP Device Architecture specification.
Os The OS provides Redfish service, this information is acquired from “Server” header returned in the response of M-SEARCH request. Below is the response in “Server” header defined in UPnP Device Architecture specification.
    SERVER:OS/version UPnP/1.1 product/version
OsVersion Redfish service OS version, this information is acquired from “Server” header returned in the response of M-SEARCH request. Below is the
response in “Server” header defined in UPnP Device Architecture specification.
SERVER:OS/version UPnP/1.1 product/version

**Product**
Product name, this information is extracted from “Server” header returned in the response of M-SEARCH request. Below is the response in “Server” header defined in UPnP Architecture Device specification.
SERVER:OS/version UPnP/1.1 product/version

**ProductVersion**
Product version, this information is acquired from “Server” header returned in the response of M-SEARCH request. Below is the response in “Server” header defined in UPnP Device Architecture specification.
SERVER:OS/version UPnP/1.1 product/version

**UseHttps**
Indicates the Redfish service is reached via HTTPS protocol.

### EFI_REDFISH_DISCOVER_PROTOCOL.AbortAcquireRedfishService()

**Summary**
This function aborts Redfish service discovery on the given network interface.

**Protocol Interface**

typedef
EFI_STATUS
(EIFIAPI *EFI_REDFISH_DISCOVER_ABORT_ACQUIRE)(
    IN EFI_REDFISH_DISCOVER_PROTOCOL *This,
    IN EFI_REDFISH_DISCOVER_NETWORK_INTERFACE *TargetNetworkInterface OPTIONAL);

**Parameters**

**This**
This is the EFI_REDFISH_DISCOVER_PROTOCOL instance.

**TargetNetworkInterface**
The target Network Interface on which Redfish services discovery is in process. NULL to abort Redfish service discovery on all network interfaces.
Description
In `AbortAcquireRedfishService()`, to abort the in-process Redfish service, discovery is required for preventing unexpected behaviors from happening. This function has to cancel in-process SSDP, the unicast over Udp4/Udp6, close Udp4/Udp6 protocol and destroy the Udp4/Udp6 child. Also closes REST EX opened for configuring REST EX child instance.

Status Codes Returned

**EFI_REDFISH_DISCOVER_PROTOCOL.ReleaseRedfishService ()**

Summary
This function releases the list of Redfish services discovered previously.

Protocol Interface

```c
typedef EFI_STATUS
  (EFIAPI *EFI_REDFISH_DISCOVER_RELEASE_SERVICE)(
    IN EFI_REDFISH_DISCOVER_PROTOCOL *This,
    IN EFI_REDFISH_DISCOVERED_LIST *List
  );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>This</td>
<td>This is the <code>EFI_REDFISH_DISCOVER_PROTOCOL</code> instance.</td>
</tr>
<tr>
<td>List</td>
<td>The pointer to <code>EFI_REDFISH_DISCOVERED_LIST</code> which lists the Redfish services to release.</td>
</tr>
</tbody>
</table>

Description
The Redfish services which listed in List will be released in `ReleaseRedfishService()`. All memory blocks which were allocated for Redfish service information will be freed in this function. EFI REST EX protocol instance which was created in `AcquireRedfishService()` will be also destroyed in `ReleaseRedfishService()`. The Redfish service listed in *List is not required to be identical or in the same order with `EFI_REDFISH_DISCOVERED_LIST` retuned from `AcquireRedfishService()`. List is flexible to list any Redfish services which were discovered by `AcquireRedfishService()` earlier. In `ReleaseRedfishService()`, free the resource allocated for the discovered Redfish service indicated in `EFI_REDFISH_DISCOVERED_LIST`.

31.1.5 Implementation Examples

31.1.5.1 Processes to Discover Redfish Services

The following flowchart delineates the EFI Redfish client processes of utilizing EFI Discover Protocol to discover Redfish service, abort discovery and release discovered Redfish service instance.

![Flowchart](image)

31.1.5.2 Network Interface Configuration

The EFI Redfish Discover Protocol provides a Redfish service discovery function to discover Redfish service through SMBIOS type 42 or optionally discover Redfish service on specific network interface. EFI Redfish Clients (EFI driver or EFI Application) can utilize the discover function to acquire Redfish service and manipulate Redfish properties to manage a system. For example, applying BIOS settings on the systems managed by Redfish Service. The system could be the one that runs EFI Redfish Client, or other systems on the network. If Redfish service is discovered according to SMBIOS type 42, then the platform developer has to create an SMBIOS type 42 entry with host (station) and Redfish Service information (Refer to DSP0270, Redfish Host Interface Specification). Besides discovering Redfish service using SMBIOS type 42, Redfish services can be also discovered by using SSDP over UDP. However, the network interface must be configured using either DHCP or static configuration prior to discovery of Redfish services. If the network interface is configured statically, then at least the IP address and Subnet mask must be configured for the station. The VLAN ID and new route entry may need to be configured depending on the networking environment if necessary.
Below is the implementation example for configuring network interface. Network interface could be configured in platform-implementation method. For example, platform developer can provide HII network options in BIOS setup utility. Network interface could be configured in statically or dynamically (DHCP) manner and the configuration could be stored in EFI variables or any platform non-volatile storage which may consumed by network stacks when each time system boot. This makes sure certain network interface is configured properly before EFI Redfish Clients utilizing EFI Redfish Discover Protocol.

The alternative of configuring network stack is system boots to EFI Shell and execute ifconfig shell command. This configures the settings of certain network interfaces. After this, network interface is ready to process Redfish service discovery by EFI Redfish Clients. However, this method requires user to configure network interface when each time system boot to EFI shell, unless other implementations of ifconfig EFI shell command is provided.

Once EFI Redfish Client is launched, it gets network interface information using EFI Redfish Discover protocol. EFI Redfish Client may provide selection UI of network interfaces for Redfish service discovery. EFI Redfish Client could manipulate Redfish properties such as BIOS Attributes on the discovered Redfish services for system management or deployment. EFI Redfish Client can also optionally maintain the information, location and other properties of discovered Redfish services in non-volatile storage for next system boots afterward.
31.2 EFI Redfish JSON Structure Converter

31.2.1 The Guidance of Writing EFI Redfish JSON Structure Converter

To provide interoperability between the Redfish service and the EFI environment, EFI Redfish JSON structure converters for each Redfish schema namespace should be implemented for EFI Redfish clients. This recommendation of writing EFI Redfish JSON structure converters is necessary to unify the implementation and capability of the converters.

- One converter supports one Redfish schema resource type; write the converter based on Redfish resource type. Using Redfish schema as an example:
  - AccountService.v1_0_0.json: RedfishAccountService_V1_0_0_Dxe driver
  - AttributeRegistry.v1_2_0.json: RedfishAttributeRegistry_V1_2_0_Dxe driver
  - EthernetInterface.v1_4_0.json: EthernetInterface_V1_4_0_Dxe driver

- Redfish JSON structure converter can be delivered in source code package or binary (library or EFI driver) format.

- A C header file must be released with the Redfish JSON structure converter package. The package could be provisioned to conform to any EFI implementation, such as EFI EDKII open source.

- Provide documents which can describe the usage of structure members defined in REST JSON structure.

- The documentation can be published with a source code package, binary package, web site, online help, etc.

- Write the converter as an EFI DXE driver, and utilize EFI_REST_JSON_STRUCTURE_PROTOCOL to register the converter to provide the corresponding EFI_REST_JSON_STRUCTURE_PROTOCOL functions:
  - ToStructure()
  -ToJson()
  -DestoryStructure()

**EFI_REST_JSON_RESOURCE_TYPE_IDENTIFIER**

**Namespace**

- **ResourceTypeName**: String to Redfish schema resource type.
- **MajorVersion**: String to Redfish schema major version, NULL string for non version controlled schema.
- **MinorVersion**: String to Redfish schema minor version, NULL string for non version controlled schema.
- **ErrataVersion**: String to Redfish schema errata version, NULL string for non version controlled schema.

**Datatype**

String to data type defined in Redfish schema

**Examples**

AccountService.v1_0_0.json
Namespace
   ResourceTypeName: "AccountService"
   MajorVersion: "1"
   MinorVersion: "0"
   ErrataVersion: "0"

Datatype: "AccountService"

Namespace
   ResourceTypeName: "ComputerSystemCollection"
   MajorVersion: NULL
   MinorVersion: NULL
   ErrataVersion: NULL

Datatype: "ComputerSystemCollection"

- Determine Redfish resource type according to the given JsonRsrcIdentifier. If the given JsonRsrcIdentifier is non-NULL, the Redfish resource structure converter must convert the JSON resource to the Redfish JSON structure according to the resource type and revision specified in JsonRsrcIdentifier. The converter should not refer to the resource type and revision according to Redfish namespace and datatype indicated in “odata.type” in JSON text resource. This prevents from the returned structure format is different with what consumer expects.

- Automatically determine the Redfish resource type. If the given JsonRsrcIdentifier is NULL, the EFI Redfish JSON structure converter should check the namespace and datatype indicated in “odata.type” in the JSON text resource. Parse this identifier property to retrieve the corresponding Redfish schema name space and data type, then decode the JSON text resource into the corresponding structure. EFI_REST_JSON_RESOURCE_TYPE_IDENTIFIER in JsonStructure returned to consumer should be filled with the correct Redfish schema resource type information following the guidance mentioned above.

- All structure members for Redfish schema must be declared as C pointers. With this, the converter consumer can get the partial Redfish JSON properties from the converter. The consumer just initializes certain structure members, and the converter producer only converts non-NULL pointers in the given structure into corresponding Redfish JSON properties in text format.

31.2.2 The Guidance of Using EFI Redfish JSON Structure Converter

The consumer of EFI Redfish JSON structure converter utilizes EFI_REST(JSON) STRUCTURE_PROTOCOL for converting Redfish JSON resource to Redfish JSON structure and vice versa.

Refer to the converter document to include the C header file of the Redfish JSON structure converter into the build process. For example, include the converter’s EDKII package into an EFI module INF file for the C header file reference, or follow the build rule of other EFI implementations.
There are two ways for a consumer to convert JSON resources using the
**EFI_REST_JSON_STRUCTURE_PROTOCOL**:

- **Setup the correct Redfish namespace and datatype in**
  **EFI_REST_JSON_RESOURCE_TYPE_IDENTIFIER**. This makes sure the EFI REST JSON Structure Protocol uses the exact converter that the consumer prefers for the conversion. In this case, the Redfish namespace and datatype indicated in “odata.type” in the **EFI_REST_JSON_RESOURCE_TYPE_IDENTIFIER** is set to NULL. This means the converter may recognize the Redfish namespace and datatype indicated in “odata.type” in the JSON text resource, and converts it to the C structure it supports. In this case, the consumer has to be careful when using a C structure pointer to refer to the Redfish JSON structure.

- **EFI_REST_JSON_RESOURCE_TYPE_IDENTIFIER** set to NULL means the returned structure format may not be in the same form as the consumer’s expectation. The consumer then has to check the **EFI_REST_JSON_RESOURCE_TYPE_IDENTIFIER** for the Redfish namespace and datatype, and use the correct prototype for structure reference.
32 - Secure Boot and Driver Signing

32.1 Secure Boot

This protocol is intended to provide access for generic authentication information associated with
specific device paths. The authentication information is configurable using the defined interfaces.
Successive configuration of the authentication information will overwrite the previously configured
information. Once overwritten, the previous authentication information will not be retrievable.

EFI_AUTHENTICATION_INFO_PROTOCOL

Summary
This protocol is used on any device handle to obtain authentication information associated with the
physical or logical device.

GUID
#define EFI_AUTHENTICATION_INFO_PROTOCOL_GUID \
{0x7671d9d0,0x53db,0x4173,\ 
 {0xaa,0x69,0x23,0x27,0xf2,0x1f,0x0b,0xc7}}

Protocol Interface Structure

typedef struct _EFI_AUTHENTICATION_INFO_PROTOCOL {
EFI_AUTHENTICATION_INFO_PROTOCOL_GET Get;
EFI_AUTHENTICATION_INFO_PROTOCOL_SET Set;
} EFI_AUTHENTICATION_INFO_PROTOCOL;

Parameters
Get() Used to retrieve the Authentication Information associated with the controller handle
Set() Used to set the Authentication information associated with the controller handle

Description
The EFI_AUTHENTICATION_INFO_PROTOCOL provides the ability to get and set the authentication
information associated with the controller handle.

EFI_AUTHENTICATION_INFO_PROTOCOL.Get()

Summary
Retrieves the Authentication information associated with a particular controller handle.
Prototype

typedef
  EFI_STATUS
  (EFIAPI *EFI_AUTHENTICATION_INFO_PROTOCOL_GET) (
    IN EFI_AUTHENTICATION_INFO_PROTOCOL *This,
    IN EFI_HANDLE ControllerHandle,
    OUT VOID **Buffer
  );

Parameters

  This Pointer to the EFI_AUTHENTICATION_INFO_PROTOCOL
  ControllerHandle Handle to the Controller
  Buffer Pointer to the authentication information. This function is responsible for allocating the buffer and it is the caller's responsibility to free buffer when the caller is finished with buffer.

Description

This function retrieves the Authentication Node for a given controller handle.

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>Successfully retrieved Authentication information for the given ControllerHandle</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>No matching Authentication information found for the given ControllerHandle</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>The authentication information could not be retrieved due to a hardware error.</td>
</tr>
</tbody>
</table>

EFI_AUTHENTICATION_INFO_PROTOCOL.Set()

Summary

Set the Authentication information for a given controller handle.

Prototype

typedef
  EFI_STATUS
  (EFIAPI *EFI_AUTHENTICATION_INFO_PROTOCOL_SET) (
    IN EFI_AUTHENTICATION_INFO_PROTOCOL *This,
    IN EFI_HANDLE ControllerHandle
    IN VOID *Buffer
  );

Parameters

  This Pointer to the EFI_AUTHENTICATION_INFO_PROTOCOL
  ControllerHandle Handle to the controller.
Buffer  Pointer to the authentication information.

Description
This function sets the authentication information for a given controller handle. If the authentication node exists corresponding to the given controller handle this function overwrites the previously present authentication information.

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>Successfully set the Authentication node information for the given ControllerHandle.</td>
</tr>
<tr>
<td>EFI_UNSUPPORTED</td>
<td>If the platform policies do not allow setting of the Authentication information.</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>The authentication node information could not be configured due to a hardware error.</td>
</tr>
<tr>
<td>EFI_OUT_OF_RESOURCES</td>
<td>Not enough storage is available to hold the data.</td>
</tr>
</tbody>
</table>

Authentication Nodes
The authentication node is associated with specific controller paths. There can be various types of authentication nodes, each describing a particular authentication method and associated properties.

Generic Authentication Node Structures
An authentication node is a variable length binary structure that is made up of variable length authentication information. **Table 32-1** defines the generic structure. The Authentication type GUID defines the corresponding authentication node.

Table 32-1 Generic Authentication Node Structure

<table>
<thead>
<tr>
<th>Mnemonic</th>
<th>Byte Offset</th>
<th>Byte Length</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type GUID</td>
<td>0</td>
<td>16</td>
<td>Authentication Type GUID</td>
</tr>
<tr>
<td>Length</td>
<td>16</td>
<td>2</td>
<td>Length of this structure in bytes.</td>
</tr>
<tr>
<td>Specific Authentication Data</td>
<td>18</td>
<td>n</td>
<td>Specific Authentication Data. Type defines the authentication method and associated type of data. Size of the data is included in the length.</td>
</tr>
</tbody>
</table>

All Authentication Nodes are byte-packed data structures that may appear on any byte boundary. All code references to Authentication Nodes must assume all fields are UNALIGNED. Since every Authentication Node contains a length field in a known place, it is possible to traverse Authentication Node of unknown type.

CHAP (using RADIUS) Authentication Node
This Authentication Node type defines the CHAP authentication using RADIUS information.
GUID

```c
#define EFI_AUTHENTICATION_CHAP_RADIUS_GUID \  
{0xd6062b50,0x15ca,0x11da,\  
{0x92,0x19,0x00,0x10,0x83,0xff,0xca,0x4d}}
```

32.2 UEFI Driver Signing Overview

This section describes a means of generating a digital signature for a UEFI executable, embedding that digital signature within the UEFI executable and verifying that the digital signature is from an authorized source.

The UEFI specification provides a standard format for executables. These executables may be located on un-secured media (such as a hard drive or unprotected flash device) or may be delivered via a un-secured transport layer (such as a network) or originate from a un-secured port (such as ExpressCard device or USB device). In each of these cases, the system provider may decide to authenticate either the origin of the executable or its integrity (i.e., it has not been tampered with). This section describes a means of doing so.

32.2.1 Digital Signatures

As a rule, digital signatures require two pieces: the data (often referred to as the message) and a public/private key pair. In order to create a digital signature, the message is processed by a hashing algorithm to create a hash value. This hash value is, in turn, encrypted using a signature algorithm and the private key to create the digital signature.
In order to verify a signature, two pieces of data are required: the original message and the public key. First, the hash must be calculated exactly as it was calculated when the signature was created. Then the digital signature is decoded using the public key and the result is compared against the computed hash. If the two are identical, then you can be sure that message data is the one originally signed and it has not been tampered with.
32.2.2 Embedded Signatures

The signatures used for digital signing of UEFI executables are embedded directly within the executable itself. Within the header is an array of directory entries. Each of these entries points to interesting places within the executable image. The fifth data directory entry contains a pointer to a list of certificates along with the length of the certificate areas. Each certificate may contain a digital signature used for validating the driver.

The following diagram illustrates how certificates are embedded in the PE/COFF file:
Within the PE/COFF optional header is a data directory. The 5th entry, if filled, points to a list of certificates. Normally, these certificates are appended to the end of the file.

### 32.2.3 Creating Image Digests from Images

One of the pieces required for creating a digital signature is the image digest. For a detailed description on how to create image digests from PE/COFF images, refer to the "Creating the PE Image Hash" section of the Microsoft Authenticode Format specification (see References).

### 32.2.4 Code Definitions

This section describes data structures used for signing UEFI executables.
WIN_CERTIFICATE

Summary
The WIN_CERTIFICATE structure is part of the PE/COFF specification.

Prototype

typedef struct _WIN_CERTIFICATE {
    UINT32 dwLength;
    UINT16 wRevision;
    UINT16 wCertificateType;
    //UINT8 bCertificate[ANYSIZE_ARRAY];
} WIN_CERTIFICATE;

dwLength The length of the entire certificate, including the length of the header, in bytes.
wRevision The revision level of the WIN_CERTIFICATE structure. The current revision level is 0x0200.
wCertificateType The certificate type. See WIN_CERT_TYPE_xxx for the UEFI certificate types. The UEFI specification reserves the range of certificate type values from 0x0EF0 to 0x0EFF.
bCertificate The actual certificate. The format of the certificate depends on wCertificateType. The format of the UEFI certificates is defined below.

Related Definitions
#define WIN_CERT_TYPE_PKCS_SIGNED_DATA 0x0002
#define WIN_CERT_TYPE_EFI_PKCS1_15 0x0EF0
#define WIN_CERT_TYPE_EFI_GUID 0x0EF1

Description
This structure is the certificate header. There may be zero or more certificates. If

• the wCertificateType field is set to WIN_CERT_TYPE_EFI_PKCS1_15, then the certificate follows the format described in WIN_CERTIFICATE_EFI_PKCS1_15.

• If the wCertificateType field is set to WIN_CERT_TYPE_EFI_GUID, then the certificate follows the format described in WIN_CERTIFICATE_EFI_GUID.

• If the wCertificateType field is set to WIN_CERT_TYPE_PKCS_SIGNED_DATA then the certificate is formatted as described in the Authenticode specification.

These certificates can be validated using the contents of the signature database described in Section 32.4.1. The following table illustrates the relationship between the certificates and the signature types in the database.

Note: In the case of a WIN_CERT_TYPE_PKCS_SIGNED_DATA (or WIN_CERT_TYPE_EFI_GUID where CertType = EFI_CERT_TYPE_PKCS7_GUID) certificate, a match can occur against an entry in the authorized signature database (or the forbidden signature database; see Section 32.6.1) at
any level of the chain of X.509 certificates present in the certificate, and matches can occur against any of the applicable signature types defined in Section 32.4:

Table 32-4 PE/COFF Certificates Types and UEFI Signature Database Certificate Types

<table>
<thead>
<tr>
<th>Image Certificate Type</th>
<th>Verified Using Signature Database Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>WIN_CERT_TYPE_EFI_PKCS1_15 (Signature Size = 256 bytes)</td>

</tr>
<tr>
<td>WIN_CERT_TYPE_EFI_GUID (CertType = EFI_CERT_TYPE_RSA2048_SHA256_GUID)</td>
<td>EFI_CERT_RSA2048_GUID (public key).</td>
</tr>
<tr>
<td>WIN_CERT_TYPE_EFI_GUID (CertType = EFI_CERT_TYPE_PKCS7_GUID)</td>
<td>EFI_CERT_X509_GUID, EFI_CERT_RSA2048_GUID (when applicable)</td>
</tr>
<tr>
<td>WIN_CERT_TYPE_PKCS_SIGNED_DATA</td>
<td>EFI_CERT_X509_GUID, EFI_CERT_RSA2048_GUID (when applicable)</td>
</tr>
<tr>
<td>(Always applicable regardless of whether a certificate is present or not)</td>
<td>EFI_CERT_SHA1_GUID, EFI_CERT_SHA224_GUID, EFI_CERT_SHA256_GUID, EFI_CERT_SHA384_GUID, EFI_CERT_SHA512_GUID</td>
</tr>
</tbody>
</table>

**WIN_CERTIFICATE_EFI_PKCS1_15**

**Summary**
Certificate which encapsulates the RSASSA_PKCS1-v1_5 digital signature.
Prototype

typedef struct _WIN_CERTIFICATE_EFI_PKCS1_15 {
    WIN_CERTIFICATE Hdr;
    EFI_GUID HashAlgorithm;
    // UINT8 Signature[ANYSIZE_ARRAY];
} WIN_CERTIFICATE_EFI_PKCS1_15;

Hdr This is the standard WIN_CERTIFICATE header, where wCertificateType is set to WIN_CERT_TYPE_EFI_PKCS1_15.

HashAlgorithm This is the hashing algorithm which was performed on the UEFI executable when creating the digital signature. It is one of the enumerated values pre-defined in Section 37.1.2.1. See EFI_HASH_ALGORITHM_x.

Signature This is the actual digital signature. The size of the signature is the same size as the key (2048-bit key is 256 bytes) and can be determined by subtracting the length of the other parts of this header from the total length of the certificate as found in Hdr.dwLength.

Description

The WIN_CERTIFICATE_EFI_PKCS1_15 structure is derived from WIN_CERTIFICATE and encapsulates the information needed to implement the RSASSA-PKCS1-v1_5 digital signature algorithm as specified in RFC2437, sections 8-9.

WIN_CERTIFICATE_EFI_GUID

Summary

Certificate which encapsulates a GUID-specific digital signature.

Prototype

typedef struct _WIN_CERTIFICATE_EFI_GUID {
    WIN_CERTIFICATE Hdr;
    EFI_GUID CertType;
    UINT8 CertData[ANYSIZE_ARRAY];
} WIN_CERTIFICATE_EFI_GUID;

Hdr This is the standard WIN_CERTIFICATE header, where wCertificateType is set to WIN_CERT_TYPE_EFI_GUID.

CertType This is the unique id which determines the format of the CertData.

CertData This is the certificate data. The format of the data is determined by the CertType.
Related Definitions

```
#define EFI_CERT_TYPE_RSA2048_SHA256_GUID
{0xa7717414, 0xc616, 0x4977, \n{0x94, 0x20, 0x84, 0x47, 0x12, 0xa7, 0x35, 0xbf}}
#define EFI_CERT_TYPE_PKCS7_GUID
{0x4aafd29d, 0x68df, 0x49ee, \n{0x8a, 0xa9, 0x34, 0x7d, 0x37, 0x56, 0x65, 0xa7}}
typedef struct _EFI_CERT_BLOCK_RSA_2048_SHA256 {
  EFI_GUID HashType;
  UINT8  PublicKey[256];
  UINT8  Signature[256];
} EFI_CERT_BLOCK_RSA_2048_SHA256;
```

Public Key

The RSA exponent e for this structure is 0x10001.

Signature

This signature block is PKCS 1 version 1.5 formatted.

Description

The WIN_CERTIFICATE_UEFI_GUID certificate type allows new types of certificates to be developed for driver authentication without requiring a new certificate type. The CertType defines the format of the CertData, which length is defined by the size of the certificate less the fixed size of the WIN_CERTIFICATE_UEFI_GUID structure.

- If CertType is EFI_CERT_TYPE_RSA2048_SHA256_GUID then the structure which follows has the format specified by EFI_CERT_BLOCK_RSA_2048_SHA256.
- If CertType is EFI_CERT_TYPE_PKCS7_GUID then the CertData component shall contain a DER-encoded PKCS #7 version 1.5 [RFC2315] SignedData value.

32.3 Firmware/OS Key Exchange: creating trust relationships

This section describes a means of creating a trust relationship between the platform owner, the platform firmware, and an operating system. This trust relationship enables the platform firmware and one or more operating systems to exchange information in a secure manner.

The trust relationship uses two types of asymmetric key pairs:

**Platform Key (PK)**

The platform key establishes a trust relationship between the platform owner and the platform firmware. The platform owner enrolls the public half of the key (PK_{pub}) into the platform firmware. The platform owner can later use the private half of the key (PK_{priv}) to change platform ownership or to enroll a Key Exchange Key. For UEFI, the recommended Platform Key format is RSA-2048. See “Enrolling The Platform Key” and “Clearing The Platform Key” for more information.

**Key Exchange Key (KEK)**

Key exchange keys establishes a trust relationship between the operating system and the platform firmware. Each operating system (and potentially, each 3rd party application which need to communicate with platform firmware) enrolls a public key
(KEKpub) into the platform firmware. See “Enrolling Key Exchange Keys” for more information.

While no Platform Key is enrolled, the SetupMode variable shall be equal to 1. While SetupMode == 1, the platform firmware shall not require authentication in order to modify the Platform Key, Key Enrollment Key, OsRecoveryOrder, OsRecovery####, and image security databases.

After the Platform Key is enrolled, the SetupMode variable shall be equal to 0. While SetupMode == 0, the platform firmware shall require authentication in order to modify the Platform Key, Key Enrollment Key, OsRecoveryOrder, OsRecovery####, and image security databases.

While no Platform Key is enrolled, and while the variable AuditMode == 0, the platform is said to be operating in setup mode.

After the Platform Key is enrolled, and while the variable AuditMode == 0, the platform is operating in user mode. The platform will continue to operate in user mode until the Platform Key is cleared, or the system is transitioned to either Audit or Deployed Modes. See "Clearing The Platform Key," "Transitioning to Audit Mode," and "Transitioning to Deployed Mode" for more information.

Audit Mode enables programmatic discovery of signature list combinations that successfully authenticate installed EFI images without the risk of rendering a system unbootable. Chosen signature lists configurations can be tested to ensure the system will continue to boot after the system is transitioned out of Audit Mode. Details on how to transition to Audit Mode are detailed below in the section "Transitioning to Audit Mode." After transitioning to Audit Mode, signature enforcement is disabled such that all images are initialized and enhanced Image Execution Information Table (IEIT) logging is performed including recursive validation for multi-signed images.

Deployed Mode is the most secure mode. For details on transitioning to Deployed Mode see the section "Transitioning to Deployed Mode" below. By design, both User Mode and Audit Mode support unauthenticated transitions to Deployed Mode. However, to move from Deployed Mode to any other mode requires a secure platform-specific method, or deleting the PK, which is authenticated.

Secure Boot Mode transitions to User Mode or Deployed Mode shall take effect immediately. Mode transitions to Setup Mode or Audit Mode may either take effect immediately (recommended) or after a reset. For implementations that require a reset, the mode transition shall be processed prior to the initialization of the SecureBoot variable, and the SetVariable() workflow shall be as follows:

1. If the variable has an authenticated attribute, it shall be authenticated as specified, and failure will result in immediate termination of this workflow by returning the appropriate error.
2. Check secure storage to determine if a Secure Boot Mode transition is already queued. If a transition is already queued, terminate this workflow by returning EFI_ALREADY_STARTED
3. Queue the request to secure storage
4. The Secure Boot Mode and Policy variables SHALL remain unchanged
5. Return EFI_WARN_RESET_REQUIRED.
6. After reboot, if the transition is successful, Secure Boot Mode and Policy variables will change accordingly. If the transition to lower security modes is rejected or fail, the workflow is terminated and the Secure Boot Mode and Policy variables remain unchanged
32.3.1 Enrolling The Platform Key

The platform owner enrolls the public half of the Platform Key (PK\textsubscript{pub}) by calling the UEFI Boot Service \texttt{SetVariable()} as specified in Section 8.2.1. If the platform is in setup mode, then the new PK\textsubscript{pub} may be signed with its PK\textsubscript{priv} counterpart. If the platform is in user mode, then the new PK\textsubscript{pub} must be signed with the current PK\textsubscript{priv}. When the platform is in setup mode, a successful enrollment of a Platform Key shall cause the platform to immediately transition to user mode.

The authenticated PK variable can always be read but can only be written if the platform is in setup mode, or if the platform is in user mode and the provided PK\textsubscript{pub} is signed with the current PK\textsubscript{priv}.

The name and GUID of the Platform Key variable are specified in Section 3.3 “Globally Defined Variables” The variable has the format of a signature database as described in “Signature Database” below, with exactly one entry.

The platform vendor may provide a default PKpub in the PKDefault variable described in Section 3.3. This variable is formatted identically to the Platform Key variable. If present, this key may optionally be used as the public half of the Platform Key when transitioning from setup mode to user mode. If so, it may be
read, placed within an `EFI_VARIABLE_AUTHENTICATION2` structure and copied to the Platform Key variable using the `SetVariable()` call.

### 32.3.2 Clearing The Platform Key

The platform owner clears the public half of the Platform Key (PK\textsubscript{pub}) by deleting the Platform Key variable using UEFI Runtime Service `SetVariable()`. The data buffer submitted to the `SetVariable()` must be signed with the current PK\textsubscript{priv}; see Section 8.1.1 for details. The name and GUID of the Platform Key variable are specified in Section 3.3, “Globally Defined Variables”.

The platform key may also be cleared using a secure platform-specific method. When platform key is cleared, the global variable SetupMode must also be updated to 1.

### 32.3.3 Transitioning to Audit Mode

To enter Audit Mode, a new UEFI variable AuditMode is set to 1. Entering Audit Mode has the side effect of changing SetupMode == 1, PK is cleared, and the new DeployedMode == 0.

**Note:** The AuditMode variable is only writable before `ExitBootServices()` is called when the system is not in Deployed Mode. See Figure 32-4 for more details.

### 32.3.4 Transitioning to Deployed Mode

To enter Deployed Mode from Audit Mode, set the variable PK. To enter Deployed Mode from User Mode, set the variable DeployedMode to 1. This transition takes effect immediately with no reset required. Entering Deployed Mode has the side effect of changing SetupMode == 0, AuditMode == 0 and is made read-only, and DeployedMode == 1 and is made read-only. See Figure 32-4 for more details.

### 32.3.5 Enrolling Key Exchange Keys

Key exchange keys are stored in a signature database as described in "Signature Database" below. The signature database is stored as an authenticated UEFI variable.

The platform owner enrolls the key exchange keys by either calling `SetVariable()` as specified in Section 8.2.1 with the `EFI_VARIABLE_APPEND_WRITE` attribute set and the Data parameter containing the new key(s), or by reading the database using `GetVariable()`, appending the new key exchange key to the existing keys and then writing the database using `SetVariable()` as specified in Section 8.2.1 without the `EFI_VARIABLE_APPEND_WRITE` attribute set.

The authenticated UEFI variable that stores the key exchange keys (KEKs) can always be read but only be written if:

- The platform is in user mode and the provided variable data is signed with the current PK\textsubscript{priv}, or
- The platform is in setup mode (in this case the variable can be written without a signature validation, but the `SetVariable()` call needs to be formatted in accordance with the procedure for authenticated variables in Section 8.2.1).

The name and GUID of the Key Exchange Key variable are specified in Section 3.3, “Globally Defined Variables.”
The platform vendor may provide a default set of Key Exchange Keys in the KEKDefault variable described in Section 3.3. If present, these keys (or a subset) may optionally be used when performing the initial enrollment of Key Exchange Keys. If any are to be used, they may be parsed from the variable and enrolled as described above.

32.3.6 Platform Firmware Key Storage Requirements

This section describes the platform firmware storage requirements of the different types of keys.

**Platform Keys:**

The public key must be stored in non-volatile storage which is tamper and delete resistant.

**Key Exchange Keys:**

The public key must be stored in non-volatile storage which is tamper resistant.

Careful consideration should be given to the security and configuration of any out-of-band management agent (e.g. hypervisor or service processor) such that the platform cannot exploit the management agent in order to circumvent Secure Boot.

32.4 Firmware/OS Key Exchange: passing public keys

This section describes a means of passing public keys from the OS to the platform firmware so that these keys can be used to securely pass information between the OS and the platform firmware.

Typically, the OS has been unable to communicate sensitive information or enforce any sort of policy because of the possibility of spoofing by a malicious software agent. That is, the platform firmware has been unable to trust the OS. By enrolling these public keys, authorized by the platform owner, the platform firmware can now check the signature of data passed by the operating system.

Of course if the malicious software agent is running as part of the OS, such as a rootkit, then any communication between the firmware and operating system still remains the subject of spoofing as the malicious code has access to the key exchange key.

32.4.1 Signature Database

**EFI_SIGNATURE_DATA**

**Summary**

The format of a signature database.

**Prototype**

```c
#pragma pack(1)
typedef struct _EFI_SIGNATURE_DATA {
    EFI_GUID    SignatureOwner;
    UINT8       SignatureData[...];
} EFI_SIGNATURE_DATA;
```
typedef struct _EFI_SIGNATURE_LIST {
    EFI_GUID   SignatureType;
    UINT32    SignatureListSize;
    UINT32    SignatureHeaderSize;
    UINT32    SignatureSize;
    // UINT8 SignatureHeader[SignatureHeaderSize];
    // EFI_SIGNATURE_DATA Signatures[...][SignatureSize];
} EFI_SIGNATURE_LIST;

#pragma pack()

Members

SignatureListSize
Total size of the signature list, including this header.

SignatureType
Type of the signature. GUID signature types are defined in "Related Definitions" below.

SignatureHeaderSize
Size of the signature header which precedes the array of signatures.

SignatureSize
Size of each signature. Must be at least the size of EFI_SIGNATURE_DATA.

SignatureHeader
Header before the array of signatures. The format of this header is specified by the SignatureType.

Signatures
An array of signatures. Each signature is SignatureSize bytes in length. The format of the signature is defined by the SignatureType.

SignatureOwner
An identifier which identifies the agent which added the signature to the list.

Description
The signature database consists of zero or more signature lists. The size of the signature database can be determined by examining the size of the UEFI variable.

Each signature list is a list of signatures of one type, identified by SignatureType. The signature list contains a header and then an array of zero or more signatures in the format specified by the header. The size of each signature in the signature list is specified by SignatureSize.

Each signature has an owner SignatureOwner, which is a GUID identifying the agent which inserted the signature in the database. Agents might include the operating system or an OEM-supplied driver or application. Agents may examine this field to understand whether they should manage the signature or not.

### Related Definitions

```c
#define EFI_CERT_SHA256_GUID \
  { 0xc1c41626, 0x504c, 0x4092, \
    { 0xac, 0xa9, 0x41, 0xf9, 0x36, 0x93, 0x43, 0x28 } };  
```

This identifies a signature containing a SHA-256 hash. The `SignatureHeader` size shall always be 0. The `SignatureSize` shall always be 16 (size of `SignatureOwner` component) + 32 bytes.

```c
#define EFI_CERT_RSA2048_GUID \
  { 0x3c5766e8, 0x269c, 0x4e34, \
    { 0xaa, 0x14, 0xed, 0x77, 0x6e, 0x85, 0xb3, 0xb6 } };  
```

This identifies a signature containing an RSA-2048 key. The key (only the modulus since the public key exponent is known to be 0x10001) shall be stored in big-endian order.

The `SignatureHeader` size shall always be 0. The `SignatureSize` shall always be 16 (size of `SignatureOwner` component) + 256 bytes.

```c
#define EFI_CERT_RSA2048_SHA256_GUID \
  { 0xe2b36190, 0x879b, 0x4a3d, \
    { 0xad, 0x8d, 0xf2, 0xe7, 0xbb, 0xa3, 0x27, 0x84 } };  
```

This identifies a signature containing a RSA-2048 signature of a SHA-256 hash. The `SignatureHeader` size shall always be 0. The `SignatureSize` shall always be 16 (size of `SignatureOwner` component) + 256 bytes.
#define EFI_CERT_SHA1_GUID \
{ 0x826ca512, 0xcf10, 0x4ac9, \
{ 0xb1, 0x87, 0xbe, 0x01, 0x49, 0x66, 0x31, 0xbd } };

This identifies a signature containing a SHA-1 hash. The `SignatureSize` shall always be 16 (size of `SignatureOwner` component) + 20 bytes.

#define EFI_CERT_RSA2048_SHA1_GUID \
{ 0x67f8444f, 0x8743, 0x48f1, \
{ 0xa3, 0x28, 0x1e, 0xaa, 0xb8, 0x73, 0x60, 0x80 } };

This identifies a signature containing a RSA-2048 signature of a SHA-1 hash. The `SignatureHeader` size shall always be 0. The `SignatureSize` shall always be 16 (size of `SignatureOwner` component) + 256 bytes.

#define EFI_CERT_X509_GUID \
{ 0xa5c059a1, 0x94e4, 0x4aa7, \
{ 0x87, 0xb5, 0xab, 0x15, 0x5c, 0x2b, 0xf0, 0x72 } };

This identifies a signature based on a DER-encoded X.509 certificate. If the signature is an X.509 certificate then verification of the signature of an image should validate the public key certificate in the image using certificate path verification, up to this X.509 certificate as a trusted root. The `SignatureHeader` size shall always be 0. The `SignatureSize` may vary but shall always be 16 (size of the `SignatureOwner` component) + the size of the certificate itself.

Note: This means that each certificate will normally be in a separate `EFI_SIGNATURE_LIST`.

#define EFI_CERT_SHA224_GUID \
{ 0xb6e5233, 0xa65c, 0x44c9, \
{0x94, 0x07, 0xd9, 0xab, 0x83, 0xbf, 0xc8, 0xbd} };

This identifies a signature containing a SHA-224 hash. The `SignatureHeader` size shall always be 0. The `SignatureSize` shall always be 16 (size of `SignatureOwner` component) + 28 bytes.

#define EFI_CERT_SHA384_GUID \
{ 0xff3e5307, 0x9fd0, 0x48c9, \
{0x85, 0xf1, 0x8a, 0xd5, 0x6c, 0x70, 0x1e, 0x01})};

This identifies a signature containing a SHA-384 hash. The `SignatureHeader` size shall always be 0. The `SignatureSize` shall always be 16 (size of `SignatureOwner` component) + 48 bytes.
#define EFI_CERT_SHA512_GUID \
{ 0x93e0fae, 0xa6c4, 0x4f50, \
{0x9f, 0x1b, 0xd4, 0x1e, 0x2b, 0x89, 0xc1, 0x9a}}

This identifies a signature containing a SHA-512 hash. The SignatureHeader size shall always be 0. The SignatureSize shall always be 16 (size of SignatureOwner component) + 64 bytes.

#define EFI_CERT_X509_SHA256_GUID \
{ 0x3bd2a492, 0x96c0, 0x4079, \
{ 0xb4, 0x20, 0xfc, 0xf9, 0xe, 0xf1, 0x03, 0xed } };

Prototype
#pragma pack(1)
typedef struct _EFI_CERT_X509_SHA256 {
  EFI_SHA256_HASH ToBeSignedHash;
  EFI_TIME TimeOfRevocation;
} EFI_CERT_X509_SHA256;
#pragma pack()

Members
ToBeSignedHash
The SHA256 hash of an X.509 certificate’s To-Be-Signed contents.

TimeOfRevocation
The time that the certificate shall be considered to be revoked.

This identifies a signature containing the SHA256 hash of an X.509 certificate’s To-Be-Signed contents, and a time of revocation. The SignatureHeader size shall always be 0. The SignatureSize shall always be 16 (size of the SignatureOwner component) + 48 bytes for an EFI_CERT_X509_SHA256 structure. If the TimeOfRevocation is non-zero, the certificate should be considered to be revoked from that time and onwards, and otherwise the certificate shall be considered to always be revoked.

#pragma pack()
```

Members

- **ToBeSignedHash**
  - The SHA512 hash of an X.509 certificate’s To-Be-Signed contents.
- **TimeOfRevocation**
  - The time that the certificate shall be considered to be revoked.

This identifies a signature containing the SHA512 hash of an X.509 certificate’s To-Be-Signed contents, and a time of revocation. The `SignatureHeader` size shall always be 0. The `SignatureSize` shall always be 16 (size of the `SignatureOwner` component) + 80 bytes for an `EFI_CERT_X509_SHA512`
structure. If the TimeOfRevocation is non-zero, the certificate should be considered to be revoked from that time and onwards, and otherwise the certificate shall be considered to always be revoked.

```c
#define EFI_CERT_EXTERNAL_MANAGEMENT_GUID \
{ 0x452e8ced, 0xdfff, 0x4b8c, \
  { 0xae, 0x01, 0x51, 0x18, 0x86, 0x2e, 0x68, 0x2c } };```

This SignatureType describes a pseudo-signature which will not facilitate authentication. It is only meaningful within a signature list used for authenticating writes through SetVariable(), and is only effective if it is the only signature present in that signature list. It allows a signature list to be populated without providing any means for SetVariable() to succeed. This signature type is intended for use on a platform with an external out-of-band management agent (e.g. hypervisor or service processor). When a platform is configured such that only signatures of this SignatureType are available for authenticating writes to a variable, that variable may only be modified by the external management agent using a platform-specific interface.

When a write may be authenticated using any signature from multiple signature lists, the presence of this signature in one of those signature lists does not inhibit the use of signatures present in the other signature lists. For example, if this signature is placed in PK, an attempt to write to db using SetVariable() will still succeed if it is signed by a valid KEKpriv, but a write to PK or KEK through SetVariable() cannot succeed because no PKpriv exists.

The SignatureHeader size shall always be 0. The SignatureSize shall always be 16 (size of SignatureOwner component) + 1 byte. The one byte of SignatureData exists only for compatibility reasons; It should be written as zero, and any value read should be ignored.

### 32.4.2 Image Execution Information Table

**Summary**

When AuditMode==0, if the image’s signature is not found in the authorized database, or is found in the forbidden database, the image will not be started and instead, information about it will be placed in the **EFI_IMAGE_EXECUTION_INFO_TABLE** (see Section 32.5.3.1, Using The Image Execution Information Table).

When AuditMode==1, an **EFI_IMAGE_EXECUTION_INFO** element is created in the **EFI_IMAGE_EXECUTION_INFO_TABLE** for every certificate found in the certificate table of every image that is validated.

Additionally for every image, an element will be created in the table for every EFI_CERT_SHAXXX that is supported by the platform. The contents of Action for each element are determined by comparing that specific element’s Signature (which will contain exactly 1 **EFI_SIGNATURE_DATA**) to the currently-configured image security databases and policies, and shall be either **EFI_IMAGE_EXECUTION_AUTH_SIG_PASSED**, **EFI_IMAGE_EXECUTION_AUTH_SIG_FAILED**, or **EFI_IMAGE_EXECUTION_POLICY_FAILED**.

Finally, because the system is in Audit Mode, all modules are initialized even if they fail to authenticate, and the **EFI_IMAGE_EXECUTION_INITIALIZED** bit shall be set in Action for all elements.
Prototype

typedef struct {
    EFI_IMAGE_EXECUTION_ACTION Action;
    UINT32 InfoSize;
    // CHAR16 Name[...];
    // EFI_DEVICE_PATH_PROTOCOL DevicePath;
    // EFI_SIGNATURE_LIST Signature;
} EFI_IMAGE_EXECUTION_INFO;

Parameters

Action

Describes the action taken by the firmware regarding this image. Type
EFI_IMAGE_EXECUTION_ACTION is described in “Related Definitions” below.

InfoSize

Size of all of the entire structure.

Name

If this image was a UEFI device driver (for option ROM, for example) this is the null-terminated, user-friendly name for the device. If the image was for an application, then this is the name of the application. If this cannot be determined, then a simple NULL character should be put in this position.

DevicePath

Image device path. The image device path typically comes from the Loaded Image Device Path Protocol installed on the image handle. If image device path cannot be determined, a simple end-of-path device node should be put in this position.

Signature

Zero or more image signatures. If the image contained no signatures, then this field is empty. The type WIN_CERTIFICATE is defined in chapter 26.

Prototype

typedef struct {
    UINTN NumberOfImages;
    EFI_IMAGE_EXECUTION_INFO InformationInfo[...]
} EFI_IMAGE_EXECUTION_INFO_TABLE;

NumberOfImages Number of EFI_IMAGE_EXECUTION_INFO structures.
InformationInfo NumberOfImages instances of EFI_IMAGE_EXECUTION_INFO structures.
Related Definitions

typedef UINT32 EFI_IMAGE_EXECUTION_ACTION;

#define EFI_IMAGE_EXECUTION_AUTHENTICATION 0x00000007
#define EFI_IMAGE_EXECUTION_AUTH_UNTESTED 0x00000000
#define EFI_IMAGE_EXECUTION_AUTH_SIG_FAILED 0x00000001
#define EFI_IMAGE_EXECUTION_AUTH_SIG_PASSED 0x00000002
#define EFI_IMAGE_EXECUTION_AUTH_SIG_NOT_FOUND 0x00000003
#define EFI_IMAGE_EXECUTION_AUTH_SIG_FOUND 0x00000004
#define EFI_IMAGE_EXECUTION_POLICY_FAILED 0x00000005

#define EFI_IMAGE_EXECUTION_INITIALIZED 0x00000008

Description

This structure describes an image in the EFI System Configuration Table. It is only required in the case where image signatures are being checked and the image was not initialized because its signature failed, when AuditMode==1, or was not found in the signature database and an authorized user or the owner would not authorize its execution. It may be used in other cases as well.

In these cases, the information about the image is copied into the EFI System Configuration Table. Information about other images which were successfully initialized may also be included as well, but this is not required.

The Action field describes what action the firmware took with regard to the image and what other information it has about the image, including the device which it is related to.

First, this field describes the results of the firmware’s attempt to authenticate the image.

1. If EFI_IMAGE_EXECUTION_AUTH_UNTESTED is set, then no authentication attempt was made.
2. If EFI_IMAGE_EXECUTION_AUTH_SIG_FAILED is set, then the image had at least one digital signature and the check of the digital signatures failed.
3. If EFI_IMAGE_EXECUTION_AUTH_SIG_PASSED is set, then the image had at least one valid digital signature and a check of that digital signature passed.
4. If EFI_IMAGE_EXECUTION_AUTH_SIG_NOT_FOUND is set, then the image’s signature could not be found in the signature database.
5. If EFI_IMAGE_EXECUTION_AUTH_SIG_FOUND is set, then the image’s signature was found in the signature database.
6. If EFI_IMAGE_EXECUTION_POLICY_FAILED is set, then authentication failed because of (unspecified) firmware security policy.

Second, this field describes whether the image was initialized or not.

This table can be used by an agent which executes later to audit which images were not loaded and perhaps query other sources to discover whether the image should be authorized. If so, the agent can use the method described in “Signature Database Update” to update the Signature Database with the image’s signature. Switching the system into Audit Mode generates a more verbose table which provides additional insights to this agent.
If an attempt to boot a legacy non-UEFI OS takes place when the system is in User Mode, the OS load shall fail and a corresponding `EFI_IMAGE_EXECUTION_INFO` entry shall be created with Action set to `EFI_IMAGE_EXECUTION_AUTH_UNTESTED`, Name set to the NULL-terminated “Description String” from the BIOS Boot Specification Device Path and DevicePath set to the BIOS Boot Specification Device Path (see Section 10.3.6).

### 32.5 UEFI Image Validation

#### 32.5.1 Overview

This section describes a way to use the platform ownership model described in the previous section and the key exchange mechanism to allow the firmware to authenticate a UEFI image, such as an OS loader or an option ROM, using the digital signing mechanisms described here.

The hand-off between the platform firmware and the operating system is a critical part of ensuring secure boot. Since there are large numbers of operating systems and a large number of minor variations in the loaders for those operating systems, it is difficult to carry all possible keys or signatures within the firmware as it ships. This requires some sort of update mechanism, to identify the proper loader. But, as with any update mechanism, there is the risk of allowing malicious software to “authenticate” itself, posing as the real operating system.

Likewise, there are a large number of potential 3rd-party UEFI applications, drivers and option ROMs and it is difficult to carry all possible keys or signatures within the firmware as it ships.

The mechanism described here requires that the platform firmware maintain a signature database, with entries for each authorized UEFI image (the authorized UEFI signature database). The signature database is a single UEFI Variable.

It also requires that the platform firmware maintain a signature database with entries for each forbidden UEFI image. This signature database is also a single UEFI variable.

The signature database is checked when the UEFI Boot Manager is about to start a UEFI image. If the UEFI image’s signature is not found in the authorized database, or is found in the forbidden database, the UEFI image will be deferred and information placed in the Image Execution Information Table. In the case of OS Loaders, the next boot option will be selected. The signature databases may be updated by the firmware, by a pre-OS application or by an OS application or driver.

If a firmware supports the `EFI_CERT_X509_SHA*_GUID` signature types, it should support the RFC3161 timestamp specification. Images whose signature matches one of these types in the forbidden signature database shall only be considered forbidden if the firmware either does not support timestamp verification, or the signature type has a time of revocation equal to zero, or the timestamp does not pass verification against the authorized timestamp and forbidden signature databases, or finally the signature type's time of revocation is less than or equal to the time recorded in the image signature's timestamp. If the timestamp's signature is authorized by the authorized timestamp database and the time recorded in the timestamp is less than the time of revocation, the image shall not be considered forbidden provided it is not forbidden by any other entry in the forbidden signature database. Finally, this requires that firmware supporting timestamp verification must support the authorized timestamp database and have a suitable time stamping authority certificate in that database.
32.5.2 Authorized User

An authorized user (for the purposes of UEFI image security) is one who possesses a key exchange key (KEK_{priv}). This key is used to sign updates to the signature databases.

32.5.3 Signature Database Update

The Authorized, Forbidden, Timestamp, and Recovery signature databases are stored as UEFI authenticated variables (see Variable Services in Section 8.1.1) with the GUID $\text{EFI\_IMAGE\_SECURITY\_DATABASE\_GUID}$ and the names $\text{EFI\_IMAGE\_SECURITY\_DATABASE}$, $\text{EFI\_IMAGE\_SECURITY\_DATABASE1}$, $\text{EFI\_IMAGE\_SECURITY\_DATABASE2}$, and $\text{EFI\_IMAGE\_SECURITY\_DATABASE3}$, respectively.

These authenticated UEFI variables that store the signature databases (db, dbx, dbt, or dbt) can always be read but can only be written if:

- The platform is in user mode and the provided variable data is signed with the private half of a previously enrolled key exchange key (KEK_{priv}), or the platform private key (PK_{priv});

or if

- The platform is in setup mode (in this case the variables can be written without a signature validation, but the SetVariable() call needs to be formatted in accordance with the procedure for authenticated variables in Section 8.2.1)

The signature databases are in the form of Signature Databases, as described in “Signature Database” above.

The platform vendor may provide a default set of entries for the Signature Database in the dbDefault, dbxDefault, dbtDefault, and dbtDefault variables described in Section 3.3. If present, these keys (or a subset) may optionally be used when performing the initial enrollment of signature database entries. If any are to be used, they may be parsed from the variable and enrolled as described below.

If, when adding a signature to the signature database, SetVariable() returns EFI\_OUT\_OF\_RESOURCES, indicating there is no more room, the updater may discard the new signature or it may decide to discard one of the database entries. These authenticated UEFI variables that store the signature databases (db, or dbx, dbt, or dbt) can always be read but can only be written if:
The following diagram illustrates the process for adding a new signature by the OS or an application that has access to a previously enrolled key exchange key using `SetVariable()`. In the diagram, the `EFI_VARIABLE_APPEND_WRITE` attribute is not used. If `EFI_VARIABLE_APPEND_WRITE` had been used, then steps 2 and 3 could have been omitted and step 7 would have included setting the `EFI_VARIABLE_APPEND_WRITE` attribute.

1. The procedure begins by generating a new signature, in the format described by the Signature Database.
2. Call `GetVariable()` using `EFI_IMAGE_SECURITY_DATABASE_GUID` for the `VendorGuid` parameter and `EFI_IMAGE_SECURITY_DATABASE` for the `VariableName` parameter.
3. If the variable exists, go to step 5.
4. Create an empty authorized signature database.
5. Create a new buffer which contains the authorized signature database, along with the new signature appended to the end.
6. Sign the new signature database using the private half of the Key Exchange Key as described in `SetVariable()`.
7. Update the authorized signature database using the UEFI Runtime Service `SetVariable()`.
8. If there was no error, go to step 11.
9. If there was an error because of no more resources, determine whether the database can be shrunk any more. The algorithm by which an agent decides which signatures may be safely removed is agent-specific. In most cases, agents should not remove signatures where the `SignatureOwner` field is not the agent’s. If not, then go to step 11, discarding the new signature.
10. If the signature database could be shrunk further, then remove the entries and go to step 6.
11. Exit.
Figure 32-6 Process for adding a new signature by the OS
32.5.3.1 Using The Image Execution Information Table

During the process of loading UEFI images, the firmware must gather information about which UEFI images were not started. The firmware may additionally gather information about UEFI images which were started. The information is used to create the EFI_IMAGE_EXECUTION_INFO_TABLE, which is added to the EFI System Configuration Table and assigned the GUID EFI_IMAGE_SECURITY_DATABASE_GUID.

For each UEFI image, the following information is collected:

- The image hash.
- The user-friendly name of the UEFI image (if known)
- The device path
- The action taken on the device (was it initialized or why was it rejected)

For more information, see the Image Execution Information Table definition in Section 32.4.2.

32.5.3.2 Firmware Policy

The firmware may approve UEFI images for other reasons than those specified here. For example: whether the image is in the system flash, whether the device providing the UEFI image is secured (in a case, etc.) or whether the image contains another type of platform-supported digital signature.

32.5.3.3 Authorization Process

This section describes the process by which an unknown UEFI image might be authorized to run. Implementations are not required to support all portions of this. For example, an implementation might defer all UEFI image or none.
Table 32-5 Authorization process flow

1. Reset

2. KEY STORE INITIALIZED

3. UEFI APPLICATION VALIDATED?
   - Yes: Go to NEXT APPLICATION
   - No: 7. GO TO NEXT BOOT OPTION

4. START UEFI APPLICATION

5. UEFI APPLICATION APPROVED?
   - Yes: Go to NEXT APPLICATION
   - No: Deferral

6. UEFI APP SIGNATURE ADDED TO DATABASE

7. GO TO NEXT APPLICATION

8. UEFI APPLICATION HASH PASSED IN SYSTEM CONFIGURATION TABLE

9. OS APP VALIDATES UEFI APPLICATION
   - Yes: 10. UEFI APP SIGNATURE DATABASE UPDATED
   - No: End

10. UEFI APP SIGNATURE DATABASE UPDATED

11. End
1. Reset. This is when the platform begins initialization during boot.
2. Key Store Initialization. During the firmware initialization and before any signed UEFI images are initialized, the platform firmware must validate the signature database.
3. UEFI Image Validation Succeeded? During initialization of an UEFI image, the UEFI Boot Manager decides whether or not the UEFI image should be initialized. By comparing the calculated UEFI image signature against that in one of the signature databases, the firmware can determine if there is a match.

The security database $\text{db}$ must either contain an entry with a hash value of the image (with a supported hash type), or it must contain an entry with a certificate against which an entry in the image’s certificate table can be verified. In either case verification must not succeed if the security database $\text{dbx}$ contains any record with:

A. Any entry with $\text{SignatureListType}$ of $\text{EFI\_CERT\_SHA256\_GUID}$ with any $\text{SignatureData}$ containing the SHA-256 hash of the binary.

B. Any entry with $\text{SignatureListType}$ of $\text{EFI\_CERT\_X509\_SHA256}$, $\text{EFI\_CERT\_X509\_SHA384}$, or $\text{EFI\_CERT\_X509\_SHA512}$, with any $\text{SignatureData}$ which reflects the To-Be-Signed hash included in any certificate in the signing chain of the signature being verified.

C. Any entry with $\text{SignatureListType}$ of $\text{EFI\_CERT\_X509\_GUID}$, with $\text{SignatureData}$ which contains a certificate with the same Issuer, Serial Number, and To-Be-Signed hash included in any certificate in the signing chain of the signature being verified.

Multiple signatures are allowed to exist in the binary’s certificate table (as per PE/COFF Section “Attribute Certificate Table”). Only one hash or signature is required to be present in $\text{db}$ in order to pass validation, so long as neither the SHA-256 hash of the binary nor any present signature is reflected in $\text{dbx}$.

Then, based on this match or its own policy, the firmware can decide whether or not to launch the UEFI image.
4. Start UEFI Image. If the UEFI Image is approved, then it is launched normally.
5. UEFI Image Not Approved. If the UEFI image was not approved the platform firmware may use other methods to discover if the UEFI image is authorized, such as consult a disk-based catalog or ask an authorized user. The result can be one of three responses: Yes, No or Defer.
6. UEFI Image Signature Added To Signature Database. If the user approves of the UEFI image, then the UEFI image’s signature is saved in the firmware’s signature database. If user approval is supported, then the firmware be able to update of the Signature Database. For more information, see Signature Database Update.
7. Go To Next Boot Option. If an UEFI image is rejected, then the next boot option is selected normally and go to step 3. This is in the case where the image is listed as a boot option.
8. UEFI Image Signature Passed In System Configuration Table. If user defers, then the UEFI image signature is copied into the Image Execution Information Table in the EFI System Configuration Table which is available to the operating system.
9. OS Application Validates UEFI Image. An OS application determines whether the image is valid.
10. UEFI Image Signature Added To Signature Database. For more information, see Signature Database Update.
11. End.
32.6 Code Definitions

32.6.1 UEFI Image Variable GUID & Variable Name

Summary
Constants used for UEFI signature database variable access.

Prototype

```c
#define EFI_IMAGE_SECURITY_DATABASE_GUID \
 { 0xd719b2cb, 0x3d3a, 0x4596, \
 { 0xa3, 0xbc, 0xda, 0xd0, 0x0e, 0x67, 0x65, 0x6f }}
#define EFI_IMAGE_SECURITY_DATABASE L"db"
#define EFI_IMAGE_SECURITY_DATABASE1 L"dbx"
#define EFI_IMAGE_SECURITY_DATABASE2 L"dbt"
#define EFI_IMAGE_SECURITY_DATABASE3 L"dbr"
```

Description

- This GUID and name are used when calling the EFI Runtime Services `GetVariable()` and `SetVariable()`.
- The `EFI_IMAGE_SECURITY_DATABASE_GUID` and `EFI_IMAGE_SECURITY_DATABASE` are used to retrieve and change the authorized signature database.
- The `EFI_IMAGE_SECURITY_DATABASE_GUID` and `EFI_IMAGE_SECURITY_DATABASE1` are used to retrieve and change the forbidden signature database.
- The `EFI_IMAGE_SECURITY_DATABASE_GUID` and `EFI_IMAGE_SECURITY_DATABASE2` are used to retrieve and change the authorized timestamp signature database.
- The `EFI_IMAGE_SECURITY_DATABASE_GUID` and `EFI_IMAGE_SECURITY_DATABASE3` are used to retrieve and change the authorized recovery signature database.
- Firmware shall support the `EFI_VARIABLE_APPEND_WRITE` flag (see Section 8.1.1) for the UEFI signature database variables.
- The signature database variables db, dbt, dbx, and dbr must be stored in tamper-resistant non-volatile storage.
33 - Human Interface Infrastructure Overview

This section defines the core code and services that are required for an implementation of the Human Interface Infrastructure (HII). This specification does the following:

- Describes the basic mechanisms to manage user input
- Provides code definitions for the HII-related protocols, functions, and type definitions that are architecturally required by the UEFI Specification

33.1 Goals

This chapter describes the mechanisms by which UEFI-compliant systems manage user input. The major areas described include the following:

- String and font management.
- User input abstractions (for keyboards and mice)
- Internal representations of the forms (in the HTML sense) that are used for running a preboot setup.
- External representations (and derivations) of the forms that are used to pass configuration information to runtime applications, and the mechanisms to allow the results of those applications to be driven back into the firmware.

General goals include:

- Simplified localization, the process by which the interface is adapted to a particular language.
- A "forms" representation mechanism that is rich enough to support the complex configuration issues encountered by platform developers, including stock keeping unit (SKU) management and interrelationships between questions in the forms.
- Definition of a mechanism to allow most or all the configuration of the system to be performed during boot, at runtime, and remotely. Where possible, the forms describing the configuration should be expressed using existing standards such as XML.
- Ability for the different drivers (including those from add-in cards) and applications to contribute forms, strings, and fonts in a uniform manner while still allowing innovation in the look and feel for Setup.

Support user-interface on a wide range of display devices:

- Local text display
- Local graphics display
- Remote text display
- Remote graphics display
- Web browser
- OS-present GUI

Support automated configuration without a display.
33.2 Design Discussion

This section describes the basic concepts behind the Human Interface Infrastructure. This is a set of protocols that allow a UEFI driver to provide the ability to register user interface and configuration content with the platform firmware. Unlike legacy option ROMs, the configuration of drivers and controllers is delayed until a platform management utility chooses to use the services of these protocols. UEFI drivers are not allowed to perform setup-like operations outside the context of these protocols. This means that a driver is not allowed to interact with the user outside the context of this protocol.

The following example shows a basic platform configuration or “setup” model. The drivers and applications install elements (such as fonts, strings, images and forms) into the HII Database, which acts as a central repository for the entire platform. The Forms Browser uses these elements to render the user interface on the display devices and receive information from the user via HID devices. When complete, the changes made by the user in the Forms Browser are saved, either to the UEFI global variable storage—(GetVariable() and SetVariable())—or to variable storage provided by the individual drivers.

---

**Figure 33-1 Platform Configuration Overview**

33.2.1 Drivers And Applications

The user interface elements in the form of package lists are carried by the drivers and applications. Drivers and applications can create the package lists dynamically, or they can be pre-built and carried as resources in the driver/application image.

If they are stored as resources, then an editor can be used to modify the user interface elements without recompiling. For example, display elements can be modified or deleted, new languages added, and default values modified.
The means by which the string, font, image and form resources are created is beyond the scope of this specification. The following diagram shows a few possible implementations. In both cases, the GUI design is an optional element and the user-interface elements are stored within a text-based resource file. Eventually, this source file is converted into a RES file (PE/COFF Resource Section) which can be linked with the main application.
Figure 33-3 Creating UI Resources With Resource Files
33.2.1.1 Platform and Driver Configuration

The intent is for this specification to enable the configuration of various target components in the system. The normally arduous task of managing user interface and configuration can be greatly simplified for the consumers of such functionality by enabling the platform to comprehend some standard user interactions.
33.2.1.2 Pre-O/S applications

There are various scenarios where a platform component must interact in some fashion with the user. Examples of this are when presenting a user with several choices of information (e.g. boot menu) and sending information to the display (e.g. system status, logo, etc.).
33.2.1.3 Description of User Interface Components

Various components listed in this specification are described in greater detail in their own sections. The user interface is composed of several distinct components illustrated below.

![User Interface Components Diagram](image)

**Figure 33-7 User Interface Components**

33.2.1.4 Forms

This component describes what type of content needs to be displayed to the user by means of a binary encoding (i.e., Internal Forms Representation) and also has added context information such as how to validate certain input and further describes where to store such input if it is intended to be non-volatile. Applications such as a browser or script engine may use the information with the forms to validate configuration setting values with or without a user interface.

33.2.1.5 Strings

The strings are the text-based (UCS-2 encoded) representations of the information typically being referenced by the forms. The intent of this infrastructure is also to seamlessly enable multiple language support. To that end the strings have the appropriate language designators to differentiate one language from another.

33.2.1.6 Images/Fonts

Since most content is typically intended to have the ability to be rendered on the local system, the human interface infrastructure also supports the ability for images and fonts to be accepted and used by the underlying user interface components.

33.2.1.7 Consumers of the user interface data

The ultimate consumer of the user interface information will be some type of forms browser or forms processor. There are several usage scenarios which should be supported by this specification. These are illustrated below:
33.2.1.8 Connected forms browser/processor

The ability to have the forms processing engine render content when directly connected to the target platform should be apparent. From the forms processing engine perspective, this could be the local machine or a machine that is network attached. In either case, there is a constructed agent which feeds the material to the forms processor for purposes of rendering the user interface and interacting with the user. Note that a forms processor could simply act on the forms data without ever having to render the user interface and interact with the user. This situation is much more akin to script processing and should be a very supportable situation.

---

33.2.1.9 Disconnected Forms Browser/Processor

By enabling the ability to import and export a platform’s settings, this infrastructure can also enable the ability for offline configuration. In this instance, a forms processor can interpret a given platform’s form data and enable (either through user interaction or through automated scripting) the changing of configuration settings. These settings can then be applied to the target platform when a connection is established.
33.2.1.10 O/S-Present Forms Browser/Processor
When it is desired that the forms data be used in the presence of an O/S, this specification describes a means by which to support this capability. By being able to encapsulate the data and export it through standard means such that an O/S agent (e.g. forms browser/processor) can retrieve it, O/S-present usage models can be made available for further value-add implementations.

Figure 33-10 O/S-Present Forms Browser/Processor

33.2.1.11 Where are the Results Stored
The forms data encodes how to store the changes per configuration question. The ability to save data to the platform as well as to a proprietary on-board store is provided. The premise is that each of the target non-volatile store components (e.g. motherboard, add-in device, etc.) would advertise an interface as described in this specification so that the forms browser/processor can route changes to the appropriate target.
33.2.2 Localization

Localization is the process by which the interface is adapted to a particular language. The table below discusses issues with localization and provides possible solutions.

Table 33-1 Localization Issues

<table>
<thead>
<tr>
<th>Issue</th>
<th>Example</th>
<th>Solution</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Directional display</td>
<td>Right to left printing for Hebrew.</td>
<td>Printing direction is a function of the language.</td>
<td>The display engine may or may not support all display techniques. If a language supports a display mechanism that the display engine does not, the language that uses the font must be selected.</td>
</tr>
<tr>
<td>Punctuation</td>
<td>Punctuation is directional. A comma in a right-to-left language is different from a comma in a left-to-right language.</td>
<td>Character choice is the choice of the author or translator.</td>
<td></td>
</tr>
<tr>
<td>Line breakage</td>
<td>Rules vary from language to language.</td>
<td>The UEFI preboot GUI performs little or no formatting.</td>
<td>The runtime display depends on the runtime browser and is not defined here.</td>
</tr>
</tbody>
</table>
33.2.3 User Input

To limit the number of required glyphs, we must also limit the amount and type of user input.

User input generally comes from the following main types of devices:

- Keyboards
- Mouse-like pointing devices

Input from other devices, such as limited keys on a front panel, can be handled two ways:

- Treat the limited keys as special-purpose devices with completely unique interfaces.
- Programmatically make the limited keys mimic a keyboard or mouse-like pointing device.

Pointing devices require no localization. They are universally understood by the subset of the world population addressed in this specification. For example, if a person does not know how to use a mouse or other pointing device, it is probably not a good idea to allow that person to change a system’s configuration.

On the other hand, keyboards are localized at the keycaps but not in the electronics. In other words, a French keyboard and a German keyboard might have very different keys but the software inside the keyboard—let alone the software in the system at the other end of the wire—cannot know which set of keycaps are installed.

This specification proposes to solve this issue by using the keys that are common between keyboards and ignoring language-specific keys. Keys that are available on USB keyboards in preboot mode include the following:

- Function keys (F1 – F12)
- Number keys (0-9)
- "Upside down T" cursor keys (the arrows, home, end, page up, page down)
- Numeric keypad keys
- The Enter, Space, Tab, and Esc keys
- Modifier keys (shifts, alts, controls, Windows*)

<table>
<thead>
<tr>
<th>Issue</th>
<th>Example</th>
<th>Solution</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date and time</td>
<td>Most Europeans would write July 4, 1776, as 4/7/1776 while the United States would write it 7/4/1776 and others would write 1776/7/4. The separator characters between the parts of both date and time vary as well.</td>
<td>Generally left to the creator of the user interface.</td>
<td></td>
</tr>
<tr>
<td>Numbers</td>
<td>12,345.67 in one language is presented as 12.345,67 in another.</td>
<td>Print only integers and do not insert separator characters.</td>
<td>This solution is gaining acceptance around the world as more people use computers.</td>
</tr>
</tbody>
</table>
Number lock

The scan codes for these keys do not vary from language to language. These keys are the standard keys used for browser navigation although most end-users are unaware of this fact. Help for form-entry-specific keys must be provided to enable a useful keys-only interface. The one case where other, language-specific keys may be used is to enter passwords. Because passwords are never displayed, there is no requirement to translate scan code to Unicode character codes (keyboard localization) or scan codes to font glyphs.

Additional data can be provided to enable a richer set of input characters. This input is necessary to support features such as arbitrary text input and passwords.

33.2.4 Keyboard Layout

33.2.4.1 Keyboard Mapping

UEFI’s keyboard mapping loosely based definitions on ISO 9995. It bases the naming mechanism on the figure below. The keys highlighted in brown are the keys that nearly all keyboard layouts use for customizations. However, customization does not necessarily mean that all the keys are different. In fact, most of the keys are likely to be the same. When modifying the mapping, one can normally reference the keys in brown as the likely candidates (for whom to create modifications).

![Figure 33-12 Keyboard Layout](image)

Instead of referencing keys in hardware-specific ways such as scan codes, the HII specification defines an `EFI_KEY` enumeration that allows for a simple method of referencing this hardware abstraction. Type `EFI_KEY` is defined in `EFI_HII_DATABASE_PROTOCOL.GetKeyboardLayout()`. It also provides a way to update the keyboard layout with a great deal of flexibility. Any of the keys can be mapped to any 16-bit Unicode character code or control code value.

When defining the values for a particular key, there are six elements that are pertinent to the key:

- **Key name**
  - The `EFI_KEY` enumeration defines the names of the above keys.

- **Unicode Character Code**
  - Defines the Unicode Character Code (if any) of the named key.

- **Shifted Unicode Character Code**
  - Defines the Unicode Character Code (if any) of the named key while the shift modifier key is being pressed.
Alt-GR Unicode Character Code
Defines the Unicode Character Code (if any) of the named key while the Alt-GR modifier key (if any) is being pressed.

Shifted Alt-GR Unicode Character Code
Defines the Unicode Character Code (if any) of the named key while the Shift and Alt-GR modifier key (if any) is being pressed.

Modifier key value
Defines the nonprintable special function that this key has assigned to it.
- Under normal circumstances, a key that has any Unicode character code definitions generally has a modifier key value of EFI_NULL_MODIFIER. This value means the key has no special function other than the printing of a character. An exception to the rule is if any of the Unicode character codes have a value of 0xFFFF. Although rarely used, this value is the one case in which a key might have both a printable character and an active control key value.

An example of this exception would be the numeric keypad’s insert key. The definition for this key on a standard US keyboard is as follows:

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>EfiKeyZero</td>
<td></td>
</tr>
<tr>
<td>Unicode</td>
<td>0x0030 (basically ‘0’)</td>
</tr>
<tr>
<td>ShiftedUnicode</td>
<td>0xFFF (the exception to the rule)</td>
</tr>
<tr>
<td>AltGrUnicode</td>
<td>0x0000</td>
</tr>
<tr>
<td>ShiftedAltGrUnicode</td>
<td>0x0000</td>
</tr>
<tr>
<td>Modifier</td>
<td>EFI_INSERT_MODIFIER</td>
</tr>
</tbody>
</table>

This key is one of the few keys that, under normal circumstances, prints something out but also has a special function. These special functions are generally limited to the numeric keypad; however, this general limitation does not prevent someone from having the flexibility of defining these types of variations.

33.2.4.2 Modifier Keys
The definitions of the modifier keys allow for special functionality that is not necessarily accomplished by a printable character. Many of these modifier keys are flags to toggle certain state bits on and off inside of a keyboard driver. An example is EFI_CAPS_LOCK_MODIFIER. This state being active could alter what the typing of a particular key produces. Other control keys, such as EFI_LEFT_ARROW_MODIFIER and EFI_END_MODIFIER, affect the position of the cursor. One modifier key is likely unfamiliar to most people who exclusively use US keyboards, and that key is the EFI_ALT_GR_MODIFIER key. This key’s primary purpose is to activate a secondary type of shift modifier that exposes additional printable characters on certain keys. In some keyboard layouts, this key does not exist and is normally the EFI_RIGHT_ALT_MODIFIER key. None of the other modifier key functions should be a mystery to someone familiar with the usage of a standard computer keyboard.

An example of a few descriptor entries would be as follows:
Layout = {
    EfiKeyLCtrl, 0, 0, 0, 0, EFI_LEFT_CONTROL_MODIFIER, // Left control
    // key
    EfiKeyA0, 0, 0, 0, 0, EFI_NULL_MODIFIER,      // Not defined
    // Windows key
    EfiKeySpaceBar, 0x0020, 0x0020, 0x0020, 0x0020, EFI_NULL_MODIFIER
    // (Space Bar)
}

See "Related Definitions" in EFI_HII_DATABASE_PROTOCOL.GetKeyboardLayout() for the defined modifier values.

### 33.2.4.3 Non-spacing Keys

Non-spacing keys are a concept that provides the ability to OR together an accent key and another printable character. Non-spacing keys are defined as special types of modifier characters. They are typically accent keys that do not advance the cursor and in essence are a type of modifier key in that they maintain some level of state.

The way a person uses a non-spacing key is that the non-spacing key that maybe has the function of overlaying an umlaut (two dots) onto whatever the next character might be. The user presses the umlaut non-spacing key and follows it with a capital A, which yields an "Ä."

An example of a few descriptor entries would be as follows:

```c
    // If it's a dead key, we need to pass a list of physical key
    // names, each with a unicode, shifted, altgr, shiftedaltgr
    // character code. Each key name will have a Modifier value of
    // EFI_NS_KEY_MODIFIER for the first entry, and then the list of
    // EFI_NS_KEY_DEPENDENCY_MODIFIER physical key descriptions.
    // This eventually will lead to the next normal non-modifier key
    // definition.
    //
    // This requires defining an additional Modifier value of
    // EFI_NS_KEY_DEPENDENCY_MODIFIER to signify
    // EFI_NS_KEY_MODIFIER children definitions.
    //
    // The keyboard driver (consumer of the layouts) will know that
    // any key definitions with the EFI_NS_KEY_DEPENDENCY_MODIFIER
    // modifier do not redefine the value of the specified EFI_KEY.
    // They are simply used as a special case augmentation to the
    // original EFI_NS_KEY_MODIFIER.
    //
    // It is an error condition to define a
    // EFI_NS_KEY_MODIFIER without having all the
    // EFI_NS_KEY_DEPENDENCY_MODIFIER keys defined serially.
    //
    Layout = {
        EfiKeyE0, 0, 0, 0, 0, EFI_NS_KEY_MODIFIER,
```
In the above example, a key located at E0 is designated as a dead key. Using a common German keyboard layout as the example, a circumflex accent "^" is defined as a dead key at the E0 location. The A, E, I, O, and U characters are valid keys that can be pressed after the dead key and will produce a valid printable character. These characters are located at C1, D3, D8, D9, and D7 respectively.

The results of the Layout definition provided above would allow for the production of the following characters: âˆšå™©ëŒšø–º.

### 33.2.5 Forms

This specification describes how a UEFI driver or application may present a forms (or dialogs) based interface. The forms-based interface assumes that each window or screen consists of some window dressing (title & buttons) and a list of questions. These questions represent individual configuration settings for the application or driver, although several GUI controls may be used for one question.

---

**Figure 33-13 Forms-based Interface Example**

The forms are stored in the HII database, along with the strings, fonts and images. The various attributes of the forms and questions are encoded in IFR (Internal Forms Representation)—with each object and attribute a byte stream.

Other applications (so-called “Forms Processors”) may use the information within the forms to validate configuration setting values without a user interface at all.

The Forms Browser provides a forms-based user interface which understands how to read the contents of the forms, interact with the user, and save the resulting values. The Forms Browser uses forms data installed by an application or driver during initialization in the HII database. The Forms Browser organizes the forms so that a user may navigate between the forms, select the individual questions and change the values using the HID and display devices. When the user has finished making modifications, the Forms...
Browser saves the values, either to the global EFI variable store or else to a private variable store provided by the driver or application.

---

**Figure 33-14 Platform Configuration Overview**

### 33.2.5.1 Form Sets

*Form sets* are logically-related groups of forms.

**Attributes**

Each forms set has the following attributes:

**Form Set Identifier**

Uniquely identifies the form set within a package list using a GUID. The Form Set Identifier, along with a device path, uniquely identifies a form set in a system.

**Form Set Class Identifier**

Optional array of up to three GUIDs which identify how the form set should be used or classified. The list of standard form set classes is found in the "Related Definitions" section of **EFI_FORM_BROWSER2_PROTOCOL.SendForm()**.

**Title**

Title text for the form set.

**Help**

Help text for the form set.
Image
Optional title image for the form set.

Animation
Optional title animation for the form set

Description
Within a form set, there is one parent form and zero or more child forms. The parent form is the first enabled, visible form in the form set. The child forms are the second or later enabled, visible forms in the form set. In general, the Forms Browser will provide a means to navigate to the parent form. A cross-reference (see Section 33.2.5.4.10) is used to navigate between forms within a form set or between forms in different form sets.

Variable stores are declared within a form set. Variable stores describe the means for retrieval and storage of configuration settings, and location information within that variable store. For more information, see Section 33.2.5.6.

Default stores are declared within a form set. Default stores group together different types of default settings (normal, manufacturing, etc.) and give them a name. See Section 33.2.5.8 for more information.

The form set can control whether or not to process an individual form by nesting it inside of an EFI_IFR_DISABLE_IF expression. See Section 33.2.5.2.1 for more information. The form set can control whether or not to display an individual form by nesting it inside of an EFI_IFR_SUPPRESS_IF expression.

Syntax
The form set consists of an EFI_IFR_FORM_SET object, where the body consists of

```
form-set := EFI_IFR_FORM_SET form-set-list
```

33.2.5.2 Forms
Forms are logically-related groups of statements (including questions) designed to be displayed together.
Attributes
Each form has the following attributes:

Form Identifier
A 16-bit unsigned integer, which uniquely identifies the form within the form set.
The Form Identifier, along with the device path and Form Set Identifier, uniquely
identifies a form within a system.

Title
Title text for the form. The Forms Browser may use this text to describe the nature
and purpose of the form in a window title.

Image
Optional title image for the form. The Forms Browser may use this image to display
the nature and purpose of the form in a window title.

Animation
Optional title animation for the form set.

Modal
If a form is modal, then the on-form interaction must be completed prior to
navigating to another form. See "User Interaction", Section 33.2.10.1.

The form can control whether or not to process a statement by nesting it inside of an
EFI_IFR_DISABLE_IF expression. See Section 33.2.5.3.2 for more information.

The form can control whether a particular statement is selectable by nesting it inside of an
EFI_IFR_GRAY_OUT_IF expression. Statements that cannot be selected are displayed by Form
Browsers, but cannot be selected by a user. EFI_IFR_GRAY_OUT_IF causes statements to be displayed
with some visual indication. See Section 33.2.5.3.4 for more information.

The form can control whether to display a statement by nesting it inside of an EFI_IFR_SUPPRESS_IF
expression. See Section 33.3.8.3.75 for more information.

Syntax
The form consists of an EFI_IFR_FORM object, where the body consists of:

form:=EFI_IFR_FORM form-tag-list |
EFI_IFR_FORM_MAP form-tag-list
form-tag-list:=form-tag form-tag-list |
<empty>
form-tag:=EFI_IFR_IMAGE |
EFI_IFR_ANIMATION |
EFI_IFR_LOCKED |
EFI_IFR_RULE |
 EFI_IFR_MODAL_TAG | 
statement | 
question | 
cond-statement-list | 
<empty>

statement-list:= statement statement-list | 
question statement-list | 
cond-statement-list | 
<empty>

cond-statement-list:= EFI_IFR_DISABLE_IF expression statement-list | 
EFI_IFR_SUPPRESS_IF expression statement-list | 
EFI_IFR_GRAY_OUT_IF expression statement-list | 
question-list := question question-list | 
<empty>

Other unknown opcodes are permitted, but will be ignored.

33.2.5.2.1 Enable/Disable
Disabled forms will not be processed at all by a Forms Processor. Forms are enabled unless:

- The form nests inside an EFI_IFR_DISABLE_IF expression which evaluated to false.
- The disabling of forms is evaluated during Forms Processor initialization and is not re-evaluated.

33.2.5.2.2 Modifiability
Forms can be locked so that a Forms Editor will not change it. Forms are unlocked unless:

- The form has an EFI_IFR_LOCKED in its scope.

The locking of statement is evaluated only during Forms Editor initialization.

33.2.5.2.3 Visibility
Suppressed forms will not be displayed. Forms are visible unless:

- The form is disabled (see Section 33.2.5.4)
- The form is nested inside an EFI_IFR_SUPPRESS_IF expression which evaluates to false.
33.2.5.3 Statements

All displayable items within the body of a form are statements. Statements provide information or capabilities to the user. Questions (see Section 33.2.5.4) are a specialized form of statement with a value. Statements are used only by Forms Browsers and are ignored by other Forms Processors.

Attributes

Statements have the following attributes:

- **Prompt**
  The text that will be displayed with the statement.

- **Help**
  The extended descriptive text that can be displayed with the statement.

- **Image**
  The optional image that will be displayed with the statement.

- **Animation**
  The optional animation that will be displayed with the statement.

Other than Questions, there are three types of statements:

- Static Text/Image
- Subtitle
- Cross-Reference

Syntax

```
statement ::= subtitle | static-text | reset button
statement-tag-list ::= statement-tag statement-tag-list | <empty>
statement-tag ::= EFI_IFR_IMAGE | EFI_IFR_LOCKED | EFI_IFR_ANIMATION
```

33.2.5.3.1 Display

Statement display depends on the Forms Browser. Statements do not describe how the statement must be displayed but rather provide resources (such as text and images) for use by the Forms Browser. The Forms Browser uses this information to create the necessary user interface.

The Forms Browser may use the visibility (see Section 33.2.5.3) or selectability (see Section 33.2.5.4) of the statements to change the way the item is displayed. The `EFI_IFR_GRAY_OUT_IF` expression explicitly requires that nested statements have visual differentiation from normal statements.
### 33.2.5.3.2 Enable/Disable

Statements which have been disabled will not be processed at all by a Forms Processor. Statements are enabled unless:

- The parent statement or question is disabled.
- The statement is nested inside an `EFI_IFR_DISABLE_IF` expression which evaluated to false.
- The disabling of statements is evaluated during Forms Browser initialization and is not re- evaluated.

### 33.2.5.3.3 Visibility

Suppressed statements will not be displayed. Statements are displayed unless:

- The parent statement or question is suppressed.
- The statement is disabled (see Section 33.2.5.3.2).
- The statement is nested inside an `EFI_IFR_SUPPRESS_IF` expression which evaluated to false.

The suppression of the statements is evaluated during Forms Browser initialization. Subsequently, the suppression of statements is reevaluated each time a value in any question on the selected form has changed.

### 33.2.5.3.4 Evaluation of Selectable Statements

A user in a Forms Browser can choose statements which are selectable. Statements are selectable unless:

- The parent statement or question is not selectable.
- The statement is suppressed (see Section 33.2.5.3.2).
- The statement is nested inside an `EFI_IFR_GRAY_OUT_IF` expression which evaluated to false.

The evaluation of selectable statements takes place during Forms Browser initialization. Subsequently, selectable statements are reevaluated each time a value in any question on the selected form has changed.

### 33.2.5.3.5 Modifiability

A statement can be locked so that a Forms Editor will not change it. Statements are unlocked unless:

- The parent form or parent statement/question is locked.
- The statement has an `EFI_IFR_LOCKED` in its scope.

The locking of a statement is evaluated only during Forms Editor initialization.

### 33.2.5.3.6 Static Text/Image

The Forms Browser displays the specified prompt, the specified text and (optionally) the image, but has no user interaction.

**Syntax**

```
static-text:= EFI_IFR_TEXT  statement-tag-list
```
33.2.5.3.7 Subtitle
The subtitle is a means of visually grouping questions by providing a separator, some optional separating text, and an optional image.

Syntax
subtitle := EFI_IFR_SUBTITLE statement-tag-list

33.2.5.3.8 Reset Button
Attributes
Reset Buttons have the following attributes:

  Default Id
  Specifies the default set to use when restoring defaults to the current form.

Syntax
reset button := EFI_IFR_RESET_BUTTON statement-tag-list

33.2.5.4 Questions
Questions are statements which have a value. The value corresponds to a configuration setting for the platform or for a device. The question uniquely identifies the configuration setting, describes the possible values, the way the value is stored, and how the question should be displayed.

Attributes
Questions have the following attributes (in addition to those of statements):

  Question Identifier
  A 16-bit unsigned integer which uniquely identifies the question within the form set in which it appears. The Question Identifier, along with the device path and Form Set Identifier, uniquely identifies a question within a system.

  Default Value
  The value used when the user requests that defaults be loaded.

  Manufacturing Value
  The value used when the user requests that manufacturing defaults are loaded.

  Value
  Each question has a current value. See Section 33.2.5.4.1 for more information.

  Value Format
  The format used to store a question’s value.

  Value Storage
  The means by which values are stored. See Section 33.2.5.4.2 for more information.
Refresh Identifiers

Zero or more GUIDs associated with an event group initialized by the Forms Browser when the form set containing the question is opened. If the event group associated with the GUID is signaled (see `SignalEvent()`), then the question value will be updated from storage.

Refresh Interval

The minimum number of seconds that must pass before the Forms Browser will automatically update the current question value from storage. The default value is zero, indicating there will be no automatic refresh.

Validation

New values assigned to questions can be validated, using validation expressions, or, if connected, using a callback. See Section 33.2.5.9 for more information.

Callback

If set, the callback will be called when the question’s value is changed. In some cases, the presence of these callbacks prevents the question’s value from being edited while disconnected.

The question can control whether a particular option can be displayed by nesting it inside of an `EFI_IFR_SUPPRESS_IF` expression. Form Browsers do not display Suppressed Options, but Suppressed Options may still be examined by Form Processors.

Syntax

```
question ::= action-button | boolean | date | number | ordered-list | string | time |
<empty>
question-tag ::= statement-tag |
EFI_IFR_INCONSISTENT_IF expression |
EFI_IFR_NO_SUBMIT_IF   expression |
EFI_IFR_WARNING_IF     expression |
EFI_IFR_DISABLE_IF     expression question-list |
EFI_IFR_REFRESH_ID    RefreshEventGroupId |
EFI_IFR_REFRESH       |
EFI_IFR_VARSTORE_DEVICE

question-option-tag ::= EFI_IFR_SUPPRESS_IF   expression |
EFI_IFR_VALUE         optional-expression |
```
33.2.5.4.1 Values

Question values are a data type listed in Section 33.2.5.7.4. During initialization of the Forms Processor or Forms Browser, the values of all enabled questions are retrieved. If the value cannot be retrieved, then the question’s value is **Undefined**.

A question with the value of type **Undefined** will be suppressed. This suppression will be reevaluated based on Value Refresh or when any question value on the selected form is changed.

When the form is submitted, the modified values are written to Value Storage. When the form is reset, the question value is set to the default question value. If there is no default question value, the question value is unchanged.

When a question value is retrieved, the following process is used:

1. Set the *this* internal constant to have the same value as the one read from the question’s storage.
2. If present, change the current question value to the value returned by a question’s nested **EFI_IFR_READ** operator.
When a question value is changed, the following process is used:

1. Set the `this` internal constant to have the same value as the current question value.
2. If present, evaluate the question’s nested `EFI_IFR_WRITE` (Section 33.3.8.3.94) operator.
3. Write the value to the question’s storage.
33.2.5.4.2 Storage Requirements

Question storage requirements describe the type and size of storage for the value. These storage requirements describe whether the question’s value will be stored as an EFI global variable or using driver local storage. It also describes whether the value is packed together with other values in a buffer, or passed as a name-value pair. See Section 33.2.5.6 for more information.

33.2.5.4.3 Display

Question display depends on the Forms Browser. Questions do not describe how the question must be displayed. Instead, questions provide resources (such as text and images) and information about visibility and the ability to edit the question. The Forms Browser uses these to create the necessary user interface.

Questions can have prompt text, help text and (optionally) an image. The prompt text usually describes the nature of the question. Help text is displayed either in a special display area or only at the request of the user. Questions can also have hints which describe how to visually organize the information.

33.2.5.4.4 Action Button

Action buttons are buttons which cause a pre-defined configuration string to process immediately. There is no storage directly associated with the button.
**Attributes**
Action buttons have no additional attributes other than the common question attributes).

**Storage**
There is no storage associated with the action button.

**Results**
There are no results associated with the action button. If used in an expression, the question value will always be **Undefined**.

**Syntax**

```plaintext
action-button:= EFI_IFR_ACTION question-tag-list
```

### 33.2.5.4.5 Boolean

Boolean questions are those that allow a choice between true and false. The question’s value is Boolean. In general, construct questions so that the prompt text asks questions resulting in ‘yes/enabled/on’ is ‘true’ and ‘no/disabled/off’ is ‘false’.

Boolean questions may be displayed as a check box, two radio buttons, a selection list, a list box, or a drop list box.

**Attributes**
Boolean questions have no additional attributes other than the common question attributes:

**Storage**
If the boolean question uses Buffer storage or EFI Variable (see Section 33.2.5.6), then the size is exactly one byte, with the FALSE condition is zero and the TRUE value is 1.

**Results**
The results are represented as either 0 (**FALSE**) or 1 (**TRUE**).

**Syntax**

```plaintext
boolean:= EFI_IFR_CHECKBOX question-option-list
```

### 33.2.5.4.6 Date

Date questions allow modification of part or all of a standard calendar date. The format of the date display depends on the Forms Browser and any localization.

**Attributes**
Date questions have the following attributes:

**Year Suppressed**
The year will not be displayed or updated.

**Month Suppressed**
The month will not be displayed or updated.
**Day Suppressed**

The day will not be displayed or updated.

**UEFI Storage**

In addition to normal question Value Storage, Date questions can optionally be instructed to save the date to either the system time or system wake-up time using the UEFI runtime services `SetTime()` or `SetWakeupTime()`. In this case, the date and time will be read first, the modifications made and changes will be written back.

Conversion to and from strings to a date depends on the system localization.

The date value is stored an `EFI_HII_TIME` structure. The TimeZone field is always set to `EFI_UNSPECIFIED_TIMEZONE`. The Daylight field is always set to zero. The contents of the other fields are undetermined.

**Storage**

If the date question uses Buffer storage or EFI Variable storage (see Section 33.2.5.6), then the stored result will occupy exactly the size of `EFI_HII_DATE`.

**Results**

Results for date questions are represented as a hex dump of the `EFI_HII_DATE` structure. If used in a question, the value will be a buffer containing the contents of the `EFI_HII_DATE` structure.

**Syntax**

\[ date \ := \ EFI_IFR_DATE \ \ question-option-list \]

**33.2.5.4.7 Number**

Number questions allow modification of an integer value up to 64-bits. Number questions can also specify pre-defined options.

**Attributes**

Number questions have the following attributes:

- **Radix**
  
  Hint describes the output radix of numbers. The possible values are unsigned decimal, signed decimal or hexadecimal. Numbers displayed in hexadecimal will be prefixed by ‘0x’

- **Minimum Value**

  The minimum unsigned value which can be accepted for this question.

- **Maximum Value**:

  The maximum unsigned value which can be accepted for this question.

- **Skip Value**:

  Defines the minimum increment between values.
Storage

If the number question uses Buffer storage or EFI Variable storage (see Section 33.2.5.6), then the buffer size specified by must be 1, 2, 4 or 8. Also, the Forms Processor will do implicit error checking to make sure that the signed or unsigned value can be stored in the Buffer without lost of significant bits. For example, if the buffer size is 1 byte, then the largest unsigned integer value would be 255. Likewise, the largest signed integer value would be 127 and the smallest signed integer value would be -128. The Forms Processor will automatically detect this as an error and generate an appropriate error.

Results

The results are represented as string versions of unsigned hexadecimal values.

Syntax

number := EFI_IFR_NUMERIC question-option-list |
          EFI_IFR_ONE_OF question-option-list

33.2.5.4.8 Set

Sets are questions where \( n \) containers can be filled with any of \( m \) pre-defined choices. This supports both lists where a given value can only appear in one of the slots or where the same choice can appear many times.

Each of the containers takes the form of an option which a name, a value and (optionally) an image.

Attributes

Set questions have the following attributes:

**Container Count**

Specifies the number of available selectable options.

**Unique**

If set, then each choice may be used at most, once.

**NoEmpty**

All slots must be filled with a non-zero value.

**Storage**

The set questions are stored as a Buffer with one byte for each Container.

Results

Each Container value is represented as two characters, one for each nibble. All hexadecimal characters (a-f) are in lower-case.

The results are represented as a series of Container values, starting with the lowest Container.

Syntax

ordered-list := EFI_IFR_ORDERED_LIST question-option-list
Options
Set questions treat the values specified by nested EFI_IFR_ONE_OF_OPTION values as the value for a single Container, not the entire question storage. This is different from other question types.

Defaults
Set questions treat the default values specified by nested EFI_IFR_DEFAULT or EFI_IFR_ONE_OF_OPTION opcodes as the default value for all Containers. The default values must be of type EFI_IFR_TYPE_BUFFER, with each byte in the buffer corresponding to a single Container value, starting with the first container. If the buffer contains fewer bytes than MaxContainers, then the remaining Containers will be set to a value of 0.

Default values returned from the ALTCFG section when ExtractConfig() is called fill the storage starting with the first container.

33.2.5.4.9 String
String questions allow modification of a string.

Attributes
String questions have the following attributes:

Minimum Length
Hint describes the minimum length of the string, in characters.

Maximum Length
Hint describes the maximum length of the string, in characters.

Multi-Line
Hint describes that the string might contain multiple lines.

Output Mask
If set, the text entered will not be displayed.

Storage
The string questions are stored as a NULL-terminated string. If the time question uses Buffer or EFI Variable storage (see Section 33.2.5.6), then the buffer size must exceed the size of the NULL-terminated string. If the string is shorter than the length of the buffer, the remainder of the buffer is filled with NULL characters.

Results
Results for string questions are represented as hex dump of the string, including the terminating NULL character.

Syntax
string := EFI_IFR_STRING question-option-list |
EFI_IFR_PASSWORD question-option-list
33.2.5.4.10 Cross-Reference

Cross-reference questions provide a selectable means by which users navigate to other forms and/or other questions. The form and question can be in the current form set, another form set or even in a form associated with a different device. If the specified form or question does not exist, the button is not selectable, is grayed-out, or is suppressed.

Attributes

Cross references can have the following attributes:

- **Form Identifier**
  - The identifier of the target form.

- **Form Set Identifier**
  - Optionally specifies an alternate form-set which contains the target form. If specified, then the focus will be on form within the form set specified by Form Identifier. If the Form Identifier is not specified, then the first form in the Form Set is used.

- **Question Identifier**
  - Optionally specifies the question identifier of the target question on the target form. If specified then focus will be placed on the question specified by this question identifier. Otherwise, the focus will be on the first question within the specified form.

- **Device Path**
  - Optionally, the device path which contains the Form Identifier. Otherwise, the device path associated with the form set containing this cross-reference will be used.

- **Storage**
  - Storage is optional for a cross-reference question. It is only present when the cross-reference question does not supply any target (i.e., REF5). If the question uses Buffer or EFI Variable storage (see Section 33.2.5.6), then the buffer size must be exactly the size of the **EFI_HII_REF** structure.

- **Results**
  - Results for cross-reference questions are represented as a hex dump of the question identifier, form identifier, form set GUID and null-terminated device path text. If used in a question, the question value will be a buffer containing the **EFI_HII_REF** structure..

**Syntax**

cross-reference := **EFI_IFR_REF**  statement-tag-list

33.2.5.4.11 Time

Time questions allow modification of part or all of a time. The format of the time display depends on the Forms Browser and any localization.
Attributes
Time questions have the following attributes:

**Hour Suppressed**
The hour will not be displayed or updated.

**Minute Suppressed**
The minute will not be displayed or updated.

**Second Suppressed**
The second will not be displayed or updated.

**UEFI Storage**
In addition to normal question Value Storage, time questions can be instructed to save the time to either the system time or system wake-up time using the UEFI runtime services `SetTime` or `SetWakeupTime`. In these instances, the date and time is read first, the modifications made and changes are then written back.

Conversion to and from strings to a time depends on the system localization.

The time value is stored as part of an `EFI_HII_TIME` structure. The contents of the other fields are undetermined.

**Storage**
If the time question uses Buffer or EFI Variable storage (see Section 33.2.5.6), then the buffer size must be exactly the size of the `EFI_HII_TIME` structure.

**Results**
Results for time questions are represented as a hex dump of the `EFI_HII_TIME` structure. If used in a question, the value will be a buffer containing the contents of the `EFI_HII_TIME` structure.

**Syntax**
```
time := EFI_IFR_TIME question-option-list
```

33.2.5.5 Options
Use Options within questions to give text or graphic description of a particular question value. They may also describe the choices in the set data type.

Attributes
Options have the following attributes:

**Text**
The text for the option.

**Image**
The optional image for the option.
Animation
The optional animation for the option.

Value
The value for the option.

Default
If set, this is the option selected when the user asks for the defaults. Only one visible option can have this bit set within a question’s scope.

Manufacturing Default
If set, this is the option selected when manufacturing defaults are set. Only one visible option can have this bit set within a question’s scope.

Syntax
```plaintext
option ::= EFI_IFR_ONE_OF_OPTION option-tag-list
option-tag-list ::= option-tag option-tag-list | <empty>
option-tag ::= EFI_IFR_IMAGE | EFI_IFR_ANIMATION
```

33.2.5.5.1 Visibility
Options which have been suppressed will not be displayed. Options are displayed unless:

- The parent question is suppressed.
- The option is nested inside an EFI_IFR_SUPPRESS_IF expression which evaluated to false.

The suppression of the options is evaluated each time the option is displayed.

33.2.5.6 Storage
Question values are stored in Variable Stores, which are application, platform or device repositories for configuration settings. In many cases, this is non-volatile storage. In other cases, it holds only the current behavior of a driver or application.

Question values are retrieved from the variable store when the form is initialized. They are updated periodically based on question settings and stored back in the variable store when the form is submitted.

It is possible for a question to have no associated Variable Store. This happens when the VarStoreID associated with the question is set to zero and, for Date/Time questions, the UEFI Storage is disabled. For questions with no associated Variable Store, the question must either support the RETRIEVE and CHANGED callback actions (see EFI_HII CONFIG ACCESS PROTOCOL.CallBack()) or contain an embedded READ or WRITE opcode: EFI_IFR_READ_OP and EFI_IFR_WRITE_OP (see Section 33.3.8.3.58 and Section 33.3.8.3.94).

Because the value associated with a question contained in a Variable Store can be shared by multiple questions, the questions must all treat the shared information as compatible data types. There are four types of variable stores:
Buffer Storage
With buffer storage, the application, platform or driver provides the definition of a buffer which contains the values for one or more questions. The size of the entire buffer is defined in the EFI_IFR_VARSTORE definition. Each question defines a field in the buffer by providing an offset within the buffer and the size of the required storage. These variable stores are exposed by the app/driver using the EFI_HII_CONFIG_ACCESS_PROTOCOL, which is installed on the same handle as the package list. Question values are retrieved via EFI_HII_CONFIG_ACCESS_PROTOCOL.ExtractConfig() and updated via EFI_HII_CONFIG_ACCESS_PROTOCOL.RouteConfig(). Rather than access the buffer as a whole, Buffer Storage Variable Stores access each field independently, via a list of one or more (field offset, value) pairs encoded as variable length text strings as defined for the EFI_HII_CONFIG_ACCESS_PROTOCOL.

Name/Value Storage
With name/value storage, the application provides a string which contains the encoded values for a single question. These variable stores are exposed by the app/driver using the EFI_HII_CONFIG_ACCESS_PROTOCOL, which is installed on the same handle as the package list.

EFI Variable Storage
This is a specialized form of Buffer Storage, which uses the EFI runtime services GetVariable() and SetVariable() to access the entire buffer defined for the Variable Store as a single binary object.

EFI Date/Time Storage
For date and time-related questions, the question values can be retrieved using the EFI runtime services GetTime() and GetWakeupTime() and stored using the EFI runtime services SetTime() and SetWakeupTime().

The following table summarizes the types of information needed for each type of storage and where it is retrieved from.

<table>
<thead>
<tr>
<th>Storage Type</th>
<th>Information Type</th>
<th>Where It Comes From</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>Driver Handle</td>
<td>Handle specified with NewPackageList() or derived from EFI_IFR_VARSTORE_DEVICE.DevicePath</td>
</tr>
</tbody>
</table>
### 33.2.5.7 Expressions

This section describes the expressions used in various expressions in IFR. The expressions are encoded using normal IFR opcodes, but in RPN (Reverse Polish Notation) where the operands occur before the operator.

<table>
<thead>
<tr>
<th>Storage Type</th>
<th>Information Type</th>
<th>Where It Comes From</th>
</tr>
</thead>
<tbody>
<tr>
<td>Buffer Storage</td>
<td>Driver Handle</td>
<td>Handle specified with <code>NewPackageList()</code> or derived from <code>EFI_IFR_VARSTORE_DEVICE.DevicePath</code></td>
</tr>
<tr>
<td>Variable ID</td>
<td>Variable store specified by <code>EFI_IFR_QUESTION_HEADER.VarStoreId</code></td>
<td></td>
</tr>
<tr>
<td>Variable Name</td>
<td>Variable store specified by <code>EFI_IFR_QUESTION_HEADER.VarStoreId</code></td>
<td></td>
</tr>
<tr>
<td>Variable Store Offset</td>
<td>Variable store offset specified by <code>EFI_IFR_QUESTION_HEADER.VarOffset</code>.</td>
<td></td>
</tr>
<tr>
<td>Name/Value Storage</td>
<td>Driver Handle</td>
<td>Handle specified with <code>NewPackageList()</code> or derived from <code>EFI_IFR_VARSTORE_DEVICE.DevicePath</code></td>
</tr>
<tr>
<td>Variable ID</td>
<td>Variable store specified by <code>EFI_IFR_QUESTION_HEADER.VarStoreId</code></td>
<td></td>
</tr>
<tr>
<td>Variable Name</td>
<td>Variable name specified by <code>EFI_IFR_QUESTION_HEADER.VarStoreInfo.VarName</code>.</td>
<td></td>
</tr>
<tr>
<td>EFI Variable Storage</td>
<td>Driver Handle</td>
<td>None</td>
</tr>
<tr>
<td>Variable ID</td>
<td>Variable store specified by <code>EFI_IFR_QUESTION_HEADER.VarStoreId</code></td>
<td></td>
</tr>
<tr>
<td>EFI_Variable GUID (for Variable Services)</td>
<td>EFI variable GUID specified by <code>EFI_IFR_VARSTORE_EFI.Guid</code>.</td>
<td></td>
</tr>
<tr>
<td>EFI_Variable Name (for Variable Services)</td>
<td>EFI variable name specified by <code>EFI_IFR_VARSTORE_EFI.Name</code>.</td>
<td></td>
</tr>
<tr>
<td>Variable Name</td>
<td>Variable name specified by <code>EFI_IFR_QUESTION_HEADER.VarStoreId</code>.</td>
<td></td>
</tr>
<tr>
<td>Variable Store Offset</td>
<td>Variable store offset specified by <code>EFI_IFR_QUESTION_HEADER.VarStoreInfo.VarOffset</code>.</td>
<td></td>
</tr>
<tr>
<td>EFI Date/Time Storage</td>
<td>Driver Handle</td>
<td>None</td>
</tr>
<tr>
<td>Variable ID</td>
<td>None</td>
<td></td>
</tr>
<tr>
<td>Variable Name</td>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

---

**Example:**

```
DeviceHandle = NewPackageList()

VarStore = EFI_IFR_VARSTORE_DEVICE.DevicePath

VarID = EFI_IFR_QUESTION_HEADER.VarStoreId

VarName = EFI_IFR_QUESTION_HEADER.VarStoreInfo.VarName
```
The opcodes fall into these categories:

**Unary operators**
- Functions taking a single sub-expression.

**Binary operators.**
- Functions taking two sub-expressions.

**Ternary operators.**
- Functions taking three sub-expressions.

**Built-in functions.**
- Operators taking zero or more sub-expressions.

**Constants.**
- Numeric and string constants.

**Question Values.**
- Specified by their question identifier.

All integer operations are performed at 64-bit precision.

### 33.2.5.7.1 Expression Encoding

Expressions are usually encoded within the scope of another binary object. If the expression consists of more than a single opcode, the first opcode should open a scope (Header.Scope = 1) and use an **EFI_IFR_END** opcode to close the scope in order to make sure they can be skipped.

### 33.2.5.7.2 Expression Stack

When evaluating expressions, the Forms Processor uses a stack to hold intermediate values. Each operator either pushes a value on the stack, pops a value from the stack, or both. For example, the **EFI_IFR_ONE** operator pushes the integer value 1 on the expression stack. The **EFI_IFR_ADD** operator pops two integer values from the expression stack, adds them together, and pushes the result back on the stack.

After evaluating an expression, there should be only one value left on the expression stack.

### 33.2.5.7.3 Rules

Rules are pre-defined expressions attached to the form. These rules may be used in any expression within the form’s scope. Each rule is given a unique identifier (0-255) when it is created by **EFI_IFR_RULE**. This same identifier is used when the rule is referred to in an expression with **EFI_IFR_RULE_REF**.

To save space, rules are intended to allow manual or automatic extraction of common sub-expressions from form expressions.

### 33.2.5.7.4 Data Types

The expressions use five basic data types:

**Boolean**
- True or false.
**Unsigned Integer**

64-bit unsigned integer.

**String**

Null-terminated string.

**Buffer**

Fixed size array of unsigned 8-bit integers.

**Undefined**

Undetermined value. Used when the value cannot be calculated or for run-time errors.

Data conversion is not implicit. Explicit data conversion can be performed using the `EFI_IFR_TO_STRING`, `EFI_IFR_TO_UINT`, and `EFI_IFR_TO_BOOLEAN` operators.

The Date and Time question values are converted to the Buffer data type filled with the `EFI_HII_DATE` and `EFI_HII_TIME` structure contents (respectively).

The Ref question values are converted to the Buffer data type and filled with the `EFI_HII_REF` and structure contents.

**Syntax**

The expressions have the following syntax:

- `expression ::= built-in-function | constant | expression unary-op | expression expression binary-op | expression expression expression ternary-op`

**EFI_IFR_MAP**

- `expression-pair-list ::= expression-pair-list expression expression | <empty>`

- `optional-expression ::= expression | <empty>`

- `built-in-function ::= EFI_IFR_DUP | EFI_IFR_EQ_ID_VAL | EFI_IFR_EQ_ID_ID | EFI_IFR_EQ_ID_VAL_LIST |`
EFI_IFR_GET |
EFI_IFR_QUESTION_REF1 |
EFI_IFR_QUESTION_REF3 |
EFI_IFR_RULE_REF |
EFI_IFR_STRING_REF1 |
EFI_IFR_THIS |
EFI_IFR_SECURITY

constant := EFI_IFR_FALSE |
EFI_IFR_ONE |
EFI_IFR_ONES |
EFI_IFR_TRUE |
EFI_IFR_UINT8 |
EFI_IFR_UINT16 |
EFI_IFR_UINT32 |
EFI_IFR_UINT64 |
EFI_IFR_UNDEFINED |
EFI_IFR_VERSION |
EFI_IFR_ZERO

binary-op := EFI_IFR_ADD |
EFI_IFR_AND |
EFI_IFR_BITWISE_AND |
EFI_IFR_BITWISE_OR |
EFI_IFR_CATEGATE |
EFI_IFR_DIVIDE |
EFI_IFR_EQUAL |
EFI_IFR_GREATER_EQUAL |
EFI_IFR_GREATER_THAN |
EFI_IFR_LESS_EQUAL |
EFI_IFR_LESS_THAN |
EFI_IFR_MATCH |
EFI_IFR_MATCH2 |
33.2.5.8 Defaults

To ensure consistent behavior when a platform attempts to restore settings to defaults, each question op-code must have an active default setting. Defaults are pre-defined question values. The question values may be changed to their defaults either through a Forms Processor-defined means or when the user selects an `EFI_IFR_RESET_BUTTON` statement (see Section 33.2.5.3.8).

Each question may have zero or more default values, with each default value used for different purposes. For example, there might be a "standard" default value, a default value used for manufacturing and a "safe" default value. A group of default values used to configure a platform or device for a specific purpose is called default store.

Default Stores

There are three standard default stores:
Standard Defaults
These are the defaults used to prepare the system/device for normal operation.

Manufacturing Defaults
These are the defaults used to prepare the system/device for manufacturing.

Safe Defaults
These are the defaults used to boot the system in a “safe” or low-risk mode.

Attributes
Default stores have the following attributes:

Name
Each default store has a user-readable name

Identifier
A 16-bit unsigned integer. The values between 0x0000 and 0x3fff are reserved for use by the UEFI specification. The values between 0x4000 and 0x7fff are reserved for platform providers. The values between 0x8000 and 0xbfff are reserved for hardware vendors. The values between 0xc000 and 0xffff are reserved for firmware vendors.

```
#define EFI_HII_DEFAULT_CLASS_STANDARD     0x0000
#define EFI_HII_DEFAULT_CLASS_MANUFACTURING   0x0001
#define EFI_HII_DEFAULT_CLASS_SAFE       0x0002
#define EFI_HII_DEFAULT_CLASS_PLATFORM_BEGIN  0x4000
#define EFI_HII_DEFAULT_CLASS_PLATFORM_END   0x7fff
#define EFI_HII_DEFAULT_CLASS_HARDWARE_BEGIN  0x8000
#define EFI_HII_DEFAULT_CLASS_HARDWARE_END   0xbfff
#define EFI_HII_DEFAULT_CLASS_FIRMWARE_BEGIN  0xc000
#define EFI_HII_DEFAULT_CLASS_FIRMWARE_END   0xffff
```

Users of these ranges are encouraged to use the specification defined ranges for maximum interoperability. Questions or platforms may support defaults for only a sub-set of the possible default stores. Support for default store 0 (“standard”) is recommended.

Defaulting
When retrieving the default values for a question, the Forms Processor uses one of the following (listed from highest priority to lowest priority):

1. The value returned from the `Callback()` member function of the Config Access protocol associated with the question when called with the `Action` set to one of the `EFI_BROWSER_ACTION_DEFAULT_x` values (see Section 35.5). It is recommended that this form only be used for questions where the default value alters dynamically at runtime.

2. The value returned in the `Response` parameter of the `ConfigAccess()` member function (using the ALTCFG form). See Section 35.2.1.

3. The value specified by an `EFI_IFR_DEFAULT` opcodes appear within the scope of a question. (see Section 33.3.8.3.12)
4. One of the Options (see Section 33.2.5.5) has its Standard Default or Manufacturing Default attribute set.

5. For Boolean questions, the Standard Default or Manufacturing Default values in the Flags field. (see Section 33.2.5.4.5).

**Syntax**

```
Default := EFI_IFR_DEFAULT
default-tag := EFI_IFR_VALUE | <empty>
```

### 33.2.5.9 Validation

Validation is the process of determining whether a value can be applied to a configuration setting. Validation takes place at three different points in the editing process: edit-level, question-level and form-level.

#### 33.2.5.9.1 Edit-Level Validation

First, it takes place while the value is being edited with a Forms Browser. The Forms Browser may optionally reject values selected by the user which would fail Question-Level validation. For example, the Forms Browser may limit the length of strings entered so that they meet the Minimum and Maximum Length.

#### 33.2.5.9.2 Question-Level Validation

Second, it takes place when the value has changed, normally when the user attempts to leave the control, navigate between the portions of the control or selects one of the option values. At this point, an error occurs if:

- For a String (see Section 33.2.5.4.9), if the string length is less than the Minimum Length, then the Forms Processor generates an error.
- For a String (see Section 33.2.5.4.9), if the string length is greater than the Maximum Length, then the Forms Processor generates an error.
- For a Number (see Section 33.2.5.4.7), if the number cannot fit in the specified variable storage without loss of significant bits, then the Forms Processor generates an error.
- For all questions, if an `EFI_IFR_INCONSISTENT_IF` evaluates to TRUE, then the Forms Processor will display the specified error text.
- For all questions, if an `EFI_IFR_WARNING_IF` evaluates to TRUE, then the Forms Processor will display the specified warning text.

#### 33.2.5.9.3 Form-Level Validation

Third, it takes place when exiting the form or when the values are submitted. The error occurs under two conditions:

- For all questions, if an `EFI_IFR_NO_SUBMIT_IF` evaluates to TRUE, then the Forms Processor will display the specified error text.
• If a Forms Processor such as a script processor performs Form-Level validation, where the concept of a form is not maintained, then the Form-Level validation must occur before processing question values from other forms or before completion of the configuration session.

33.2.5.10 Forms Processing

Forms Processors interpret the IFR in order to extract information about configuration settings. This section describes how the IFR should be interpreted and how errors should be handled.

33.2.5.10.1 Error Handling

The Forms Processor may encounter problems in interpreting the IFR. This section describes the standard ways of handling these issues:

- **Unknown Opcodes.**
  Unknown opcodes have a type which is not recognized by the Forms Processor. In general, the Forms Processor ignores the opcode, along with any nested opcodes.

- **Malformed Opcodes.**
  Malformed objects have a length which is less than the minimum length for that object type. In this case, the entire form is disabled.

- **Extended Opcodes.**
  Extended objects have a length longer than that expected by the Forms Processor. In this case, the Forms Processor interprets the object normally and ignores the extra data.

- **Malformed Forms Sets**
  Malformed forms sets occur when an object's length would cause it extend beyond the end of the forms set, or when the end of the forms set occurs while a scope is still open. In this case, the entire forms set is ignored.

- **Reserved Bits Set.**
  The Forms Processor should ignore all set reserved bits.

33.2.5.11 Forms Editing

This section describes considerations for Forms Editors, which are a specialized Forms Processor which can create and manipulate form lists, forms and questions in their binary form.

33.2.5.11.1 Locking

Locking indicates that a question or statement—along with its related options, prompts, help text or images—should not be moved or edited. A statement or question is locked when the `IFR_LOCKED` opcode is found within its scope.

UEFI-compliant Forms Editors must allow statements or questions within an image to be locked, but should not allow them to be unlocked. UEFI-compliant Forms Editors must not allow modification of locked statements or questions or any of their associated data (including options, text or images).
Note: This mechanism cannot prevent unauthorized modification. However, it does clearly state the intent of the driver creator that they should not be modified.

33.2.5.11.2 Moving Forms

When forms are moved between form sets, the related data (such as forms, variable stores and default stores) need to have their references renumbered to avoid conflicts with identifiers in the new form set. For forms, these include:

- **EFI_IFR_FORM** or **EFI_IFR_FORM_MAP** (and all references in **EFI_IFR_REF**)
- **EFI_IFR_DEFAULTSTORE** (and all references in **EFI_IFR_DEFAULT**)
- **EFI_IFR_VARSTORE_x** (and all references within question headers)

33.2.5.11.3 Moving Questions

When questions are moved between form sets, the related data (such as images and strings) need to be moved and references to results-processing and storage may need to be revised. For example:

**String and Images.**

If the question is being moved to another form set, then all strings and images associated with the question must be moved to the package list containing the form set and removed from the current one.

**Form Set.**

If the question is moved to a package list installed by a different driver, then the **EFI_IFR_VAR_STORAGE_DEVICE** (see Section 33.3.8.3.92) should be nested in the scope of the question, describing the driver installation device path.

**Question References.**

If a question value in another form set is referred to in any expressions (such as **EFI_IFR_INCONSISTENT_IF** or **EFI_IFR_NO_SUBMIT_IF** or **EFI_IFR_WARNING_IF**) using either **EFI_IFR_QUESTION_REF2** (see Section 33.3.8.3.56) or **EFI_IFR_QUESTION_REF1** (see Section), then these must be converted to a form of **EFI_IFR_QUESTION_REF3** (see Section 33.3.8.3.57), specifying the EFI_GUID of the form set and/or the device path of the package list containing the form set wherein the question referred to is defined.

When questions are moved between forms, whether in the same form list or another form list, question behavior reliant on the current form may need revision. One example is the use of **EFI_IFR_RULE_REF** in expressions. Here, rules are shortcuts for common expressions used in a form. If a question is moved to another form, the references to any rules in expressions must be replaced by the expression itself.

33.2.5.12 Forms Processing & Security Privileges

The IFR provides a way for a Forms Processor to identify which forms, statements, questions and even question values are available only to users with specific privilege levels and enforce those privilege levels.

Setup access security privileges are described in terms of GUIDs. The current user profile either has the specified privilege or it does not. The **EFI_IFR_SECURITY** opcode returns whether or not the current user profile has the specified setup access privilege. Combined with the expressions such as **EFI_IFR_DISABLE_IF**, **EFI_IFR_SUPPRESS_IF**, **EFI_IFR_GRAY_OUT_IF**, **EFI_IFR_WARNING_IF**, etc.
EFI_IFR_INCONSISTENT_IF and EFI_IFR_NOSUBMIT_IF, the author of a form can control access to specific forms, statements and questions, or even control whether specific values are valid.

Forms Processors on systems with multiple setup-related user privilege levels must support report these correctly when processing the EFI_IFR_SECURITY opcode.

Forms Processors on systems which support the UEFI User Authentication proposal must correctly inquire from the current user profile whether or not it has security privileges (see Section 36.4.1.6 on EFI_USER_INFO_ACCESS_SETUP and Section 36.3.1 on EFI_USER_MANAGER_PROTOCOL.GetInfo()).

Forms Processors on systems which support re-identification during the platform configuration process must support reevaluation of the EFI_IFR_SUPPRESS_IF and EFI_IFR_GRAY_OUT_IF upon receipt of notification that the current user profile has been changed by using the UEFI Boot Service CreateEventEx() and the EFI_USER_PROFILE_CHANGED_EVENT_GUID.

33.2.6 Strings

Strings in the UEFI environment are defined using UCS-2, which is a 16-bit-per-character representation. For user-interface purposes, strings are one of the types of resources which can be installed into the HII Database (see Section 33.2.9).

In order to facilitate localization, users reference strings by an identifier unique to the package list which the driver installed. Each identifier may have several translations associated with it, such as English, French, and Traditional Chinese. When displaying a string, the Forms Browser selects the actual text to display based on the current platform language setting.

The actual text for each language is stored separately (in a separate package), which makes it possible to add and remove language support just by including or excluding the appropriate package.
Each string may have font information, including the font family name, font size and font style, associated with it. Not all platforms or displays can support fonts and styles beyond the system default font (see Section 33.2.7), so the font information associated with the string should be viewed as a set of hints.

### 33.2.6.1 Configuration Language Paradigm

This specification uses the RFC 4646 language naming scheme to identify the language that a given string is associated with. Since RFC 4646 allows for the same Primary language tags to contain a large variation of subtags (e.g. regions), a best matching language algorithm is defined in RFC 4647. Callers of interfaces that require RFC 4646 language codes to retrieve a Unicode string, must use the RFC 4647 algorithm to lookup the Unicode string with the closest matching RFC 4646 language code.

Since the majority of strings discussed in this specification are associated with generating a user interface, the languages that are typically associated with strings have commonly defined languages such as en-US, zh-Hant, and it-IT. The RFC 4646 standard also reserves for private use languages prefixed with a value of “x”.

**Note:** This specification defines for its own purposes one of these private use areas as a special-purpose language that components can use for extracting information out of. Assume that any private-use languages encountered by a compliant implementation will likely consider those languages as configuration languages, and the associated behavior when referencing those languages will be platform specific. Section 33.2.11.2 describes an example of such a use.

### 33.2.6.2 Unicode Usage

This section describes how different aspects of the Unicode specification related to the strings within this specification.

#### 33.2.6.2.1 Private Use Area

Unicode defines a private use area of 6500 characters that may be defined for local uses. Suggested uses include Egyptian Hieroglyphics; see *Developing International Software For Windows 95* and *Windows NT* for more information. UEFI prohibits use of this area in a UEFI environment. This is because a centralized font database accumulated from the various drivers (a valid implementation) would end up with collisions in the private use area, and, generally, an XML browser could not display these characters.

#### 33.2.6.2.2 Surrogate Area

The Unicode specification has two 16-bit character representations: UCS-2 and UTF-16. The UEFI specification uses UCS-2. The primary difference is that UTF-16 defines surrogate areas (see page 56 in *Professional XML*) that allow for expanded character representations of the 16-bit Unicode. These character representations are very similar to Double Byte Character Set (DBCS)—2048 Unicode values split into two groups (D800–DBFF and DC00–DFFF). They are defined as having 16 additional bits of value to make up the character, for a total of about one million extra characters. UEFI does not support surrogate characters.

#### 33.2.6.2.3 Non-Spacing Characters

Unicode uses the concept of a nonspacing character. These glyphs are used to add accents, and so on, to other characters by what amounts to logically OR’ing the glyph over the previous glyph. There does not appear to be any predictable range in the Unicode encoding to determine nonspacing characters, yet
these characters appear in many languages. Further, these characters enable spelling of several
languages including many African languages and Vietnamese.

33.2.6.2.4 Common Control Codes

This specification allows the encoding of font display information within the strings using special control
characters. These control codes are meant as display hints, and different platforms may ignore them,
depending on display capabilities.

In single-byte encoding, these are in the form 0x7F 0xyy or 0x7F 0x0y 0xzz. Single-byte encoding is
used only when coupled with the Standard Compression Scheme for Unicode, described in
Section 33.3.6.3.

In double-byte encoding, these are in the form 0xF6yy, 0xF7zz or 0xF8zz. When converted to UCS-2,
all control codes should use the 0xFxyy form.

Table 33-3 Common Control Codes for Font Display Information

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
<th>Single-Byte Encoding</th>
<th>Double-Byte Encoding</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x00</td>
<td>Font Family Select. The subsequent text will be displayed in the font specified by the following byte.</td>
<td>0x7F 0x00 0xzz</td>
<td>0xF7zz</td>
</tr>
<tr>
<td>0x01</td>
<td>Font Size Select. The subsequent text will be displayed in the point size, in half points, specified by the following byte.</td>
<td>0x7F 0x01 0xzz</td>
<td>0xF8zz</td>
</tr>
<tr>
<td>0x20</td>
<td>Bold On.</td>
<td>0x7F 0x20</td>
<td>0xF620</td>
</tr>
<tr>
<td>0x21</td>
<td>Bold Off</td>
<td>0x7F 0x21</td>
<td>0xF621</td>
</tr>
<tr>
<td>0x22</td>
<td>Italic On</td>
<td>0x7F 0x22</td>
<td>0xF622</td>
</tr>
<tr>
<td>0x23</td>
<td>Italic Off</td>
<td>0x7F 0x23</td>
<td>0xF623</td>
</tr>
<tr>
<td>0x24</td>
<td>Underline On</td>
<td>0x7F 0x24</td>
<td>0xF624</td>
</tr>
<tr>
<td>0x25</td>
<td>Underline Off</td>
<td>0x7F 0x25</td>
<td>0xF625</td>
</tr>
<tr>
<td>0x26</td>
<td>Emboss ON</td>
<td>0x7F 0x26</td>
<td>0xF626</td>
</tr>
<tr>
<td>0x27</td>
<td>Emboss OFF</td>
<td>0x7F 0x27</td>
<td>0xF627</td>
</tr>
<tr>
<td>0x28</td>
<td>Shadow ON</td>
<td>0x7F 0x28</td>
<td>0xF628</td>
</tr>
<tr>
<td>0x29</td>
<td>Shadow OFF</td>
<td>0x7F 0x29</td>
<td>0xF629</td>
</tr>
<tr>
<td>0x2A</td>
<td>DblUnderline ON</td>
<td>0x7F 0x2A</td>
<td>0xF62A</td>
</tr>
<tr>
<td>0x2B</td>
<td>DblUnderline OFF</td>
<td>0x7F 0x2B</td>
<td>0xF62B</td>
</tr>
</tbody>
</table>

33.2.6.2.5 Line Breaks

This section describes the use of control characters to determine where break opportunities within
strings. These guidelines are based on Unicode Technical Report #14, but are significantly simplified.

Spaces

In general, any of the following space characters is a line-break opportunity:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0020</td>
<td>SPACE</td>
</tr>
<tr>
<td>1680</td>
<td>OGHAM SPACE MARK</td>
</tr>
</tbody>
</table>
When a space is desired without a line-break opportunity, one of the following spaces should be used:

<table>
<thead>
<tr>
<th>Character Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>00A0</td>
<td>NO-BREAK SPACE (NBSP)</td>
</tr>
<tr>
<td>202F</td>
<td>NARROW NO-BREAK SPACE (NNBSP)</td>
</tr>
</tbody>
</table>

**In-Word Break Opportunities**

In some cases, allowing line-breaks in a word is desirable. These line break opportunities should be explicitly described using one of the characters from the following list:

<table>
<thead>
<tr>
<th>Character Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>200B</td>
<td>ZERO WIDTH SPACE (ZWSP)</td>
</tr>
</tbody>
</table>

**Hyphens**

The following characters are hyphens and other characters which describe line break opportunities after the character.

<table>
<thead>
<tr>
<th>Character Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>058A</td>
<td>ARMENIAN HYPHEN</td>
</tr>
<tr>
<td>2010</td>
<td>HYPHEN</td>
</tr>
<tr>
<td>2012</td>
<td>FIGURE DASH</td>
</tr>
<tr>
<td>2013</td>
<td>EN DASH</td>
</tr>
<tr>
<td>0F08</td>
<td>TIBETAN MARK INTERSYLLABIC TSHEG</td>
</tr>
<tr>
<td>1361</td>
<td>ETHIOPIC WORDSPACE</td>
</tr>
<tr>
<td>17D5</td>
<td>KHMER SIGN BARIYOOSAN</td>
</tr>
</tbody>
</table>

The following characters describe line break opportunities before and after them, but not between a pair of them:

<table>
<thead>
<tr>
<th>Character Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>2014</td>
<td>EM DASH</td>
</tr>
</tbody>
</table>
The following characters describe a hyphen which is not a line-breaking opportunity:

| 2011 | NON-BREAKING HYPHEN (NBHY) |

Mandatory Breaks
The following characters force a line-break:

| 000A | NEW LINE |
| 000C | FORM FEED |
| 000D | CARRIAGE RETURN |
| 2028 | LINE SEPARATOR |
| 2029 | PARAGRAPH SEPARATOR |

33.2.7 Fonts
This section describes how fonts are used within the UEFI environment.

UEFI describes a standard font, which is required for all systems which support text display on bitmapped output devices. The standard font (named ‘system’) is a fixed pitch font, where all characters are either narrow (8x19) or wide (16x19). UEFI also allows for display of other fonts, both fixed-pitch and variable-pitch. Platform support for these fonts is optional.

UEFI fonts are described using either the Simplified Font Package (Section 33.3.2) or the normal Font Package (Section 33.3.3).

33.2.7.1 Font Attributes
Fonts have the following attributes:

**Font Name**
The font name describes, in broad terms, the visual style of the font. For example, “Arial” or “Times New Roman” The standard font always has the name “sysdefault”.

**Font Size**
The font size describes the maximum height of the character cell, in pixels. The standard font always has the font size of 19.

**Font Style**
The font style describes standard visual modifies to the base visual style of a font. Supported font styles include: bold, italic, underline, double-underline, embossed, outline and shadowed. Some font styles may also be simulated by the font rendering engine. The standard font always has no additional font styles.

33.2.7.2 Limiting Glyphs
Strings in the UEFI environment can be presented in environments with very different limitations. The most constrained environment is in the firmware phases prior to discovery of a boot device with a system partition. The main limitation in this environment is storage space. If unexpected strings could be
displayed before system partition availability, the UEFI environment would have to store glyphs for all characters in a Unicode font. After system partition discovery, all glyphs could be made available.

Careful user interface design can limit to a manageable number, the quantity of unexpected characters that the system could be called on to display. Knowing what strings the firmware is going to display limits the number of glyphs it is required to carry.

In addition, carefully designed firmware can support a system where a limited number of strings are displayed before system partition availability. This may be done while enabling the input and display of large numbers of characters/glyphs using a full font file stored on the system partition. In such a situation, the designer must ensure that enough information can be displayed. The designer must also insure that the configuration can be changed using only information from firmware-based non-volatile storage to obtain access to a satisfactory system partition.

UEFI requires platform support of a font containing the basic Latin character set.

While the system firmware will carry this standard font, there might be times when a UEFI application or driver requires the printing of a character not contained within the platform firmware. In this case, a UEFI driver or application can carry this font data and add it to the font already present in the HII Database. New font glyphs are accepted when there is no font glyph definition for the Unicode character already in the specified font.

In addition the standard system font and fonts extended by UEFI applications or drivers, it is possible for drivers that implement the EFI HII Font Glyph Generator Protocol to render additional font glyphs with specific font name, style, and size information, and add the new font packages to the HII Database. That is when HII Font Ex searches the glyph block in the existing HII font packages, it will try to locate `EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL` protocol for generating the corresponding glyph block and inserting the new glyph block into HII font package if the glyph block information is not exist in any HII font package. The HII font package which the new glyph block inserted can be an existing HII font package or a new HII font package created by HII Font Ex according to the `EFI_FONT_DISPLAY_INFO` of character.

The figure below shows how fonts interact with the HII database and UEFI drivers, even if the font does not already exist in the database.
33.2.7.3 Fixed Font Description

To allow a UEFI application or driver to extend the existing fonts with additional characters, the UEFI driver must be able to provide characters that fit aesthetically with the system font. For this reason the capability to define attributes of different fonts and to suggest a reasonable default target for these parameters is important.

Fonts can vary in width, style, baseline, height, size, and so on. The fixed font definition includes white space and the glyph data, as well as the positioning of the glyph data. This prevents characters of different fixed fonts from being adjusted at runtime to fit aesthetically together. To provide UEFI drivers
with a basic description of how to design fixed font characters, a subset of industry standard font terms are defined below:

**baseline**

The distance from upper left corner of cell to the base of the Caps (A, B, C, …)

**cap_height**

The distance from the base of the Caps to the top of the Caps

**x_height**

The distance from the baseline to the top of the lower case ‘x’

**descender**

The distance some characters extended below the baseline (g, j, p, q, y)

**ascender**

The distance from the top of the lower case ‘x’ to the tall lower case characters (b, d, f, h, k, l)

The following figure illustrates the font description terms:

![Figure 33-19 Font Description Terms](image)

This 8x19 system font example (above), follows the original VGA 8x16 definition and creating double wide vertical lines, giving a **bold** look to the font (style = bold). Along with matching the 8x19 base system font, if a UEFI driver wants to extend the DBCS (Double Byte Character Set) font, it must be aware of the parameters that describe the 16x19 font, as shown below.
This 16x19 font example (above) has a style of *plain* (single width vertical lines) instead of *bold* like the 8x19 font, since there is not enough horizontal resolution to cleanly define the DBCS glyphs. The 16x19 ASCII characters have also been designed in a style matching the DBCS characters, allowing them to fit aesthetically together. Note that the default 16x19 fixed width characters are not stored like 1-bit images, one row after another; but instead stored with the left column (19 bytes) first, followed by the right column (19 bytes) of character data. The figure below shows how the characters of the previous figure would be laid out in the font structure.
33.2.7.3.1 System Fixed Font Design Guidelines

To allow a UEFI application or driver to extend the fixed font character set, the UEFI system fonts must adhere, at least roughly, to the design guidelines in the table below:

<table>
<thead>
<tr>
<th>Term</th>
<th>8 x 19 Font</th>
<th>16 x 19 Font</th>
</tr>
</thead>
<tbody>
<tr>
<td>baseline</td>
<td>15 pixels</td>
<td>14 pixels</td>
</tr>
<tr>
<td>cap_height</td>
<td>12 pixels</td>
<td>11 pixels</td>
</tr>
<tr>
<td>x_height</td>
<td>8 pixels</td>
<td>7 pixels</td>
</tr>
<tr>
<td>descender</td>
<td>3 pixels</td>
<td>4 pixels</td>
</tr>
<tr>
<td>ascender</td>
<td>4 pixels</td>
<td>4 pixels</td>
</tr>
</tbody>
</table>

In the table above lists the terms in priority order. The most critical guideline to match is the baseline, followed by cap_height and x_height. The terms descender and ascender are not as critical to the aesthetic look of the font as are the other terms. These font design parameters are only guidelines. Failing to match them will not prevent reasonable operation of a UEFI driver that attempting to extend the system font.

33.2.7.4 Proportional Fonts Description

Unlike the fixed fonts, proportional fonts do not have a predefined character cell; instead the character cell is created based on the characters that are being displayed in the current line. In a proportional font only the glyph data is defined, no whitespace. Instead, the proportional font defines five parameters (Width, Height, Offset_X, Offset_Y, & Advance), which allow the glyph data to be position in the character cell and calculate the origin of the next character.

In the figure below, you can see these parameters (in ‘…’) for the characters shown, in addition you can see the actual byte storage (the padding to the nearest byte is shown shaded).

To determine font baseline, scan all font glyphs calculating sum of Height and Offset_Y for each glyph. The largest value of the sum defines location of the baseline.

The font line height is calculated by adding baseline with the largest by absolute value negative Offset_Y among all the font glyphs.
33.2.7.4.1 Aligning Glyphs to the Baseline

To display a line of proportional glyphs, baseline and line height have to be determined. If all the characters to be displayed are from the same font, the baseline and line height are the baseline and line height of the font.

If the characters being displayed are from different fonts, scan glyphs of the characters to be displayed calculating sum of Height and Offset_Y for each glyph. The largest value of the sum defines location of the baseline.

The line height is calculated by adding baseline with the largest by absolute value negative Offset_Y among all the characters to be displayed.

As shown in the following figure, once the baseline value is found it is added to the starting position of the line to calculate the Origin. From the Origin, each and every glyph can be generated based on the individual glyph parameters, including the calculation of the next glyph’s Origin.

![Figure 33-23 Aligning Glyphs](image)

The starting position (upper left hand corner) of the glyph is defined by (Origin_X + Offset_X), (Origin_Y – (Offset_Y + Height)). The Origin of the next glyph is defined by (Origin_X + Advance), (Origin_Y).

In addition to determining the line height and baseline values; the scan of the characters also calculates the line width by totaling up all of the advance values.

33.2.7.4.2 Proportional Font Design Guidelines

This method of aligning glyphs to a baseline allows one to place wildly different characters correctly position on a single line. However there still is a need for the system proportional fonts to roughly adhere to overall font height (19 pixels high character cells) and the placement of the baseline at the bottom of the Caps (if applicable or about 5 pixels up from the bottom of the character cell). These guidelines are not as critical as the fixed font guidelines, since the character cell height are defined at runtime, based on what else is displayed with that character.

33.2.8 Images

The format of the images to be stored in the Human Interface Infrastructure (HII) database have been created to conform to the industry standard 1-bit, 4-bit, 8-bit, and 24-bit video memory layouts. The 24-bit and 32-bit display systems have the exact same display capabilities and the exact same pixel definition. The difference is that the 32-bit pixels are DWORD aligned for improve CPU efficiency when accessing video memory. The extra byte that is inserted from the 24-bit and the 32-bit layout has no bearing on the actual screen.
Video memory is arranged left-to-right, and then top-to-bottom. In a 1-bit or monochrome display, the most significant bit of the first byte defines the screen’s upper left most pixel. In a 4-bit or 16 color display, the most significant nibble of the first byte defines the screen’s upper left most pixel. In an 8-bit or 256 color display, the first byte defines the screen’s upper left most pixel.

In both the 24-bit and 32-bit TrueColor displays, the first three bytes define the screen’s upper left most pixel. The first byte is the pixel’s blue component value, the next byte is the pixel’s green component value, and the third byte is the pixel’s red component value (B,G,R). Each color component value can vary from 0x00 (color off) to 0xFF (color full on), allowing 16.8 millions colors that can be specified. In the 32-bit TrueColor display modes, the fourth byte is a don’t care.

33.2.8.1 Converting to a 32-bit Display

The UEFI recommended video mode for computer-like devices uses a 32-bit Linear Frame Buffer video mode. All images stored in the HII database will need conversion to 32-bit before display.

To display a 24-bit image into 32-bit video memory, a pixel of the image is retrieved (read DWORD value advance pixel offset by 3) and then written to the video memory (write DWORD value advance pixel offset by 4).

To display any of the non-TrueColor images (1-bit, 4-bit, and 8-bit), there is an extra step of indirection through the palette definition to get the TrueColor pixel value. First retrieve the palette index value by isolating the corresponding bits, then index into the associated palette to retrieve the 24-bit (B,G,R) color entry (read DWORD value), then write it to the video memory (write DWORD value advance pixel offset by 4). For this reason, the palette color entry definition is defined exactly the same as the image color pixel (B,G,R).

33.2.8.2 Non-TrueColor Displays

It is possible to display the HII database images on non-TrueColor video modes. You cannot however, display images beyond the bit depth of the target screen resolution. For example you would be able to display 1-bit, 4-bit, and 8-bit images in a 256 color video mode. To do this you must create a global palette (256 entries), by merging all images color needs to a best fit palette and then programming the hardware palette with that data.

The hardware palette color definition (R,G,B) is backwards from the screen pixel definition (B,G,R), and will have to be swapped before programming. In addition, the hardware palette may only support 6-bit of magnitude per color component instead of the 8-bit defined in the palette information section; therefore the values will have to be shifted before writing.

33.2.9 HII Database

The Human Interface Infrastructure (HII) database is the resource that serves as the repository of all the form, string, image and font data for the system. Drivers that contain information that is appropriate for the database will export this data to the HII database.

For example, one driver might contain all the motherboard-specific data (the traditional “Setup” for the system). Additionally, add-in cards may contain their own drivers, which, in turn, have their own Setup-related data. All of the drivers that contain Setup-related data would export their information to the HII database, as shown in the figure below.
33.2.10 Forms Browser

The UEFI Forms Browser is the service that reads the contents of the HII Database and interprets the forms data in order to present it to the user. For example, the Forms Browser can be used to gather all setup-related data and presents it to the user. This service also takes the user input and allows for changes to be saved into non-volatile storage.

The figure below shows the relationship between the HII database, UEFI drivers, and the UEFI Forms Browser.

33.2.10.1 User Interaction

The Forms Browser implementer has great flexibility as to the type of actual user interface provided. For example, while required to support some forms of navigation (see `EFI_FORM_BROWSER2_PROTOCOL.SendForm()` or the cross-reference question), it may optionally support additional navigation capabilities, such as a back button or a menu bar. This section describes the rules to which the Forms Browser user-interaction must conform.
33.2.10.1.1 Forms Browser details

The forms browser maintains a collection of one or more forms. The forms browser is required to provide navigation for these forms if there is more than one (see Section 35.6, “Form Browser Protocol”).

The forms browser maintains one or more active forms. An active form is any form where the forms browser is maintaining a set of question values. A form is considered active after all question values have been read from storage and the EFI_BROWSER_ACTION_FORM_OPEN action has been sent to all questions on the form which require callback. A form is considered inactive after all question values have been either discarded or written to storage and the EFI_BROWSER_ACTION_FORM_CLOSE action has been sent to all questions on the form which require callback.

The forms browser maintains a selected form. The selected form contains the selected question and indicates the primary area of user interaction.

The standards form navigation behaviors are:

Navigate Forms.

When the user chooses this required behavior, a new form is selected and, if any questions on the form are selectable (see Section 33.2.5.3.4), a question is selected. Forms browsers are required to provide navigation to (at least) the first form in all form sets when FormId is zero (see Section 35.6). This behavior cannot be selected if the current form is modal (see Section 33.2.5.2, “Forms”).

Exit Browser/Discard All.

When the user chooses this optional behavior, the question values for active forms are discarded, the active forms are deactivated and the forms browser exits with an action request of EFI_BROWSER_ACTION_REQUEST_EXIT. This behavior cannot be selected if the current form is modal (see Section 33.2.5.2, “Forms”).

Exit Browser/Submit All.

When the user chooses optional behavior, the question values are written to storage, the active forms are deactivated and the forms browser exits with an action request of EFI_BROWSER_ACTION_REQUEST_SUBMIT or EFI_BROWSER_ACTION_REQUEST_RESET. This behavior cannot be selected if the current form is modal (see Section 33.2.5.2, “Forms”).

Default.

When the user chooses this optional behavior, the current question values for the questions on the focus form are updated from one of the default stores and then the EFI_IFR_BROWSER_ACTION_REQUEST_DEFAULT_x action is sent for each of the questions with the Callback attribute. This behavior can be initiated by a Reset Button question (see section Section 33.2.5.3.8).

33.2.10.1.2 Selected Form

When a form is made active, the forms browser sends the EFI_BROWSER_ACTION_FORM_OPEN for all questions supporting callback, retrieves the current question values, saves those as the original question values and begins refreshing any questions that support it.
The forms browser maintains a current question value for each question on active forms. The current question value is the last value that the forms browser read from storage/callback (see Section 33.2.5.4.1, “Values”) or the last value committed by the user. The form is considered modified if any of the current question values are modified (see Questions, below). The forms browser refreshes the current question values of at least questions on the selected with a non-zero refresh interval.

The forms browser maintains a selected question on the selected form. The selected question is the primary focus of the user’s interaction. When a form is selected, the forms browser must choose a selectable question (see Section 33.2.5.3.4, “Evaluation of Selectable Statements”) as the selected question, if one is present on the form.

The standard active form behaviors are:

**Exit Browser/Discard All.**
When the user chooses this required behavior, the question values for active forms are discarded, the active forms are deactivated and the forms browser exits with an action request of `EFI_BROWSER_ACTION_REQUEST_EXIT`. This behavior can be initiated by the function associated with a question with the Callback attribute.

**Exit Browser/Submit All.**
When the user chooses this required behavior, the current question values for active forms are validated (see nosubmitif, Section 33.3.8.3.45) and, if successful, question values for active forms are written to storage, the active forms are deactivated and the forms browser exits with an action request of `EFI_BROWSER_ACTION_REQUEST_SUBMIT`. This behavior can be initiated by the function associated with a question with the Callback attribute.

**Exit Browser/Discard All/Reset Platform.**
When the user chooses this required behavior, the question values for active forms are discarded, the active forms are deactivated and the form browser exits with an action request of `EFI_BROWSER_ACTION_REQUEST_RESET`. This behavior can be initiated by the function associated with a question with the Callback attribute.

**Exit Form/Submit Form.**
Apply Form. When the user chooses this required behavior, the question values for the selected form are validated (see -nosubmitif, BUGBUG< ) and, if successful, question values for the selected form are written to storage and the selected form is deselected. This behavior can be initiated by the function associated with a question with the Callback attribute.

**Exit Form/Discard Form.**
When the user chooses this required behavior, the question values for the selected form are discarded and the selected form is deselected. This behavior can be initiated by the function associated with a question with the Callback attribute.

**Apply Form.**
When the user chooses this required behavior, the question values for the selected form are validated (see nosubmitif, BUGBUG) and, if successful, question values for
the selected form are written to storage. This behavior can be initiated by the function associated with a question with the Callback attribute.

**Discard Form.**

When the user chooses this required behavior, the question values for the selected form are discarded. This behavior can be initiated by the function associated with a question with the Callback attribute.

**Default.**

When the user chooses this required behavior, the current question values for the questions on the selected form are updated from a default store. This behavior can be initiated by a Reset Button question (see Section 33.2.5.3.8).

**Navigate To Question.**

When the user chooses this required behavior, the selected question is deselected and another question on the same form is selected. The types of navigation provided between questions on the same form are beyond the scope of this specification.

**Navigate To Form.**

When the user chooses this required behavior, the selected form is deselected and the form specified by the question is selected. This behavior can be initiated by a Cross-Reference question. Note that this behavior is distinct from the Navigate Forms behavior described in Forms Navigation.

From these basic behaviors, more complex behaviors can be constructed. For example, a forms browser might check whether the form is modified and, if so, prompt the user to select between the Exit Browser/Discard All and Exit Browser/Submit All behaviors.

### 33.2.10.1.3 Selected Question

When the user navigates to a question or the forms browser selects a form with a selectable question, the forms browser places the question in the **static** state. When the user is choosing another question values for the selected question (by typing or from a menu or other means), the forms browser places the question in the **changing** state. When the user finalizes selection of a question value the forms browser returns the question to the static state.

The forms browser refreshes all questions in at least the selected form with a non-zero refresh interval that are not modified. Typically, a forms browser will not update the displayed question value while the selected question is in the changing state, but will when the selected question is in the static state. A question is considered modified if there is storage associated with the question (i.e., a variable store was specified) and the current question value is different from the original question value.

The standard active question behaviors are:

**Change**

When the user chooses this required behavior, the forms browser places the selected question in the changing state and allows the user to specify a new current question value for the active question. For example, selecting items in a drop box or beginning to type a new value in an edit box.
With some question types and user interface styles, this behavior is hidden from the user. For example, with check boxes or radio buttons as found in most windowed user-interfaces, the user changes and commits the value with one action. Likewise, with action buttons, selecting the action button implies both the question value and the commit action.

This behavior corresponds to the CHANGING browser action request for questions that support callback.

**Commit**

When the user chooses this required behavior, the forms browser validates the specified question value (see `EFI_IPF_INCONSISTENT_IF`, Section 33.3.8.3.33) and, if successful, places the selected question in the static state and updates the current question value to that specified while in the changing state. If the selected question’s current question value is different than the selected question’s original question value, the selected question is considered modified. The form browser must then re-evaluate the modifiability, selectability and visibility of other questions in the selected form.

This behavior corresponds to the CHANGED browser action request for questions that support callback.

**Discard**

When the user chooses this required behavior, the forms browser places the question in the changed state.

### 33.2.11 Configuration Settings

In order to save user changes to configuration settings after the system reset or power-off, there must be some form of non-volatile storage available. There are two types of non-volatile storage: system non-volatile storage or add-in card non-volatile storage. Both types are supported.

In general, settings are not saved to non-volatile storage until the user specifically directs the Forms Browser to do so. There are exceptions, such as when operating in a batch or script mode, setting a system password, and updating the system date and time. The underlying platform support dictates whether or not hardware configuration changes are committed immediately.

As shown in the figure below, when a system reset occurs, the firmware’s initialization routines will launch the UEFI drivers (e.g. option ROMs). Drivers enabled to take direction from a non-volatile setting read the updated settings during their initialization.
33.2.11.1 OS Runtime Utilization

Due to the static nature of the data that is contained in the HII Database and the fact that certain classes of non-volatile storage can be updated during OS run-time, it is possible for an application running under an OS to read the HII information, make configuration changes and even make changes.

The figure below shows how an OS makes use of the HII database during runtime. In this case, the contents of the HII Database is exported to a buffer. The pointer to the buffer is placed in the EFI System Configuration Table, where it can be retrieved by an OS application.
The process used to allow an OS application to use this is as follows:

Drivers/applications in the system register user interface data into the HII Database

When the platform transitions from pre-boot to runtime phases of operation, the HII `ExportPackageLists()` is called to export the contents of the HII Database into a runtime buffer.

This runtime buffer is advertised in the UEFI Configuration Table using the HII Database Protocol’s GUID so that an OS application can find the data.

The HII `ExportConfig()` is called to export the current configuration into a runtime buffer.

This runtime buffer is advertised in the UEFI Configuration Table using the HII Configuration Routing Protocol’s GUID so that an OS application can find the data.

When an O/S application wants to display pre-boot configuration content, it searches the UEFI Configuration Table for the HII Database Protocol’s GUID entry and renders the contents from the runtime buffer which it points to.

If the OS application needs to update the system configuration, the configuration information can be updated.

For those configuration settings which are stored in UEFI variables (i.e., using `GetVariable()` and `SetVariable()`), the application can update these using the abstraction provided by the operating system.

For those configuration settings which are not stored in UEFI variables, the OS application can use the UEFI UpdateCapsule runtime service to change the configuration.
33.2.11.2 Working with a UEFI Configuration Language

By defining the concept of a language that may provide hints to a consumer that the string payload may contain pre-defined standard keyword content, the user of this solution can export their configuration data for evaluation. This evaluation enables the consumer to determine if a particular platform supports a given configuration language, and in-turn be able to adjust known settings that are stored in a platform-specific manner. An example of this is illustrated below which uses various component described in this and the other HII chapters of this specification. In the example, a fictional technology called XYZ exists, and this particular platform supports it. The question is, how does a standard application which is not privy to the platform’s construction know how this setting is stored? To-date, this is not a reasonably solvable problem, but in the illustration below, this example shows how one might go about solving this issue.

Figure 33-28 Standard Application Obtaining Setting Example

33.2.12 Form Callback Logic

Since it has been the design intent that the forms processor not need to understand the underlying hardware implementations or design paradigms of the platform, there were certain needs that could
only be met by calling a more platform knowledgeable component. In this case, the component would typically be associated with some hardware device (e.g. motherboard, add-in card, etc.). To facilitate this interaction, some formal interfaces were declared for more platform-specific components to advertise and the forms processor could then call.

Note that the need for the forms processor to call into an alternate component driver should be limited as much as possible. The two primary reasons for this are the cases where off-line or O/S-present configuration is important. The three flow charts which follow describe the typical decisions that a forms processor would make with regards to handling processes which necessitate a callback.

Figure 33-29 Typical Forms Processor Decisions Necessitating a Callback (1)
Figure 33-30 Typical Forms Processor Decisions Necessitating a Callback (2)
33.2.13 Driver Model Interaction

The ability for a UEFI driver to interact with a target controller is abstracted through the Configuration Access Protocol. If a particular piece of hardware managed by a controller needs configuration services, it is the responsibility of that controller to provide this configuration abstraction for the given device. Regardless of whether a device driver or bus driver is abstracting the hardware configuration, the interaction with a configured device is identical.

Note that the ability for a driver to provide these access protocols might be done fairly early in the initialization process. Depending on the hardware capabilities, one might be advantaged in providing configuration access very early so that being able to determine a given device’s current settings can be done without a full enumeration of certain bus devices. Also note that the same recommendations that are made in the DriverBinding sections should still be maintained. These cover the Supported, Started, and Stopped functions.
33.2.14 Human Interface Component Interactions

The figure below depicts the model used inside a common deployment of HII to manage human interface components.
33.2.15 Standards Map Forms

Configuration settings are configuration settings. But the way in which they are controlled is driven by different requirements. For example, the UEFI HII infrastructure focuses primarily on the way in which the configuration settings can be browsed and manipulated by a user. Other standards such as the DMTF Command-Line Protocol, focus on the way in which configuration settings can be manipulated via text commands.

Each configuration method tends to view the configuration settings a different way. In the end, they are changing the same configuration setting, but their means of exposing the control differs. The means by which a configuration method (HII, DMTF, WMI, SNMP, etc.) exposes an individual configuration setting is called a question.

In many cases, there is a one-to-one mapping between the questions exposed by these different configuration methods. That is, a question, as exposed by one configuration method matches the semantic meaning of the configuration setting exactly.

However, in other cases, there is not a one-to-one mapping. These cases break down into three broad categories:

1. Value Shift. In this case, the configuration setting has the same scope as the question exposed by a configuration method, but the values used to describe them are different. It may be as simple as 1=5, 2=6, 3=7, etc. or something more complicated, where “ON”=1 and “OFF”=0.

2. One-To-Many. In this case, the configuration setting maps to two or more questions exposed by a configuration method. For example the configuration setting might have the following enumerated values:
   a  0 = Disable Serial Port
   b  1 = Enable Serial Port, I/O Port 0x3F8, IRQ 4
c 2 = Enable Serial Port, I/O Port 0x2F8, IRQ 3  

d 3 = Enable Serial Port, I/O Port 0x3E8, IRQ 4  
e 4 = Enable Serial Port, I/O Port 0x2E8, IRQ 3

But in the configuration method, the serial port is controlled by three separate questions:

- Question #1: 0 = disable, 1 = enable  
- Question #2: I/O Port (disabled if Question #1 = 0)  
- Question #3: IRQ (disabled if Question #1 = 0)

Changing the configuration method question #1 to a value of 0 requires that the configuration setting be set to 0. In this case, there is the possibly of data loss. After changing the configuration setting to 0, the information about the I/O port and IRQ are not preserved.

So, in order to change the configuration setting to the value of 1 would require three of the configuration method’s questions to change value: Question #1=1, Question #2=0x3F8, Question #3=IRQ 4.

Figure 33-34 EFI IFR Form set configuration

3. Many-To-One. In this case, the conditions are reversed from the example described in #2 above. Now there are three configuration settings which map to a single configuration method question.

For example, the configuration settings are described using three separate questions:

- Question #1: 0 = disable, 1 = enable  
- Question #2: I/O Port (disabled if Question #1 = 0)  
- Question #3: IRQ (disabled if Question #1 = 0)
But in the configuration method, the serial port is controlled by a single question with the following enumerated values:

a 0 = Disable Serial Port
b 1 = Enable Serial Port, I/O Port 0x3F8, IRQ 4
c 2 = Enable Serial Port, I/O Port 0x2F8, IRQ 3
d 3 = Enable Serial Port, I/O Port 0x3E8, IRQ 4
e 4 = Enable Serial Port, I/O Port 0x2E8, IRQ 3

So, in order to change the configuration method to the value of 1 would require three configuration settings to change value: Question #1=1, Question #2=0x3F8, Question #3=IRQ 4.

Some configuration settings may involve more than one of these mappings.

Standards map forms describe the questions exposed by these other configuration methods and how they map back to the configuration settings exposed by the UEFI drivers. Each standards map form describes the mapping for a single configuration method, along with that configuration method’s name and version.

The questions within standards map forms are encoded using IFR in the same fashion as those within other UEFI forms. The prompt strings for these questions are tied back to the names for those questions within the configuration method (e.g., DMTF CLP).
33.2.15.1 Create A Question’s Value By Combing Multiple Configuration Settings

Rather than reading directly from storage, these standards map questions retrieve their value using the EFI_IFR_READ (Section 33.3.8.3.58) operator. This operator can aggregate a value from more than one configuration settings using EFI_IFR_GET (Section 33.3.8.3.27). This operator can also change the type (integer, string, Boolean) of the value so that, say, a configuration setting with a type of integer can be represented in a standards map form as a string.

For example, to map a single question to three configuration settings (CS1, CS2 and CS3) as described in scenario #3 in Section 33.2.1.5 above would have the following truth table:

<table>
<thead>
<tr>
<th>CS1</th>
<th>CS2</th>
<th>CS3</th>
<th>Q</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>X</td>
<td>X</td>
<td>0</td>
</tr>
<tr>
<td>true</td>
<td>0x3F8</td>
<td>4</td>
<td>1</td>
</tr>
<tr>
<td>true</td>
<td>0x2F8</td>
<td>3</td>
<td>2</td>
</tr>
<tr>
<td>true</td>
<td>0x3E8</td>
<td>4</td>
<td>3</td>
</tr>
<tr>
<td>true</td>
<td>0x2E8</td>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>true</td>
<td>any other value</td>
<td>any other value</td>
<td>Undefined</td>
</tr>
</tbody>
</table>

These become the following equations:

\[ x_0: \text{Get}(\text{CS1}) ? x_1 : 0 \]
\[ x_1: ((\text{Get}(\text{CS2}) & 0xF00) >> 8) == \text{Get}(\text{CS3}) + 1 ? x_2 : \text{Undefined} \]
\[ x_2: \text{Map}(\text{Get}(\text{CS2}), 0x3f8, 1, 0x2F8, 2, 0x3E8, 3, 0x2E8, 4) \]

33.2.15.2 Changing Multiple Configuration Settings From One Question’s Value

Rather than writing directly to storage, these standards map questions change their value using the EFI_IFR_WRITE (Section 33.3.8.3.94) operator. This operator can, in turn, use the EFI_IFR_SET (Section 33.3.8.3.66) operator to change one or more configuration settings. This operator can also change the type (integer, string, Boolean, etc.) of the value written so that, say, a configuration setting with a type of integer can be represented in a standards map form as a string.

For example, in example #2 above, the following table applies:

<table>
<thead>
<tr>
<th>CS1</th>
<th>CS2</th>
<th>CS3</th>
<th>Q</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>X</td>
<td>X</td>
<td>0</td>
</tr>
<tr>
<td>true</td>
<td>0x3F8</td>
<td>4</td>
<td>1</td>
</tr>
<tr>
<td>true</td>
<td>0x3E8</td>
<td>3</td>
<td>2</td>
</tr>
<tr>
<td>true</td>
<td>0x2F8</td>
<td>4</td>
<td>3</td>
</tr>
<tr>
<td>true</td>
<td>0x2E8</td>
<td>3</td>
<td>4</td>
</tr>
</tbody>
</table>
\textbf{Set}(CS1,Q \neq 0) \&\&
\textbf{Set}(CS2, \text{Map}(\text{this},1,0x3F8,2,0x3E8,3,0x2F8,4,0x2E8)) \&\&
\textbf{Set}(CS3, \text{Map}(\text{this},1,4,2,3,3,4,4,3)

\textbf{33.2.15.3 Value Shifting}

Value shifting is facilitated by the \texttt{EFI_IFR_MAP} (Section 33.3.8.3.38) operator. If this operator finds a value in a list, it replaces it with another value from the list, even if the other value is a different type.

For example, consider the following list of values

\textbf{Table 33-7 Values:}

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>PEI Module</td>
</tr>
<tr>
<td>2</td>
<td>DXE Boot Service Driver</td>
</tr>
<tr>
<td>3</td>
<td>DXE Runtime Driver</td>
</tr>
<tr>
<td>10</td>
<td>UEFI Boot Service Driver</td>
</tr>
<tr>
<td>11</td>
<td>UEFI Runtime Driver</td>
</tr>
<tr>
<td>12</td>
<td>UEFI Application</td>
</tr>
</tbody>
</table>

If the integer value 10 were supplied, the value “UEFI Boot Service Driver” would be returned. If the integer value 20 were supplied, Undefined would be returned.

\textbf{33.2.15.4 Prompts}

In standards map forms, the prompts can be used as the key words for the configuration method. They should be specified in the language \texttt{i-uefi} unless there are multiple translations available. Other standards may use the question identifiers as the means of identifying the standard question.

\textbf{33.3 Code Definitions}

This chapter describes the binary encoding of the different package types:

- Font Package
- Simplified Font Package
- String Package
- Image Package
- Device Path Package
- Keyboard Layout Package
- GUID Package
- Forms Package
33.3.1 Package Lists and Package Headers

**EFI_HII_PACKAGE_HEADER**

**Summary**
The header found at the start of each package.

**Prototype**
```c
typedef struct {
    UINT32 Length:24;
    UINT32 Type:8;
    UINT8 Data[ ... ];
} EFI_HII_PACKAGE_HEADER;
```

**Members**
- **Length**
  The size of the package in bytes.
- **Type**
  The package type. See `EFI_HII_PACKAGE_TYPE_x`, below.
- **Data**
  The package data, the format of which is determined by `Type`.

**Description**
Each package starts with a header, as defined above, which indicates the size and type of the package. When added to a pointer pointing to the start of the header, `Length` points at the next package. The package lists form a package list when concatenated together and terminated with an `EFI_HII_PACKAGE_HEADER` with a `Type` of `EFI_HII_PACKAGE_END`.

The type `EFI_HII_PACKAGE_TYPE_GUID` is used for vendor-defined HII packages, whose contents are determined by the `Guid`.

The range of package types starting with `EFI_HII_PACKAGE_TYPE_SYSTEM_BEGIN` through `EFI_HII_PACKAGE_TYPE_SYSTEM_END` are reserved for system firmware implementers.

### 33.3.1.1 EFI_HII_PACKAGE_LIST_HEADER

**Summary**

The header found at the start of each package list.
Prototype

typedef struct {
    EFI_GUID PackageListGuid;
    UINT32   PackagLength;
} EFI_HII_PACKAGE_LIST_HEADER;

Members

    PackageListGuid   The unique identifier applied to the list of packages which follows.
    PackageLength     The size of the package list (in bytes), including the header.

Description

This header uniquely identifies the package list and is placed in front of a list of packages. Package lists with the same PackageListGuid value should contain the same data set. Updated versions should have updated GUIDs.

33.3.2 Simplified Font Package

The simplified font package describes the font glyphs for the standard 8x19 pixel (narrow) and 16x19 (wide) fonts. Other fonts should be described using the normal Font Package.

A simplified font package consists of a header and two types of glyph structures—standard-width (narrow) and wide glyphs.

33.3.2.1 EFI_HII_SIMPLE_FONT_PACKAGE_HDR

Summary

A simplified font package consists of a font header followed by a series of glyph structures.

Prototype

typedef struct _EFI_HII_SIMPLE_FONT_PACKAGE_HDR {
    EFI_HII_PACKAGE_HEADER    Header;
    UINT16   NumberOfNarrowGlyphs;
    UINT16   NumberOfWideGlyphs;
    EFI_NARROW_GLYPH           NarrowGlyphs[];
    EFI_WIDE_GLYPH             WideGlyphs[];
} EFI_HII_SIMPLE_FONT_PACKAGE_HDR;

Members

    Header

    The header contains a Length and Type field. In the case of a font package, the type will be EFI_HII_PACKAGE_SIMPLE_FONTS and the length will be the total size of the font package including the size of the narrow and wide glyphs. See EFI_HII_PACKAGE_HEADER.

    NumberOfNarrowGlyphs The number of NarrowGlyphs that are included in the font package.
NumberOfWideGlyphs: The number of WideGlyphs that are included in the font package.

NarrowGlyphs: An array of EFI_NARROW_GLYPH entries. The number of entries is specified by NumberOfNarrowGlyphs.

WideGlyphs: An array of EFI_WIDE_GLYPH entries. The number of entries is specified by NumberOfWideGlyphs. To calculate the offset of WideGlyphs, use the offset of NarrowGlyphs and add the size of EFI_NARROW_GLYPH multiplied by the NumberOfNarrowGlyphs.

Description

The glyphs must be sorted by Unicode character code.

It is up to developers who manage fonts to choose efficient mechanisms for accessing fonts. The contiguous presentation can easily be used because narrow and wide glyphs are not intermixed, so a binary search is possible (hence the requirement that the glyphs be sorted by weight).

33.3.2.2 EFI_NARROW_GLYPH

Summary

The EFI_NARROW_GLYPH has a preferred dimension (w x h) of 8 x 19 pixels.

Prototype

typedef struct {
    CHAR16   UnicodeWeight;
    UINT8    Attributes;
    UINT8    GlyphCol1[EFI_GLYPH_HEIGHT];
} EFI_NARROW_GLYPH;

Members

UnicodeWeight: The Unicode representation of the glyph. The term weight is the technical term for a character code.

Attributes: The data element containing the glyph definitions; see "Related Definitions" below.

GlyphCol1: The column major glyph representation of the character. Bits with values of one indicate that the corresponding pixel is to be on when normally displayed; those with zero are off.

Description

Glyphs are represented by two structures, one each for the two sizes of glyphs. The narrow glyph (EFI_NARROW_GLYPH) is the normal glyph used for text display.
Related Definitions

```c
// Contents of EFI_NARROW_GLYPH.Attributes
#define EFI_GLYPH_NON_SPACING 0x01
#define EFI_GLYPH_WIDE 0x02
#define EFI_GLYPH_HEIGHT 19
#define EFI_GLYPH_WIDTH 8
```

Following is a description of the fields in the above definition:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_GLYPH_NON_SPACING</td>
<td>This symbol is to be printed &quot;on top of&quot; (OR'd with) the previous glyph before display.</td>
</tr>
<tr>
<td>EFI_GLYPH_WIDE</td>
<td>This symbol uses 16x19 formats rather than 8x19.</td>
</tr>
</tbody>
</table>

### 33.3.2.3 EFI_WIDE_GLYPH

**Summary**

The **EFI_WIDE_GLYPH** has a preferred dimension \((w \times h)\) of 16 x 19 pixels, which is large enough to accommodate logographic characters.

**Prototype**

```c
typedef struct {
    CHAR16  UnicodeWeight;
    UINT8   Attributes;
    UINT8   GlyphCol1[EFI_GLYPH_HEIGHT];
    UINT8   GlyphCol2[EFI_GLYPH_HEIGHT];
    UINT8   Pad[3];
} EFI_WIDE_GLYPH;
```

**Members**

- **UnicodeWeight** The Unicode representation of the glyph. The term weight is the technical term for a character code.
- **Attributes** The data element containing the glyph definitions; see "Related Definitions" in **EFI_NARROW_GLYPH** for attribute values.
- **GlyphCol1** and **GlyphCol2** The column major glyph representation of the character. Bits with values of one indicate that the corresponding pixel is to be on when normally displayed; those with zero are off.
- **Pad** Ensures that `sizeof (EFI_WIDE_GLYPH)` is twice the `sizeof (EFI_NARROW_GLYPH)`. The contents of Pad must be zero.

**Description**

Glyphs are represented via the two structures, one each for the two sizes of glyphs. The wide glyph (**EFI_WIDE_GLYPH**) is large enough to display logographic characters.
### 33.3.3 Font Package

The font package describes the glyphs for a single font with a single family, size and style. The package has two parts: a fixed header and the glyph blocks. All structures described here are byte packed.

#### 33.3.3.1 Fixed Header

The fixed header consists of a standard record header and then the character values in this section, the flags (including the encoding method) and the offsets of the glyph information, the glyph bitmaps and the character map.

```c
typedef struct _EFI_HII_FONT_PACKAGE_HDR {
  EFI_HII_PACKAGE_HEADER Header;
  UINT32 HdrSize;
  UINT32 GlyphBlockOffset;
  EFI_HII_GLYPH_INFO Cell;
  EFI_HII_FONT_STYLE FontStyle;
  CHAR16 FontFamily[];
} EFI_HII_FONT_PACKAGE_HDR;
```

- **Header** The standard package header, where `Header.Type = EFI_HII_PACKAGE_FONTS`.
- **HdrSize** Size of this header.
- **GlyphBlockOffset** The offset, relative to the start of this header, of a series of variable-length glyph blocks, each describing information about the bitmap associated with a glyph.
- **Cell** This contains the measurement of the widest and tallest characters in the font (`Cell.Width` and `Cell.Height`). It also contains the default offset to the horizontal and vertical origin point of the character cell (`Cell.OffsetX` and `Cell.OffsetY`). Finally, it contains the default `AdvanceX`.
- **FontStyle** The design style of the font, 1 bit per style. See `EFI_HII_FONT_STYLE`.
- **FontFamily** The null-terminated string with the name of the font family to which the font belongs.
Related Definitions

```c
typedef UINT32 EFI_HII_FONT_STYLE;
#define EFI_HII_FONT_STYLE_NORMAL    0x00000000
#define EFI_HII_FONT_STYLE_BOLD     0x00000001
#define EFI_HII_FONT_STYLE_ITALIC    0x00000002
#define EFI_HII_FONT_STYLE_EMBOSSED 0x00010000
#define EFI_HII_FONT_STYLE_OUTLINE  0x00020000
#define EFI_HII_FONT_STYLE_SHADOW    0x00040000
#define EFI_HII_FONT_STYLE_UNDERLINE 0x00080000
#define EFI_HII_FONT_STYLE_DBL_UNDER 0x00100000
```

### 33.3.3.2 Glyph Information

For each Unicode character code, the glyph information gives the glyph bitmap, the character size and the position of the bitmap relative to the origin of the character cell. The glyph information is encoded as a series of blocks, each with a single byte header. The blocks must be processed in order.

Each block begins with a single byte, which contains the block type.

![Figure 33-36 Glyph Information Encoded in Blocks](image)
Prototype

```c
typedef struct _EFI_HII_GLYPH_BLOCK {
    UINT8 BlockType;
    UINT8 BlockBody[];
} EFI_HII_GLYPH_BLOCK;
```

Members

The following table describes the different block types:

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_HII_GIBT_END</td>
<td>0x00</td>
<td>The end of the glyph information.</td>
</tr>
<tr>
<td>EFI_HII_GIBT_GLYPH</td>
<td>0x10</td>
<td>Glyph information for a single character value, bit-packed.</td>
</tr>
<tr>
<td>EFI_HII_GIBT_GLYPHS</td>
<td>0x11</td>
<td>Glyph information for multiple character values.</td>
</tr>
<tr>
<td>EFI_HII_GIBT_GLYPH_DEFAULT</td>
<td>0x12</td>
<td>Glyph information for a single character value, using the default character cell information.</td>
</tr>
<tr>
<td>EFI_HII_GIBT_GLYPHS_DEFAULT</td>
<td>0x13</td>
<td>Glyph information for multiple character values, using the default character cell information.</td>
</tr>
<tr>
<td>EFI_HII_GIBT_GLYPH_VARIABILITY</td>
<td>0x14</td>
<td>Glyph information for the variable glyph.</td>
</tr>
<tr>
<td>EFI_HII_GIBT_DUPLICATE</td>
<td>0x20</td>
<td>Create a duplicate of an existing glyph but with a new character value.</td>
</tr>
<tr>
<td>EFI_HII_GIBT_SKIP2</td>
<td>0x21</td>
<td>Skip a number (1-65535) character values.</td>
</tr>
<tr>
<td>EFI_HII_GIBT_SKIP1</td>
<td>0x22</td>
<td>Skip a number (1-255) character values.</td>
</tr>
<tr>
<td>EFI_HII_GIBT_DEFAULTS</td>
<td>0x23</td>
<td>Set default glyph information for subsequent glyph blocks.</td>
</tr>
<tr>
<td>EFI_HII_GIBT_EXT1</td>
<td>0x30</td>
<td>For future expansion (one byte length field)</td>
</tr>
<tr>
<td>EFI_HII_GIBT_EXT2</td>
<td>0x31</td>
<td>For future expansion (two byte length field)</td>
</tr>
<tr>
<td>EFI_HII_GIBT_EXT4</td>
<td>0x32</td>
<td>For future expansion (four byte length field)</td>
</tr>
</tbody>
</table>

Description

In order to recreate all glyphs, start at the first block and process them all until a **EFI_HII_GIBT_END** block is found. When processing the glyph blocks, each block refers to the current character value (**CharValueCurrent**), which is initially set to one (1).

Glyph blocks of an unknown type should be skipped. If they cannot be skipped, then processing halts.
Related Definitions

```c
typedef struct _EFI_HII_GLYPH_INFO {
    UINT16 Width;
    UINT16 Height;
    INT16 OffsetX;
    INT16 OffsetY;
    INT16 AdvanceX;
} EFI_HII_GLYPH_INFO;
```

- **Width**: Width of the character or character cell, in pixels. For fixed-pitch fonts, this is the same as the advance.
- **Height**: Height of the character or character cell, in pixels.
- **OffsetX**: Offset to the horizontal edge of the character cell.
- **OffsetY**: Offset to the vertical edge of the character cell.
- **AdvanceX**: Number of pixels to advance to the right when moving from the origin of the current glyph to the origin of the next glyph.

### 33.3.3.2.1 EFI_HII_GIBT_DEFAULTS

**Summary**

Changes the default character cell information.

**Prototype**

```c
typedef struct _EFI_HII_GIBT_DEFAULTS_BLOCK {
    EFI_HII_GLYPH_BLOCK Header;
    EFI_HII_GLYPH_INFO Cell;
} EFI_HII_GIBT_DEFAULTS_BLOCK;
```

**Members**

- **Header**: Standard glyph block header, where `Header.BlockType = EFI_HII_GIBT_DEFAULTS`.
- **Cell**: The new default cell information which will be applied to all subsequent `GLYPH_DEFAULT` and `GLYPHS_DEFAULT` blocks.

**Description**

Changes the default cell information used for subsequent `EFI_HII_GIBT_GLYPH_DEFAULT` and `EFI_HII_GIBT_GLYPHS_DEFAULT` glyph blocks. The cell information described by `Cell` remains in effect until the next `EFI_HII_GIBT_DEFAULTS` is found. Prior to the first `EFI_HII_GIBT_DEFAULTS` block, the cell information in the fixed header are used.
33.3.3.2.2 EFI_HII_GIBT_DUPLICATE

Summary
Assigns a new character value to a previously defined glyph.

Prototype
```c
typedef struct _EFI_HII_GIBT_DUPLICATE_BLOCK {
    EFI_HII_GLYPH_BLOCK    Header;
    CHAR16                 CharValue;
} EFI_HII_GIBT_DUPLICATE_BLOCK;
```

Members
- **Header**
  Standard glyph block header, where `Header.BlockType = EFI_HII_GIBT_DUPLICATE`.
- **CharValue**
  The previously defined character value with the exact same glyph.

Description
Indicates that the glyph with character value `CharValueCurrent` has the same glyph as a previously defined character value and increments `CharValueCurrent` by one.

33.3.3.2.3 EFI_HII_GIBT_END

Summary
Marks the end of the glyph information.

Prototype
```c
typedef struct _EFI_GLYPH_GIBT_END_BLOCK {
    EFI_HII_GLYPH_BLOCK    Header;
} EFI_GLYPH_GIBT_END_BLOCK;
```

Members
- **Header**
  Standard glyph block header, where `Header.BlockType = EFI_HII_GIBT_END`.

Description
Any glyphs with a character value greater than or equal to `CharValueCurrent` are empty.

33.3.3.2.4 EFI_HII_GIBT_EXT1, EFI_HII_GIBT_EXT2, EFI_HII_GIBT_EXT4

Summary
Future expansion block types which have a length byte.
Prototype

```c
typedef struct _EFI_HII_GIBT_EXT1_BLOCK {
    EFI_HII_GLYPH_BLOCK Header;
    UINT8     BlockType2;
    UINT8     Length;
} EFI_HII_GIBT_EXT1_BLOCK;

typedef struct _EFI_HII_GIBT_EXT2_BLOCK {
    EFI_HII_GLYPH_BLOCK Header;
    UINT8     BlockType2;
    UINT16    Length;
} EFI_HII_GIBT_EXT2_BLOCK;

typedef struct _EFI_HII_GIBT_EXT4_BLOCK {
    EFI_HII_GLYPH_BLOCK Header;
    UINT8     BlockType2;
    UINT32    Length;
} EFI_HII_GIBT_EXT4_BLOCK;
```

Members

- **Header**
  - Standard glyph block header, where `Header.BlockType` = `EFI_HII_GIBT_EXT1`, `EFI_HII_GIBT_EXT2` or `EFI_HII_GIBT_EXT4`.

- **Length**
  - Size of the glyph block, in bytes.

- **BlockType2**
  - Indicates the type of extended block. Currently all extended block types are reserved for future expansion.

Description

These are reserved for future expansion, with length bytes included so that they can be easily skipped.

**33.3.3.2.5 EFI_HII_GIBT_GLYPH**

Summary

Provide the bitmap for a single glyph.
Prototype

```c
typedef struct _EFI_HII_GIBT_GLYPH_BLOCK {
    EFI_HII_GLYPH_BLOCK Header;
    EFI_HII_GLYPH_INFO Cell;
    UINT8 BitmapData[1];
} EFI_HII_GIBT_GLYPH_BLOCK;
```

Members

- **Header**
  Standard glyph block header, where `Header.BlockType` = `EFI_HII_GIBT_GLYPH`.

- **Cell**
  Contains the width and height of the encoded bitmap (`Cell.Width` and `Cell.Height`), the number of pixels (signed) right of the character cell origin where the left edge of the bitmap should be placed (`Cell.OffsetX`), the number of pixels above the character cell origin where the top edge of the bitmap should be placed (`Cell.OffsetY`) and the number of pixels (signed) to move right to find the origin for the next character cell (`Cell.AdvanceX`).

- **GlyphCount**
  The number of glyph bitmaps.

- **BitmapData**
  The bitmap data specifies a series of pixels, one bit per pixel, left-to-right, top-to-bottom. Each glyph bitmap only encodes the portion of the bitmap enclosed by its character-bounding box, but the entire glyph is padded out to the nearest byte. The number of bytes per bitmap can be calculated as: `((Cell.Width + 7)/8) * Cell.Height`.

Description

This block provides the bitmap for the character with the value `CharValueCurrent` and increments `CharValueCurrent` by one. Each glyph contains a glyph width and height, a drawing offset, number of pixels to advance after drawing and then the encoded bitmap.

33.3.3.2.6 EFI_HII_GIBT_GLYPHS

Summary

Provide the bitmaps for multiple glyphs with the same cell information.
Prototype

typedef struct _EFI_HII_GIBT_GLYPHS_BLOCK {
    EFI_HII_GLYPH_BLOCK Header;
    EFI_HII_GLYPH_INFO Cell;
    UINT16 Count
    UINT8 BitmapData[1];
} EFI_HII_GIBT_GLYPHS_BLOCK;

Members

Header

Standard glyph block header, where Header.BlockType = EFI_HII_GIBT_GLYPHS.

Cell

Contains the width and height of the encoded bitmap (Cell.Width and Cell.Height), the number of pixels (signed) right of the character cell origin where the left edge of the bitmap should be placed (Cell.OffsetX), the number of pixels above the character cell origin where the top edge of the bitmap should be placed (Cell.OffsetY) and the number of pixels (signed) to move right to find the origin for the next character cell (Cell.AdvanceX).

BitmapData

The bitmap data specifies a series of pixels, one per pixel, left-to-right, top-to-bottom, for each glyph. Each glyph bitmap only encodes the portion of the bitmap enclosed by its character-bounding box. The number of bytes per bitmap can be calculated as: \((\text{Cell.Width} + 7)/8\) * Cell.Height.

Description

Provides the bitmaps for the characters with the values CharValueCurrent through CharValueCurrent + Count - 1 and increments CharValueCurrent by Count. These glyphs have identical cell information and the encoded bitmaps are exactly the same number of bytes.

33.3.3.2.7 EFI_HII_GIBT_GLYPH_DEFAULT

Summary

Provide the bitmap for a single glyph, using the default cell information.

Prototype

typedef struct _EFI_HII_GIBT_GLYPH_DEFAULT_BLOCK {
    EFI_HII_GLYPH_BLOCK Header;
    UINT8 BitmapData[];
} EFI_HII_GIBT_GLYPH_DEFAULT_BLOCK;

Members

Header

Standard glyph block header, where Header.BlockType = EFI_HII_GIBT_GLYPH_DEFAULT.
**BitmapData**

The bitmap data specifies a series of pixels, one bit per pixel, left-to-right, top-to-bottom. Each glyph bitmap only encodes the portion of the bitmap enclosed by its character-bounding box. The number of bytes per bitmap can be calculated as:

\[
((\text{Global.Cell.Width} + 7)/8) \times \text{Global.Cell.Height}
\]

**Description**

Provides the bitmap for the character with the value `CharValueCurrent` and increments `CharValueCurrent` by 1. This glyph uses the default cell information. The default cell information is found in the font header or the most recently processed `EFI_HII_GIBT_DEFAULTS`.

### 33.3.3.2.8 EFI_HII_GIBT_GLYPHS_DEFAULT

**Summary**

Provide the bitmaps for multiple glyphs with the default cell information

**Prototype**

```c
typedef struct _EFI_HII_GIBT_GLYPHS_DEFAULT_BLOCK {
    EFI_HII_GLYPH_BLOCK Header;
    UINT16       Count;
    UINT8        BitmapData[];
} EFI_HII_GIBT_GLYPHS_DEFAULT_BLOCK;
```

**Members**

- **Header**
  
  Standard glyph block header, where `Header.BlockType = EFI_HII_GIBT_GLYPHS_DEFAULT`.

- **Count**
  
  Number of glyphs in the glyph block.

- **BitmapData**
  
  The bitmap data specifies a series of pixels, one bit per pixel, left-to-right, top-to-bottom, for each glyph. Each glyph bitmap only encodes the portion of the bitmap enclosed by its character-bounding box. The number of bytes per bitmap can be calculated as:

  \[
  ((\text{Global.Cell.Width} + 7)/8) \times \text{Global.Cell.Height}
  \]

**Description**

Provides the bitmaps for the characters with the values `CharValueCurrent` through `CharValueCurrent + Count - 1` and increments `CharValueCurrent` by `Count`. These glyphs use the default cell information and the encoded bitmaps have exactly the same number of bytes.

### 33.3.3.2.9 EFI_HII_GIBT_SKIPx

**Summary**

Increments the current character value `CharValueCurrent` by the number specified.
Prototype

```c
typedef struct _EFI_HII_GIBT_SKIP2_BLOCK {
    EFI_HII_GLYPH_BLOCK  Header;
    UINT16               SkipCount;
} EFI_HII_GIBT_SKIP2_BLOCK;

typedef struct _EFI_HII_GIBT_SKIP1_BLOCK {
    EFI_HII_GLYPH_BLOCK  Header;
    UINT8               SkipCount;
} EFI_HII_GIBT_SKIP1_BLOCK;
```

Members

- **Header**
  Standard glyph block header, where `BlockType = EFI_HII_GIBT_SKIP1` or `EFI_HII_GIBT_SKIP2`.

- **SkipCount**
  The unsigned 8- or 16-bit value to add to `CharValueCurrent`.

Description

Increments the current character value `CharValueCurrent` by the number specified.

### 33.3.3.2.10 EFI_HII_GIBT_GLYPH_VARIABILITY

Related Definitions

```c
// **************************************************************
// EFI_HII_GIBT_GLYPH_VARIABILITY (0x14)
// **************************************************************
typedef struct _EFI_HII_GIBT_VARIABILITY_BLOCK {
    EFI_HII_GLYPH_BLOCK  Header;
    EFI_HII_GLYPH_INFO   Cell;
    UINT8               GlyphPackInBits;
    UINT8               BitmapData [1];
} EFI_HII_GIBT_VARIABILITY_BLOCK;
```

Member

- **Header**
  Standard glyph block header, where `BlockType = EFI_HII_GIBT_GLYPH_VARIABILITY`.

- **Cell**
  Contains the width and height of the encoded bitmap (`Cell.Width` and `Cell.Height`), the number of pixels (signed) right of the character cell origin where the left edge of the bitmap should be placed (`Cell.OffsetX`), the number of pixels above the character cell origin where the top edge of the
bitmap should be placed (Cell.OffsetY) and the number of pixels (signed) to move right to find the origin for the next character cell (Cell.AdvanceX).

**GlyphPackInBits**

This describes the bit length for each pixel in glyph. With this, the length of BitmapData can be determined according to GlyphPackInBits, cell.with and cell.height.

The valid value is `GIBT_VARIABILITY_BLOCK_1_BIT`, `GIBT_VARIABILITY_BLOCK_2_BIT`, `GIBT_VARIABILITY_BLOCK_4_BIT`, `GIBT_VARIABILITY_BLOCK_8_BIT`, `GIBT_VARIABILITY_BLOCK_16_BIT`, `GIBT_VARIABILITY_BLOCK_24_BIT`, `GIBT_VARIABILITY_BLOCK_32_BIT`

HII Font Ex protocol has no idea about how to decode the bitmap of glyph if the glyph is declared as `EFI_HII_GIBT_GLYPH_VARIABILITY`. The bitmap decoding is resolved in `EFI_HII_FONT_GLPHY_GENERATOR_PROTOCOL`. This field is used to determine the length of entire glyph block.

**BitmapData**

The raw data of the glyph pixels. The format of the glyph pixel depends on the glyph generator. Only `EFI_HII_FONT_GLPHY_GENERATOR_PROTOCOL` knows how to draw the glyph.
33.3.4 Device Path Package

Summary
The device path package is used to carry a device path associated with the package list.

Prototype

```c
typedef struct _EFI_HII_DEVICE_PATH_PACKAGE {
    EFI_HII_PACKAGE_HEADER Header;
    EFI_DEVICE_PATH_PROTOCOL DevicePath[];
} EFI_HII_DEVICE_PATH_PACKAGE;
```

Parameters

- **Header**
  The standard package header, where `Header.Type = EFI_HII_PACKAGE_DEVICE_PATH`.

- **DevicePath**
  The Device Path description associated with the driver handle that provided the content sent to the HII database.
### Description

This package is created by `NewPackageList()` when the package list is first added to the HII database by locating the ` EFI_DEVICE_PATH_PROTOCOL` attached to the driver handle passed in to that function.

### 33.3.5 GUID Package

The GUID package is used to carry data where the format is defined by a GUID.

#### Prototype

```c
typedef struct _EFI_HII_GUID_PACKAGE_HDR {
    EFI_HII_PACKAGE_HEADER Header;
    EFI_GUID Guid;
    // Data per GUID definition may follow
} EFI_HII_GUID_PACKAGE_HDR;
```

#### Members

- **Header**
  - The standard package header, where `Header.Type` = `EFI_HII_PACKAGE_TYPE_GUID`.

- **Guid**
  - Identifier which describes the remaining data within the package.

#### Description

This is a free-form package type designed to allow extensibility by allowing the format to be specified using `Guid`.

### 33.3.6 String Package

The Strings package record describes the mapping between string identifiers and the actual text of the strings themselves. The package consists of three parts: a fixed header, the string information and the font information.

#### 33.3.6.1 Fixed Header

The fixed header consists of a standard record header and then the string identifiers contained in this section and the offsets of the string and language information.

#### Prototype

```c
typedef struct _EFI_HII_STRING_PACKAGE_HDR {
    EFI_HII_PACKAGE_HEADER Header;
    UINT32 HdrSize;
    UINT32 StringInfoOffset;
    CHAR16 LanguageWindow[16];
    EFI_STRING_ID LanguageName;
    CHAR8 Language[ ... ];
} EFI_HII_STRING_PACKAGE_HDR;
```
Members

Header

The standard package header, where Header.Type = EFI_HII_PACKAGE_STRINGS.

HdrSize

Size of this header.

StringInfoOffset

Offset, relative to the start of this header, of the string information.

LanguageWindow

Specifies the default values placed in the static and dynamic windows before processing each SCSU-encoded string.

LanguageName

String identifier within the current string package of the full name of the language specified by Language.

Language

The null-terminated ASCII string that specifies the language of the strings in the package. The languages are described as specified by Appendix M.

Related Definition

#define UEFI_CONFIG_LANG "x-UEFI"
#define UEFI_CONFIG_LANG_2 "x-i-UEFI"

33.3.6.2 String Information

For each string identifier, the string information gives the string’s text and font. The string information is encoded as a series of blocks, each with a single byte header. The blocks must be processed in order, using the current string identifier (StringIdCurrent), which is set initially to one (1). Processing continues until an EFI_SIBT_END block is found.

The types of blocks are: string blocks, duplicate blocks, font blocks, and skip blocks. String blocks specify the text and font for the current string identifier and increment to the next string identifier. Duplicate blocks copy the text of a previous string identifier and increment to the next string identifier. Skip blocks skip string identifiers, leaving them blank.
Figure 33-39 String Information Encoded in Blocks

Each block begins with a single byte, which contains the block type.

```c
typedef struct {
    UINT8 BlockType;
    UINT8 BlockBody[];
} EFI_HII_STRING_BLOCK;
```

The following table describes the different block types:

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>

Figure 33-41 String Block Processing: SCSU Processing
33.3.6.2.1 EFI_HII_SIBT_DUPLICATE

Summary
Creates a duplicate of a previously defined string.

Prototype
```c
typedef struct _EFI_HII_SIBT_DUPLICATE_BLOCK {
  EFI_HII_STRING_BLOCK     Header;
  EFI_STRING_ID            StringId;
} EFI_HII_SIBT_DUPLICATE_BLOCK;
```
Members

Header

Standard string block header, where Header.BlockType = EFI_HII_SIBT_DUPLICATE.

StringId

The string identifier of a previously defined string with the exact same string text.

Description

Indicates that the string with string identifier StringIdCurrent is the same as a previously defined string and increments StringIdCurrent by one.

33.3.6.2.2 EFI_HII_SIBT_END

Summary

Marks the end of the string information.

Prototype

typedef struct _EFI_HII_SIBT_END_BLOCK {
  EFI_HII_STRING_BLOCK Header;
} EFI_HII_SIBT_END_BLOCK;

Members

Header

Standard extended header, where Header.Header.BlockType = EFI_HII_SIBT_EXT2 and Header.BlockType2 = EFI_HII_SIBT_FONT.

BlockType2

Indicates the type of extended block. See Section 33.3.6.2 for a list of all block types.

Description

Any strings with a string identifier greater than or equal to StringIdCurrent are empty.

33.3.6.2.3 EFI_HII_SIBT_EXT1, EFI_HII_SIBT_EXT2, EFI_HII_SIBT_EXT4

Summary

Future expansion block types which have a length byte.
Prototype

```
typedef struct _EFI_HII_SIBT_EXT1_BLOCK {
    EFI_HII_STRING_BLOCK  Header;
    UINT8 BlockType2;
    UINT8 Length;
} EFI_HII_SIBT_EXT1_BLOCK;

typedef struct _EFI_HII_SIBT_EXT2_BLOCK {
    EFI_HII_STRING_BLOCK  Header;
    UINT8 BlockType2;
    UINT16 Length;
} EFI_HII_SIBT_EXT2_BLOCK;

typedef struct _EFI_HII_SIBT_EXT4_BLOCK {
    EFI_HII_STRING_BLOCK  Header;
    UINT8 BlockType2;
    UINT32 Length;
} EFI_HII_SIBT_EXT4_BLOCK;
```

Members

- **Header**
  Standard string block header, where `Header.BlockType = EFI_HII_SIBT_EXT1`, `EFI_HII_SIBT_EXT2` or `EFI_HII_SIBT_EXT4`.

- **Length**
  Size of the string block, in bytes.

- **BlockType2**
  Indicates the type of extended block. See Section 33.3.6.2 for a list of all block types.

Description

These are reserved for future expansion, with length bytes included so that they can be easily skipped.

### 33.3.6.2.4 EFI_HII_SIBT_FONT

Summary

Provide information about a single font.
Prototype

typedef struct _EFI_HII_SIBT_FONT_BLOCK {
    EFI_HII_SIBT_EXT2_BLOCK Header;
    UINT8 FontId;
    UINT16 FontSize;
    EFI_HII_FONT_STYLE FontStyle;
    CHAR16 FontName[...];
} EFI_HII_SIBT_FONT_BLOCK;

Members

  Header
    Standard extended header, where Header.BlockType2 = EFI_HII_SIBT_FONT.

  FontId
    Font identifier, which must be unique within the string package.

  FontSize
    Character cell size, in pixels, of the font.

  FontStyle
    Font style. Type EFI_HII_FONT_STYLE is defined in “Related Definitions” in EFI_HII_FONT_PACKAGE_HDR.

  FontName
    Null-terminated font family name.

Description

Associates a font identifier FontId with a font name FontName, size FontSize and style FontStyle. This font identifier may be used with the string blocks. The font identifier 0 is the default font for those string blocks which do not specify a font identifier.

33.3.6.2.5 EFI_HII_SIBT_SKIP1

Summary

Skips string identifiers.

Prototype

typedef struct _EFI_HII_SIBT_SKIP1_BLOCK {
    EFI_HII_STRING_BLOCK Header;
    UINT8 SkipCount;
} EFI_HII_SIBT_SKIP1_BLOCK;

Members

  Header
    Standard string block header, where Header.BlockType = EFI_HII_SIBT_SKIP1.
SkipCount

The unsigned 8-bit value to add to StringIdCurrent.

Description
Increments the current string identifier StringIdCurrent by the number specified.

33.3.6.2.6 EFI_HII_SIBT_SKIP2

Summary
Skips string ids.

Prototype

typedef struct _EFI_HII_SIBT_SKIP2_BLOCK {
    EFI_HII_STRING_BLOCK       Header;
    UINT16                     SkipCount;
} EFI_HII_SIBT_SKIP2_BLOCK;

Members

Header
Standard string block header, where Header.BlockType = EFI_HII_SIBT_SKIP2.

SkipCount
The unsigned 16-bit value to add to StringIdCurrent.

Description
Increments the current string identifier StringIdCurrent by the number specified.

33.3.6.2.7 EFI_HII_SIBT_STRING_SCSU

Summary
Describe a string encoded using SCSU, in the default font.

Prototype

typedef struct _EFI_HII_SIBT_STRING_SCSU_BLOCK {
    EFI_HII_STRING_BLOCK     Header;
    UINT8                    StringText[];
} EFI_HII_SIBT_STRING_SCSU_BLOCK;

Members

Header
Standard header where Header.BlockType = EFI_HII_SIBT_STRING_SCSU.

StringText
The string text is a null-terminated string, which is assigned to the string identifier StringIdCurrent.
Description
This string block provides the SCSU-encoded text for the string in the default font with string identifier StringIdCurrent and increments StringIdCurrent by one.

33.3.6.2.8 EFI_HII_SIBT_STRING_SCSU_FONT

Summary
Describe a string in the specified font.

Prototype

typedef struct _EFI_HII_SIBT_STRING_SCSU_FONT_BLOCK {
  EFI_HII_STRING_BLOCK Header;
  UINT8 FontIdentifier;
  UINT8 StringText[];
} EFI_HII_SIBT_STRING_SCSU_FONT_BLOCK;

Members

  Header
  Standard string block header, where Header.BlockType = EFI_HII_SIBT_STRING_SCSU_FONT.

  FontIdentifier
  The identifier of the font to be used as the starting font for the entire string. The identifier must either be 0 for the default font or an identifier previously specified by an EFI_HII_SIBT_FONT block. Any string characters that deviates from this font family, size or style must provide an explicit control character. See Section 33.2.6.2.4.

  StringText
  The string text is a null-terminated encoded string, which is assigned to the string identifier StringIdCurrent.

Description
This string block provides the SCSU-encoded text for the string in the font specified by FontIdentifier with string identifier StringIdCurrent and increments StringIdCurrent by one.

33.3.6.2.9 EFI_HII_SIBT_STRINGS_SCSU

Summary
Describe strings in the default font.
Prototype

```c
typedef struct _EFI_HII_SIBT_STRINGS_SCSU_BLOCK {
  EFI_HII_STRING_BLOCK Header;
  UINT16 StringCount;
  UINT8 StringText[];
} EFI_HII_SIBT_STRINGS_SCSU_BLOCK;
```

Members

- **Header**
  Standard header where `Header.BlockType = EFI_HII_SIBT_STRINGS_SCSU`.

- **StringCount**
  Number of strings in `StringText`.

- **StringText**
  The strings, where each string is a null-terminated encoded string.

Description

This string block provides the SCSU-encoded text for `StringCount` strings which have the default font and which have sequential string identifiers. The strings are assigned the identifiers, starting with `StringIdCurrent` and continuing through `StringIdCurrent + StringCount – 1`. `StringIdCurrent` is incremented by `StringCount`.

33.3.6.2.10 EFI_HII_SIBT_STRINGS_SCSU_FONT

Summary

Describe strings in the specified font.

Prototype

```c
typedef struct _EFI_HII_SIBT_STRINGS_SCSU_FONT_BLOCK {
  EFI_HII_STRING_BLOCK Header;
  UINT8 FontIdentifier;
  UINT16 StringCount;
  UINT8 StringText[];
} EFI_HII_SIBT_STRINGS_SCSU_FONT_BLOCK;
```

Members

- **Header**
  Standard header where `Header.BlockType = EFI_HII_SIBT_STRINGS_SCSU_FONT`.

- **StringCount**
  Number of strings in `StringText`.

- **FontIdentifier**
  The identifier of the font to be used as the starting font for the entire string. The identifier must either be 0 for the default font or an identifier previously specified by
an **EFI_HII_SIBT_FONT** block. Any string characters that deviates from this font family, size or style must provide an explicit control character. See [Section 33.2.6.2.4](#).

**StringText**

The strings, where each string is a null-terminated encoded string.

**Description**

This string block provides the SCSU-encoded text for **StringCount** strings which have the font specified by **FontIdentifier** and which have sequential string identifiers. The strings are assigned the identifiers, starting with **StringIdCurrent** and continuing through **StringIdCurrent + StringCount – 1**. **StringIdCurrent** is incremented by **StringCount**.

### 33.3.6.2.11 EFI_HII_SIBT_STRING_UCS2

**Summary**

Describe a string in the default font.

**Prototype**

```c
typedef struct _EFI_HII_SIBT_STRING_UCS2_BLOCK {
    EFI_HII_STRING_BLOCK     Header;
    CHAR16                   StringText[];
} EFI_HII_SIBT_STRING_UCS2_BLOCK;
```

**Members**

- **Header**
  
  Standard header where **Header.BlockType** = **EFI_HII_SIBT_STRING_UCS2**.

- **StringText**
  
  The string text is a null-terminated UCS-2 string, which is assigned to the string identifier **StringIdCurrent**.

**Description**

This string block provides the UCS-2 encoded text for the string in the default font with string identifier **StringIdCurrent** and increments **StringIdCurrent** by one.

### 33.3.6.2.12 EFI_HII_SIBT_STRING_UCS2_FONT

**Summary**

Describe a string in the specified font.
Prototype

```c
typedef struct _EFI_HII_SIBT_STRING_UCS2_FONT_BLOCK {
  EFI_HII_STRING_BLOCK   Header;
  UINT8                  FontIdentifier;
  CHAR16                 StringText[];
} EFI_HII_SIBT_STRING_UCS2_FONT_BLOCK;
```

Members

- **Header**
  Standard header where `Header.BlockType = EFI_HII_SIBT_STRING_UCS2_FONT`.

- **FontIdentifier**
  The identifier of the font to be used as the starting font for the entire string. The identifier must either be 0 for the default font or an identifier previously specified by an `EFI_HII_SIBT_FONT` block. Any string characters that deviates from this font family, size or style must provide an explicit control character. See Section 33.2.6.2.4.

- **StringText**
  The string text is a null-terminated UCS-2 string, which is assigned to the string identifier `StringIdCurrent`.

Description

This string block provides the UCS-2 encoded text for the string in the font specified by `FontIdentifier` with string identifier `StringIdCurrent` and increments `StringIdCurrent` by one.

33.3.6.2.13 EFI_HII_SIBT_STRINGS_UCS2

Summary

Describes strings in the default font.

Prototype

```c
typedef struct _EFI_HII_SIBT_STRINGS_UCS2_BLOCK {
  EFI_HII_STRING_BLOCK   Header;
  UINT16                 StringCount;
  CHAR16                 StringText[];
} EFI_HII_SIBT_STRINGS_UCS2_BLOCK;
```

Members

- **Header**
  Standard header where `Header.BlockType = EFI_HII_SIBT_STRINGS_UCS2`.

- **StringCount**
  Number of strings in `StringText`.
**StringText**

The string text is a series of null-terminated UCS-2 strings, which are assigned to the string identifiers `StringIdCurrent` to `StringIdCurrent + StringCount – 1`.

**Description**

This string block provides the UCS-2 encoded text for the strings in the default font with string identifiers `StringIdCurrent` to `StringIdCurrent + StringCount – 1` and increments `StringIdCurrent` by `StringCount`.

### 33.3.6.2.14 EFI_HII_SIBT_STRINGS_UCS2_FONT

**Summary**

Describes strings in the specified font.

**Prototype**

```c
typedef struct _EFI_HII_SIBT_STRINGS_UCS2_FONT_BLOCK {
    EFI_HII_STRING_BLOCK    Header;
    UINT8                   FontIdentifier;
    UINT16                  StringCount;
    CHAR16                  StringText[];
} EFI_HII_SIBT_STRINGS_UCS2_FONT_BLOCK;
```

**Members**

* **Header**
  
  Standard header where `Header.BlockType = EFI_HII_SIBT_STRINGS_UCS2_FONT`.

* **FontIdentifier**
  
  The identifier of the font to be used as the starting font for the entire string. The identifier must either be 0 for the default font or an identifier previously specified by an `EFI_HII_SIBT_FONT` block. Any string characters that deviates from this font family, size or style must provide an explicit control character. See Section 33.2.6.2.4.

* **StringCount**

  Number of strings in `StringText`.

* **StringText**

  The string text is a series of null-terminated UCS-2 strings, which are assigned to the string identifiers `StringIdCurrent` through `StringIdCurrent + StringCount – 1`.

**Description**

This string block provides the UCS-2 encoded text for the strings in the font specified by `FontIdentifier` with string identifiers `StringIdCurrent` to `StringIdCurrent + StringCount – 1` and increments `StringIdCurrent` by `StringCount`. 
33.3.6.3 String Encoding

Each of the following sections describes part of how string text is encoded.

33.3.6.3.1 Standard Compression Scheme for Unicode (SCSU)

The Unicode consortium provides a standard text compression algorithm, which minimizes the amount of storage required for multiple-language strings. For more information, see “Links to UEFI-Related Documents” (http://uefi.org/uefi) under the heading “Unicode Compression Scheme”.

This specification extends the technique described in the following ways:

- The strings use the control code 0x7F to introduce the control codes described in Section 33.2.6.2.4. The following byte is the control code. The character value 0x7F will be encoded as 0x01 (SQ0) 0x7F.
- The language information contains default static and dynamic code windows, whereas SCSU provides fixed values for these.
- Characters between 0xF000 and 0xFCFF should be rejected.

33.3.6.3.2 Unicode 2-Byte Encoding (UCS-2)

The Unicode consortium provides a standard encoding algorithm, which takes two bytes per character. For more information see “Links to UEFI-Related Documents” (http://uefi.org/uefi) under the heading “Unicode Consortium”.

Characters between 0xF000 and 0xFCFF should be rejected.

33.3.7 Image Package

The Image package record describes the mapping between image identifiers and the pixels of the image themselves. The package consists of three parts: a fixed header, image information and the palette information.

33.3.7.1 Fixed Header

Summary

The fixed header consists of a standard record header and the offsets of the image and palette information.

Prototype

```c
typedef struct _EFI_HII_IMAGE_PACKAGE_HDR {
    EFI_HII_PACKAGE_HEADER Header;
    UINT32 ImageInfoOffset;
    UINT32 PaletteInfoOffset;
} EFI_HII_IMAGE_PACKAGE_HDR;
```

Members

- **Header**

  Standard package header, where Header.Type = EFI_HII_PACKAGE_IMAGES.
**ImageInfoOffset**
Offset, relative to this header, of the image information. If this is zero, then there are no images in the package.

**PaletteInfoOffset**
Offset, relative to this header, of the palette information. If this is zero, then there are no palettes in the image package.

### 33.3.7.2 Image Information
For each image identifier, the image information gives the bitmap and the relevant palette. The image information is encoded as a series of blocks, each with a single byte header. The blocks must be processed in order.

Each block begins with a single byte, which contains the block type.

```c
typedef struct _EFI_HII_IMAGE_BLOCK {
    UINT8 BlockType;
    UINT8 BlockBody[];
} EFI_HII_IMAGE_BLOCK;
```

![Image Information Encoded in Blocks](image.png)

Figure 33-43 Image Information Encoded in Blocks
The following table describes the different block types:

**Table 33-9 Block Types**

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_HII_IIBT_END</td>
<td>0x00</td>
<td>The end of the image information.</td>
</tr>
<tr>
<td>EFI_HII_IIBT_IMAGE_1BIT</td>
<td>0x10</td>
<td>1-bit w/palette</td>
</tr>
<tr>
<td>EFI_HII_IIBT_IMAGE_1BIT_TRANS</td>
<td>0x11</td>
<td>1-bit w/palette &amp; transparency</td>
</tr>
<tr>
<td>EFI_HII_IIBT_IMAGE_4BIT</td>
<td>0x12</td>
<td>4-bit w/palette</td>
</tr>
<tr>
<td>EFI_HII_IIBT_IMAGE_4BIT_TRANS</td>
<td>0x13</td>
<td>4-bit w/palette &amp; transparency</td>
</tr>
<tr>
<td>EFI_HII_IIBT_IMAGE_8BIT</td>
<td>0x14</td>
<td>8-bit w/palette</td>
</tr>
<tr>
<td>EFI_HII_IIBT_IMAGE_8BIT_TRANS</td>
<td>0x15</td>
<td>8-bit w/palette &amp; transparency</td>
</tr>
<tr>
<td>EFI_HII_IIBT_IMAGE_24BIT</td>
<td>0x16</td>
<td>24-bit RGB</td>
</tr>
<tr>
<td>EFI_HII_IIBT_IMAGE_24BIT_TRANS</td>
<td>0x17</td>
<td>24-bit RGB w/transparency</td>
</tr>
<tr>
<td>EFI_HII_IIBT_IMAGE_JPEG</td>
<td>0x18</td>
<td>JPEG encoded image</td>
</tr>
<tr>
<td>EFI_HII_IIBT_IMAGE_PNG</td>
<td>0x19</td>
<td>PNG encoded image</td>
</tr>
<tr>
<td>EFI_HII_IIBT_DUPLICATE</td>
<td>0x20</td>
<td>Duplicate an existing image identifier</td>
</tr>
<tr>
<td>EFI_HII_IIBT_SKIP2</td>
<td>0x21</td>
<td>Skip a certain number of image identifiers</td>
</tr>
<tr>
<td>EFI_HII_IIBT_SKIP1</td>
<td>0x22</td>
<td>Skip a certain number of image identifiers</td>
</tr>
<tr>
<td>EFI_HII_IIBT_EXT1</td>
<td>0x30</td>
<td>For future expansion (one byte length field)</td>
</tr>
<tr>
<td>EFI_HII_IIBT_EXT2</td>
<td>0x31</td>
<td>For future expansion (two byte length field)</td>
</tr>
<tr>
<td>EFI_HII_IIBT_EXT4</td>
<td>0x32</td>
<td>For future expansion (four byte length field)</td>
</tr>
</tbody>
</table>

In order to recreate all images, start at the first block and process them all until an **EFI_HII_IIBT_END_BLOCK** block is found. When processing the image blocks, each block refers to the current image identifier (ImageIdCurrent), which is initially set to one (1). Image blocks of an unknown type should be skipped. If they cannot be skipped, then processing halts.

### 33.3.7.2.1 EFI_HII_IIBT_END

**Summary**

Marks the end of the image information.

**Prototype**

```
#define EFI_HII_IIBT_END 0x00

typedef struct _EFI_HII_IIBT_END_BLOCK {
  EFI_HII_IMAGE_BLOCK Header;
} EFI_HII_IIBT_END_BLOCK;
```

**Members**

- **Header**

  Standard image block header, where Header.BlockType = **EFI_HII_IIBT_END_BLOCK**.
BlockType2

Indicates the type of extended block. See Section 33.3.6.2 for a list of all block types.

Description

Any images with an image identifier greater than or equal to ImageIdCurrent are empty.

33.3.7.2 EFI_HII_IIBT_EXT1, EFI_HII_IIBT_EXT2, EFI_HII_IIBT_EXT4

Summary

Generic prefix for image information with a 1-byte length.

Prototype

```c
#define EFI_HII_IIBT_EXT1 0x30
typedef struct _EFI_HII_IIBT_EXT1_BLOCK {
  EFI_HII_IMAGE_BLOCK  Header;
  UINT8    BlockType2;
  UINT8    Length;
} EFI_HII_IIBT_EXT1_BLOCK;

#define EFI_HII_IIBT_EXT2 0x31
typedef struct _EFI_HII_IIBT_EXT2_BLOCK {
  EFI_HII_IMAGE_BLOCK  Header;
  UINT8    BlockType2;
  UINT16   Length;
} EFI_HII_IIBT_EXT2_BLOCK;

#define EFI_HII_IIBT_EXT4 0x32
typedef struct _EFI_HII_IIBT_EXT4_BLOCK {
  EFI_HII_IMAGE_BLOCK  Header;
  UINT8    BlockType2;
  UINT32   Length;
} EFI_HII_IIBT_EXT4_BLOCK;
```

Members

- **Header**
  
  Standard image block header, where Header.BlockType = EFI_HII_IIBT_EXT1_BLOCK, EFI_HII_IIBT_EXT2_BLOCK or EFI_HII_IIBT_EXT4_BLOCK.

- **Length**
  
  Size of the image block, in bytes, including the image block header.

- **BlockType2**
  
  Indicates the type of extended block. See Section 33.3.7.2 for a list of all block types.
Description
Future extensions for image records which need a length-byte length use this prefix.

33.3.7.2.3 EFI_HII_IIBT_IMAGE_1BIT

Summary
One bit-per-pixel graphics image with palette information.

Prototype

```c
typedef struct _EFI_HII_IIBT_IMAGE_1BIT_BASE {
    UINT16 Width;
    UINT16 Height;
    UINT8 Data[ ... ];
} EFI_HII_IIBT_IMAGE_1BIT_BASE;

#define EFI_HII_IIBT_IMAGE_1BIT 0x10

typedef struct _EFI_HII_IIBT_IMAGE_1BIT_BLOCK {
    EFI_HII_IMAGE_BLOCK Header;
    UINT8 PaletteIndex;
    EFI_HII_IIBT_IMAGE_1BIT_BASE Bitmap;
} EFI_HII_IIBIT_IMAGE_1BIT_BLOCK;
```

Members

- **Header**
  Standard image header, where `Header.BlockType = EFI_HII_IIBT_IMAGE_1BIT`.

- **Width**
  Width of the bitmap in pixels.

- **Height**
  Height of the bitmap in pixels.

- **Bitmap**
  The bitmap specifies a series of pixels, one bit per pixel, left-to-right, top-to-bottom, and is padded out to the nearest byte. The number of bytes per bitmap can be calculated as: \((\text{Width} + 7)/8\) * \(\text{Height}\).

- **PaletteIndex**
  Index of the palette in the palette information.

Description
This record assigns the 1-bit-per-pixel bitmap data to the `ImageIdCurrent` identifier and increment `ImageIdCurrent` by one. The image’s upper left hand corner pixel is the most significant bit of the first bitmap byte. An example of a `EFI_HII_IIBT_IMAGE_1BIT` structure is shown below:
33.3.7.2.4 EFI_HII_IIBT_IMAGE_1BIT_TRANS

Summary

One bit-per-pixel graphics image with palette information and transparency.

Prototype

```c
#define EFI_HII_IIBT_IMAGE_1BIT_TRANS 0x11

typedef struct _EFI_HII_IIBT_IMAGE_1BIT_TRANS_BLOCK {
    EFI_HII_IMAGE_BLOCK Header;
    UINT8 PaletteIndex;
    EFI_HII_IIBT_IMAGE_1BIT_BASE Bitmap;
} EFI_HII_IIBT_IMAGE_1BIT_TRANS_BLOCK;
```

Members

*Header*

Standard image header, where `Header.BlockType = EFI_HII_IIBT_IMAGE_1BIT_TRANS`.

*PaletteIndex*

Index of the palette in the palette information.
**Bitmap**

The bitmap specifies a series of pixels, one bit per pixel, left-to-right, top-to-bottom, and is padded out to the nearest byte. The number of bytes per bitmap can be calculated as: \((\text{Width} + 7)/8 \times \text{Height}\).

**Description**

This record assigns the 1-bit-per-pixel bitmap data to the `ImageIdCurrent` identifier and increment `ImageIdCurrent` by one. The data in the `EFI_HII_IIBT_IMAGE_1BIT_TRANS` structure is exactly the same as the `EFI_HII_IIBT_IMAGE_1BIT` structure, the difference is how the data is treated.

The bitmap pixel value 0 is the ‘transparency’ value and will not be written to the screen. The bitmap pixel value 1 will be translated to the color specified by `Palette`.

### 33.3.7.2.5 EFI_HII_IIBT_IMAGE_24BIT

**Summary**

A 24 bit-per-pixel graphics image.

**Prototype**

```c
#define EFI_HII_IIBT_IMAGE_24BIT 0x16

typedef struct _EFI_HII_IIBT_IMAGE_24BIT_BASE
    UINT16 Width;
    UINT16 Height;
    EFI_HII_RGB_PIXEL Bitmap[ ... ];
} EFI_HII_IIBT_IMAGE_24BIT_BASE;

typedef struct _EFI_HII_IIBT_IMAGE_24BIT_BLOCK {
    EFI_HII_IMAGE_BLOCK Header;
    EFI_HII_IIBT_IMAGE_24BIT_BASE Bitmap;
} EFI_HII_IIBT_IMAGE_24BIT_BASE;
```

**Members**

- **Width**
  - Width of the bitmap in pixels.

- **Height**
  - Height of the bitmap in pixels.

- **Header**
  - Standard image header, where `Header.BlockType = EFI_HII_IIBT_IMAGE_24BIT`.

- **Bitmap**
  - The bitmap specifies a series of pixels, 24 bits per pixel, left-to-right, top-to-bottom. The number of bytes per bitmap can be calculated as: \((\text{Width} \times 3) \times \text{Height}\). Type `EFI_HII.RGB_PIXEL` is defined in “Related Definitions” below.
Description
This record assigns the 24-bit-per-pixel bitmap data to the `ImageIdCurrent` identifier and increment `ImageIdCurrent` by one. The image's upper left hand corner pixel is composed of the first three bitmap bytes. The first byte is the pixel's blue component value, the next byte is the pixel's green component value, and the third byte is the pixel's red component value (B,G,R). Each color component value can vary from 0x00 (color off) to 0xFF (color full on), allowing 16.8 millions colors that can be specified.

Related Definitions
```c
typedef struct _EFI_HII_RGB_PIXEL {
    UINT8 b;
    UINT8 g;
    UINT8 r;
} EFI_HII_RGB_PIXEL;
```

- `b` The relative intensity of blue in the pixel's color, from off (0x00) to full-on (0xFF).
- `g` The relative intensity of green in the pixel's color, from off (0x00) to full-on (0xFF).
- `r` The relative intensity of red in the pixel's color, from off (0x00) to full-on (0xFF).

33.3.7.2.6 EFI_HII_IIBT_IMAGE_24BIT_TRANS

Summary
A 24 bit-per-pixel graphics image with transparency.

Prototype
```c
#define _EFI_HII_IIBT_IMAGE_24BIT_TRANS 0x17

typedef struct EFI_HII_IIBT_IMAGE_24BIT_TRANS_BLOCK {
    EFI_HII_IMAGE_BLOCK Header;
    EFI_HII_IIBT_IMAGE_24BIT_BASE Bitmap;
} EFI_HII_IIBT_IMAGE_24BIT_TRANS_BLOCK;
```

Members
- `Header` Standard image header, where `Header.BlockType = EFI_HII_IIBT_IMAGE_24BIT_TRANS`.
- `Bitmap` The bitmap specifies a series of pixels, 24 bits per pixel, left-to-right, top-to-bottom. The number of bytes per bitmap can be calculated as: (Width * 3) * Height.
- `Width` Width of the bitmap in pixels.
**Height**

Height of the bitmap in pixels.

**Description**

This record assigns the 24-bit-per-pixel bitmap data to the `ImageIdCurrent` identifier and increment `ImageIdCurrent` by one. The data in the `EFI_HII_IMAGE_24BIT_TRANS` structure is exactly the same as the `EFI_HII_IMAGE_24BIT` structure, the difference is how the data is treated.

The bitmap pixel value 0x00, 0x00, 0x00 is the ‘transparency’ value and will not be written to the screen. All other bitmap pixel values will be written as defined to the screen. Since the ‘transparency’ value replaces true black, for image to display black they should use the color 0x00, 0x00, 0x01 (very dark red)

### 33.3.7.2.7 EFI_HII_IIBT_IMAGE_4BIT

**Summary**

Four bits-per-pixel graphics image with palette information.

**Prototype**

```c
typedef struct _EFI_HII_IIBT_IMAGE_4BIT_BASE {
    UINT16 Width;
    UINT16 Height;
    UINT8 Data[ ... ];
} EFI_HII_IIBT_IMAGE_4BIT_BASE;

#define EFI_HII_IIBT_IMAGE_4BIT 0x12

typedef struct _EFI_HII_IIBT_IMAGE_4BIT_BLOCK {
    EFI_HII_IMAGE_BLOCK Header;
    UINT8 PaletteIndex;
    EFI_HII_IIBT_IMAGE_4BIT_BASE Bitmap;
} EFI_HII_IIBT_IMAGE_4BIT_BLOCK;
```

**Members**

- **Width**
  Width of the bitmap in pixels.

- **Height**
  Height of the bitmap in pixels.

- **Header**
  Standard image header, where `Header.BlockType = EFI_HII_IIBT_IMAGE_4BIT`.

- **PaletteIndex**
  Index of the palette in the palette information.
**Bitmap**

The bitmap specifies a series of pixels, four bits per pixel, *left-to-right, top-to-bottom*, and is padded out to the nearest byte. The number of bytes per bitmap can be calculated as: \((\text{Width} + 1)/2\) * \(\text{Height}\).

**Description**

This record assigns the 4-bit-per-pixel bitmap data to the `ImageIdCurrent` identifier using the specified palette and increment `ImageIdCurrent` by one. The image’s upper left hand corner pixel is the most significant nibble of the first bitmap byte.

### 33.3.7.2.8 EFI_HII_IIBT_IMAGE_4BIT_TRANS

**Summary**

Four bits-per-pixel graphics image with palette information and transparency.

**Prototype**

```c
#define EFI_HII_IIBT_IMAGE_4BIT_TRANS 0x13
typedef struct _EFI_HII_IIBT_IMAGE_4BIT_TRANS_BLOCK {
    EFI_HII_IMAGE_BLOCK Header;
    UINT8 PaletteIndex;
    EFI_HII_IIBT_IMAGE_4BIT_BASE Bitmap;
} EFI_HII_IIBT_IMAGE_4BIT_TRANS_BLOCK;
```

**Members**

- **Header**
  Standard image header, where `Header.BlockType = EFI_HII_IIBT_IMAGE_4BIT_TRANS`.

- **PaletteIndex**
  Index of the palette in the palette information.

- **Bitmap**
  The bitmap specifies a series of pixels, four bits per pixel, *left-to-right, top-to-bottom*, and is padded out to the nearest byte. The number of bytes per bitmap can be calculated as: \((\text{Width} + 1)/2\) * \(\text{Height}\).

**Description**

This record assigns the 4-bit-per-pixel bitmap data to the `ImageIdCurrent` identifier using the specified palette and increment `ImageIdCurrent` by one. The data in the `EFI_HII_IMAGE_4BIT_TRANS` structure is exactly the same as the `EFI_HII_IMAGE_4BIT` structure, the difference is how the data is treated.

The bitmap pixel value 0 is the ‘transparency’ value and will not be written to the screen. All the other bitmap pixel values will be translated to the color specified by `Palette`. 
33.3.7.2.9 EFI_HII_IIBT_IMAGE_8BIT

Summary
Eight bits-per-pixel graphics image with palette information.

Prototype

```c
#define EFI_HII_IIBT_IMAGE_8BIT 0x14

typedef struct _EFI_HII_IIBT_IMAGE_8BIT_BASE {
    UINT16 Width;
    UINT16 Height;
    UINT8 Data[...];
} EFI_HII_IIBT_IMAGE_8BIT_BASE;

typedef struct _EFI_HII_IIBT_IMAGE_8BIT_BLOCK {
    EFI_HII_IMAGE_BLOCK Header;
    UINT8 PalettesIndex;
    EFI_HII_IIBT_IMAGE_8BIT_BASE Bitmap;
} EFI_HII_IIBT_IMAGE_8BIT_BLOCK;
```

Members

- **Width**
  Width of the bitmap in pixels.

- **Height**
  Height of the bitmap in pixels.

- **Header**
  Standard image header, where `Header.BlockType = EFI_HII_IIBT_IMAGE_8BIT`.

- **PalettesIndex**
  Index of the palette in the palette information.

- **Bitmap**
  The bitmap specifies a series of pixels, eight bits per pixel, left-to-right, top-to-bottom. The number of bytes per bitmap can be calculated as: `Width * Height`.

Description
This record assigns the 8-bit-per-pixel bitmap data to the `ImageIdCurrent` identifier using the specified palette and increment `ImageIdCurrent` by one. The image’s upper left hand corner pixel is the first bitmap byte.

33.3.7.2.10 EFI_HII_IIBT_IMAGE_8BIT_TRANS

Summary
Eight bits-per-pixel graphics image with palette information and transparency.
Prototype

```c
#define EFI_HII_IIBT_IMAGE_8BIT_TRANS 0x15

typedef struct _EFI_HII_IIBT_IMAGE_8BIT_TRANS_BLOCK {
    EFI_HII_IMAGE_BLOCK    Header;
    UINT8                  PaletteIndex;
    EFI_HII_IIBT_IMAGE_8BIT_BASE Bitmap;
} EFI_HII_IIBT_IMAGE_8BIT_TRANS_BLOCK;
```

Members

- **Header**
  Standard image header, where `Header.BlockType = EFI_HII_IIBT_IMAGE_8BIT_TRANS`.

- **PaletteIndex**
  Index of the palette in the palette information.

- **Bitmap**
  The bitmap specifies a series of pixels, eight bits per pixel, left-to-right, top-to-bottom. The number of bytes per bitmap can be calculated as: `Width * Height`.

Description

This record assigns the 8-bit-per-pixel bitmap data to the `ImageIdCurrent` identifier using the specified palette and increment `ImageIdCurrent` by one. The data in the `EFI_HII_IMAGE_8BIT_TRANS` structure is exactly the same as the `EFI_HII_IMAGE_8BIT` structure, the difference is how the data is treated.

The bitmap pixel value 0 is the ‘transparency’ value and will not be written to the screen. All the other bitmap pixel values will be translated to the color specified by `Palette`.

### 33.3.7.2.11 EFI_HII_IIBT_DUPLICATE

**Summary**

Assigns a new character value to a previously defined image.

Prototype

```c
#define EFI_HII_IIBT_DUPLICATE 0x20

typedef struct _EFI_HII_IIBT_DUPLICATE_BLOCK {
    EFI_HII_IMAGE_BLOCK    Header;
    EFI_IMAGE_ID           ImageId;
} EFI_HII_IIBT_DUPLICATE_BLOCK;
```

Members

- **Header**
  Standard image header, where `Header.BlockType = EFI_HII_IIBT_DUPLICATE`.
**ImageId**

The previously defined image ID with the exact same image.

**Description**

Indicates that the image with image ID `ImageValueCurrent` has the same image as a previously defined image ID and increments `ImageValueCurrent` by one.

### 33.3.7.2.12 EFI_HII_IIBT_IMAGE_JPEG

**Summary**

A true-color bitmap is encoded with JPEG image compression.

**Prototype**

```c
#define EFI_HII_IIBT_IMAGE_JPEG 0x18

typedef struct _EFI_HII_IIBT_JPEG_BLOCK {
  EFI_HII_IMAGE_BLOCK Header;
  UINT32 Size;
  UINT8 Data[...];
} EFI_HII_IIBT_JPEG;
```

**Members**

- **Header**
  Standard image header, where `Header.BlockType` = `EFI_HII_IIBT_IMAGE_JPEG`.

- **Size**
  Specifies the size of the JPEG encoded data.

- **Data**
  JPEG encoded data with ‘JFIF’ signature at offset 6 in the data block. The JPEG encoded data, specifies type of encoding and final size of true-color image.

**Description**

This record assigns the JPEG image data to the `ImageIdCurrent` identifier and increments `ImageIdCurrent` by one. The JPEG decoder is only required to cover the basic JPEG encoding types, which are produced by standard available paint packages (for example: MSPaint under Windows from Microsoft). This would include JPEG encoding of high (1:1:1) and medium (4:1:1) quality with only three components (R,G,B) – no support for the special gray component encoding.

### 33.3.7.2.13 EFI_HII_IIBT_SKIP1

**Summary**

Skips image IDs.
Prototype

#define EFI_HII_IIBT_SKIP1 0x22

typedef struct _EFI_HII_IIBT_SKIP1_BLOCK {
  EFI_HII_IMAGE_BLOCK Header;
  UINT8 SkipCount;
} EFI_HII_IIBT_SKIP1_BLOCK;

Members

  Header
  Standard image header, where Header.BlockType = EFI_HII_IIBT_SKIP1.

  SkipCount
  The unsigned 8-bit value to add to ImageIdCurrent.

Description

Increments the current image ID ImageIdCurrent by the number specified.

33.3.7.2.14 EFI_HII_IIBT_SKIP2

Summary

Skips image IDs.

Prototype

#define EFI_HII_IIBT_SKIP2 0x21

typedef struct _EFI_HII_IIBT_SKIP2_BLOCK {
  EFI_HII_IMAGE_BLOCK Header;
  UINT16 SkipCount;
} EFI_HII_IIBT_SKIP2_BLOCK;

Members

  Header
  Standard image header, where Header.BlockType = EFI_HII_IIBT_SKIP2.

  SkipCount
  The unsigned 16-bit value to add to ImageIdCurrent.

Description

Increments the current image ID ImageIdCurrent by the number specified.

33.3.7.2.15 EFI_HII_IIBT_PNG_BLOCK

Add a new image block structure for EFI_HII_IIBT_IMAGE_PNG. This supports the PNG image format in EFI HII image database.
Related Definitions

typedef struct _EFI_HII_IIBT_IMAGE_PNG {
    EFI_HII_IMAGE_BLOCK   Header;
    UINT32                Size;
    UINT8 Data[1];
} EFI_HII_IIBT_PNG_BLOCK;

Member

    Header   Standard image block header, where Header.locktype =
             EFI_HII_IIBT_IMAGE_PNG.
    Size     Size of the PNG image.
    Data     The raw data of the PNG image file.

33.3.7.3 Palette Information

Summary
This section describes the palette information within an image package.

Prototype

typedef struct _EFI_HII_IMAGE_PALETTE_INFO_HEADER {
    UINT16 PaletteCount;
} EFI_HII_IMAGE_PALETTE_INFO_HEADER;

Members

    PaletteCount
    Number of palettes.

Description
This fixed header is followed by zero or more variable-length palette information records. The structures
are assigned a number 1 to n.

33.3.7.3.1 Palette Information Records

Summary
A single palette
Prototype

typedef struct _EFI_HII_IMAGE_PALETTE_INFO {
  UINT16 PaletteSize;
  EFI_HII_RGB_PIXEL PaletteValue[...];
} EFI_HII_IMAGE_PALETTE_INFO;

Members

   PaletteSize
       Size of the palette information.

   PaletteValue
       Array of color values. Type EFI_HII_RGB_PIXEL is described in "Related Definitions" in EFI_HII_IIBT_IMAGE_24BIT.

Description

Each palette information record is an array of 24-bit color structures. The first entry (PaletteValue[0]) corresponds to color 0 in the source image; the second entry (PaletteValue[1]) corresponds to color 1, etc. Each palette entry is a three byte entry, with the first byte equal to the blue component of the color, followed by green, and finally red (B,G,R). Each color component value can vary from 0x00 (color off) to 0xFF (color full on), allowing 16.8 millions colors that can be specified.

A black & white 1-bit image would have the following palette structure:

\[
\text{PaletteSize} = 6
\]

\[
\begin{align*}
0. & \text{B(00) G(00) R(00) } \\
1. & \text{B(FF) G(FF) R(FF) } \\
\end{align*}
\]

Figure 33-44 Palette Structure of a Black & White, One-Bit Image
A 4-bit image would have the following palette structure:

![Palette Structure of a Four-Bit Image](image)

Figure 33-45 Palette Structure of a Four-Bit Image

The image palette must only contain the palette entries specified in the bitmap. The bitmap should allocate each color index starting from 0x00, so the palette information can be as small as possible. The following is an example of a palette structure of a 4-bit image that only uses 6 colors:
Each palette entry specifies each unique color in the image. The above figure would be typical of light blue logo on a black background, with several shades of blue for anti-aliasing the blue logo on the black background.

### 33.3.8 Forms Package

The Forms package is used to carry forms-based encoding data.

#### Prototype

```c
typedef struct _EFI_HII_FORM_PACKAGE_HDR {
    EFI_HII_PACKAGE_HEADER Header;
    //EFI_IFR_OP_HEADER OpCodeHeader;
    //More op-codes follow
} EFI_HII_FORM_PACKAGE_HDR;
```

#### Parameters

- **Header**
  
  The standard package header, where `Header.Type = EFI_HII_PACKAGE_FORMS`.

- **OpCodeHeader**
  
  The header for the first of what will be a series of op-codes associated with the forms data described in this package. The syntax of the forms can be referenced in [Section 33.2.5](#).  

#### Description

This is a package type designed to represent Internal Forms Representation (IFR) objects as a collection of op-codes.

### 33.3.8.1 Binary Encoding

The IFR is a binary encoding for HII-related objects. Every object has (at least) three attributes:
Opcode. The enumeration of all of the different HII-related objects.

Length. The length of the opcode itself (2-127 bytes).

Scope. If set, this opens up a new scope. Certain objects describe attributes or capabilities which only apply to the current scope rather than the entire form. The scope extends up to the special END opcode, which marks the end of the current scope.

The binary objects are encoded as byte stream. Every object begins with a standard header (EFI_IFR_OP_HEADER), which describes the opcode type, length and scope.

The simple binary object consists of a standard header, which contains a single 8-bit opcode, a 7-bit length and a 1-bit nesting indicator. The length specifies the number of bytes in the opcode, including the header. The simple binary object may also have zero or more bytes of fixed, object-specific, data.

---

**Figure 33-47 Simple Binary Object**

When the Scope bit is set, it marks the beginning of a new scope which applies to all subsequent opcodes until the matching EFI_IFR_END opcode is found to close the scope. Those opcodes may, in turn, open new scopes as well, creating nested scopes.

33.3.8.2 Standard Headers

33.3.8.2.1 EFI_IFR_OP_HEADER

**Summary**

Standard opcode header

**Prototype**

```c
typedef struct _EFI_IFR_OP_HEADER {
    UINT8 OpCode;
    UINT8 Length:7;
    UINT8 Scope:1;
} EFI_IFR_OP_HEADER;
```

**Members**

- **OpCode** Defines which type of operation is being described by this header. See Section 33.3.8.3 for a list of IFR opcodes.
- **Length** Defines the number of bytes in the opcode, including this header.
- **Scope** If this bit is set, the opcode begins a new scope, which is ended by an EFI_IFR_END opcode.

**Description**

Forms are represented in a binary format roughly similar to processor instructions.
Each header contains an opcode, a length and a scope indicator.

If Scope indicator is set, the scope exists until it reaches a corresponding EFI_IFR_END opcode. Scopes may be nested within other scopes.

Related Definitions

```c
typedef UINT16 EFI_QUESTION_ID;
typedef UINT16 EFI_IMAGE_ID;
typedef UINT16 EFI_STRING_ID;
typedef UINT16 EFI_FORM_ID;
typedef UINT16 EFI_VARSTORE_ID;
typedef UINT16 EFI_ANIMATION_ID;
```

### 33.3.8.2.2 EFI_IFR_QUESTION_HEADER

**Summary**

Standard question header.

**Prototype**

```c
typedef struct _EFI_IFR_QUESTION_HEADER {
  EFI_IFR_STATEMENT_HEADER Header;
  EFI_QUESTION_ID QuestionId;
  EFI_VARSTORE_ID VarStoreId;
  union {
    EFI_STRING_ID VarName;
    UINT16 VarOffset;
  } VarStoreInfo;
  UINT8 Flags;
} EFI_IFR_QUESTION_HEADER;
```

**Members**

- **Header**
  The standard statement header.

- **QuestionId**
  The unique value that identifies the particular question being defined by the opcode. The value of zero is reserved.

- **Flags**
  A bit-mask that determines which unique settings are active for this question. See “Related Definitions” below for the meanings of the individual bits.

- **VarStoreId**
  Specifies the identifier of a previously declared variable store to use when storing the question’s value. A value of zero indicates no associated variable store.

- **VarStoreInfo**
  If VarStoreId refers to Buffer Storage (EFI_IFR_VARSTORE or EFI_IFR_VARSTORE_EFI), then VarStoreInfo contains a 16-bit Buffer Storage offset (VarOffset). If VarStoreId refers to Name/Value Storage (EFI_IFR_VARSTORE_NAME_VALUE), then VarStoreInfo contains the String ID of the name (VarName) for this name/value pair.
Description
This is the standard header for questions.

Related Definitions

```c
// Flags values
#define EFI_IFR_FLAG_READ_ONLY           0x01
#define EFI_IFR_FLAG_CALLBACK            0x04
#define EFI_IFR_FLAG_RESET_REQUIRED      0x10
#define EFI_IFR_FLAG_REST_STYLE          0x20
#define EFI_IFR_FLAG_RECONNECT_REQUIRED  0x40
#define EFI_IFR_FLAG_OPTIONS_ONLY        0x80
```

EFI_IFR_FLAG_READ_ONLY The question is read-only

EFI_IFR_FLAG_CALLBACK Designates if a particular opcode is to be treated as something that will initiate a callback to a registered driver.

EFI_IFR_FLAG_RESET_REQUIRED If a particular choice is modified, designates that a return flag will be activated upon exiting of the browser, which indicates that the changes that the user requested require a reset to enact.

EFI_IFR_FLAG_REST_STYLE Designates if a question supports REST architectural style operation. This flag can be omitted if the formset class guid already contains EFI_HII_REST_STYLE_FORMSET_GUID.

EFI_IFR_FLAG_RECONNECT_REQUIRED If a particular choice is modified, designates that a return flag will be activated upon exiting of the formset or the browser, which indicates that the changes that the user requested require a reconnect to enact.

EFI_IFR_FLAG_OPTIONS_ONLY For questions with options, this indicates that only the options will be available for user choice.

### 33.3.8.2.3 EFI_IFR_STATEMENT_HEADER

Summary
Standard statement header.

Prototype

```c
typedef struct _EFI_IFR_STATEMENT_HEADER {
    EFI_STRING_ID Prompt;
    EFI_STRING_ID Help;
} EFI_IFR_STATEMENT_HEADER;
```
Members

- **Prompt**: The string identifier of the prompt string for this particular statement. The value 0 indicates no prompt string.
- **Help**: The string identifier of the help string for this particular statement. The value 0 indicates no help string.

Description

This is the standard header for statements, including questions.

33.3.8.3 Opcode Reference

This section describes each of the IFR opcode encodings in detail. The table below lists the opcodes in numeric order while the reference section lists them in alphabetic order.

<table>
<thead>

Prototype

```
#define EFI_IFR_ACTION_OP 0x0C
typedef struct _EFI_IFR_ACTION {
    EFI_IFR_OP_HEADER Header;
    EFI_IFR_QUESTION_HEADER Question;
    EFI_STRING_ID QuestionConfig;
} EFI_IFR_ACTION;
```

```
#define EFI_IFR_ACTION_1 {
    EFI_IFR_OP_HEADER Header;
    EFI_IFR_QUESTION_HEADER Question;
} EFI_IFR_ACTION;
```

Members

- **Header**: The standard opcode header, where `Header.OpCode = EFI_IFR_ACTION_OP`
- **Question**: The standard question header. See `EFI_IFR_QUESTION_HEADER` (Section 33.3.8.2.2) for more information.
- **QuestionConfig**: The results string which is in `<ConfigResp>` format will be processed when the button is selected by the user.

Description

Creates an action question. When the question is selected, the configuration string specified by `QuestionConfig` will be processed. If `QuestionConfig` is 0 or is not present, then no configuration string will be processed. This is useful when using an action button only for the callback.

If the question is marked read-only (see `EFI_IFR_QUESTION_HEADER`) then the action question cannot be selected.

33.3.8.3.2 EFI_IFR_ANIMATION

Summary

Creates an image for a statement or question.

Prototype

```
#define EFI_IFR_ANIMATION_OP 0xF
typedef struct _EFI_IFR_ANIMATION {
    EFI_IFR_OP_HEADER Header;
    EFI_ANIMATION_ID Id;
} EFI_IFR_ANIMATION;
```

Members

- **Header**: Standard opcode header, where `Header.OpCode` is `EFI_IFR_ANIMATION_OP`
- **Id**: Animation identifier in the HII database.
Description
Associates an animation from the HII database with the current question, statement or form. If the specified animation does not exist in the HII database.

33.3.8.3.3 EFI_IFR_ADD

Summary
Pops two unsigned integers, adds them and pushes the result.

Prototype
```
#define EFI_IFR_ADD_OP 0x3a
typedef struct _EFI_IFR_ADD {
  EFI_IFR_OP_HEADER Header;
} EFI_IFR_ADD;
```

Members

Description
This opcode performs the following actions:

1. Pop two values from the expression stack. The first popped is the **right-hand** value. The second popped is the **left-hand** value.
2. If the two values do not evaluate to unsigned integers, push Undefined.
3. Zero-extend the **left-hand** and **right-hand** values to 64-bits.
4. Add the left-hand value to right-hand value.
5. Push the lower 64-bits of the result. Overflow is ignored.

33.3.8.3.4 EFI_IFR_AND

Summary
Pops two booleans, push **TRUE** if both are **TRUE**, otherwise push **FALSE**.

Prototype
```
#define EFI_IFR_AND_OP 0x15
typedef struct _EFI_IFR_AND {
  EFI_IFR_OP_HEADER Header;
} EFI_IFR_AND;
```

Members
- **Header**: The standard opcode header, where `Header.OpCode = EFI_IFR_AND_OP`.

Description
This opcode performs the following actions:
1. Pop two expressions from the expression stack.
2. If the two expressions cannot be evaluated as boolean, push Undefined.
3. If both expressions evaluate to **TRUE**, then push **TRUE**. Otherwise, push **FALSE**.

### 33.3.8.3.5 EFI_IFR_BITWISE_AND

**Summary**

Pops two unsigned integers, perform bitwise AND and push the result.

**Prototype**

```c
#define EFI_IFR_BITWISE_AND_OP 0x35
typedef struct _EFI_IFR_BITWISE_AND {
  EFI_IFR_OP_HEADER Header;
} EFI_IFR_BITWISE_AND;
```

**Members**

- **Header**
  

**Description**

This opcode performs the following actions:

1. Pop two expressions from the expression stack.
2. If the two expressions cannot be evaluated as unsigned integers, push Undefined.
3. Otherwise, zero-extend the unsigned integers to 64-bits.
4. Perform a bitwise-AND on the two values.
5. Push the result.

### 33.3.8.3.6 EFI_IFR_BITWISE_NOT

**Summary**

Pop an unsigned integer, perform a bitwise NOT and push the result.

**Prototype**

```c
#define EFI_IFR_BITWISE_NOT_OP 0x37
typedef struct _EFI_IFR_BITWISE_NOT {
  EFI_IFR_OP_HEADER Header;
} EFI_IFR_BITWISE_NOT;
```

**Members**

- **Header**
  
  The standard opcode header, where `Header.OpCode = EFI_IFR_BITWISE_NOT_OP`.

**Description**

This opcode performs the following actions:

1. Pop an expression from the expression stack.
2. If the expression cannot be evaluated as an unsigned integer, push Undefined.
3. Otherwise, zero-extend the unsigned integer to 64-bits.
4. Perform a bitwise-NOT on the value.
5. Push the result.

### 33.3.8.3.7 EFI_IFR_BITWISE_OR

**Summary**

Pops two unsigned integers, perform bitwise OR and push the result.

**Prototype**

```c
#define EFI_IFR_BITWISE_OR_OP 0x36
typedef struct _EFI_IFR_BITWISE_OR {
    EFI_IFR_OP_HEADER Header;
} EFI_IFR_BITWISE_OR;
```

**Members**

- **Header**
  
  Standard opcode header, where **OpCode** is **EFI_IFR_BITWISE_OR_OP**.

**Description**

This opcode performs the following actions:
1. Pop two expressions from the expression stack.
2. If the two expressions cannot be evaluated as unsigned integers, push Undefined.
3. Otherwise, zero-extend the unsigned integers to 64-bits.
4. Perform a bitwise-OR of the two values.
5. Push the result.

### 33.3.8.3.8 EFI_IFR_CATENATE

**Summary**

Pops two buffers or strings, concatenates them and pushes the result.

**Prototype**

```c
#define EFI_IFR_CATENATE_OP 0x5e
typedef struct _EFI_IFR_CATENATE {
    EFI_IFR_OP_HEADER Header;
} EFI_IFR_CATENATE;
```

**Members**

- **Header**
  
  Standard opcode header, where **OpCode** is **EFI_IFR_CATENATE_OP**.

**Description**

This opcode performs the following actions:
1. Pop two expressions from the expression stack. The first expression popped is the left value and the second value popped is the right value.

2. If the left or right values cannot be evaluated as a string or a buffer, push Undefined. If the left or right values are of different types, then push Undefined.

3. If the left and right values are strings, push a new string which contains the contents of the left string (without the NULL terminator) followed by the contents of the right string on to the expression stack.

4. If the left and right values are buffers, push a new buffer that contains the contents of the left buffer followed by the contents of the right buffer on to the expression stack.

33.3.8.3.9 EFI_IFR_CHECKBOX

Summary

Creates a boolean checkbox.

Prototype

```c
#define EFI_IFR_CHECKBOX_OP 0x06
typedef struct _EFI_IFR_CHECKBOX {
    EFI_IFR_OP_HEADER   Header;
    EFI_IFR_QUESTION_HEADER Question;
    UINT8                Flags;
} EFI_IFR_CHECKBOX;
```

Members

- **Header**
  - The standard question header, where `Header.OpCode = EFI_IFR_CHECKBOX_OP`.

- **Question**
  - The standard question header. See `EFI_IFR_QUESTION_HEADER` (Section 33.3.8.2.2) for more information.

- **Flags**
  - Flags that describe the behavior of the question. All undefined bits should be zero. See `EFI_IFR_CHECKBOX_x` in "Related Definitions" for more information.

Description

Creates a Boolean checkbox question and adds it to the current form. The checkbox has two values: `FALSE` if the box is not checked and `TRUE` if it is.

There are three ways to specify defaults for this question: the Flags field (lowest priority), one or more nested `EFI_IFR_ONE_OF_OPTION`, or nested `EFI_IFR_DEFAULT` (highest priority).

An image may be associated with the question using a nested `EFI_IFR_IMAGE`. An animation may be associated with the option using a nested `EFI_IFR_ANIMATION`. 
Related Definitions

#define EFI_IFR_CHECKBOX_DEFAULT 0x01
#define EFI_IFR_CHECKBOX_DEFAULT_MFG 0x02

33.3.8.3.10 EFI_IFR_CONDITIONAL

Summary
Pops two values and a boolean, pushes one of the values depending on the boolean.

Prototype

#define EFI_IFR_CONDITIONAL_OP 0x50
typedef struct _EFI_IFR_CONDITIONAL {
    EFI_IFR_OP_HEADER Header;
} EFI_IFR_CONDITIONAL;

Members

Header Standard opcode header, where OpCode is EFI_IFR_CONDITIONAL_OP.

Description
This opcode performs the following actions:

1. Pop three values from the expression stack. The first value popped is the right value. The second expression popped is the middle value. The last expression popped is the left value.
2. If the left value cannot be evaluated as a boolean, push Undefined.
3. If the left expression evaluates to TRUE, push the right value.
4. Otherwise, push the middle value.

33.3.8.3.11 EFI_IFR_DATE

Summary
Create a date question.

Prototype

#define EFI_IFR_DATE_OP 0x1A
typedef struct _EFI_IFR_DATE {
    EFI_IFR_OP_HEADER Header;
    EFI_IFR_QUESTION_HEADER Question;
    UINT8 Flags;
} EFI_IFR_DATE;

Members

Header The sequence that defines the type of opcode as well as the length of the opcode being defined. Header.OpCode = EFI_IFR_DATE_OP.
**Question**
The standard question header. See [Section 33.3.8.2.2](#) for more information.

**Flags**
Flags that describe the behavior of the question. All undefined bits should be zero.

```c
#define EFI_QF_DATE_YEAR_SUPPRESS 0x01
#define EFI_QF_DATE_MONTH_SUPPRESS 0x02
#define EFI_QF_DATE_DAY_SUPPRESS 0x04
#define EFI_QF_DATE_STORAGE 0x30
```

For **QF_DATE_STORAGE**, there are currently three valid values:

```c
#define QF_DATE_STORAGE_NORMAL   0x00
#define QF_DATE_STORAGE_TIME     0x10
#define QF_DATE_STORAGE_WAKEUP   0x20
```

**Description**
Create a Date question (see [Section 33.2.5.4.6](#)) and add it to the current form.

There are two ways to specify defaults for this question: one or more nested **EFI_IFR_ONE_OF_OPTION** (lowest priority) or nested **EFI_IFR_DEFAULT** (highest priority). An image may be associated with the option using a nested **EFI_IFR_IMAGE**. An animation may be associated with the question using a nested **EFI_IFR_ANIMATION**.

### 33.3.8.3.12 EFI_IFR_DEFAULT

**Summary**
Provides a default value for the current question

**Prototype**

```c
#define EFI_IFR_DEFAULT_OP 0x5b
typedef struct _EFI_IFR_DEFAULT {
  EFI_IFR_OP_HEADER Header;
  UINT16             DefaultId;
  UINT8              Type;
  EFI_IFR_TYPE_VALUE Value;
} EFI_IFR_DEFAULT;

typedef struct _EFI_IFR_DEFAULT_2 {
  EFI_IFR_OP_HEADER Header;
  UINT16             DefaultId;
  UINT8              Type;
} EFI_IFR_DEFAULT_2;
```
Members

Header
The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, Header.OpCode = EFI_IFR_DEFAULT_OP.

DefaultId
Identifies the default store for this value. The default store must have previously been created using EFI_IFR_DEFAULTSTORE.

Type
The type of data in the Value field. See EFI_IFR_TYPE_x in EFI_IFR_ONE_OF_OPTION.

Value
The default value. The actual size of this field depends on Type. If Type is EFI_IFR_TYPE_OTHER, then the default value is provided by a nested EFI_IFR_VALUE.

Description
This opcode specifies a default value for the current question. There are two forms. The first (EFI_IFR_DEFAULT) assumes that the default value is a constant, embedded directly in the Value member. The second (EFI_IFR_DEFAULT_2) assumes that the default value is specified using a nested EFI_IFR_VALUE opcode.

33.3.8.3.13 EFI_IFR_DEFAULTSTORE

Summary
Provides a declaration for the type of default values that a question can be associated with.

Prototype

```c
#define EFI_IFR_DEFAULTSTORE_OP 0x5c
typedef struct _EFI_IFR_DEFAULTSTORE {
    EFI_IFR_OP_HEADER Header;
    EFI_STRING_ID DefaultName;
    UINT16 DefaultId;
} EFI_IFR_DEFAULTSTORE;
```

Members

Header
The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, Header.OpCode = EFI_IFR_DEFAULTSTORE_OP.

DefaultName
A string token reference for the human readable string associated with the type of default being declared.

DefaultId
The default identifier, which is unique within the current form set. The default identifier creates a group of defaults. See Section for the default identifier ranges.

Description
Declares a class of default which can then have question default values associated with.

An EFI_IFR_DEFAULTSTORE with a specified DefaultId must appear in the IFR before it can be referenced by an EFI_IFR_DEFAULT.
33.3.8.3.14 EFI_IFR_DISABLE_IF

Summary
Disable all nested questions and expressions if the expression evaluates to **TRUE**.

Prototype
```
#define EFI_IFR_DISABLE_IF_OP 0x1e
typedef struct _EFI_IFR_DISABLE_IF {
  EFI_IFR_OP_HEADER Header;
} EFI_IFR_DISABLE_IF;
```

Members
- **Header**
  The byte sequence that defines the type of opcode as well as the length of the opcode being defined. `Header.OpCode` is `EFI_IFR_DISABLE_IF_OP`.

Description
All nested statements, questions, options or expressions will not be processed if the expression appearing as the first nested object evaluates to TRUE. If the expression consists of more than a single opcode, then the first opcode in the expression must have the Scope bit set and the expression must end with `EFI_IFR_END`.

When this opcode appears under a form set, the expression must only rely on constants. When this opcode appears under a form, the expression may rely on question values in the same form which are not inside of an `EFI_DISABLE_IF` expression.

33.3.8.3.15 EFI_IFR_DIVIDE

Summary
Pops two unsigned integers, divide one by the other and pushes the result.

Prototype
```
#define EFI_IFR_DIVIDE_OP 0x3d
typedef struct _EFI_IFR_DIVIDE {
  EFI_IFR_OP_HEADER Header;
} EFI_IFR_DIVIDE;
```

Members
- **Header**
  Standard opcode header, where OpCode is `EFI_IFR_DIVIDE`.

Description
1. Pop two expressions from the expression stack. The first popped is the right-hand expression. The second popped is the left-hand expression.
2. If the two expressions do not evaluate to unsigned integers, push Undefined. If the right-hand expression is equal to zero, push Undefined.
3. Zero-extend the left-hand and right-hand expressions to 64-bits.
4. Divide the left-hand value to right-hand expression.
5. Push the result.

33.3.8.3.16 EFI_IFR_DUP

Summary
Duplicate the top value on the expression stack.

Prototype
```
#define EFI_IFR_DUP_OP 0x57
typedef struct _EFI_IFR_DUP {
    EFI_IFR_OP_HEADER   Header;
} EFI_IFR_DUP;
```

Members
- Header: Standard opcode header, where OpCode is EFI_IFR_DUP_OP.

Description
Duplicate the top expression on the expression stack.

Note: This opcode is usually used as an optimization by the tools to help eliminate common sub-expression calculation and make smaller expressions.

33.3.8.3.17 EFI_IFR_END

Summary
End of the current scope.

Prototype
```
#define EFI_IFR_END_OP 0x29
typedef struct _EFI_IFR_END {
    EFI_IFR_OP_HEADER   Header;
} EFI_IFR_END;
```

Members
- Header: Standard opcode header, where OpCode is EFI_IFR_END_OP.

Description
Marks the end of the current scope.

33.3.8.3.18 EFI_IFR_EQUAL

Summary
Pop two values, compare and push TRUE if equal, FALSE if not.
Prototype

```c
#define EFI_IFR_EQUAL_OP 0x2f
typedef struct _EFI_IFR_EQUAL {
    EFI_IFR_OP_HEADER Header;
} EFI_IFR_EQUAL;
```

Members

- **Header**: Standard opcode header, where **OpCode** is **EFI_IFR_EQUAL_OP**.

Description

The opcode performs the following actions:

1. Pop two values from the expression stack.
2. If the two values are not strings, Booleans or unsigned integers, push Undefined.
3. If the two values are of different types, push Undefined.
4. Compare the two values. Strings are compared lexicographically.
5. If the two values are equal then push **TRUE** on the expression stack. If they are not equal, push **FALSE**.

33.3.8.3.19 EFI_IFR_EQ_ID_ID

Summary

Push **TRUE** if the two questions have the same value or **FALSE** if they are not equal.

Prototype

```c
#define EFI_IFR_EQ_ID_ID_OP 0x13
typedef struct _EFI_IFR_EQ_ID_ID {
    EFI_IFR_OP_HEADER Header;
    EFI_QUESTION_ID QuestionId1;
    EFI_QUESTION_ID QuestionId2;
} EFI_IFR_EQ_ID_ID;
```

Members

- **Header**: Standard opcode header, where **OpCode** is **EFI_IFR_EQ_ID_ID_OP**.
- **QuestionId1, QuestionId2**: Specifies the identifier of the questions whose values will be compared.

Description

Evaluate the values of the specified questions (**QuestionId1, QuestionId2**). If the two values cannot be evaluated or cannot be converted to comparable types, then push Undefined. If they are equal, push **TRUE**. Otherwise push **FALSE**.
33.3.8.3.20 EFI_IFR_EQ_ID_VAL_LIST

**Summary**
Push **TRUE** if the question’s value appears in a list of unsigned integers.

**Prototype**

```c
#define EFI_IFR_EQ_ID_VAL_LIST_OP 0x14
typedef struct _EFI_IFR_EQ_ID_VAL_LIST {
    EFI_IFR_OP_HEADER Header;
    EFI_QUESTION_ID QuestionId;
    UINT16 ListLength;
    UINT16 ValueList[1];
} EFI_IFR_EQ_ID_VAL_LIST;
```

**Members**
- **Header**
  - Standard opcode header, where OpCode is `EFI_IFR_EQ_ID_VAL_LIST_OP`.
- **QuestionId**
  - Specifies the identifier of the question whose value will be compared.
- **ListLength**
  - Number of entries in `ValueList`.
- **ValueList**
  - Zero or more unsigned integer values to compare against.

**Description**
Evaluate the value of the specified question (`QuestionId`). If the specified question cannot be evaluated as an unsigned integer, then push Undefined. If the value can be found in `ValueList`, then push **TRUE**. Otherwise push **FALSE**.

33.3.8.3.21 EFI_IFR_EQ_ID_VAL

**Summary**
Push **TRUE** if a question’s value is equal to a 16-bit unsigned integer, otherwise **FALSE**.

**Prototype**

```c
#define EFI_IFR_EQ_ID_VAL_OP 0x12
typedef struct _EFI_IFR_EQ_ID_VAL {
    EFI_IFR_OP_HEADER Header;
    EFI_QUESTION_ID QuestionId;
    UINT16 Value;
} EFI_IFR_EQ_ID_VAL;
```

**Members**
- **Header**
  - Standard opcode header, where OpCode is `EFI_IFR_EQ_ID_VAL_OP`.
- **QuestionId**
  - Specifies the identifier of the question whose value will be compared.
- **Value**
  - Unsigned integer value to compare against.
### Description
Evaluate the value of the specified question (QuestionId). If the specified question cannot be evaluated as an unsigned integer, then push Undefined. If they are equal, push TRUE. Otherwise push FALSE.

#### 33.3.8.3.22 EFI_IFR_FALSE

**Summary**
Push a FALSE on to the expression stack.

**Prototype**
```c
#define EFI_IFR_FALSE_OP 0x47
typedef struct _EFI_IFR_FALSE {
    EFI_IFR_OP_HEADER Header;
} EFI_IFR_FALSE;
```

**Members**
- **Header**: The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, Header.OpCode = EFI_IFR_FALSE_OP

**Description**
Push a FALSE on to the expression stack.

#### 33.3.8.3.23 EFI_IFR_FIND

**Summary**
Pop two strings and an unsigned integer, find one string in the other and the index where found.

**Prototype**
```c
#define EFI_IFR_FIND_OP 0x4c
typedef struct _EFI_IFR_FIND {
    EFI_IFR_OP_HEADER Header;
    UINT8 Format;
} EFI_IFR_FIND;
```

**Members**
- **Header**: Standard opcode header, where OpCode is EFI_IFR_FIND_OP.
- **Format**: The following flags govern the matching criteria:

**Related Definitions**
- `#define EFI_IFR_FF_CASE_SENSITIVE   0x00`
- `#define EFI_IFR_FF_CASE_INSENSITIVE  0x01`

**Description**
This opcode performs the following actions:
1. Pop three expressions from the expression stack. The first expression popped is the right-hand value and the second value popped is the middle value and the last value popped is the left-hand value.

2. If the left-hand or middle values cannot be evaluated as a string, push Undefined. If the third expression cannot be evaluated as an unsigned integer, push Undefined.

3. The left-hand value is the string to search. The middle value is the string to compare with. The right-hand expression is the zero-based index of the search.

4. If the string is found, push the zero-based index of the found string.

5. Otherwise, if the string is not found or the right-hand value specifies a value which is greater-than or equal to the length of the left-hand value’s string, push 0xFFFFFFFFFFFFFFFF.

33.3.8.3.24 EFI_IFR_FORM

Summary
Creates a form.

Prototype

```c
#define EFI_IFR_FORM_OP 0x01
typedef struct _EFI_IFR_FORM {
    EFI_IFR_OP_HEADER Header;
    EFI_FORM_ID FormId;
    EFI_STRING_ID FormTitle;
} EFI_IFR_FORM;
```

Members

- **Header**: The sequence that defines the type of opcode as well as the length of the opcode being defined. `Header.OpCode = EFI_IFR_FORM_OP`.

- **FormId**: The form identifier, which uniquely identifies the form within the form set. The form identifier, along with the device path and form set GUID, uniquely identifies a form within a system.

- **FormTitle**: The string token reference to the title of this particular form.

Description

A form is the encapsulation of what amounts to a browser page. The header defines a FormId, which is referenced by the form set, among others. It also defines a FormTitle, which is a string to be used as the title for the form.

33.3.8.3.25 EFI_IFR_FORM_MAP

Summary

Creates a standards map form.
Prototype

```c
#define EFI_IFR_FORM_MAP_OP 0x5D
typedef struct _EFI_IFR_FORM_MAP_METHOD {
    EFI_STRING_ID       MethodTitle;
    EFI_GUID            MethodIdentifier;
} EFI_IFR_FORM_MAP_METHOD;

typedef struct _EFI_IFR_FORM_MAP {
    EFI_IFR_OP_HEADER   Header;
    EFI_FORM_ID         FormId;
    //EFI_IFR_FORM_MAP_METHOD   Methods[];
} EFI_IFR_FORM_MAP;
```

Parameters

- **Header**
  The sequence that defines the type of opcode as well as the length of the opcode being defined. `Header.OpCode = EFI_IFR_FORM_MAP_OP`.
- **FormId**
  The unique identifier for this particular form.
- **Methods**
  One or more configuration method’s name and unique identifier.
- **MethodTitle**
  The string identifier which provides the human-readable name of the configuration method for this standards map form.
- **MethodIdentifier**
  Identifier which uniquely specifies the configuration methods associated with this standards map form. See “Related Definitions” for current identifiers.

Description

A standards map form describes how the configuration settings are represented for a configuration method identified by `MethodIdentifier`. It also defines a `FormTitle`, which is a string to be used as the title for the form.

Related Definitions

```c
#define EFI_HII_STANDARD_FORM_GUID \
    { 0x3bd2f4ec, 0xe524, 0x46e4, \
      { 0xa9, 0xd8, 0x51, 0x01, 0x17, 0x42, 0x55, 0x62 } }
```

An `EFI_IFR_FORM_MAP` where the method identifier is `EFI_HII_STANDARD_FORM_GUID` is semantically identical to a normal `EFI_IFR_FORM`.

33.3.8.3.26 EFI_IFR_FORM_SET

Summary

The form set is a collection of forms that are intended to describe the pages that will be displayed to the user.
Prototype

```c
#define EFI_IFR_FORM_SET_OP 0x0E

typedef struct _EFI_IFR_FORM_SET {
    EFI_IFR_OP_HEADER   Header;
    EFI_GUID              Guid;
    EFI_STRING_ID        FormSetTitle;
    EFI_STRING_ID        Help;
    UINT8                Flags;
    //EFI_GUID        ClassGuid[...];
} EFI_IFR_FORM_SET;
```

Members

- **Header**: The sequence that defines the type of opcode as well as the length of the opcode being defined. `Header.OpCode = EFI_IFR_FORM_SET_OP`.
- **Guid**: The unique GUID value associated with this particular form set. Type ` EFI_GUID` is defined in `InstallProtocolInterface()` in this specification.
- **FormSetTitle**: The string token reference to the title of this particular form set.
- **Help**: The string token reference to the help of this particular form set.
- **Flags**: Flags which describe additional features of the form set. Bits 0:1 = number of members in `ClassGuid`. Bits 2:7 = Reserved. Should be set to zero.
- **ClassGuid**: Zero to four class identifiers. The standard class identifiers are described in `EFI_HII_FORM_BROWSER2_PROTOCOL.SendForm()`. They do not need to be unique in the form set.

Description

The form set consists of a header and zero or more forms.

### 33.3.8.3.27 EFI_IFR_GET

**Summary**

Return a stored value.
Prototype

```c
#define EFI_IFR_GET_OP 0x2B
typedef struct _EFI_IFR_GET {
    EFI_IFR_OP_HEADER Header;
    EFI_VARSTORE_ID VarStoreId;
    union {
        EFI_STRING_ID VarName;
        UINT16 VarOffset;
    } VarStoreInfo;
    UINT8 VarStoreType;
} EFI_IFR_GET;
```

Parameters

- **Header**: The sequence that defines the type of opcode as well as the length of the opcode being defined. `Header.OpCode = EFI_IFR_GET_OP`.
- **VarStoreId**: Specifies the identifier of a previously declared variable store to use when retrieving the value.
- **VarStoreInfo**: Depending on the type of variable store selected, this contains either a 16-bit Buffer Storage offset (`VarOffset`) or a Name/Value or EFI Variable name (`VarName`).
- **VarStoreType**: Specifies the type used for storage. The storage types `EFI_IFR_TYPE_x` are defined in `EFI_IFR_ONE_OF_OPTION`.

Description

This operator takes the value from storage and pushes it on to the expression stack. If the value could not be retrieved from storage, then `Undefined` is pushed on to the expression stack.

The type of value retrieved from storage depends on the setting of `VarStoreType`, as described in the following table:

<table>
<thead>
<tr>
<th>VarStoreType</th>
<th>Storage Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>EFI_IFR_TYPE_NUM_SIZE_8</code></td>
<td>8-bit unsigned integer</td>
</tr>
<tr>
<td><code>EFI_IFR_TYPE_NUM_SIZE_16</code></td>
<td>16-bit unsigned integer</td>
</tr>
<tr>
<td><code>EFI_IFR_TYPE_NUM_SIZE_32</code></td>
<td>32-bit unsigned integer</td>
</tr>
<tr>
<td><code>EFI_IFR_TYPE_NUM_SIZE_64</code></td>
<td>64-bit unsigned integer</td>
</tr>
<tr>
<td><code>EFI_IFR_TYPE_BOOLEAN</code></td>
<td>8-bit boolean (0 = false, 1 = true)</td>
</tr>
<tr>
<td><code>EFI_IFR_TYPE_TIME</code></td>
<td><code>EFI_HII_TIME</code></td>
</tr>
<tr>
<td><code>EFI_IFR_TYPE_DATE</code></td>
<td><code>EFI_HII_DATE</code></td>
</tr>
</tbody>
</table>
33.3.8.3.28 EFI_IFR_GRAY_OUT_IF

Summary
Creates a group of statements or questions which are conditionally grayed-out.

Prototype
#define EFI_IFR_GRAY_OUT_IF_OP 0x19
typedef struct _EFI_IFR_GRAY_OUT_IF {
   EFI_IFR_OP_HEADER Header;
} EFI_IFR_GRAY_OUT_IF;

Members
Header The byte sequence that defines the type of opcode as well as the length of the opcode being defined. Header.OpCode = EFI_IFR_GRAY_OUT_IF_OP.

Description
All nested statements or questions will be grayed out (not selectable and visually distinct) if the expression appearing as the first nested object evaluates to TRUE. If the expression consists of more than a single opcode, then the first opcode in the expression must have the Scope bit set and the expression must end with EFI_IFR_END.

Different browsers may support this option to varying degrees. For example, HTML has no similar construct so it may not support this facility.

33.3.8.3.29 EFI_IFR_GREATER_EQUAL

Summary
Pop two values, compare, push TRUE if first is greater than or equal the second, otherwise push FALSE.
Prototype

\[
\text{#define EFI_IFR_GREATER_EQUAL_OP 0x32}\\
\text{typedef struct _EFI_IFR_GREATER_EQUAL} \{\\
\text{ EFI_IFR_OP_HEADER Header;}\\
\} \text{ EFI_IFR_GREATER_EQUAL;}\\
\]

Members

\begin{itemize}
  \item \textbf{Header} \quad \text{Standard opcode header, where OpCode is EFI_IFR_GREATER_EQUAL_OP.}
\end{itemize}

Description

This opcode performs the following actions:

1. Pop two values from the expression stack. The first value popped is the right-hand value and the second value popped is the left-hand value.
2. If the two values do not evaluate to string, boolean or unsigned integer, push Undefined.
3. If the two values do not evaluate to the same type, push Undefined.
4. Compare the two values. Strings are compared lexicographically.
5. If the left-hand value is greater than or equal to the right-hand value, push \textbf{TRUE}. Otherwise push \textbf{FALSE}.

33.3.8.3.30 EFI_IFR_GREATER_THAN

Summary

Pop two values, compare, push \textbf{TRUE} if first is greater than the second, otherwise push \textbf{FALSE}.

Prototype

\[
\text{#define EFI_IFR_GREATER_THAN_OP 0x31}\\
\text{typedef struct _EFI_IFR_GREATER_THAN} \{\\
\text{ EFI_IFR_OP_HEADER Header;}\\
\} \text{ EFI_IFR_GREATER_THAN;}\\
\]

Members

\begin{itemize}
  \item \textbf{Header} \quad \text{Standard opcode header, where OpCode is EFI_IFR_GREATER_THAN_OP}
\end{itemize}

Description

This opcode performs the following actions:

1. Pop two values from the expression stack. The first value popped is the right-hand value and the second value popped is the left-hand value.
2. If the two values do not evaluate to string, boolean or unsigned integer, push Undefined.
3. If the two values do not evaluate to the same type, push Undefined.
4. Compare the two values. Strings are compared lexicographically.
5. If the left-hand value is greater than the right-hand value, push \textbf{TRUE}. Otherwise push \textbf{FALSE}.\]
33.3.8.3.31 EFI_IFR_GUID

Summary
A GUIDed operation. This op-code serves as an extensible op-code which can be defined by the Guid value to have various functionality. It should be noted that IFR browsers or scripts which cannot interpret the meaning of this GUIDed op-code will skip it.

Prototype
```c
#define EFI_IFR_GUID_OP 0xF
typedef struct _EFI_IFR_GUID {
    EFI_IFR_OP_HEADER       Header;
    EFI_GUID                Guid;
    //Optional Data Follows
} EFI_IFR_GUID;
```

Parameters
- **Header**: The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, `Header.OpCode = EFI_IFR_GUID_OP`
- **Guid**: The GUID value for this op-code. This field is intended to define a particular type of special-purpose function, and the format of the data which immediately follows the Guid field (if any) is defined by that particular GUID.

33.3.8.3.32 EFI_IFR_IMAGE

Summary
Creates an image for a statement or question.

Prototype
```c
#define EFI_IFR_IMAGE_OP 0x4
typedef struct _EFI_IFR_IMAGE {
    EFI_IMAGE_ID        Id;
} EFI_IFR_IMAGE;
```

Members
- **Id**: Image identifier in the HII database.

Description
Specifies the image within the HII database.

33.3.8.3.33 EFI_IFR_INCONSISTENT_IF

Summary
Creates a validation expression and error message for a question.
Prototype

```c
#define EFI_IFR_INCONSISTENT_IF_OP 0x011
typedef struct _EFI_IFR_INCONSISTENT_IF {
    EFI_IFR_OP_HEADER Header;
    EFI_STRING_ID Error;
} EFI_IFR_INCONSISTENT_IF;
```

Members

- **Header**: The byte sequence that defines the type of opcode as well as the length of the opcode being defined. `Header.OpCode = EFI_IFR_INCONSISTENT_IF_OP`.
- **Error**: The string token reference to the string that will be used for the consistency check message.

Description

This tag uses a Boolean expression to allow the IFR creator to check options in a richer manner than provided by the question tags themselves. For example, this tag might be used to validate that two options are not using the same address or that the numbers that were entered align to some pattern (such as leap years and February in a date input field). The tag provides a string to be used in an error display to alert the user to the issue. Inconsistency tags will be evaluated when the user traverses from tag to tag. The user should not be allowed to submit the results of a form inconsistency.

33.3.8.3.34 EFI_IFR_LENGTH

Summary

Pop a string or buffer, push its length.

Prototype

```c
#define EFI_IFR_LENGTH_OP 0x56
typedef struct _EFI_IFR_LENGTH {
    EFI_IFR_OP_HEADER Header;
} EFI_IFR_LENGTH;
```

Members

- **Header**: Standard opcode header, where `OpCode` is `EFI_IFR_LENGTH_OP`.

Description

This opcode performs the following actions:

1. Pop a value from the expression stack.
2. If the value cannot be evaluated as a buffer or string, then push Undefined.
3. If the value can be evaluated as a buffer, push the length of the buffer, in bytes.
4. If the value can be evaluated as a string, push the length of the string, in characters.
33.3.8.3.35 EFI_IFR_LESS_EQUAL

Summary
Pop two values, compare, push TRUE if first is less than or equal to the second, otherwise push FALSE.

Prototype
```
#define EFI_IFR_LESS_EQUAL_OP 0x34
typedef struct _EFI_IFR_LESS_EQUAL {
  EFI_IFR_OP_HEADER Header;
} EFI_IFR_LESS_EQUAL;
```

Members
Header Standard opcode header, where OpCode is EFI_IFR_LESS_EQUAL_OP.

Description
This opcode performs the following actions:
1. Pop two values from the expression stack. The first value popped is the right-hand value and the second value popped is the left-hand value.
2. If the two values do not evaluate to string, boolean or unsigned integer, push Undefined.
3. If the two values do not evaluate to the same type, push Undefined.
4. Compare the two values. Strings are compared lexicographically.
5. If the left-hand value is less than or equal to the right-hand value, push TRUE. Otherwise push FALSE.

33.3.8.3.36 EFI_IFR_LESS_THAN

Summary
Pop two values, compare, push TRUE if the first is less than the second, otherwise push FALSE.

Prototype
```
#define EFI_IFR_LESS_THAN_OP 0x33
typedef struct _EFI_IFR_LESS_THAN {
  EFI_IFR_OP_HEADER Header;
} EFI_IFR_LESS_THAN;
```

Members
Header Standard opcode header, where OpCode is EFI_IFR_LESS_THAN_OP.

Description
This opcode performs the following actions:
1. Pop two values from the expression stack. The first value popped is the right-hand value and the second value popped is the left-hand value.
2. If the two values do not evaluate to string, boolean or unsigned integer, push Undefined.
3. If the two values do not evaluate to the same type, push Undefined.
4. Compare the two values. Strings are compared lexicographically.
5. If the left-hand value is less than the right-hand value, push TRUE. Otherwise push FALSE.

### 33.3.8.3.37 EFI_IFR_LOCKED

**Summary**
Specifies that the statement or question is locked.

**Prototype**

```c
#define EFI_IFR_LOCKED_OP 0x0B
typedef struct _EFI_IFR_LOCKED {
    EFI_IFR_OP_HEADER Header;
} EFI_IFR_LOCKED;
```

**Parameters**
- **Header**
  Standard opcode header, where `Header.Opcode` is `EFI_IFR_LOCKED_OP`.

**Members**
None

**Description**
The presence of `EFI_IFR_LOCKED` indicates that the statement or question should not be modified by a Forms Editor.

### 33.3.8.3.38 EFI_IFR_MAP

**Summary**
Pops value, compares against an array of comparison values, pushes the corresponding result value.

**Prototype**

```c
#define EFI_IFR_MAP_OP 0x22
typedef struct _EFI_IFR_MAP {
    EFI_IFR_OP_HEADER Header;
} EFI_IFR_MAP;
```

**Parameters**
- **Header**
The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, `Header.Opcode` = `EFI_IFR_MAP_OP`

**Description**
This operator contains zero or more expression pairs nested within its scope. Each expression pair contains a match expression and a return expression.
This opcode performs the following actions:

1. This operator pops a single value from the expression stack.
2. Compare this value against the evaluated result of each of the match expressions.
3. If there is a match, then the evaluated result of the corresponding return expression is pushed on to the expression stack.
4. If there is no match, then Undefined is pushed.

33.3.8.3.39 EFI_IFR_MATCH

Summary
Pop a source string and a pattern string, push **TRUE** if the source string matches the pattern specified by the pattern string, otherwise push **FALSE**.

Prototype

```c
#define EFI_IFR_MATCH_OP 0x2a
typedef struct _EFI_IFR_MATCH {
    EFI_IFR_OP_HEADER Header;
} EFI_IFR_MATCH;
```

Members

- **Header** Standard opcode header, where `Header.OpCode` is `EFI_IFR_MATCH_OP`.

Description

1. Pop two values from the expression stack. The first value popped is the string and the second value popped is the pattern.
2. If the string or the pattern cannot be evaluated as a string, then push Undefined.
3. Process the string and pattern using the `MetaiMatch` function of the `EFI_UNICODE_COLLATION2_PROTOCOL`.
4. If the result is **TRUE**, then push **TRUE**.
5. If the result is **FALSE**, then push **FALSE**.

33.3.8.3.40 EFI_IFR_MID

Summary
Pop a string or buffer and two unsigned integers, push an extracted portion of the string or buffer.

Prototype

```c
#define EFI_IFR_MID_OP 0x4b
typedef struct _EFI_IFR_MID {
    EFI_IFR_OP_HEADER Header;
} EFI_IFR_MID;
```

Members

- **Header** Standard opcode header, where ` OpCode` is `EFI_IFR_MID_OP`. 
Description

1. Pop three values from the expression stack. The first value popped is the right value and the second value popped is the middle value and the last expression popped is the left value.

2. If the left value cannot be evaluated as a string or a buffer, push Undefined. If the middle or right value cannot be evaluated as unsigned integers, push Undefined.

3. If the left value is a string, then the middle value is the 0-based index of the first character in the string to extract and the right value is the length of the string to extract. If the right value is zero or the middle value is greater than or equal the string’s length, then push an Empty string. Push the extracted string on the expression stack. If the right value would cause extraction to extend beyond the end of the string, then only the characters up to and include the last character of the string are in the pushed result.

4. If the left value is a buffer, then the middle value is the 0-based index of the first byte in the buffer to extract and the right value is the length of the buffer to extract. If the right value is zero or the middle value is greater than the buffer’s length, then push an empty buffer. Push the extracted buffer on the expression stack. If the right value would cause extraction to extend beyond the end of the buffer, then only the bytes up to and include the last byte of the buffer are in the pushed result.

33.3.8.3.41 EFI_IFR_MODAL_TAG

Summary

Specify that the current form is a modal form.

Prototype

```c
#define EFI_IFR_MODAL_TAG_OP 0x61
typedef struct _EFI_IFR_MODAL_TAG {
    EFI_IFR_OP_HEADER    Header;
} EFI_IFR_MODAL_TAG;
```

Members

- **Header**
  - Standard opcode header, where OpCode is `EFI_IFR_MODAL_TAG_OP`.

Description

When this opcode is present within the scope of a form, the form is modal; if the opcode is not present, the form is not modal.

A “modal” form is one that requires specific user interaction before it is deactivated. Examples of modal forms include error messages or confirmation dialogs.

When a modal form is activated, it is also selected. A modal form is deactivated only when one of the following occurs:

- The user chooses a “Navigate To Form” behavior (defined in Section 33.2.10.1.2, “Selected Form”). Note that this is distinct from the “Navigate Forms” behavior.
- A question in the form requires callback, and the callback returns one of the following ActionRequest values (defined in `EFI_HII_CONFIG_ACCESS_PROTOCOL.CallBack()`):
  - `EFI_BROWSER_ACTION_REQUEST_RESET`
A modal form cannot be deactivated using other navigation behaviors, including:

- Navigate Forms
- Exit Browser/Discard All (except when initiated by a callback as indicated above)
- Exit Browser/Submit All (except when initiated by a callback as indicated above)
- Exit Browser/Discard All/Reset Platform (except when initiated by a callback as indicated above)

### 33.3.8.3.42 EFI_IFR_MODULO

**Summary**

Pop two unsigned integers, divide one by the other and push the remainder.

**Prototype**

```c
define EFI_IFR_MODULO_OP 0x3e
typedef struct EFI_IFR_MODULO {
    EFI_IFR_OP_HEADER Header;
} EFI_IFR_MODULO;
```

**Members**

- **Header** Standard opcode header, where OpCode is EFI_IFR_MODULO_OP.

**Description**

This opcode performs the following actions:

1. Pop two values from the expression stack. The first value popped is the right-hand value and the second value popped is the left-hand value.
2. If the two values do not evaluate to unsigned integers, push Undefined. If the right-hand value to 0, push Undefined.
3. Zero-extend the values to 64-bits. Then, divide the left-hand value by the right-hand value.
4. Push the difference between the left-hand value and the product of the right-hand value and the calculated quotient.

### 33.3.8.3.43 EFI_IFR_MULTIPLY

**Summary**

Multiply one unsigned integer by another and push the result.
Prototype

```c
#define EFI_IFR_MULTIPLY_OP 0x3c
typedef struct _EFI_IFR_MULTIPLY {
    EFI_IFR_OP_HEADER Header;
} EFI_IFR_MULTIPLY;
```

Members

- **Header**: Standard opcode header, where `OpCode` is `EFI_IFR_MULTIPLY_OP`.

Description

This opcode performs the following actions:

1. Pop two values from the expression stack. The first value popped is the right-hand expression and the second value popped is the left-hand expression.
2. If the two values do not evaluate to unsigned integers, push Undefined.
3. Zero-extend the values to 64-bits. Then, multiply the right-hand value by the left-hand value. Push the lower 64-bits of the result.

### 33.3.8.3.44 EFI_IFR_NOT

Summary

Pop a boolean and, if `TRUE`, push `FALSE`. If `FALSE`, push `TRUE`.

Prototype

```c
#define EFI_IFR_NOT_OP 0x17
typedef struct _EFI_IFR_NOT {
    EFI_IFR_OP_HEADER Header;
} EFI_IFR_NOT;
```

Members

- **Header**: The sequence that defines the type of opcode as well as the length of the opcode being defined. `Header.OpCode` is `EFI_IFR_NOT_OP`.

Description

This opcode performs the following actions:

1. Pop one value from the expression stack.
2. If the value cannot be evaluated as a Boolean, push Undefined.
3. If the value evaluates to `TRUE`, then push `FALSE`. Otherwise, push `TRUE`.

### 33.3.8.3.45 EFI_IFR_NOT_EQUAL

Summary

Pop two values, compare and push `TRUE` if not equal, otherwise push `FALSE`. 
Prototype

```c
#define EFI_IFR_NOT_EQUAL_OP 0x30
typedef struct __EFI_IFR_NOT_EQUAL {
    EFI_IFR_OP_HEADER Header;
} EFI_IFR_NOT_EQUAL;
```

Members

- **Header**: Standard opcode header, where `OpCode` is `EFI_IFR_NOT_EQUAL_OP`.

Description

This opcode performs the following actions:

1. Pop two values from the expression stack.
2. If the two values are not strings, Booleans or unsigned integers, push Undefined.
3. If the two values are of different types, push Undefined.
4. Compare the two values. Strings are compared lexicographically.
5. If the two values are not equal then push **TRUE** on the expression stack. If they are equal, push **FALSE**.

### 33.3.8.3.46 EFI_IFR_NO_SUBMIT_IF

Summary

Creates a validation expression and error message for a question.

Prototype

```c
#define EFI_IFR_NO_SUBMIT_IF_OP 0x10
typedef struct __EFI_IFR_NO_SUBMIT_IF {
    EFI_IFR_OP_HEADER Header;
    EFI_STRING_ID Error;
} EFI_IFR_NO_SUBMIT_IF;
```

Members

- **Header**: The byte sequence that defines the type of opcode as well as the length of the opcode being defined. `Header.OpCode = EFI_IFR_NO_SUBMIT_IF_OP`.
- **Error**: The string token reference to the string that will be used for the consistency check message.

Description

Creates a conditional expression which will be evaluated when the form is submitted. If the conditional evaluates to **TRUE**, then the error message `Error` will be displayed to the user and the user will be prevented from submitting the form.
**33.3.8.3.47 EFI_IFR_NUMERIC**

**Summary**

Creates a number question.

**Prototype**

```c
#define EFI_IFR_NUMERIC_OP 0x07
typedef struct _EFI_IFR_NUMERIC {
    EFI_IFR_OP_HEADER Header;
    EFI_IFR_QUESTION_HEADER Question;
    UINT8 Flags;

    union {
        struct {
            UINT8 MinValue;
            UINT8 MaxValue;
            UINT8 Step;
        } u8;
        struct {
            UINT16 MinValue;
            UINT16 MaxValue;
            UINT16 Step;
        } u16;
        struct {
            UINT32 MinValue;
            UINT32 MaxValue;
            UINT32 Step;
        } u32;
        struct {
            UINT64 MinValue;
            UINT64 MaxValue;
            UINT64 Step;
        } u64;
    } data;
} EFI_IFR_NUMERIC;
```

**Members**

- **Header**
  The sequence that defines the type of opcode as well as the length of the opcode being defined. `Header.OpCode = EFI_IFR_NUMERIC_OP`.

- **Question**
  The standard question header. See Section 33.3.8.2.2 for more information.

- **Flags**
  Specifies flags related to the numeric question. See “Related Definitions”
MinValue

The minimum value to be accepted by the browser for this opcode. The size of the data field may vary from 8 to 64 bits.

MaxValue

The maximum value to be accepted by the browser for this opcode. The size of the data field may vary from 8 to 64 bits.

Step

Defines the amount to increment or decrement the value each time a user requests a value change. If the step value is 0, then the input mechanism for the numeric value is to be free-form and require the user to type in the actual value. The size of the data field may vary from 8 to 64 bits.

Description

Creates a number question on the current form, with built-in error checking and default information. The storage size depends on the EFI_IFR_NUMERIC_SIZE portion of the Flags field.

There are two ways to specify defaults for this question: one or more nested EFI_IFR_ONE_OF_OPTION (lowest priority) or nested EFI_IFR_DEFAULT (highest priority). An image may be associated with the option using a nested EFI_IFR_IMAGE. An animation may be associated with the question using a nested EFI_IFR_ANIMATION.

Related Definitions

```c
#define EFI_IFR_NUMERIC_SIZE     0x03
#define  EFI_IFR_NUMERIC_SIZE_1   0x00
#define  EFI_IFR_NUMERIC_SIZE_2   0x01
#define  EFI_IFR_NUMERIC_SIZE_4   0x02
#define  EFI_IFR_NUMERIC_SIZE_8   0x03

#define EFI_IFR_DISPLAY        0x30
#define  EFI_IFR_DISPLAY_INT_DEC   0x00
#define  EFI_IFR_DISPLAY_UINT_DEC  0x10
#define  EFI_IFR_DISPLAY_UINT_HEX  0x20
```

EFI_IFR_NUMERIC_SIZE

Specifies the size of the numeric value, the storage required and the size of the MinValue, MaxValue and Step values in the opcode header.

EFI_IFR_DISPLAY

The value will be displayed in signed decimal, unsigned decimal or unsigned hexadecimal. Input is still allowed in any form.

Note: IFR expressions do not support signed types (see Section 33.2.5.7.4 Data Types). The value of a numeric question is treated during expression evaluation as an unsigned integer even if EFI_IFR_DISPLAY_INT_DEC flag is specified. However, the EFI_IFR_DISPLAY_INT_DEC flag is taken into consideration while validating question’s current or default value against MinValue and MaxValue. When EFI_IFR_DISPLAY_INT_DEC flag is specified, forms
processor must treat MinValue, MaxValue, current question value, and default question value as signed integers.

33.3.8.3.48 EFI_IFR_ONE

Summary
Push a one on to the expression stack.

Prototype
```c
#define EFI_IFR_ONE_OP 0x53
typedef struct _EFI_IFR_ONE {
   EFI_IFR_OP_HEADER  Header;
} EFI_IFR_ONE;
```

Members
- **Header**
  The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, `Header.OpCode = EFI_IFR_ONE_OP`

Description
Push a one on to the expression stack.

33.3.8.3.49 EFI_IFR_ONES

Summary
Push 0xFFFFFFFFFFFFFFFF on to the expression stack.

Prototype
```c
#define EFI_IFR_ONES_OP 0x54
typedef struct _EFI_IFR_ONES {
   EFI_IFR_OP_HEADER  Header;
} EFI_IFR_ONES;
```

Members
- **Header**
  The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, `Header.OpCode = EFI_IFR_ONES_OP`

Description
Push 0xFFFFFFFFFFFFFFFF on to the expression stack.

33.3.8.3.50 EFI_IFR_ONE_OF

Summary
Creates a select-one-of question.
Prototype

```c
#define EFI_IFR_ONE_OF_OP 0x05

typedef struct _EFI_IFR_ONE_OF {
    EFI_IFR_OP_HEADER     Header;
    EFI_IFR_QUESTION_HEADER Question;
    UINT8                Flags;

    union {
        struct {
            UINT8     MinValue;
            UINT8     MaxValue;
            UINT8     Step;
        } u8;
        struct {
            UINT16    MinValue;
            UINT16    MaxValue;
            UINT16    Step;
        } u16;
        struct {
            UINT32    MinValue;
            UINT32    MaxValue;
            UINT32    Step;
        } u32;
        struct {
            UINT64    MinValue;
            UINT64    MaxValue;
            UINT64    Step;
        } u64;
    } data;
} EFI_IFR_ONE_OF;
```

Members

- **Header**: The sequence that defines the type of opcode as well as the length of the opcode being defined. `Header.OpCode = EFI_IFR_ONE_OF_OP`.
- **Question**: The standard question header. See [Section 33.3.8.2.2](#) for more information.
- **Flags**: Specifies flags related to the numeric question. See “Related Definitions” in **EFI_IFR_NUMERIC**.
- **MinValue**: The minimum value to be accepted by the browser for this opcode. The size of the data field may vary from 8 to 64 bits, depending on the size specified in **Flags**.
MaxValue

The maximum value to be accepted by the browser for this opcode. The size of the data field may vary from 8 to 64 bits, depending on the size specified in Flags.

Step

Defines the amount to increment or decrement the value each time a user requests a value change. If the step value is 0, then the input mechanism for the numeric value is to be free-form and require the user to type in the actual value. The size of the data field may vary from 8 to 64 bits, depending on the size specified in Flags.

Description

This opcode creates a select-on-of object, where the user must select from one of the nested options. This is identical to EFI_IFR_NUMERIC.

There are two ways to specify defaults for this question: one or more nested EFI_IFR_ONE_OF_OPTION (lowest priority) or nested EFI_IFR_DEFAULT (highest priority). An image may be associated with the option using a nested EFI_IFR_IMAGE. An animation may be associated with the question using a nested EFI_IFR_ANIMATION.

33.3.8.3.51 EFI_IFR_ONE_OF_OPTION

Summary

Creates a pre-defined option for a question.

Prototype

```c
#define EFI_IFR_ONE_OF_OPTION_OP 0x09
typedef struct _EFI_IFR_ONE_OF_OPTION {
  EFI_IFR_OP_HEADER     Header;
  EFI_STRING_ID         Option;
  UINT8                 Flags;
  UINT8                 Type;
  EFI_IFR_TYPE_VALUE    Value;
} EFI_IFR_ONE_OF_OPTION;
```

Members

**Header**

The sequence that defines the type of opcode as well as the length of the opcode being defined. `Header.OpCode = EFI_IFR_ONE_OF_OPTION_OP`.

**Option**

The string token reference to the option description string for this particular opcode.

**Flags**

Specifies the flags associated with the current option. See EFI_IFR_OPTION_x.

**Type**

Specifies the type of the option’s value. See EFI_IFR_TYPE.

**Value**

The union of all of the different possible values. The actual contents (and size) of the field depends on Type.
Related Definitions

#define EFI_IFR_TYPE_OTHER     0x08
#define EFI_IFR_TYPE_UNDEF INDED 0x09
#define EFI_IFR_TYPE_ACTION    0x0A
#define EFI_IFR_TYPE_BUFFER    0x0B
#define EFI_IFR_TYPE_REF 0x0C

#define EFI_IFR_OPTION_DEFAULT 0x10
#define EFI_IFR_OPTION_DEFAULT_MFG 0x20

Description
Create a selection for use in any of the questions.
The value is encoded within the opcode itself, unless EFI_IFR_TYPE_OTHER is specified, in which case the value is determined by a nested EFI_IFR_VALUE.

An image may be associated with the option using a nested EFI_IFR_IMAGE. An animation may be associated with the question using a nested EFI_IFR_ANIMATION.

33.3.8.3.52 EFI_IFR_OR

Summary
Pop two Booleans, push TRUE if either is TRUE. Otherwise push FALSE.

Prototype

#define EFI_IFR_OR_OP 0x16
typedef struct _EFI_IFR_OR {
    EFI_IFR_OP_HEADER Header;
} EFI_IFR_OR;

Members

Header The sequence that defines the type of opcode as well as the length of the opcode being defined. Header.OpCode = EFI_IFR_OR_OP.

Description
This opcode performs the following actions:

1. Pop two values from the expression stack.
2. If either value does not evaluate as a Boolean, then push Undefined.
3. If either value evaluates to TRUE, then push TRUE. Otherwise, push FALSE.

33.3.8.3.53 EFI_IFR_ORDERED_LIST

Summary
Creates a set question using an ordered list.
Prototype

```c
#define EFI_IFR_ORDERED_LIST_OP 0x23

typedef struct _EFI_IFR_ORDERED_LIST {
  EFI_IFR_OP_HEADER   Header;
  EFI_IFR_QUESTION_HEADER Question;
  UINT8       MaxContainers;
  UINT8       Flags;
} EFI_IFR_ORDERED_LIST;
```

Members

- **Header**: The byte sequence that defines the type of opcode as well as the length of the opcode being defined. `Header.OpCode = EFI_IFR_ORDERED_LIST_OP`.
- **Question**: The standard question header. See Section 33.3.8.2.2 for more information.
- **MaxContainers**: The maximum number of entries for which this tag will maintain an order. This value also identifies the size of the storage associated with this tag’s ordering array.
- **Flags**: A bit-mask that determines which unique settings are active for this opcode.

Description

Create an ordered list question in the current form. One thing to note is that valid values for the options in ordered lists should never be a 0. The value of 0 is used to determine if a particular "slot" in the array is empty. Therefore, if in the previous example 3 was followed by a 4 and then followed by a 0, the valid options to be displayed would be 3 and 4 only.

An image may be associated with the option using a nested `EFI_IFR_IMAGE`. An animation may be associated with the question using a nested `EFI_IFR_ANIMATION`.

Related Definitions

```c
#define EFI_IFR_UNIQUE_SET   0x01
#define EFI_IFR_NO_EMPTY_SET 0x02
```

These flags determine whether all entries in the list must be unique (`EFI_IFR_UNIQUE_SET`) and whether there can be any empty items in the ordered list (`EFI_IFR_NO_EMPTY_SET`).

33.3.8.3.54 EFI_IFR_PASSWORD

Summary

Creates a password question
Prototype

```c
#define EFI_IFR_PASSWORD_OP 0x08
typedef struct _EFI_IFR_PASSWORD {
    EFI_IFR_OP_HEADER header;
    EFI_IFR_QUESTION_HEADER question;
    UINT16 minsize;
    UINT16 maxsize;
} EFI_IFR_PASSWORD;
```

Members

- **Header**: The sequence that defines the type of opcode as well as the length of the opcode being defined. `header.opcode = EFI_IFR_PASSWORD_OP`.
- **Question**: The standard question header. See [Section 33.3.8.2.2](#) for more information.
- **MinSize**: The minimum number of characters that can be accepted for this opcode.
- **MaxSize**: The maximum number of characters that can be accepted for this opcode.

Description

Creates a password question in the current form.

An image may be associated with the option using a nested `EFI_IFR_IMAGE`. An animation may be associated with the question using a nested `EFI_IFR_ANIMATION`. The password question has two modes of operation. The first is when the `header.flags` has the `EFI_IFR_FLAG_CALLBACK` bit not set. If the bit isn't set, the browser will handle all password operations itself, including string comparisons as needed. If the password question has the `EFI_IFR_FLAG_CALLBACK` bit set, then there will be a formal handshake initiated between the browser and the registered driver that would accept the callback. See the flowchart represented in Figure 33-48 and Figure 33-49 for details.

(This flowchart is provided in two parts because of page formatting but should be viewed as a single continuous chart.)
User selects a password operation in the browser

Browser

Does Password Opcode have the INTERACTIVE bit set?

Yes

Browser calls the ConfigAccess.Callback interface with the Password opcode’s QuestionId. Check for an existing password by sending a NULL string value.

Driver

Is there a preexisting password?

Yes

Driver returns EFI_SUCCESS to indicate there is no preexisting password.

No

Driver will return EFI_SUCCESS if password was accepted and saved.

Browser prompts for the new password and calls ConfigAccess.Callback with the new password string value.

Driver returns EFI_NOT_SUCCESS if password was accepted and saved.

Browser prompts for the existing password and calls ConfigAccess.Callback with the old password string value.

Driver

Did the user type the correct preexisting password?

No

Driver returns an EFI_NOT_READY, indicating the user mistyped the previous password. The browser can optionally alert the user of the error.

Yes

Driver returns EFI_SUCCESS to indicate the user typed the correct preexisting password and wants the user to type a new password.

Driver returns an error other than EFI_NOT_READY, indicating that the browser must exit the password handshake and refresh the current displayed form.

No

Driver returns EFI_SUCCESS if password was accepted and saved.

Yes

Driver returns EFI_SUCCESS to indicate the user typed the correct preexisting password and wants the user to type a new password.

No

Driver returns EFI_SUCCESS to indicate the user typed the correct preexisting password and wants the user to type a new password.

CONTINUED in part two

Figure 33-48 Password Flowchart (part one)
Figure 33-49 Password Flowchart (part two)

**33.3.8.3.55 EFI_IFR_QUESTION_REF1**

**Summary**

Push a question’s value on the expression stack.
Prototype

```c
#define EFI_IFR_QUESTION_REF1_OP 0x40
typedef struct _EFI_IFR_QUESTION_REF1 {
    EFI_IFR_OP_HEADER Header;
    EFI_QUESTION_ID QuestionId;
} EFI_IFR_QUESTION_REF1;
```

Members

- **Header**
  The byte sequence that defines the type of opcode as well as the length of the opcode being defined. `Header.OpCode = EFI_IFR_QUESTION_REF1_OP`.

- **QuestionId**
  The question’s identifier, which must be unique within the form set.

Description

Push the value of the question specified by `QuestionId` on to the expression stack. If the question’s value cannot be determined or the question does not exist, then push Undefined.

### 33.3.8.3.56 EFI_IFR_QUESTION_REF2

Summary

Pop an integer from the expression stack, convert it to a question id, and push the question value associated with that question id onto the expression stack.

Prototype

```c
#define EFI_IFR_QUESTION_REF2_OP 0x41
typedef struct _EFI_IFR_QUESTION_REF2 {
    EFI_IFR_OP_HEADER Header;
} EFI_IFR_QUESTION_REF2;
```

Members

- **Header**
  The byte sequence that defines the type of opcode as well as the length of the opcode being defined. `Header.OpCode = EFI_IFR_QUESTION_REF2_OP`.

Description

This opcode performs the following actions:

1. Pop an integer from the expression stack
2. Convert it to a question id
3. Push the question value associated with that question id onto the expression stack.

If the popped expression cannot be evaluated as an unsigned integer or the value of the unsigned integer is greater than 0xFFFF, then push Undefined onto the expression stack in step 3. If the value of the question specified by the unsigned integer, after converted to a question id, cannot be determined or the question does not exist, also push Undefined onto the expression stack in step 3.
33.3.8.3.57 EFI_IFR_QUESTION_REF3

Summary
Pop an integer from the expression stack, convert it to a question id, and push the question value associated with that question id onto the expression stack.

Prototype
```
#define EFI_IFR_QUESTION_REF3_OP 0x51
typedef struct _ EFI_IFR_QUESTION_REF3 {
    EFI_IFR_OP_HEADER Header;
} EFI_IFR_QUESTION_REF3;

typedef struct _ EFI_IFR_QUESTION_REF3_2 {
    EFI_IFR_OP_HEADER Header;
    EFI_STRING_ID DevicePath;
} EFI_IFR_QUESTION_REF3_2;

typedef struct _ EFI_IFR_QUESTION_REF3_3 {
    EFI_IFR_OP_HEADER Header;
    EFI_STRING_ID DevicePath;
    EFI_GUID Guid;
} EFI_IFR_QUESTION_REF3_3;
```

Members
- **Header**: The byte sequence that defines the type of opcode as well as the length of the opcode being defined. `Header.OpCode = EFI_IFR_QUESTION_REF3_OP`.
- **DevicePath**: Specifies the text representation of the device path containing the form set where the question is defined. If this is not present or the value is 0 then the device path installed on the `EFI_HANDLE` which was registered with the form set containing the current question is used.
- **Guid**: Specifies the GUID of the form set where the question is defined. If the value is Nil or this field is not present, then the current form set is used (if `DevicePath` is 0) or the only form set attached to the device path specified by `DevicePath` is used. If the value is Nil and there is more than one form set on the specified device path, then the value Undefined will be pushed.

Description
This opcode performs the following actions:
1. Pop an integer from the expression stack
2. Convert it to a question id
3. Push the question value associated with that question id onto the expression stack.
If the popped expression cannot be evaluated as an unsigned integer or the value of the unsigned integer is greater than 0xFFFF, then push Undefined onto the expression stack in step 3. If the value of the question specified by the unsigned integer, after converted to a question id, cannot be determined or the question does not exist, also push Undefined onto the expression stack in step 3.

This version allows question values from other forms to be referenced in expressions.

### 33.3.8.3.58 EFI_IFR_READ

**Summary**

Provides a value for the current question or default.

**Prototype**

```c
#define EFI_IFR_READ_OP 0x2D
typedef struct _EFI_IFR_READ {
    EFI_IFR_OP_HEADER    Header;
} EFI_IFR_READ;
```

**Parameters**

- **Header**
  
  The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, `Header.OpCode = EFI_IFR_READ_OP`.

**Description**

After reading the value for the current question (if any storage was specified) and setting the `this` constant (see `EFI_IFR_THIS`), this expression will be evaluated (if present) to return the value. If the `FormId` and `QuestionId` are either both not present, or are both set to zero, then the link does nothing.

### 33.3.8.3.59 EFI_IFR_REF

**Summary**

Creates a cross-reference statement.
Prototype

```
#define EFI_IFR_REF_OP 0x0F
typedef struct _EFI_IFR_REF {
  EFI_IFR_OP_HEADER   Header;
  EFI_IFR_QUESTION_HEADER  Question;
  EFI_FORM_ID          FormId;
} EFI_IFR_REF;

typedef struct _EFI_IFR_REF2 {
  EFI_IFR_OP_HEADER   Header;
  EFI_IFR_QUESTION_HEADER  Question;
  EFI_FORM_ID          FormId;
  EFI_QUESTION_ID      QuestionId;
} EFI_IFR_REF2;

typedef struct _EFI_IFR_REF3 {
  EFI_IFR_OP_HEADER   Header;
  EFI_IFR_QUESTION_HEADER  Question;
  EFI_FORM_ID          FormId;
  EFI_QUESTION_ID      QuestionId;
  EFI_GUID             FormSetId;
} EFI_IFR_REF3;

typedef struct _EFI_IFR_REF4 {
  EFI_IFR_OP_HEADER   Header;
  EFI_IFR_QUESTION_HEADER  Question;
  EFI_FORM_ID          FormId;
  EFI_QUESTION_ID      QuestionId;
  EFI_GUID             FormSetId;
  EFI_STRING_ID        DevicePath;
} EFI_IFR_REF4;

typedef struct _EFI_IFR_REF5 {
  EFI_IFR_OP_HEADER   Header;
  EFI_IFR_QUESTION_HEADER  Question;
} EFI_IFR_REF5;
```

Members

- **Header**
  - The byte sequence that defines the type of opcode as well as the length of the opcode being defined. `Header.OpCode = EFI_IFR_REF_OP`.

- **Question**
  - Standard question header. See Section 33.3.8.2.2

- **FormId**
  - The form to which this link is referring. If this is zero, then the link is on the current form. If this is missing, then the link is determined by the nested `EFI_IFR_VALUE`. 
**QuestionId**
The question on the form to which this link is referring. If this field is not present (determined by the length of the opcode) or the value is zero, then the link refers to the top of the form.

**FormSetId**
The form set to which this link is referring. If it is all zeroes or not present, and `DevicePath` is not present, then the link is to the current form set. If it is all zeroes (or not present) and the `DevicePath` is present, then the link is to the first form set associated with the `DevicePath`.

**DevicePath**
The string identifier that specifies the string containing the text representation of the device path to which the form set containing the form specified by `FormId`.

If this field is not present (determined by the opcode's length) or the value is zero, then the link refers to the current page. The format of the device path string that this field references is compatible with the Text format that is specified in the Text Device Node Reference (Section 10.6.1.6)

**Description**
Creates a user-selectable link to a form or a question on a form. There are several forms of this opcode which are distinguished by the length of the opcode.

### 33.3.8.3.60 EFI_IFR_REFRESH

**Summary**
Mark a question for periodic refresh.

**Prototype**

```c
#define EFI_IFR_REFRESH_OP 0x1d
typedef struct _EFI_IFR_REFRESH {
    EFI_IFR_OP_HEADER Header;
    UINT8 RefreshInterval;
} EFI_IFR_REFRESH;
```

**Members**

- **Header**
The byte sequence that defines the type of opcode as well as the length of the opcode being defined. `Header.OpCode = EFI_IFR_REFRESH_OP`.

- **RefreshInterval**
Minimum number of seconds before the question value should be refreshed. A value of zero indicates the question should not be refreshed automatically.

**Description**
When placed within the scope of a question, it will force the question’s value to be refreshed at least every `RefreshInterval` seconds. The value may be refreshed less often, depending on browser policy or capabilities.
33.3.8.3.61 EFI_IFR_REFRESH_ID

Summary
Mark an Question for an asynchronous refresh.

Prototype
```
#define EFI_IFR_REFRESH_ID_OP 0x62
typedef struct _EFI_IFR_REFRESH_ID {
  EFI_IFR_OP_HEADER Header;
  EFI_GUID RefreshEventGroupId;
} EFI_IFR_REFRESH_ID;
```

Members
- **Header**: The byte sequence that defines the type of opcode as well as the length of the opcode being defined. `Header.OpCode = EFI_IFR_REFRESH_ID_OP`.
- **RefreshEventGroupId**: The GUID associated with the event group which will be used to initiate a re-evaluation of an element in a set of forms.

Description
This tag op-code must be placed within the scope of a question or a form. If within the scope of a question and the event is signaled which belongs to the RefreshEventGroupId, the question will be refreshed. More than one question may share the same Event Group.

If the tag op-code is placed within the scope of an EFI_IFR_FORM op-code and the event is signaled which belongs to the RefreshEventGroupId, the entire form’s contents will be refreshed.

- If the contents within a form had an EFI_IFR_REFRESH_ID tag op-code placed within the scope of the form, and an event is signaled, all questions associated with the RefreshEventGroupId are marked for refresh. The Forms Browser will update the question value from storage, reparse the forms from the HII database and, at some time later, reflect that change if the question is displayed.

When interpreting this op-code, a browser must do the following actions:

- The browser will create an event group via CreateEventEx() based on the specified RefreshEventGroupId when the form set which contains the op-code is opened by the browser.
- When an event is signaled, all questions associated with the RefreshEventGroupId are marked for refresh. The Forms Browser will update the question value from storage and, at some time later, update the question’s display.
- The browser will close the event group which was previously created when the form set which contains the op-code is closed by the browser.
33.3.8.3.62 EFI_IFR_RESET_BUTTON

Summary
Create a reset or submit button on the current form.

Prototype

```
#define EFI_IFR_RESET_BUTTON_OP 0x0d
typedef struct _EFI_IFR_RESET_BUTTON {
    EFI_IFR_OP_HEADER    Header;
    EFI_IFR_STATEMENT_HEADER Statement;
    EFI_DEFAULT_ID    DefaultId;
} EFI_IFR_RESET_BUTTON;

typedef UINT16 EFI_DEFAULT_ID;
```

Members

- **Header**: The standard header, where `Header.OpCode = EFI_IFR_RESET_BUTTON_OP`.
- **Statement**: Standard statement header, including the prompt and help text.
- **DefaultId**: Specifies the set of default store to use when restoring the defaults to the questions on this form. See `EFI_IFR_DEFAULTSTORE` (Section 33.3.8.3.13) for more information.

Description
This opcode creates a user-selectable button that resets the question values for all questions on the current form to the default values specified by `DefaultId`. If `EFI_IFR_FLAGS_CALLBACK` is set in the question header, then the callback associated with the form set will be called. An image may be associated with the statement using a nested `EFI_IFR_IMAGE`. An animation may be associated with the statement using a nested `EFI_IFR_ANIMATION`.

33.3.8.3.63 EFI_IFR_RULE

Summary
Create a rule for use in a form and associate it with an identifier.
Prototype

```c
#define EFI_IFR_RULE_OP 0x18
typedef struct _EFI_IFR_RULE {
    EFI_IFR_OP_HEADER Header;
    UINT8 RuleId;
} EFI_IFR_RULE;
```

Members

- **Header**: The byte sequence that defines the type of opcode as well as the length of the opcode being defined. `Header OpCode = EFI_IFR_RULE_OP`.
- **RuleId**: Unique identifier for the rule. There can only be one rule within a form with the specified `RuleId`. If another already exists, then the form is marked as invalid.

Description

Create a rule, which associates an expression with an identifier and attaches it to the currently opened form. These rules allow common sub-expressions to be re-used within a form.

33.3.8.3.64 EFI_IFR_RULE_REF

Summary

Evaluate a form rule and push its result on the expression stack.

Prototype

```c
#define EFI_IFR_RULE_REF_OP 0x3f
typedef struct _EFI_IFR_RULE_REF {
    EFI_IFR_OP_HEADER Header;
    UINT8 RuleId;
} EFI_IFR_RULE_REF;
```

Members

- **Header**: The byte sequence that defines the type of opcode as well as the length of the opcode being defined. `Header OpCode = EFI_IFR_RULE_REF_OP`.
- **RuleId**: The rule’s identifier, which must be unique within the form.

Description

Look up the rule specified by `RuleId` and push the evaluated result on the expression stack. If the specified rule does not exist, then push `Undefined`.

33.3.8.3.65 EFI_IFR_SECURITY

Summary

Push `TRUE` if the current user profile contains the specified setup access permissions.
### EFI_IFR_SECURITY

#### Prototype

```c
#define EFI_IFR_SECURITY_OP     0x60
typedef struct _EFI_IFR_SECURITY {
  EFI_IFR_OP_HEADER         Header;
  EFI_GUID                  Permissions;
} EFI_IFR_SECURITY;
```

#### Members

- **Header**: Standard opcode header, where `Header.Op = EFI_IFR_SECURITY_OP`.
- **Permissions**: Security permission level.

#### Description

This opcode pushes whether or not the current user profile contains the specified setup access permissions. This opcode can be used in expressions to disable, suppress or gray-out forms, statements and questions. It can also be used in checking question values to disallow or allow certain values.

This opcode performs the following actions:

1. If the current user profile contains the specified setup access permissions, then push `TRUE`. Otherwise, push `FALSE`.

### 33.3.8.3.66 EFI_IFR_SET

#### Summary

Change a stored value.

#### Prototype

```c
#define EFI_IFR_SET_OP 0x2C
typedef struct _EFI_IFR_SET {
  EFI_IFR_OP_HEADER         Header;
  EFI_VARSTORE_ID           VarStoreId;
  union {
    EFI_STRING_ID            VarName;
    UINT16                   VarOffset;
  } VarStoreInfo;
  UINT8                     VarStoreType;
} EFI_IFR_SET;
```

#### Parameters

- **Header**: The sequence that defines the type of opcode as well as the length of the opcode being defined. `Header.OpCode = EFI_IFR_SET_OP`.
- **VarStoreId**: Specifies the identifier of a previously declared variable store to use when storing the question’s value.
VarStoreInfo  Depending on the type of variable store selected, this contains either a 16-bit Buffer Storage offset (VarOffset) or a Name/Value or EFI Variable name (VarName).

VarStoreType  Specifies the type used for storage. The storage types EFI_IFR_TYPE_x are defined in EFI_IFR_ONE_OF_OPTION.

Description
This operator pops an expression from the expression stack. The expression popped is the value. The value is stored into the variable store identified by VarStoreId and VarStoreInfo. If the value could be stored successfully, then TRUE is pushed on to the expression stack. Otherwise, FALSE is pushed on the expression stack.

33.383.67 EFI_IFR_SHIFT_LEFT

Summary
Pop two unsigned integers, shift one left by the number of bits specified by the other and push the result.

Prototype
#define EFI_IFR_SHIFT_LEFT_OP 0x38
typedef struct _EFI_IFR_SHIFT_LEFT {
  EFI_IFR_OP_HEADER Header;
} EFI_IFR_SHIFT_LEFT;

Members
Header Standard opcode header, where OpCode is EFI_IFR_SHIFT_LEFT_OP.

Description
This opcode performs the following actions:
1. Pop two values from the expression stack. The first value popped is the right-hand value and the second value popped is the left-hand value.
2. If the two values do not evaluate to unsigned integers, push Undefined.
3. Shift the left-hand value left by the number of bits specified by the right-hand value and push the result.

33.383.68 EFI_IFR_SHIFT_RIGHT

Summary
Pop two unsigned integers, shift one right by the number of bits specified by the other and push the result.
Prototype

```c
#define EFI_IFR_SHIFT_RIGHT_OP 0x39
typedef struct _EFI_IFR_SHIFT_RIGHT {
    EFI_IFR_OP_HEADER Header;
} EFI_IFR_SHIFT_RIGHT;
```

Members

- **Header**: Standard opcode header, where OpCode is EFI_IFR_SHIFT_RIGHT_OP.

Description

This opcode performs the following actions:

1. Pop two values from the expression stack. The first value popped is the right-hand value and the second value popped is the left-hand value.
2. If the two values do not evaluate to unsigned integers, push Undefined.
3. Shift the left-hand value right by the number of bits specified by the right-hand value and push the result.

### 33.3.8.3.69 EFI_IFR_SPAN

Summary

Pop two strings and an unsigned integer, find the first character from one string that contains characters found in another and push its index.

Prototype

```c
#define EFI_IFR_SPAN_OP 0x59
typedef struct _EFI_IFR_SPAN {
    EFI_IFR_OP_HEADER Header;
    UINT8 Flags;
} EFI_IFR_SPAN;
```

Members

- **Header**: The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, Header.OpCode = EFI_IFR_SPAN_OP.
- **Flags**: Specifies whether to find the first matching string (EFI_IFR_FLAGS_FIRST_MATCHING) or the first non-matching string (EFI_IFR_FLAGS_FIRST_NON_MATCHING).

Description

This opcode performs the following actions:

1. Pop three values from the expression stack. The first value popped is the right value and the second value popped is the middle value and the last value popped is the left expression.
2. If the left or middle values cannot be evaluated as a string, push Undefined. If the right value cannot be evaluated as an unsigned integer, push Undefined.
3. The left string is the string to scan. The middle string consists of character pairs representing the low-end of a range and the high-end of a range of characters. The right unsigned integer represents the starting location for the scan.

4. The operation will push the zero-based index of the first character after the right value which falls within any one of the ranges (EFI_IFR_FLAGS_FIRST_MATCHING) or falls within none of the ranges (EFI_IFR_FLAGS_FIRST_NON_MATCHING).

Related Definitions

#define EFI_IFR_FLAGS_FIRST_MATCHING    0x00
#define EFI_IFR_FLAGS_FIRST_NON_MATCHING  0x01

33.3.8.3.70 EFI_IFR_STRING

Summary

Defines the string question.

Prototype

#define EFI_IFR_STRING_OP 0x1C
typedef struct _EFI_IFR_STRING {
    EFI_IFR_OP_HEADER       Header;
    EFI_IFR_QUESTION_HEADER Question;
    UINT8                   MinSize;
    UINT8                   MaxSize;
    UINT8                   Flags;
} EFI_IFR_STRING;

Members

Header                The sequence that defines the type of opcode as well as the length of the opcode being defined. Header.OpCode = EFI_IFR_STRING_OP.
Question              The standard question header. See Section 33.3.8.2.2 for more information.
MinSize               The minimum number of characters that can be accepted for this opcode.
MaxSize               The maximum number of characters that can be accepted for this opcode.
Flags                 Flags which control the string editing behavior. See “Related Definitions” below.

Description

This creates a string question. The minimum length is MinSize and the maximum length is MaxSize characters.

An image may be associated with the question using a nested EFI_IFR_IMAGE. An animation may be associated with the question using a nested EFI_IFR_ANIMATION.

There are two ways to specify defaults for this question: one or more nested EFI_IFR_ONE_OF_OPTION (lowest priority) or nested EFI_IFR_DEFAULT (highest priority).
If `EFI_IFR_STRING_MULTI_LINE` is set, it is a hint to the Forms Browser that multi-line text can be allowed. If it is clear, then multi-line editing should not be allowed.

Related Definitions

```c
#define EFI_IFR_STRING_MULTI_LINE 0x01
```

33.3.8.3.71 EFI_IFR_STRING_REF1

Summary

Push a string on the expression stack.

Prototype

```c
#define EFI_IFR_STRING_REF1_OP 0x4e
typedef struct _EFI_IFR_STRING_REF1 {
    EFI_IFR_OP_HEADER Header;
    EFI_STRING_ID StringId;
} EFI_IFR_STRING_REF1;
```

Members

- **Header**
  The byte sequence that defines the type of opcode as well as the length of the opcode being defined. `Header.OpCode = EFI_IFR_STRING_REF1_OP`.

- **StringId**
  The string’s identifier, which must be unique within the package list.

Description

Push the string specified by `StringId` on to the expression stack. If the string does not exist, then push an empty string.

33.3.8.3.72 EFI_IFR_STRING_REF2

Summary

Pop a string identifier, push the associated string.

Prototype

```c
#define EFI_IFR_STRING_REF2_OP 0x4f
typedef struct _EFI_IFR_STRING_REF2 {
    EFI_IFR_OP_HEADER Header;
} EFI_IFR_STRING_REF2;
```

Members

- **Header**
  The byte sequence that defines the type of opcode as well as the length of the opcode being defined. `Header.OpCode = EFI_IFR_STRING_REF2_OP`.

Description

This opcode performs the following actions:
1. Pop a value from the expression stack.
2. If the value cannot be evaluated as an unsigned integer or the value of the unsigned integer is greater than 0xFFFF, push Undefined.
3. If the string specified by the value (converted to a string identifier) cannot be determined or the string does not exist, push an empty string.
4. Otherwise, push the string on to the expression stack.

33.3.8.3.73 EFI_IFR_SUBTITLE

Summary
Creates a sub-title in the current form.

Prototype
#define EFI_IFR_SUBTITLE_OP 0x02
typedef struct _EFI_IFR_SUBTITLE {
  EFI_IFR_OP_HEADER     Header;
  EFI_IFR_STATEMENT_HEADER Statement;
  UINT8                Flags;
} EFI_IFR_SUBTITLE;

Members

  Header       The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, Header.OpCode = EFI_IFR_SUBTITLE_OP.
  Flags        Identifies specific behavior for the sub-title.

Description
Subtitle strings are intended to be used by authors to separate sections of questions into semantic groups. If Header.Scope is set, then the Forms Browser may further distinguish the end of the semantic group as including only those statements and questions which are nested.

If EFI_IFR_FLAGS_HORIZONTAL is set, then this provides a hint that the nested statements or questions should be horizontally arranged. Otherwise, they are assumed to be vertically arranged.

An image may be associated with the statement using a nested EFI_IFR_IMAGE. An animation may be associated with the statement using a nested EFI_IFR_ANIMATION.

Related Definitions
#define EFI_IFR_FLAGS_HORIZONTAL 0x01

33.3.8.3.74 EFI_IFR_SUBTRACT

Summary
Pop two unsigned integers, subtract one from the other, push the result.
Prototype

```c
#define EFI_IFR_SUBTRACT_OP 0x3b
typedef struct _EFI_IFR_SUBTRACT {
    EFI_IFR_OP_HEADER Header;
} EFI_IFR_SUBTRACT;
```

Members

- **Header**

  Standard opcode header, where `Header.OpCode` is `EFI_IFR_SUBTRACT_OP`.

Description

This opcode performs the following operations:

1. Pop two values from the expression stack. The first value popped is the *right-hand* value and the second value popped is the *left-hand* value.
2. If the two values do not evaluate to unsigned integers, push Undefined.
3. Zero-extend the values to 64-bits.
4. Subtract the *right-hand* value from the *left-hand* value.
5. Push the lower 64-bits of the result.

### 33.3.8.3.75 EFI_IFR_SUPPRESS_IF

Summary

Creates a group of statements or questions which are conditionally invisible.

Prototype

```c
#define EFI_IFR_SUPPRESS_IF_OP 0x0a
typedef struct _EFI_IFR_SUPPRESS_IF {
    EFI_IFR_OP_HEADER Header;
} EFI_IFR_SUPPRESS_IF;
```

Members

- **Header**

  The byte sequence that defines the type of opcode as well as the length of the opcode being defined. `Header.OpCode` is `EFI_IFR_SUPPRESS_IF_OP`.

Description

The suppress tag causes the nested objects to be hidden from the user if the expression appearing as the first nested object evaluates to TRUE. If the expression consists of more than a single opcode, then the first opcode in the expression must have the Scope bit set and the expression must end with `EFI_IFR_END`.

This display form is maintained until the scope for this opcode is closed.
### 33.3.8.3.76 EFI_IFR_TEXT

**Summary**
Creates a static text and image.

**Prototype**
```
#define EFI_IFR_TEXT_OP 0x03
typedef struct _EFI_IFR_TEXT {
    EFI_IFR_OP_HEADER Header;
    EFI_IFR_STATEMENT_HEADER Statement;
    EFI_STRING_ID TextTwo;
} EFI_IFR_TEXT;
```

**Members**
- **Header**
  The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, `Header.OpCode = EFI_IFR_TEXT_OP`.
- **Statement**
  Standard statement header.
- **TextTwo**
  The string token reference to the secondary string for this opcode.

**Description**
This is a static text/image statement.

An image may be associated with the statement using a nested `EFI_IFR_IMAGE`. An animation may be associated with the question using a nested `EFI_IFR_ANIMATION`.

### 33.3.8.3.77 EFI_IFR_THIS

**Summary**
Push current question’s value.

**Prototype**
```
#define EFI_IFR_THIS_OP 0x58
typedef struct _EFI_IFR_THIS {
    EFI_IFR_OP_HEADER Header;
} EFI_IFR_THIS;
```

**Members**
- **Header**
  The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, `Header.OpCode = EFI_IFR_THIS_OP`.

**Description**
Push the current question’s value.
33.3.8.3.78 EFI_IFR_TIME

Summary
Create a Time question.

Prototype
```
#define EFI_IFR_TIME_OP 0x1b
typedef struct _EFI_IFR_TIME {
    EFI_IFR_OP_HEADER Header;
    EFI_IFR_QUESTION_HEADER Question;
    UINT8 Flags;
} EFI_IFR_TIME;
```

Members
- **Header**: Basic question information. `Header.Opcode = EFI_IFR_TIME_OP`.
- **Question**: The standard question header. See Section 33.3.8.2.2 for more information.
- **Flags**: A bit-mask that determines which unique settings are active for this opcode.

  - `QF_TIME_HOUR_SUPPRESS` 0x01
  - `QF_TIME_MINUTE_SUPPRESS` 0x02
  - `QF_TIME_SECOND_SUPPRESS` 0x04
  - `QF_TIME_STORAGE` 0x30

  For `QF_TIME_STORAGE`, there are currently three valid values:

  - `QF_TIME_STORAGE_NORMAL` 0x00
  - `QF_TIME_STORAGE_TIME` 0x10
  - `QF_TIME_STORAGE_WAKEUP` 0x20

Description
Create a Time question (see Section 33.2.5.4.11) and add it to the current form.

An image may be associated with the question using a nested `EFI_IFR_IMAGE`. An animation may be associated with the question using a nested `EFI_IFR_ANIMATION`.

33.3.8.3.79 EFI_IFR_TOKEN

Summary
Pop two strings and an unsigned integer, then push the nth section of the first string using delimiters from the second string.
Prototype

```c
#define EFI_IFR_TOKEN_OP 0x4d
typedef struct _EFI_IFR_TOKEN {
  EFI_IFR_OP_HEADER    Header;
} EFI_IFR_TOKEN;
```

Members

- **Header**: Standard opcode header, where **OpCode** is **EFI_IFR_TOKEN_OP**.

Description

This opcode performs the following actions:

1. Pop three values from the expression stack. The first value popped is the **right** value and the second value popped is the **middle** value and the last value popped is the **left** value.
2. If the **left** or **middle** values cannot be evaluated as a string, push Undefined. If the **right** value cannot be evaluated as an unsigned integer, push Undefined.
3. The first value is the string. The second value is a string, where each character is a valid delimiter. The third value is the zero-based index.
4. Push the nth delimited sub-string on to the expression stack (0 = left of the first delimiter). The end of the string always acts a the final delimiter.
5. The no such string exists, an empty string is pushed.

### 33.3.8.3.80 EFI_IFR_TO_BOOLEAN

Summary

Pop a value, convert to Boolean and push the result.

Prototype

```c
#define EFI_IFR_TO_BOOLEAN_OP 0x4A
typedef struct _EFI_IFR_TO_BOOLEAN {
  EFI_IFR_OP_HEADER    Header;
} EFI_IFR_TO_BOOLEAN;
```

Members

- **Header**: The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, **Header.OpCode** = **EFI_IFR_TO_BOOLEAN_OP**

Description

This opcode performs the following actions:

1. Pop a value from the expression stack. If the value is Undefined or cannot be evaluated as a Boolean, push Undefined. Otherwise push the Boolean on the expression stack.
2. When converting from an unsigned integer, zero will be converted to \texttt{FALSE} and any other value will be converted to \texttt{TRUE}.

3. When converting from a string, if case-insensitive compare with “true” is \texttt{TRUE}, then push \texttt{TRUE}. If a case-insensitive compare with “false” is \texttt{TRUE}, then push \texttt{False}. Otherwise, push Undefined.

4. When converting from a buffer, if the buffer is all zeroes, then push \texttt{False}. Otherwise push \texttt{True}.

\subsection*{33.3.8.3.81 EFI_IFR_TO_LOWER}

**Summary**

Convert a string on the expression stack to lower case.

**Prototype**

```c
#define EFI_IFR_TO_LOWER_OP 0x20
typedef struct _EFI_IFR_TO_LOWER {
  EFI_IFR_OP_HEADER Header;
} EFI_IFR_TO_LOWER;
```

**Members**

- \textit{Header}
  
The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, \texttt{Header.OpCode = EFI_IFR_TO_LOWER_OP}

**Description**

Pop an expression from the expression stack. If the expression is Undefined or cannot be evaluated as a string, push Undefined. Otherwise, convert the string to all lower case using the \texttt{StrLwr} function of the \texttt{EFI_UNICODE_COLLATION2_PROTOCOL} and push the string on the expression stack.

\subsection*{33.3.8.3.82 EFI_IFR_TO_STRING}

**Summary**

Pop a value, convert to a string, push the result.

**Prototype**

```c
#define EFI_IFR_TO_STRING_OP 0x49
typedef struct _EFI_IFR_TO_STRING{
  EFI_IFR_OP_HEADER Header;
  UINT8 Format;
} EFI_IFR_TO_STRING;
```

**Members**

- \textit{Header}
  
The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, \texttt{Header.OpCode = EFI_IFR_TO_STRING_OP}

- \textit{Format}
  
  When converting from unsigned integers, these flags control the format:
0 = unsigned decimal
1 = signed decimal
2 = hexadecimal (lower-case alpha)
3 = hexadecimal (upper-case alpha)
When converting from a buffer, these flags control the format:
0 = ASCII
8 = UCS-2

Description
This opcode performs the following actions:

1. Pop a value from the expression stack.
2. If the value is Undefined or cannot be evaluated as a string, push Undefined.
3. Convert the value to a string. When converting from an unsigned integer, the number will be converted to an unsigned decimal string (Format = 0), signed decimal string (Format = 1) or a hexadecimal string (Format = 2 or 3).
   When converting from a boolean, the boolean will be converted to “True” (True) or “False” (False). When converting from a buffer, each 8-bit (Format =0) or 16-bit (Format =8) value will be converted into a character and appended to the string, up until the end of the buffer or a NULL character.
4. Push the result.

33.3.8.3.83 EFI_IFR_TO_UINT

Summary
Pop a value, convert to an unsigned integer, push the result.

Prototype
#define EFI_IFR_TO_UINT_OP 0x48
typedef struct _EFI_IFR_TO_UINT {
   EFI_IFR_OP_HEADER Header;
} EFI_IFR_TO_UINT;

Members
Header The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag,
Header .OpCode = EFI_IFR_TO_UINT_OP

Description
1. Pop a value from the expression stack.
2. If the value is Undefined or cannot be evaluated as an unsigned integer, push Undefined.
3. Convert the value to an unsigned integer. When converting from a boolean, if True, push 1 and if False, push 0. When converting from a string, whitespace is skipped. The prefix ‘0x’ or ‘0X’ indicates to convert from a hexadecimal string while the prefix ‘-‘ indicates conversion from a signed integer string. When converting from a buffer, if the buffer is greater than 8 bytes in length, push Undefined. Otherwise, zero-extend the contents of the buffer to 64-bits.
4. Push the result.

### 33.3.8.3.84 EFI_IFR_TO_UPPER

**Summary**
Convert a string on the expression stack to upper case.

**Prototype**
```c
#define EFI_IFR_TO_UPPER_OP 0x21
typedef struct _EFI_IFR_TO_UPPER {
    EFI_IFR_OP_HEADER  Header;
} EFI_IFR_TO_UPPER;
```

**Members**
- **Header**
  The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, `Header.OpCode = EFI_IFR_TO_UPPER_OP`

**Description**
Pop an expression from the expression stack. If the expression is Undefined or cannot be evaluated as a string, push Undefined. Otherwise, convert the string to all upper case using the `StrUp` function of the `EFI_UNICODE_COLLATION2_PROTOCOL` and push the string on the expression stack.

### 33.3.8.3.85 EFI_IFR_TRUE

**Summary**
Push a TRUE on to the expression stack.

**Prototype**
```c
#define EFI_IFR_TRUE_OP 0x46
typedef struct _EFI_IFR_TRUE {
    EFI_IFR_OP_HEADER  Header;
} EFI_IFR_TRUE;
```

**Members**
- **Header**
  The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, `Header.OpCode = EFI_IFR_TRUE_OP`

**Description**
Push a TRUE on to the expression stack.

### 33.3.8.3.86 EFI_IFR_UINT8, EFI_IFR_UINT16, EFI_IFR_UINT32, EFI_IFR_UINT64

**Summary**
Push an unsigned integer on to the expression stack.
Prototype

```c
#define EFI_IFR_UINT8_OP 0x42
typedef struct _EFI_IFR_UINT8 {
    EFI_IFR_OP_HEADER Header;
    UINT8 Value;
} EFI_IFR_UINT8;

#define EFI_IFR_UINT16_OP 0x43
typedef struct _EFI_IFR_UINT16 {
    EFI_IFR_OP_HEADER Header;
    UINT16 Value;
} EFI_IFR_UINT16;

#define EFI_IFR_UINT32_OP 0x44
typedef struct _EFI_IFR_UINT32 {
    EFI_IFR_OP_HEADER Header;
    UINT32 Value;
} EFI_IFR_UINT32;

#define EFI_IFR_UINT64_OP 0x45
typedef struct _EFI_IFR_UINT64 {
    EFI_IFR_OP_HEADER Header;
    UINT64 Value;
} EFI_IFR_UINT64;
```

Members

- **Header**: The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, `Header.OpCode = EFI_IFR_UINT8_OP, EFI_IFR_UINT16_OP, EFI_IFR_UINT32_OP` or `EFI_IFR_UINT64_OP`.
- **Value**: The unsigned integer.

Description

Push the specified unsigned integer, zero-extended to 64-bits, on to the expression stack.

### 33.3.8.3.87 EFI_IFR_UNDEFINED

**Summary**

Push an Undefined to the expression stack.
Prototype

```c
#define EFI_IFR_UNDEFINED_OP 0x55
typedef struct _EFI_IFR_UNDEFINED {
    EFI_IFR_OP_HEADER Header;
} EFI_IFR_UNDEFINED;
```

Members

- **Header**
  
  The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, `Header.OpCode = EFI_IFR_UNDEFINED_OP`

Description

Push Undefined on to the expression stack.

### 33.3.8.3.88 EFI_IFR_VALUE

**Summary**

Provides a value for the current question or default.

Prototype

```c
#define EFI_IFR_VALUE_OP 0x5a
typedef struct _EFI_IFR_VALUE {
    EFI_IFR_OP_HEADER Header;
} EFI_IFR_VALUE;
```

Members

- **Header**
  
  The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, `Header.OpCode = EFI_IFR_VALUE_OP`

Description

Creates a value for the current question or default with no storage. The value is the result of the expression nested in the scope.

If used for a question, then the question will be read-only.

### 33.3.8.3.89 EFI_IFR_VARSTORE

**Summary**

Creates a variable storage short-cut for linear buffer storage.
Prototype

```c
#define EFI_IFR_VARSTORE_OP 0x24
typedef struct {
    EFI_IFR_OP_HEADER Header;
    EFI_GUID Guid;
    EFI_VARSTORE_ID VarStoreId;
    UINT16 Size;
    //UINT8 Name[];
} EFI_IFR_VARSTORE;
```

Members

- **Header**: The byte sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, `Header.OpCode = EFI_IFR_VARSTORE_OP`.
- **Guid**: The variable’s GUID definition. This field comprises one half of the variable name, with the other half being the human-readable aspect of the name, which is represented by the string immediately following the Size field. Type `EFI_GUID` is defined in `InstallProtocolInterface()` in this specification.
- **VarStoreId**: The variable store identifier, which is unique within the current form set. This field is the value that uniquely identify this instance from others. Question headers refer to this value to designate which is the active variable that is being used. A value of zero is invalid.
- **Size**: The size of the variable store.
- **Name**: A null-terminated ASCII string that specifies the name associated with the variable store. The field is not actually included in the structure but is included here to help illustrate the encoding of the opcode. The size of the string, including the null termination, is included in the opcode’s header size.

Description

This opcode describes a Buffer Storage Variable Store within a form set. A question can select this variable store by setting the `VarStoreId` field in its opcode header.

An `EFI_IFR_VARSTORE` with a specified `VarStoreId` must appear in the IFR before it can be referenced by a question.

### 33.3.8.3.90 EFI_IFR_VARSTORE_NAME_VALUE

Summary

Creates a variable storage short-cut for name/value storage.
Prototype

```c
#define EFI_IFR_VARSTORE_NAME_VALUE_OP 0x25
typedef struct _EFI_IFR_VARSTORE_NAME_VALUE {
    EFI_IFR_OP_HEADER Header;
    EFI_VARSTORE_ID VarStoreId;
    EFI_GUID Guid;
} EFI_IFR_VARSTORE_NAME_VALUE;
```

Members

- **Header**: The byte sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, `Header.OpCode = EFI_IFR_VARSTORE_NAME_VALUE_OP`.
- **Guid**: The variable's GUID definition. This field comprises one half of the variable name, with the other half being the human-readable aspect of the name, which is specified in the `VariableName` field in the question's header (see `EFI_IFR_QUESTION_HEADER`). Type `EFI_GUID` is defined in `InstallProtocolInterface()` in the UEFI Specification.
- **VarStoreId**: The variable store identifier, which is unique within the current form set. This field is the value that uniquely identifies this variable store definition instance from others. Question headers refer to this value to designate which is the active variable that is being used. A value of zero is invalid.

Description

This opcode describes a Name/Value Variable Store within a form set. A question can select this variable store by setting the `VarStoreId` field in its question header.

An `EFI_IFR_VARSTORE_NAME_VALUE` with a specified `VarStoreId` must appear in the IFR before it can be referenced by a question.

33.3.8.3.91 EFI_IFR_VARSTORE_EFI

Summary

Creates a variable storage short-cut for EFI variable storage.
Prototype

```c
#define EFI_IFR_VARSTORE_EFI_OP 0x26
typedef struct _EFI_IFR_VARSTORE_EFI {
    EFI_IFR_OP_HEADER Header;
    EFI_VARSTORE_ID VarStoreId;
    EFI_GUID Guid;
    UINT32 Attributes;
    UINT16 Size;
    //UINT8 Name[];
} EFI_IFR_VARSTORE_EFI;
```

Members

- **Header**
  The byte sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, `Header.OpCode = EFI_IFR_VARSTORE_EFI_OP`.

- **VarStoreId**
  The variable store identifier, which is unique within the current form set. This field is the value that uniquely identifies this variable store definition instance from others. Question headers refer to this value to designate which is the active variable that is being used. A value of zero is invalid.

- **Guid**
  The EFI variable's GUID definition. This field comprises one half of the EFI variable name, with the other half being the human-readable aspect of the name, which is specified in the `Name` field below. Type `EFI_GUID` is defined in `InstallProtocolInterface()` in this specification.

- **Attributes**
  Specifies the flags to use for the variable.

- **Size**
  The size of the variable store.

- **Name**
  A null-terminated ASCII string that specifies one half of the EFI name for this variable store. The other half is specified in the `Guid` field (above). The `Name` field is not actually included in the structure but is included here to help illustrate the encoding of the opcode. The size of the string, including the null termination, is included in the opcode's header size.

Description

This opcode describes an EFI Variable Variable Store within a form set. The `Guid` and `Name` specified here will be used with `GetVariable()` and `SetVariable()`.

- A question can select this variable store by setting the `VarStoreId` field in its question header.
- A question can refer to a specific offset within the EFI Variable using the `VarOffset` field in its question header.
Note: Name must be converted to a CHAR16 string before it is passed to GetVariable() or SetVariable().

An EFI_IFR_VARSTORE_EFI with a specified VarStoreId must appear in the IFR before it can be referenced by a question.

33.3.8.3.92 EFI_IFR_VARSTOREDEVICE

Summary
Select the device which contains the variable store.

Prototype

```c
#define EFI_IFR_VARSTOREDEVICE_OP 0x27
typedef struct _EFI_IFR_VARSTOREDEVICE {
    EFI_IFR_OP_HEADER Header;
    EFI_STRING_ID DevicePath;
} EFI_IFR_VARSTOREDEVICE;
```

Members

- **Header**
  The byte sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, `Header.OpCode = EFI_IFR_VARSTOREDEVICE_OP`.

- **DevicePath**
  Specifies the string which contains the device path of the device where the variable store resides.

Description

This opcode describes the device path where a variable store resides. Normally, the Forms Processor finds the variable store on the handle specified when the HII database function NewPackageList() was called. However, if this opcode is found in the scope of a question, the handle specified by the text device path DevicePath is used instead.

33.3.8.3.93 EFI_IFR_VERSION

Summary
Push the version of the UEFI specification to which the Forms Processor conforms.

Prototype

```c
#define EFI_IFR_VERSION_OP 0x28
typedef struct _EFI_IFR_VERSION {
    EFI_IFR_OP_HEADER Header;
} EFI_IFR_VERSION;
```

Members

- **Header**
  The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, `Header.OpCode = EFI_IFR_VERSION_OP`. 
Description

Returns the revision level of the UEFI specification with which the Forms Processor is compliant as a 16-bit unsigned integer, with the form:

[15:8]Major revision
[7:4]Tens digit of the minor revision
[3:0]Ones digit of the minor revision

The fields of the version have the following correlation with the revision of the UEFI system table.

- **Major revision**: \( \text{EFI.SYSTEM_TABLE_REVISION} \gg 16 \)
- **Tens digit of the minor revision**: \( (\text{EFI.SYSTEM_TABLE_REVISION} \& 0xFFFF)/10 \)
- **Ones digit of the minor revision**: \( (\text{EFI.SYSTEM_TABLE_REVISION} \& 0xFFFF)\%10 \)

### 33.3.8.3.94 EFI_IFR_WRITE

**Summary**

Change a value for the current question.

**Prototype**

```c
#define EFI_IFR_WRITE_OP 0x2E

typedef struct _EFI_IFR_WRITE {
    EFI_IFR_OP_HEADER Header;
} EFI_IFR_WRITE;
```

**Parameters**

**Header**

The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, `Header.OpCode = EFI_IFR_WRITE_OP`

**Description**

Before writing the value of the current question to storage (if any storage was specified), the `this` constant is set (see `EFI_IFR_THIS`) and then this expression is evaluated.

### 33.3.8.3.95 EFI_IFR_ZERO

**Summary**

Push a zero on to the expression stack.
Prototype

```c
#define EFI_IFR_ZERO_OP 0x52
typedef struct _EFI_IFR_ZERO {
    EFI_IFR_OP_HEADER Header;
} EFI_IFR_ZERO;
```

Members

- **Header**: The sequence that defines the type of opcode as well as the length of the opcode being defined. For this tag, `Header.OpCode = EFI_IFR_ZERO_OP`.

Description

Push a zero on to the expression stack.

### 33.3.8.3.96 EFI_IFR_WARNING_IF

**Summary**

Creates a validation expression and warning message for a question.

Prototype

```c
#define EFI_IFR_WARNING_IF_OP 0x063
typedef struct _EFI_IFR_WARNING_IF {
    EFI_IFR_OP_HEADER Header;
    EFI_STRING_ID Warning;
    UINT8 TimeOut;
} EFI_IFR_WARNING_IF;
```

Members

- **Header**: The byte sequence that defines the type of opcode as well as the length of the opcode being defined. `Header.OpCode = EFI_IFR_WARNING_IF_OP`.
- **Warning**: The string token reference to the string that will be used for the warning check message.
- **TimeOut**: The number of seconds for the warning message to be displayed before it is timed out or acknowledged by the user. A value of zero indicates that the message is displayed indefinitely until the user acknowledges it.

Description

This tag uses a Boolean expression to allow the IFR creator to check options in a question, and provide a warning message if the expression is true. For example, this tag might be used to give a warning if the user attempts to disable a security setting, or change the value of a sensitive question. The tag provides a string to be used in a warning display to alert the user of the consequences of changing the question value. Warning tags will be evaluated when the user traverses from tag to tag. The browser must display the warning text message and not allow the form to be submitted until either the user acknowledges the message (with some key press for instance) or the number of seconds in TimeOut elapses. Unlike
inconsistency tags, the user should still be allowed to submit the results of a form even if the warning expression evaluates to true.

### 33.3.8.3.97 EFI_IFR_MATCH2

**Summary**

Pop a source string and a pattern string, push **TRUE** if the source string matches the Regular Expression pattern specified by the pattern string, otherwise push **FALSE**.

**Prototype**

```c
#define EFI_IFR_MATCH2_OP         0x64
typedef struct _EFI_IFR_MATCH2 {
    EFI_IFR_OP_HEADER           Header;
    EFI_GUID                    SyntaxType;
} EFI_IFR_MATCH2;
```

**Members**

- **Header**: Standard opcode header, where `Header.Opcode` is `EFI_IFR_MATCH2_OP`.
- **SyntaxType**: A GUID that identifies the regular expression syntax type to use for the **pattern** string. See `EFI_REGULAR_EXPRESSION_PROTOCOL` for current syntax definitions.

**Description**

This opcode performs the following actions:

1. Pop two values from the expression stack. The first value popped is the **string** and the second value popped is the **pattern**.
2. If the **string** or the **pattern** cannot be evaluated as a string, then push Undefined.
3. Call `GetInfo` function of each instance of `EFI_REGULAR_EXPRESSION_PROTOCOL`, looking for a `SyntaxType` that is listed in the set of supported regular expression syntax types returned by `RegExSyntaxTypeList`. If the type specified by `SyntaxType` is not supported in any of the `EFI_REGULAR_EXPRESSION_PROTOCOL` instances, or no `EFI_REGULAR_EXPRESSION_PROTOCOL` instance was found, push Undefined.
4. Process the **string** and **pattern** using the `MatchString` function of the `EFI_REGULAR_EXPRESSION_PROTOCOL` instance that supports the `SyntaxType`, where `SyntaxType` is the `SyntaxType` input to `MatchString`.
5. If the returned regular expression `Result` is **TRUE**, then push **TRUE**.
6. If the return regular expression `Result` is **FALSE**, then push **FALSE**.

**Note:** To ensure interoperability, drivers that publish HII IFR Forms packages should check the system capabilities by calling the `GetInfo` function of each `EFI_REGULAR_EXPRESSION_PROTOCOL` instance during initialization. If the required regular expression syntax type is not supported, the driver may install its own instance of `EFI_REGULAR_EXPRESSION_PROTOCOL` to add the support.
The driver may also choose to fall back to other methods of validation, such as using EFI_IFR_MATCH or callbacks.

33.3.9 Keyboard Package

```c
//***************************************************
// EFI_HII_KEYBOARD_PACKAGE_HDR
//***************************************************
typedef struct {
  EFI_HII_PACKAGE_HDR   Header;
  UINT16                LayoutCount;
  //EFI_HII_KEYBOARD_LAYOUT  Layout[];
} EFI_HII_KEYBOARD_PACKAGE_HDR;
```

- **Header**: The general pack header which defines both the type of pack and the length of the entire pack.
- **LayoutCount**: The number of keyboard layouts contained in the entire keyboard pack.
- **Layout**: An array of `LayoutCount` number of keyboard layouts.

33.3.10 Animations Package

The Animation package record describes how, when, and which EFI images to display. The package consists of two parts: a fixed header and the animation information.

33.3.10.1 Animated Images Package

**Summary**

The fixed header consists of a standard record header and the

**Prototype**

```c
typedef struct _EFI_HII_ANIMATION_PACKAGE_HDR {
  EFI_HII_ANIMATION_PACKAGE            Header;
  UINT32                                AnimationInfoOffset;
} EFI_HII_ANIMATION_PACKAGE_HDR;
```

- **Header**: Standard image header, where `Header.BlockType = EFI_HII_PACKAGE_ANIMATIONS`.
- **AnimationInfoOffset**: Offset, relative to this header, of the animation information. If this is zero, then there are no animation sequences in the package.

33.3.10.2 Animation Information

For each animated image identifier, the animation information gives a sequence of EFI images to display and how and when to transition to the next image. The animation information is encoded as a series of
blocks, with each block prefixed by a single byte header (**EFI_HII_ANIMATION_BLOCK** or one of the extension headers (**EFI_HII_AIBT_EXTx_BLOCK**). The blocks must be processed in order.

![Animation Information Encoded in Blocks](image)

**Figure 33-50 Animation Information Encoded in Blocks**

**Prototype**

```c
typedef struct _EFI_HII_ANIMATION_BLOCK {
    UINT8 BlockType;
    //UINT8 BlockBody[];
} EFI_HII_ANIMATION_BLOCK;
```

The following table describes the different block types:

**Table 33-12 Animation Block Types**

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_HII_AIBT_END</td>
<td>0x00</td>
<td>The end of the animation information.</td>
</tr>
<tr>
<td>EFI_HII_AIBT_OVERLAY_IMAGES</td>
<td>0x10</td>
<td>Animate sequence once by displaying the next image in the logical window.</td>
</tr>
<tr>
<td>EFI_HII_AIBT_CLEAR_IMAGES</td>
<td>0x11</td>
<td>Animate sequence once by clearing the logical window before displaying the next image.</td>
</tr>
</tbody>
</table>
In order to recreate all animation sequences, start at the first block and process them all until either an EFI_HII_AIBT_END block is found. When processing the animation blocks, each block refers to the current animation identifier (AnimationIdCurrent), which is initially set to one (1).

Animation blocks of an unknown type should be skipped. If they cannot be skipped, then processing halts.

### 33.3.10.2.1 EFI_HII_AIBT_END

**Summary**
Marks the end of the animation information.

**Prototype**
None

**Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_HII_AIBT_DUPLICATE</td>
<td>0x20</td>
<td>Duplicate an existing animation identifier</td>
</tr>
<tr>
<td>EFI_HII_AIBT_SKIP2</td>
<td>0x21</td>
<td>Skip a certain number of animation identifiers.</td>
</tr>
<tr>
<td>EFI_HII_AIBT_SKIP1</td>
<td>0x22</td>
<td>Skip a certain number of animation identifiers.</td>
</tr>
<tr>
<td>EFI_HII_AIBT_EXT1</td>
<td>0x30</td>
<td>For future expansion (one byte length field)</td>
</tr>
<tr>
<td>EFI_HII_AIBT_EXT2</td>
<td>0x31</td>
<td>For future expansion (two byte length field)</td>
</tr>
<tr>
<td>EFI_HII_AIBT_EXT4</td>
<td>0x32</td>
<td>For future expansion (four byte length field)</td>
</tr>
</tbody>
</table>

EFI_HII_AIBT_RESTORE_SCRN 0x12 Animate sequence once by clearing the restoring the logical window before displaying the next image.

EFI_HII_AIBT_OVERLAY_IMAGES_LOOP 0x18 Animate repeating sequence by displaying the next image in the logical window.

EFI_HII_AIBT_CLEAR_IMAGES_LOOP 0x19 Animate repeating sequence by clearing the logical window before displaying the next image.

EFI_HII_AIBT_RESTORE_SCRN_LOOP 0x1A Animate repeating sequence by clearing the restoring the logical window before displaying the next image.

 EFI_HII_AIBT_DUPLICATE 0x20 Duplicate an existing animation identifier
 EFI_HII_AIBT_SKIP2 0x21 Skip a certain number of animation identifiers.
 EFI_HII_AIBT_SKIP1 0x22 Skip a certain number of animation identifiers.
 EFI_HII_AIBT_EXT1 0x30 For future expansion (one byte length field)
 EFI_HII_AIBT_EXT2 0x31 For future expansion (two byte length field)
 EFI_HII_AIBT_EXT4 0x32 For future expansion (four byte length field)

**Discussion**
Any animation sequences with an animation identifier greater than or equal to AnimationIdCurrent are empty. There is no additional data.

### 33.3.10.2.2 EFI_HII_AIBT_EXT1, EFI_HII_AIBT_EXT2, EFI_HII_AIBT_EXT4

**Summary**
Generic prefix for animation information with a 1-byte,2-byte or 4-byte length.
Prototype

```c
typedef struct _EFI_HII_AIBT_EXT1_BLOCK {
    EFI_HII_ANIMATION_BLOCK    Header;
    UINT8            BlockType2;
    UINT8            Length;
} EFI_HII_AIBT_EXT1_BLOCK;

typedef struct _EFI_HII_AIBT_EXT2_BLOCK {
    EFI_HII_ANIMATION_BLOCK    Header;
    UINT8            BlockType2;
    UINT16           Length;
} EFI_HII_AIBT_EXT2_BLOCK;

typedef struct _EFI_HII_AIBT_EXT4_BLOCK {
    EFI_HII_ANIMATION_BLOCK    Header;
    UINT8            BlockType2;
    UINT32           Length;
} EFI_HII_AIBT_EXT4_BLOCK;
```

Members

- **Header**: Standard animation header, where `Header.BlockType` = `EFI_HII_AIBT_EXT1`, `EFI_HII_AIBT_EXT2`, or `EFI_HII_AIBT_EXT4`.
- **Length**: Size of the animation block, in bytes, including the animation block header.
- **BlockType2**: The block type, as described in Table 33-9 on page 1825.

Discussion

These records are used for variable sized animation records which need an explicit length.

### 33.3.10.2.3 EFI_HII_AIBT_OVERLAY_IMAGES

**Summary**

An animation block to describe an animation sequence that does not cycle, and where one image is simply displayed over the previous image.
Prototype

```c
typedef struct _EFI_HII_AIBT_OVERLAY_IMAGES_BLOCK {
    EFI_IMAGE_ID          DftImageId;
    UINT16                Width;
    UINT16                Height;
    UINT16                CellCount;
    EFI_HII_ANIMATION_CELL AnimationCell[];
} EFI_HII_AIBT_OVERLAY_IMAGES_BLOCK;
```

Members

- **DftImageId**: This is the image that is to be referenced by the image protocols, if the animation function is not supported or disabled. This image can be one particular image from the animation sequence (if any one of the animation frames has a complete image) or an alternate image that can be displayed alone. If the value is zero, no image is displayed.

- **Width**: The overall width of the set of images (logical window width).

- **Height**: The overall height of the set of images (logical window height).

- **CellCount**: The number of `EFI_HII_ANIMATION_CELL` contained in the animation sequence.

- **AnimationCell**: An array of `CellCount` animation cells. The type `EFI_HII_ANIMATION_CELL` is defined in “Related Definitions” below.

Description

This record assigns the animation sequence data to the `AnimationIdCurrent` identifier and increments `AnimationIdCurrent` by one. This animation sequence is meant to be displayed only once (it is not a repeating sequence). Each image in the sequence will remain on the screen for the specified `delay` before the next image in the sequence is displayed.

The header type (either `BlockType` in `EFI_HII_ANIMATION_BLOCK` or `BlockType2` in `EFI_HII_AIBT_EXTx_BLOCK`) will be set to `EFI_HII_AIBT_OVERLAY_IMAGES`.

Related Definition

```c
typedef struct _EFI_HII_ANIMATION_CELL {
    UINT16          OffsetX;
    UINT16          OffsetY;
    EFI_IMAGE_ID    ImageId;
    UINT16          Delay;
} EFI_HII_ANIMATION_CELL;
```

- **OffsetX**: The X offset from the upper left hand corner of the logical window to position the indexed image.

- **OffsetY**: The Y offset from the upper left hand corner of the logical window to position the indexed image.
**ImageId**
The image to display at the specified offset from the upper left hand corner of the logical window.

**Delay**
The number of milliseconds to delay after displaying the indexed image and before continuing on to the next linked image. If value is zero, no delay.

**Related Description**
The logical window definition allows the animation to be centered, even though the first image might be way off center (bounds the sequence of images). All images will be clipped to the defined logical window, since the logical window is suppose to bound all images, normally there is nothing to clip. The DftImageId definition allows an alternate image to be displayed if animation is currently not supported. The DftImageId image is to be centered in the defined logical window.

### 33.3.10.2.4 EFI_HII_AIBT_CLEAR_IMAGES

**Summary**
An animation block to describe an animation sequence that does not cycle, and where the logical window is cleared to the specified color before the next image is displayed.

**Prototype**
```c
typedef struct _EFI_HII_AIBT_CLEAR_IMAGES_BLOCK {
  EFI_IMAGE_ID      DftImageId;
  UINT16            Width;
  UINT16            Height;
  UINT16            CellCount;
  EFI_HII_RGB_PIXEL BackgndColor;
  EFI_HII_ANIMATION_CELL AnimationCell[];
} EFI_HII_AIBT_CLEAR_IMAGES_BLOCK;
```

**Members**
- **DftImageId**
  This is image that is to be reference by the image protocols, if the animation function is not supported or disabled. This image can be one particular image from the animation sequence (if any one of the animation frames has a complete image) or an alternate image that can be displayed alone. If the value is zero, no image is displayed.

- **Width**
  The overall width of the set of images (logical window width).

- **Height**
  The overall height of the set of images (logical window height).

- **CellCount**
  The number of EFI_HII_ANIMATION_CELL contained in the animation sequence.
BackgndColor

The color to clear the logical window to before displaying the indexed image.

AnimationCell

An array of CellCount animation cells. The type EFI_HII_ANIMATION_CELL is defined in “Related Definitions” in EFI_HII_AIBT_OVERLAY_IMAGES.

Description

This record assigns the animation sequence data to the AnimationIdCurrent identifier and increment AnimationIdCurrent by one. This animation sequence is meant to be displayed only once (it is not a repeating sequence). Each image in the sequence will remain on the screen for the specified delay before the logical window is cleared to the specified color (BackgndColor) and the next image is displayed. The logical window is also cleared to the specified color before displaying the DftImageId image.

The header type (either BlockType in EFI_HII_ANIMATION_BLOCK or BlockType2 in EFI_HII_AIBT_EXTx_BLOCK) will be set to EFI_HII_AIBT_CLEAR_IMAGES.

33.3.10.2.5 EFI_HII_AIBT_RESTORE_SCRN

Summary

An animation block to describe an animation sequence that does not cycle, and where the screen is restored to the original state before the next image is displayed.

Prototype

typedef struct _EFI_HII_AIBT_RESTORE_SCRN_BLOCK {
    EFI_IMAGE_ID DftImageId;
    UINT16 Width;
    UINT16 Height;
    UINT16 CellCount;
    EFI_HII_ANIMATION_CELL AnimationCell[];
} EFI_HII_AIBT_RESTORE_SCRN_BLOCK;

Members

DftImageId

This is image that is to be reference by the image protocols, if the animation function is not supported or disabled. This image can be one particular image from the animation sequence (if any one of the animation frames has a complete image) or an alternate image that can be displayed alone. If the value is zero, no image is displayed.

Width

The overall width of the set of images (logical window width).

Height

The overall height of the set of images (logical window height).

CellCount

The number of EFI_HII_ANIMATION_CELL contained in the animation sequence.

AnimationCell

An array of CellCount animation cells. The type EFI_HII_ANIMATION_CELL is defined in “Related Definitions” in EFI_HII_AIBT_OVERLAY_IMAGES.
Description
This record assigns the animation sequence data to the AnimationIdCurrent identifier and increment AnimationIdCurrent by one. This animation sequence is meant to be displayed only once (it is not a repeating sequence). Before the first image is displayed, the entire defined logical window is saved to a buffer. Then each image in the sequence will remain on the screen for the specified delay before the logical window is restored to the original state and the next image is displayed.

If memory buffers are not available to save the logical window, this structure is treated as EFI_HII_AIBT_CLEAR IMAGES structure, with the BackgndColor value set to black.

The header type (either BlockType in EFI_HII_ANIMATION_BLOCK or BlockType2 in EFI_HII_AIBT_EXTx_BLOCK) will be set to EFI_HII_AIBT_RESTORE_SCRN.

33.3.10.2.6 EFI_HII_AIBT_OVERLAY_IMAGES_LOOP

Summary
An animation block to describe an animation sequence that continuously cycles, and where one image is simply displayed over the previous image.

Prototype
typedef EFI_HII_AIBT_OVERLAY_IMAGES_BLOCK
EFI_HII_AIBT_OVERLAY_IMAGES_LOOP_BLOCK {
    EFI_IMAGE_ID            DftImageId;
    UINT16                  Width;
    UINT16                  Height;
    UINT16                  CellCount;
    EFI_HII_ANIMATION_CELL  AnimationCell[];
} EFI_HII_AIBT_OVERLAY_IMAGES_LOOP_BLOCK;

Members
DftImageId          This is image that is to be reference by the image protocols, if the animation function is not supported or disabled. This image can be one particular image from the animation sequence (if any one of the animation frames has a complete image) or an alternate image that can be displayed alone. If the value is zero, no image is displayed.
Width                The overall width of the set of images (logical window width).
Height               The overall height of the set of images (logical window height).
CellCount            The number of EFI_HII_ANIMATION_CELL contained in the animation sequence.
AnimationCell        An array of CellCount animation cells. The type EFI_HII_ANIMATION_CELL is defined in “Related Definitions” in EFI_HII_AIBT_OVERLAY_IMAGES
Description
This record assigns the animation sequence data to the AnimationIdCurrent identifier and increment AnimationIdCurrent by one. This animation sequence is meant to continuously cycle until stopped or paused. Each image in the sequence will remain on the screen for the specified delay before the next image in the sequence is displayed.

The header type (either BlockType in EFI_HII_ANIMATION_BLOCK or BlockType2 in EFI_HII_AIBT_EXTx_BLOCK) will be set to EFI_HII_AIBT_OVERLAY_IMAGES_LOOP.

33.3.10.2.7 EFI_HII_AIBT_CLEAR_IMAGES_LOOP

Summary
An animation block to describe an animation sequence that continuously cycles, and where the logical window is cleared to the specified color before the next image is displayed.

Prototype

typedef EFI_HII_AIBT_CLEAR_IMAGES_BLOCK EFI_HII_AIBT_CLEAR_IMAGES_LOOP_BLOCK
{
    EFI_IMAGE_ID    DftImageId;
    UINT16          Width;
    UINT16          Height;
    UINT16          CellCount;
    EFI_HII_RGB_PIXEL BackgndColor;
    EFI_HII_ANIMATION_CELL AnimationCell[];
} EFI_HII_AIBT_CLEAR_IMAGES_LOOP_BLOCK;

Members

DftImageId This is image that is to be reference by the image protocols, if the animation function is not supported or disabled. This image can be one particular image from the animation sequence (if any one of the animation frames has a complete image) or an alternate image that can be displayed alone. If the value is zero, no image is displayed.

Width The overall width of the set of images (logical window width).
Height The overall height of the set of images (logical window height).

CellCount The number of EFI_HII_ANIMATION_CELL contained in the animation sequence.

BackgndColor The color to clear the logical window to before displaying the indexed image.

AnimationCell An array of CellCount animation cells. The type EFI_HII_ANIMATION_CELL is defined in “Related Definitions” in EFI_HII_AIBT_OVERLAY_IMAGES
Description
This record assigns the animation sequence data to the `AnimationIdCurrent` identifier and increment `AnimationIdCurrent` by one. This animation sequence is meant to continuously cycle until stopped or paused. Each image in the sequence will remain on the screen for the specified `delay` before the logical window is cleared to the specified color (`BackgndColor`) and the next image is displayed. The logical window is also cleared to the specified color before displaying the `DftImageId` image.

The header type (either `BlockType` in `EFI_HII_ANIMATION_BLOCK` or `BlockType2` in `EFI_HII_AIBT_EXTx_BLOCK`) will be set to `EFI_HII_AIBT_CLEAR_IMAGES_LOOP`.

33.3.10.2.8 EFI_HII_AIBT_RESTORE_SCRN_LOOP

Summary
An animation block to describe an animation sequence that continuously cycles, and where the screen is restored to the original state before the next image is displayed.

Prototype
```c
typedef EFI_HII_AIBT_RESTORE_SCRN_LOOP_BLOCK
    EFI_HII_AIBT_RESTORE_SCRN_LOOP_BLOCK {
    EFI_IMAGE_ID       DftImageId;
    UINT16             Width;
    UINT16             Height;
    UINT16             CellCount;
    EFI_HII_ANIMATION_CELL AnimationCell[];
} EFI_HII_AIBT_RESTORE_SCRN_LOOP_BLOCK;
```

Members
- **Header** Standard image header, where `Header.BlockType = EFI_HII_AIBT_RESTORE_SCRN_LOOP`.
- **DftImageId** This is image that is to be reference by the image protocols, if the animation function is not supported or disabled. This image can be one particular image from the animation sequence (if any one of the animation frames has a complete image) or an alternate image that can be displayed alone. If the value is zero, no image is displayed.
- **Length** Size of the animation block, in bytes, including the animation block header.
- **Width** The overall width of the set of images (logical window width).
- **Height** The overall height of the set of images (logical window height).
- **CellCount** The number of `EFI_HII_ANIMATION_CELL` contained in the animation sequence.
- **AnimationCell** An array of `CellCount` animation cells. The type `EFI_HII_ANIMATION_CELL` is defined in “Related Definitions” in `EFI_HII_AIBT_OVERLAY_IMAGES`
Description
This record assigns the animation sequence data to the AnimationIdCurrent identifier and increment AnimationIdCurrent by one. This animation sequence is meant to continuously cycle until stopped or paused. Before the first image is displayed, the entire defined logical window is saved to a buffer. Then each image in the sequence will remain on the screen for the specified delay before the logical window is restored to the original state and the next image is displayed.

If memory buffers are not available to save the logical window, this structure is treated as EFI_HII_AIBT_CLEAR_IMAGES_LOOP structure, with the BackgndColor value set to black.

The header type (either BlockType in EFI_HII_ANIMATION_BLOCK or BlockType2 in EFI_HII_AIBT_EXTx_BLOCK) will be set to EFI_HII_AIBT_RESTORE_SCRN_LOOP.

33.3.10.2.9 EFI_HII_AIBT_DUPLICATE

Summary
Assigns a new character value to a previously defined animation sequence.

Prototype
```c
typedef struct _EFI_HII_AIBT_DUPLICATE_BLOCK {
    EFI_ANIMATION_ID AnimationId;
} EFI_HII_AIBT_DUPLICATE_BLOCK;
```

Members
- **AnimationId** The previously defined animation ID with the exact same animation information.

Discussion
Indicates that the animation sequence with animation ID AnimationIdCurrent has the same animation information as a previously defined animation ID and increments AnimationIdCurrent by one.

The header type (either BlockType in EFI_HII_ANIMATION_BLOCK or BlockType2 in EFI_HII_AIBT_EXTx_BLOCK) will be set to EFI_HII_AIBT_DUPLICATE.

33.3.10.2.10 EFI_HII_AIBT_SKIP1

Summary
Skips animation IDs.

Prototype
```c
typedef struct _EFI_HII_AIBT_SKIP1_BLOCK {
    UINT8 SkipCount;
} EFI_HII_AIBT_SKIP1_BLOCK;
```

Members
- **SkipCount** The unsigned 8-bit value to add to AnimationIdCurrent.
Discussion
Increments the current animation ID `AnimationIdCurrent` by the number specified. The header type (either `BlockType` in `EFI_HII_ANIMATION_BLOCK` or `BlockType2` in `EFI_HII_AIBT_EXTx_BLOCK`) will be set to `EFI_HII_AIBT_SKIP1`.

33.3.10.2.11 EFI_HII_AIBT_SKIP2

Summary
Skips animation IDs.

Prototype
```c
typedef struct _EFI_HII_AIBT_SKIP2_BLOCK {
    UINT16 SkipCount;
} EFI_HII_AIBT_SKIP2_BLOCK;
```

Members
- `SkipCount` The unsigned 16-bit value to add to `AnimationIdCurrent`.

Discussion
Increments the current animation ID `AnimationIdCurrent` by the number specified. The header type (either `BlockType` in `EFI_HII_ANIMATION_BLOCK` or `BlockType2` in `EFI_HII_AIBT_EXTx_BLOCK`) will be set to `EFI_HII_AIBT_SKIP2`. 
34 - HII Protocols

This section provides code definitions for the HII-related protocols, functions, and type definitions, which are the required architectural mechanisms by which UEFI-compliant systems manage user input. The major areas described include the following:

- Font management.
- String management.
- Image management.
- Database management.

34.1 Font Protocol

 EFI_HII_FONT_PROTOCOL

Summary

Interfaces which retrieve font information.

GUID

#define EFI_HII_FONT_PROTOCOL_GUID \
{ 0xe9ca4775, 0x8657, 0x47fc, \ 
{0x97, 0xe7, 0x7e, 0xd6, 0x5a, 0x8, 0x43, 0x24 }}

Protocol

typedef struct _EFI_HII_FONT_PROTOCOL {
  EFI_HII_STRING_TO_IMAGE StringToImage;
  EFI_HII_STRING_ID_TO_IMAGE StringIdToImage;
  EFI_HII_GET_GLYPH Glyph;
  EFI_HII_GET_FONT_INFO GetFontInfo;
} EFI_HII_FONT_PROTOCOL;

Members

StringToImage, StringIdToImage
  Render a string to a bitmap or to the display.
Glyph
  Return a specific glyph in a specific font.
GetFontInfo
  Return font information for a specific font.

 EFI_HII_FONT_PROTOCOL.StringToImage()  

Summary

Renders a string to a bitmap or to the display.
Prototype

typedef

EFI_STATUS

(EIFIAPI *EFI_HII_STRING_TO_IMAGE) (
    IN CONST EFI_HII_FONT_PROTOCOL *This,
    IN EFI_HII_OUT_FLAGS Flags,
    IN CONST EFI_STRING String,
    IN CONST EFI_FONT_DISPLAY_INFO *StringInfo OPTIONAL,
    IN OUT EFI_IMAGE_OUTPUT **Blt,
    IN UINTN BltX,
    IN UINTN BltY,
    OUT EFI_HII_ROW_INFO **RowInfoArray OPTIONAL,
    OUT UINTN *RowInfoArraySize OPTIONAL,
    OUT UINTN *ColumnInfoArray OPTIONAL
);

Parameters

This

A pointer to the EFI_HII_FONT_PROTOCOL instance.

Flags

Describes how the string is to be drawn. EFI_HII_OUT_FLAGS is defined in Related Definitions, below.

String

Points to the null-terminated string to be displayed.

StringInfo

Points to the string output information, including the color and font. If NULL, then the string will be output in the default system font and color.

Blt

If this points to a non-NULL on entry, this points to the image, which is Blt.Width pixels wide and Blt.Height pixels high. The string will be drawn onto this image and EFI_HII_OUT_FLAG_CLIP is implied. If this points to a NULL on entry, then a buffer will be allocated to hold the generated image and the pointer updated on exit. It is the caller’s responsibility to free this buffer.

BltX, BltY

Specifies the offset from the left and top edge of the image of the first character cell in the image.

RowInfoArray

If this is non-NULL on entry, then on exit, this will point to an allocated buffer containing row information and RowInfoArraySize will be updated to contain the number of elements. This array describes the characters which were at least partially drawn and the heights of the rows. It is the caller’s responsibility to free this buffer.
**RowInfoArraySize**

If this is non-NULL on entry, then on exit it contains the number of elements in `RowInfoArray`.

**ColumnInfoArray**

If this is non-NULL, then on return it will be filled with the horizontal offset for each character in the string on the row where it is displayed. Non-printing characters will have the offset ~0. The caller is responsible to allocate a buffer large enough so that there is one entry for each character in the string, not including the null-terminator. It is possible when character display is normalized that some character cells overlap.

**Description**

This function renders a string to a bitmap or the screen using the specified font, color and options. It either draws the string and glyphs on an existing bitmap, allocates a new bitmap or uses the screen. The strings can be clipped or wrapped. Optionally, the function also returns the information about each row and the character position on that row.

If `EFI_HII_OUT_FLAG_CLIP` is set, then text will be formatted only based on explicit line breaks and all pixels which would lie outside the bounding box specified by `Blt.Width` and `Blt.Height` are ignored. The information in the `RowInfoArray` only describes characters which are at least partially displayed. For the final row, the `RowInfoArray.LineHeight` and `RowInfoArray.BaseLine` may describe pixels which are outside the limit specified by `Blt.Height` (unless `EFI_HII_OUT_FLAG_CLIP_CLEAN_Y` is specified) even though those pixels were not drawn. The `LineWidth` may describe pixels which are outside the limit specified by `Blt.Width` (unless `EFI_HII_OUT_FLAG_CLIP_CLEAN_X` is specified) even though those pixels were not drawn.

If `EFI_HII_OUT_FLAG_CLIP_CLEAN_X` is set, then it modifies the behavior of `EFI_HII_OUT_FLAG_CLIP` so that if a character's right-most pixel cannot fit, then it will not be drawn at all. This flag requires that `EFI_HII_OUT_FLAG_CLIP` be set.

If `EFI_HII_OUT_FLAG_CLIP_CLEAN_Y` is set, then it modifies the behavior of `EFI_HII_OUT_FLAG_CLIP` so that if a row's bottom-most pixel cannot fit, then it will not be drawn at all. This flag requires that `EFI_HII_OUT_FLAG_CLIP` be set.

If `EFI_HII_OUT_FLAG_WRAP` is set, then text will be wrapped at the right-most line-break opportunity prior to a character whose right-most extent would exceed `Blt.Width`. If no line-break opportunity can be found, then the text will behave as if `EFI_HII_OUT_FLAG_CLIP_CLEAN_X` is set. This flag cannot be used with `EFI_HII_OUT_FLAG_CLIP_CLEAN_X`.

If `EFI_HII_OUT_FLAG_TRANSPARENT` is set, then `StringInfo.BackgroundColor` is ignored and all “off” pixels in the character’s drawn will use the pixel value from `Blt`. This flag cannot be used if `Blt` is NULL upon entry.

If `EFI_HII_IGNORE_IF_NO_GLYPH` is set, then characters which have no glyphs are not drawn. Otherwise, they are replaced with Unicode character code 0xFFFD (REPLACEMENT CHARACTER).

If `EFI_HII_IGNORE_LINE_BREAK` is set, then explicit line break characters will be ignored.

If `EFI_HII_DIRECT_TO_SCREEN` is set, then the string will be written directly to the output device specified by `Screen`. Otherwise the string will be rendered to the bitmap specified by `Bitmap`. 
Related Definitions

typedef UINT32 EFI_HII_OUT_FLAGS;

#define EFI_HII_OUT_FLAG_CLIP     0x00000001

typedef CHAR16 *EFI_STRING;

typedef struct _EFI_HII_ROW_INFO {
    UINTN StartIndex;
    UINTN EndIndex;
    UINTN LineHeight;
    UINTN LineWidth;
    UINTN BaselineOffset;
} EFI_HII_ROW_INFO;

StartIndex
The index of the first character in the string which is displayed on the line.

EndIndex
The index of the last character in the string which is displayed on the line.

LineHeight
The height of the line, in pixels.

LineWidth
The width of the text on the line, in pixels.

BaselineOffset
The font baseline offset in pixels from the bottom of the row, or 0 if none.

Status Codes Returned

EFI_SUCCESS The string was successfully updated.
EFI_OUT_OF_RESOURCES Unable to allocate an output buffer for RowInfoArray or Blt.
EFI_INVALID_PARAMETER The String or Blt was NULL.
EFI_INVALID_PARAMETER Flags were invalid combination
 EFI_HII_FONT_PROTOCOL.StringIdToImage()

Summary
Render a string to a bitmap or the screen containing the contents of the specified string.

Prototype

```c
typedef
  EFI_STATUS
  (EFIAPI *EFI_HII_STRING_ID_TO_IMAGE) (  
    IN   CONST EFI_HII_FONT_PROTOCOL  *This,
    IN   EFI_HII_OUT_FLAGS          Flags,
    IN   EFI_HII_HANDLE             PackageList,
    IN   EFI_STRING_ID              StringId,
    IN   CONST CHAR8*               Language,
    IN   CONST EFI_FONT_DISPLAY_INFO *StringInfo OPTIONAL,
    IN   EFI_IMAGE_OUTPUT **Blt,
    IN   UINTN                      BltX,
    IN   UINTN                      BltY,
    OUT  EFI_HII_ROW_INFO **RowInfoArray OPTIONAL,
    OUT  UINTN                      *RowInfoArraySize OPTIONAL,
    OUT  UINTN                      *ColumnInfoArray OPTIONAL
  );
```

Parameters

- **This**
  A pointer to the EFI_HII_FONT_PROTOCOL instance.

- **Flags**
  Describes how the string is to be drawn. EFI_HII_OUT_FLAGS is defined in Related Definitions, below.

- **PackageList**
  The package list in the HII database to search for the specified string.

- **StringId**
  The string’s id, which is unique within PackageList.

- **Language**
  Points to the language for the retrieved string. If NULL, then the current system language is used.

- **StringInfo**
  Points to the string output information, including the color and font. If NULL, then the string will be output in the default system font and color.
Blt
If this points to a non-NULL on entry, this points to the image, which is `Blt.Width` pixels wide and `Height` pixels high. The string will be drawn onto this image and `EFI_HII_OUT_FLAG_CLIP` is implied. If this points to a NULL on entry, then a buffer will be allocated to hold the generated image and the pointer updated on exit. It is the caller’s responsibility to free this buffer.

BltX, BltY
Specifies the offset from the left and top edge of the output image of the first character cell in the image.

RowInfoArray
If this is non-NULL on entry, then on exit, this will point to an allocated buffer containing row information and `RowInfoArraySize` will be updated to contain the number of elements. This array describes the characters which were at least partially drawn and the heights of the rows. It is the caller’s responsibility to free this buffer.

RowInfoArraySize
If this is non-NULL on entry, then on exit it contains the number of elements in `RowInfoArray`.

ColumnInfoArray
If non-NULL, on return it is filled with the horizontal offset for each character in the string on the row where it is displayed. Non-printing characters will have the offset \textasciitilde0. The caller is responsible to allocate a buffer large enough so that there is one entry for each character in the string, not including the null-terminator. It is possible when character display is normalized that some character cells overlap.

Description
This function renders a string as a bitmap or to the screen and can clip or wrap the string. The bitmap is either supplied by the caller or else is allocated by the function. The strings are drawn with the font, size and style specified and can be drawn transparently oropaquely. The function can also return information about each row and each character’s position on the row.

If `EFI_HII_OUT_FLAG_CLIP` is set, then text will be formatted only based on explicit line breaks and all pixels which would lie outside the bounding box specified by `Width` and `Height` are ignored. The information in the `RowInfoArray` only describes characters which are at least partially displayed. For the final row, the LineHeight and BaseLine may describe pixels which are outside the limit specified by `Height` (unless `EFI_HII_OUT_FLAG_CLIP_CLEAN_Y` is specified) even though those pixels were not drawn.

If `EFI_HII_OUT_FLAG_CLIP_CLEAN_X` is set, then it modifies the behavior of `EFI_HII_OUT_FLAG_CLIP` so that if a character’s right-most on pixel cannot fit, then it will not be drawn at all. This flag requires that `EFI_HII_OUT_FLAG_CLIP` be set.

If `EFI_HII_OUT_FLAG_CLIP_CLEAN_Y` is set, then it modifies the behavior of `EFI_HII_OUT_FLAG_CLIP` so that if a row’s bottom most pixel cannot fit, then it will not be drawn at all. This flag requires that `EFI_HII_OUT_FLAG_CLIP` be set.
If `EFI_HII_OUT_FLAG_WRAP` is set, then text will be wrapped at the right-most line-break opportunity prior to a character whose right-most extent would exceed `Width`. If no line-break opportunity can be found, then the text will behave as if `EFI_HII_OUT_FLAG_CLIP_CLEAN_X` is set. This flag cannot be used with `EFI_HII_OUT_FLAG_CLIP_CLEAN_X`.

If `EFI_HII_OUT_FLAG_TRANSPARENT` is set, then `BackgroundColor` is ignored and all “off” pixels in the character’s glyph will use the pixel value from `Blt`. This flag cannot be used if `Blt` is NULL upon entry.

If `EFI_HII_IGNORE_IF_NO_GLYPH` is set, then characters which have no glyphs are not drawn. Otherwise, they are replaced with Unicode character code 0xFFFD (REPLACEMENT CHARACTER).

If `EFI_HII_IGNORE_LINE_BREAK` is set, then explicit line break characters will be ignored.

If `EFI_HII_DIRECT_TO_SCREEN` is set, then the string will be written directly to the output device specified by `Screen`. Otherwise the string will be rendered to the bitmap specified by `Bitmap`.

**Status Codes Returned**

- `EFI_SUCCESS` The string was successfully updated.
- `EFI_OUT_OF_RESOURCES` Unable to allocate an output buffer for `RowInfoArray` or `Blt`.
- `EFI_INVALID_PARAMETER` The `StringId` or `PackageList` was NULL.
- `EFI_INVALID_PARAMETER` Flags were invalid combination.
- `EFI_NOT_FOUND` The `StringId` is not in the specified `PackageList`.

**EFI_HII_FONT_PROTOCOL.GetGlyph()**

**Summary**

Return image and information about a single glyph.

**Prototype**

```c
typedef EFI_STATUS
  (EFIAPI *EFI_HII_GET_GLYPH) (
    IN CONST EFI_HII_FONT_PROTOCOL *This,
    IN CHAR16 Char,
    IN CONST EFI_FONT_DISPLAY_INFO *StringInfo,
    OUT EFI_IMAGE_OUTPUT **Blt;
    OUT UINTN *Baseline OPTIONAL;
  );
```

**Parameters**

- **This**
  A pointer to the `EFI_HII_FONT_PROTOCOL` instance.

- **Char**
  Character to retrieve.
**StringInfo**

Points to the string font and color information or NULL if the string should use the default system font and color.

**Blt**

Thus must point to a NULL on entry. A buffer will be allocated to hold the output and the pointer updated on exit. It is the caller’s responsibility to free this buffer. On return, only Blt.Width, Blt.Height, and Blt.Image.Bitmap are valid.

**Baseline**

Number of pixels from the bottom of the bitmap to the baseline.

**Description**

Convert the glyph for a single character into a bitmap.

**Status Codes Returned**

- EFI_SUCCESS: Glyph bitmap created.
- EFI_OUT_OF_RESOURCES: Unable to allocate the output buffer Blt.
- EFI_WARN_UNKNOWN_GLYPH: The glyph was unknown and was replaced with the glyph for Unicode character code 0xFFFD.
- EFI_INVALID_PARAMETER: Blt is NULL or *Blt is !Null

**EFI_HII_FONT_PROTOCOL.GetFontInfo()**

**Summary**

Return information about a particular font.

**Prototype**

```c
typedef EFI_STATUS (EFIAPI *EFI_HII_GET_FONT_INFO)(
    IN CONST EFI_HII_FONT_PROTOCOL *This,
    IN OUT EFI_FONT_HANDLE *FontHandle,
    IN CONST EFI_FONT_DISPLAY_INFO *StringInfoIn, OPTIONAL
    OUT EFI_FONT_DISPLAY_INFO **StringInfoOut,
    IN CONST EFI_STRING String OPTIONAL
);

typedef VOID *EFI_FONT_HANDLE;
```

**Parameters**

- **This**
  A pointer to the **EFI_HII_FONT_PROTOCOL** instance.
FontHandle

On entry, points to the font handle returned by a previous call to `GetFontInfo()` or points to NULL to start with the first font. On return, points to the returned font handle or points to NULL if there are no more matching fonts.

StringInfoIn

Upon entry, points to the font to return information about. If NULL, then the information about the system default font will be returned.

StringInfoOut

Upon return, contains the matching font’s information. If NULL, then no information is returned. This buffer is allocated with a call to the Boot Service `AllocatePool()`. It is the caller's responsibility to call the Boot Service `FreePool()` when the caller no longer requires the contents of StringInfoOut.

String

Points to the string which will be tested to determine if all characters are available. If NULL, then any font is acceptable.

Description

This function iterates through fonts which match the specified font, using the specified criteria. If String is non-NULL, then all of the characters in the string must exist in order for a candidate font to be returned.

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>

34.2 EFI HII Font Ex Protocol

The EFI HII Font Ex protocol defines an extension to the EFI HII Font protocol which enables various new capabilities described in this section.

EFI_HII_FONT_EX_PROTOCOL

Summary

Interfaces which retrieve the font information.
GUID

```
#define EFI_HII_FONT_EX_PROTOCOL_GUID \
{ 0x849e6875, 0xdb35, 0x4df8, 0xb4, \
{0x1e, 0xc8, 0xf3, 0x37, 0x18, 0x7, 0x3f }}
```

Protocol

```c
typedef struct _EFI_HII_FONT_EX_PROTOCOL {
  EFI_HII_STRING_TO_IMAGE_EX StringToImageEx;
  EFI_HII_STRING_ID_TO_IMAGE_EX StringIdToImageEx;
  EFI_HII_GET_GLYPH_EX GetGlyphEx;
  EFI_HII_GET_FONT_INFO_EX GetFontInfoEx;
  EFI_HII_GET_GLYPH_INFO GetGlyphInfo;
} EFI_HII_FONT_EX_PROTOCOL;
```

Members

- **StringToImageEx, StringIdToImageEx**
  Render a string to a bitmap or to the display. This function will try to use the external font glyph generator for generating the glyph if it can’t find the glyph in the font database.

- **GetGlyphEx**
  Return a specific glyph in a specific font. This function will try to use the external font glyph generator for generating the glyph if it can’t find the glyph in the font database.

- **GetFontInfoEx**
  Return the font information for a specific font, this protocol invokes original `EFI_HII_FONT_PROTOCOL.GetFontInfo()` implicitly.

- **GetGlyphInfo**
  Return the glyph information for the single glyph.

**EFI_HII_FONT_EX_PROTOCOL.StringToImageEx()**

Summary

Render a string to a bitmap or to the display. The prototype of this extension function is the same with `EFI_HII_FONT_PROTOCOL.StringToImage()`. 
Protocol

typedef
  EFI_STATUS
  (EFIAPI *EFI_HII_STRING_TO_IMAGE_EX)(
    IN CONST EFI_HII_FONT_EX_PROTOCOL *This,
    IN EFI_HII_OUT_FLAGS Flags,
    IN const EFI_STRING String,
    IN const EFI_FONT_DISPLAY_INFO *StringInfo OPTIONAL,
    IN OUT EFI_IMAGE_OUTPUT **Blt,
    IN UINTN BltX,
    IN UINTN BltY,
    OUT EFI_HII_ROW_INFO **RowInfoArray OPTIONAL,
    OUT UINTN *RowInfoArraySize OPTIONAL,
    OUT UINTN *ColumnInfoArray OPTIONAL
  );

Parameters
Same with EFI_HII_FONT_PROTOCOL.StringToImage().

Description
This function is similar to EFI_HII_FONT_PROTOCOL.StringToImage(). The difference is that this function will locate all EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL instances that are installed in the system when the glyph in the string with the given font information is not found in the current HII glyph database. The function will attempt to generate the glyph information and the bitmap using the first EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL instance that supports the requested font information in the EFI_FONT_DISPLAY_INFO.

Status Codes Returned
Same with EFI_HII_FONT_PROTOCOL.StringToImage().

EFI_HII_FONT_EX_PROTOCOL.StringIdToImageEx()

Summary
Render a string to a bitmap or the screen containing the contents of the specified string. The prototype of this extension function is the same with EFI_HII_FONT_PROTOCOL.StringIdToImage().
Protocol

typedef
EFI_STATUS
(EFIAPI *EFI_HII_STRING_ID_TO_IMAGE_EX)(
    IN CONST EFI_HII_FONT_EX_PROTOCOL *This,
    IN EFI_HII_OUT_FLAGS Flags,
    IN EFI_HII_HANDLE PackageList,
    IN EFI_STRING_ID StringId,
    IN CONST CHAR8 *Language,
    IN CONST EFI_FONT_DISPLAY_INFO *StringInfo OPTIONAL,
    IN OUT EFI_IMAGE_OUTPUT **Blt,
    IN UINTN BltX,
    IN UINTN BltY,
    OUT EFI_HII_ROW_INFO **RowInfoArray OPTIONAL,
    OUT UINTN *RowInfoArraySize OPTIONAL,
    OUT UINTN *ColumnInfoArray OPTIONAL,
);

Parameters

Same with EFI_HII_FONT_PROTOCOL.StringIdToImage().

Description

This function is similar to EFI_HII_FONT_PROTOCOL.StringIdToImage(). The difference is that this function will locate all EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL instances that are installed in the system when the glyph in the string with the given font information is not found in the current HII glyph database. The function will attempt to generate the glyph information and the bitmap using the first EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL instance that supports the requested font information in the EFI_FONT_DISPLAY_INFO.

Status Codes Returned

Same with EFI_HII_FONT_PROTOCOL.StringToImage().

EFI_HII_FONT_EX_PROTOCOL.GetGlyphEx()

Summary

Return image and baseline about a single glyph. The prototype of this extension function is the same with EFI_HII_FONT_PROTOCOL.GetGlyph().
Protocol

typedef

EFI_STATUS

EFI_HII_GET_GLYPH_EX(IN CONST EFI_HII_FONT_EX_PROTOCOL *This,
IN CHAR16 Char,
IN CONST EFI_FONT_DISPLAY_INFO *StringInfo,
IN OUT EFI_IMAGE_OUTPUT **Blt,
IN UINTN Baseline OPTIONAL);

Parameters

Same with EFI_HII_FONT_PROTOCOL.GetGlyph().

Description

This function is similar to EFI_HII_FONT_PROTOCOL.GetGlyph(). The difference is that this function will locate all EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL instances that are installed in the system when the glyph in the string with the given font information is not found in the current HII glyph database. The function will attempt to generate the glyph information and the bitmap using the first EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL instance that supports the requested font information in the EFI_FONT_DISPLAY_INFO.

Status Codes Returned

Same as EFI_HII_FONT_PROTOCOL.GetGlyph().

EFI_HII_FONT_EX_PROTOCOL.GetFontInfoEx()

Summary

Return information about a particular font. The prototype of this extension function is the same with EFI_HII_FONT_PROTOCOL.GetFontInformation().

Protocol

typedef

EFI_STATUS

EFI_HII_GET_FONT_INFO_EX(IN CONST EFI_HII_FONT_EX_PROTOCOL *This,
IN OUT EFI_FONT_HANDLE *FontHandle,
IN CONST EFI_FONT_DISPLAY_INFO *StringInfoIn, OPTIONAL
OUT EFI_FONT_DISPLAY_INFO **StringInfoOut,
IN CONST EFI_STRING String OPTIONAL)

Parameters
Same with `EFI_HII_FONT_PROTOCOL.GetFontInfo()`.

**Description**

Same with `EFI_HII_FONT_PROTOCOL.GetFontInfo()`. This protocol invokes `EFI_HII_FONT_PROTOCOL.GetFontInfo()` implicitly.

**Status Codes Returned**

Same as `EFI_HII_FONT_PROTOCOL.GetFontInfo()`.

### EFI_HII_FONT_EX_PROTOCOL.GetGlyphInfo()

**Summary**

The function returns the information of the single glyph.

**Protocol**

```c
typedef EFI_STATUS
   (EFIAPI *EFI_HII_GET_GLYPH_INFO)(
   IN CONST EFI_HII_FONT_EX_PROTOCOL *This,
   IN CHAR16 Char,
   IN CONST EFI_FONT_DISPLAY_INFO *FontDisplayInfo,
   OUT EFI_HII_GLYPH_INFO * GlyphInfo
   );
```

**Parameters**

- **This**: `EFI_HII_FONT_EX_PROTOCOL` instance.
- **Char**: Information of Character to retrieve.
- **FontDisplayInfo**: Font display information of this character.
- **GlyphInfo**: Pointer to retrieve the glyph information.

**Description**

This function returns the glyph information of character in the specific font family. This function will locate all `EFI_HII_FONT_GLYPH_GENERATOR` protocol instances that are installed in the system, and attempt to use them if it can’t find the glyph information in the font database. It returns `EFI_UNSUPPORTED` if neither the font database nor any instances of the `EFI_HII_FONT_GLYPH_GENERATOR` protocols support the font glyph in the specific font family. Otherwise, the `EFI_HII_GLYPH_INFO` is returned in `GlyphInfo`. This function only returns the glyph...
geometry information instead of allocating the buffer for `EFI_IMAGE_OUTPUT` and drawing the glyph in the buffer.

![Figure 34-1 Glyph Example](image)

**Status Codes Returned**

<table>

### 34.2.1 Code Definitions

**EFI_FONT_DISPLAY_INFO**

**Summary**

Describes font output-related information.

**Prototype**

```c
typedef struct _EFI_FONT_DISPLAY_INFO {
    EFI_GRAPHICS_OUTPUT_BLT_PIXEL ForegroundColor;
    EFI_GRAPHICS_OUTPUT_BLT_PIXEL BackgroundColor;
    EFI_FONT_INFO_MASK FontInfoMask;
    EFI_FONT_INFO FontInfo
} EFI_FONT_DISPLAY_INFO;
```
Members

FontInfo

The font information. Type `EFI_FONT_INFO` is defined in `EFI_HII_STRING_PROTOCOL.NewString()`.

ForegroundColor

The color of the “on” pixels in the glyph in the bitmap.

BackgroundColor

The color of the “off” pixels in the glyph in the bitmap.

FontInfoMask

The font information mask determines which portion of the font information will be used and what to do if the specific font is not available.

Description

This structure is used for describing the way in which a string should be rendered in a particular font. `FontInfo` specifies the basic font information and `ForegroundColor` and `BackgroundColor` specify the color in which they should be displayed. The flags in `FontInfoMask` describe where the system default should be supplied instead of the specified information. The flags also describe what options can be used to make a match between the font requested and the font available.

If `EFI_FONT_INFO_SYS_FONT` is specified, then the font name in `FontInfo` is ignored and the system font name is used. This flag cannot be used with `EFI_FONT_INFO_ANY_FONT`.

If `EFI_FONT_INFO_SYS_SIZE` is specified, then the font height specified in `FontInfo` is ignored and the system font height is used instead. This flag cannot be used with `EFI_FONT_INFO_ANY_SIZE`.

If `EFI_FONT_INFO_SYS_STYLE` is specified, then the font style in `FontInfo` is ignored and the system font style is used. This flag cannot be used with `EFI_FONT_INFO_ANY_STYLE`.

If `EFI_FONT_INFO_SYS_FORE_COLOR` is specified, then `ForegroundColor` is ignored and the system foreground color is used.

If `EFI_FONT_INFO_SYS_BACK_COLOR` is specified, then `BackgroundColor` is ignored and the system background color is used.

If `EFI_FONT_INFO_RESIZE` is specified, then the system may attempt to stretch or shrink a font to meet the size requested. This flag cannot be used with `EFI_FONT_INFO_ANY_SIZE`.

If `EFI_FONT_INFOorestyle` is specified, then the system may attempt to remove some of the specified styles in order to meet the style requested. This flag cannot be used with `EFI_FONT_INFO_ANY_STYLE`.

If `EFI_FONT_INFO_ANY_FONT` is specified, then the system may attempt to match with any font. This flag cannot be used with `EFI_FONT_INFO_SYS_FONT`.

If `EFI_FONT_INFO_ANY_SIZE` is specified, then the system may attempt to match with any font size. This flag cannot be used with `EFI_FONT_INFO_SYS_SIZE` or `EFI_FONT_INFO_RESIZE`. 
If **EFI_FONT_INFO_ANY_STYLE** is specified, then the system may attempt to match with any font style. This flag cannot be used with **EFI_FONT_INFO_SYS_STYLE** or **EFI_FONT_INFO_RESTYLE**.

**Related Definitions**

```c
typedef UINT32 EFI_FONT_INFO_MASK;
#define EFI_FONT_INFO_SYS_FONT    0x00000001
#define EFI_FONT_INFO_SYS_SIZE    0x00000002
#define EFI_FONT_INFO_SYS_STYLE   0x00000004
#define EFI_FONT_INFO_SYS_FORE_COLOR 0x00000010
#define EFI_FONT_INFO_SYS_BACK_COLOR 0x00000020
#define EFI_FONT_INFO_RESIZE      0x00001000
#define EFI_FONT_INFO_RESTYLE     0x00002000
#define EFI_FONT_INFO_ANY_FONT    0x00010000
#define EFI_FONT_INFO_ANY_SIZE    0x00020000
#define EFI_FONT_INFO_ANY_STYLE   0x00040000
```

**EFI_IMAGE_OUTPUT**

**Summary**

Describes information about either a bitmap or a graphical output device.

**Prototype**

```c
typedef struct _EFI_IMAGE_OUTPUT {
    UINT16 Width;
    UINT16 Height;
    union {
        EFI_GRAPHICS_OUTPUT_BLT_PIXEL *Bitmap;
        EFI_GRAPHICS_OUTPUT_PROTOCOL *Screen;
    }
    Image;
} EFI_IMAGE_OUTPUT;
```

**Members**

- **Width**
  Width of the output image.

- **Height**
  Height of the output image.

- **Bitmap**
  Points to the output bitmap.

- **Screen**
  Points to the **EFI_GRAPHICS_OUTPUT_PROTOCOL** which describes the screen on which to draw the specified string.
34.3 String Protocol

EFI_HII_STRING_PROTOCOL

Summary

Interfaces which manipulate string data.

GUID

```
#define EFI_HII_STRING_PROTOCOL_GUID   \
  { 0xfd96974, 0x23aa, 0x4cdc, \
    { 0xb9, 0xcb, 0x98, 0xd1, 0x77, 0x50, 0x32, 0x2a } }
```

Protocol

```
typedef struct _EFI_HII_STRING_PROTOCOL {
EFI_HII_NEW_STRING NewString;
EFI_HII_GET_STRING GetString;
EFI_HII_SET_STRING SetString;
EFI_HII_GET_LANGUAGES GetLanguages;
EFI_HII_GET_2ND_LANGUAGES GetSecondaryLanguages;
} EFI_HII_STRING_PROTOCOL;
```

Members

- **NewString**
  Add a new string.

- **GetString**
  Retrieve a string and related string information.

- **SetString**
  Change a string.

- **GetLanguages**
  List the languages for a particular package list.

- **GetSecondaryLanguages**
  List supported secondary languages for a particular primary language.

EFI_HII_STRING_PROTOCOL.NewString()

Summary

Creates a new string in a specific language and add it to strings from a specific package list.
Prototype

```
typedef
  EFI_STATUS
(EFIAPI *EFI_HII_NEW_STRING) (  
  IN CONST EFI_HII_STRING_PROTOCOL *This,
  IN EFI_HII_HANDLE PackageList,
  OUT EFI_STRING_ID *StringId
  IN CONST CHAR8 *Language,
  IN CONST CHAR16 *LanguageName OPTIONAL,
  IN CONST EFI_STRING String,
  IN CONST EFI_FONT_INFO *StringFontInfo
);
```

Parameters

**This**
A pointer to the **EFI_HII_STRING_PROTOCOL** instance.

**PackageList**
Handle of the package list where this string will be added.

**Language**
Points to the language for the new string. The language information is in the format described by Appendix M of the UEFI Specification.

**LanguageName**
Points to the printable language name to associate with the passed in **Language** field. This is analogous to passing in "zh-Hans" in the **Language** field and **LanguageName** might contain "Simplified Chinese" as the printable language.

**String**
Points to the new null-terminated string.

**StringFontInfo**
Points to the new string’s font information or NULL if the string should have the default system font, size and style.

**StringId**
On return, contains the new strings id, which is unique within **PackageList**. Type **EFI_STRING_ID** is defined in Section 33.3.8.2.1.

Description

This function adds the string **String** to the group of strings owned by **PackageList**, with the specified font information **StringFontInfo** and returns a new string id. The new string identifier is guaranteed to be unique within the package list. That new string identifier is reserved for all languages in the package list.
Related Definitions

typedef struct {
    EFI_HII_FONT_STYLE FontStyle;
    UINT16 FontSize;
    CHAR16 FontName[...];
} EFI_FONT_INFO;

FontStyle
The design style of the font. Type EFI_HII_FONT_STYLE is defined in Section 33.3.3.1.

FontSize
The character cell height, in pixels.

FontName
The null-terminated font family name.

Status Codes Returns

 EFI_SUCCESS The new string was added successfully
 EFI_OUT_OF_RESOURCES Could not add the string.
 EFI_INVALID_PARAMETER String is NULL or StringId is NULL or Language is NULL.
 EFI_NOT_FOUND The input package list could not be found in the current database.

EFI_HII_STRING_PROTOCOL.GetString()

Summary
Returns information about a string in a specific language, associated with a package list.

Prototype

typedef EFI_STATUS
    (EFIAPI *EFI_HII_STRING_PROTOCOL) (        
    IN   CONST EFI_HII_STRING_PROTOCOL  *This,
    IN   CONST CHAR8                   *Language,
    IN   EFI_HII_HANDLE                PackageList,
    IN   EFI_STRING_ID                 StringId,
    OUT  EFI_STRING                    String,
    IN OUT UINTN                       *StringLength,
    OUT  EFI_FONT_INFO                 **StringFontInfo OPTIONAL
    );

Parameters

    This
A pointer to the EFI_HII_STRING_PROTOCOL instance.
PackageList

The package list in the HII database to search for the specified string.

Language

Points to the language for the retrieved string. Callers of interfaces that require RFC 4646 language codes to retrieve a Unicode string must use the RFC 4647 algorithm to lookup the Unicode string with the closest matching RFC 4646 language code.

StringId

The string’s id, which is unique within PackageList.

String

Points to the new null-terminated string.

StringSize

On entry, points to the size of the buffer pointed to by String, in bytes. On return, points to the length of the string, in bytes.

StringFontInfo

Points to a buffer that will be callee allocated and will have the string's font information into this buffer. The caller is responsible for freeing this buffer. If the parameter is NULL a buffer will not be allocated and the string font information will not be returned.

Description

This function retrieves the string specified by StringId which is associated with the specified PackageList in the language Language and copies it into the buffer specified by String.

If the string specified by StringId is not present in the specified PackageList, then EFI_NOT_FOUND is returned. If the string specified by StringId is present, but not in the specified language then EFI_INVALID_LANGUAGE is returned.

If the buffer specified by StringSize is too small to hold the string, then EFI_BUFFER_TOO_SMALL will be returned. StringSize will be updated to the size of buffer actually required to hold the string.
Status Codes Returned

- **EFI_SUCCESS**: The string was returned successfully.
- **EFI_NOT_FOUND**: The string specified by `StringId` is not available. The specified `PackageList` is not in the Database.
- **EFI_INVALID_LANGUAGE**: The string specified by `StringId` is available but not in the specified language.
- **EFI_BUFFER_TOO_SMALL**: The buffer specified by `StringLength` is too small to hold the string.
- **EFI_INVALID_PARAMETER**: The `Language` or `StringLength` was NULL.
- **EFI_INVALID_PARAMETER**: The value referenced by `StringLength` was not zero and `String` was NULL.
- **EFI_OUT_OF_RESOURCES**: There were insufficient resources to complete the request.

EFI_HII_STRING_PROTOCOL::SetString()

**Summary**
Change information about the string.

**Prototype**
```c
typedef
EFI_STATUS
(EFIAPI *EFI_HII_SET_STRING) (  
    IN CONST EFI_HII_STRING_PROTOCOL *This,  
    IN EFI_HII_HANDLE PackageList,  
    IN EFI_STRING_ID StringId,  
    IN CONST CHAR8 *Language,  
    IN CONST EFI_STRING String,  
    IN CONST EFI_FONT_INFO *StringFontInfo OPTIONAL  
);
```

**Parameters**
- **This**
  A pointer to the `EFI_HII_STRING_PROTOCOL` instance.
- **PackageList**
  The package list containing the strings.
- **Language**
  Points to the language for the updated string.
- **StringId**
  The string id, which is unique within `PackageList`.
- **String**
  Points to the new null-terminated string.
**StringFontInfo**
Points to the string’s font information or NULL if the string font information is not changed.

**Description**
This function updates the string specified by `StringId` in the specified `PackageList` to the text specified by `String` and, optionally, the font information specified by `StringFontInfo`. There is no way to change the font information without changing the string text.

**Status Codes Returned**
- **EFI_SUCCESS** The string was successfully updated.
- **EFI_NOT_FOUND** The string specified by `StringId` is not in the database. The specified `PackageList` is not in the Database.
- **EFI_INVALID_PARAMETER** The `String` or `Language` was NULL.
- **EFI_OUT_OF_RESOURCES** The system is out of resources to accomplish the task.

**EFI_HII_STRING_PROTOCOL.GetLanguages()**

**Summary**
Returns a list of the languages present in strings in a package list.

**Prototype**
```c
typedef
EFI_STATUS
(EIFIAPI *EFI_HII_GET_LANGUAGES) (
    IN   CONST EFI_HII_STRING_PROTOCOL  *This,
    IN   EFI_HII_HANDLE                PackageList,
    IN OUT CHAR8                        *Languages,
    IN OUT UINTN                         *LanguagesSize
);```

**Parameters**
- **This**
  A pointer to the `EFI_HII_STRING_PROTOCOL` instance.
- **PackageList**
  The package list to examine.
- **Languages**
  Points to the buffer to hold the returned null-terminated ASCII string.
**LanguageSize**

On entry, points to the size of the buffer pointed to by **Languages**, in bytes. On return, points to the length of **Languages**, in bytes.

**Description**

This function returns the list of supported languages, in the format specified in Appendix M.

**Status Codes Returned**

- **EFI_SUCCESS**: The languages were returned successfully.
- **EFI_BUFFER_TOO_SMALL**: The **LanguageSize** is too small to hold the list of supported languages. **LanguageSize** is updated to contain the required size.
- **EFI_NOT_FOUND**: The specified **PackageList** is not in the Database.
- **EFI_INVALID_PARAMETER**: The value referenced by **LanguageSize** is null.

**EFI_HII_STRING_PROTOCOL.GetSecondaryLanguages()**

**Summary**

Given a primary language, returns the secondary languages supported in a package list.

**Prototype**

```c
typedef EFI_STATUS (EFIAPIC *EFI_HII_GET_2ND_LANGUAGES) (  
    IN   CONST EFI_HII_STRING_PROTOCOL  *This,  
    IN   EFI_HII_HANDLE   PackageList,  
    IN   CONST CHAR8*    PrimaryLanguage;  
    IN OUT CHAR8*   *SecondaryLanguages,  
    IN OUT UINTN    *SecondaryLanguagesSize
);  
```

**Parameters**

- **This**: A pointer to the **EFI_HII_STRING_PROTOCOL** instance.
- **PackageList**: The package list to examine.
- **PrimaryLanguage**: Points to the null-terminated ASCII string that specifies the primary language.

Languages are specified in the format specified in Appendix M of the UEFI Specification.
SecondaryLanguages
Points to the buffer to hold the returned null-terminated ASCII string that describes the list of secondary languages for the specified PrimaryLanguage. If there are no secondary languages, the function returns successfully, but this is set to NULL.

SecondaryLanguagesSize
On entry, points to the size of the buffer pointed to by SecondaryLanguages, in bytes. On return, points to the length of SecondaryLanguages in bytes.

Description
Each string package has associated with it a single primary language and zero or more secondary languages. This routine returns the secondary languages associated with a package list.

Status Codes Returned
- EFI_SUCCESS: Secondary languages correctly returned
- EFI_BUFFER_TOO_SMALL: The buffer specified by SecondaryLanguagesSize is too small to hold the returned information. SecondaryLanguagesSize is updated to hold the size of the buffer required.
- EFI_INVALID_LANGUAGE: The language specified by FirstLanguage is not present in the specified package list.
- EFI_NOT_FOUND: The specified PackageList is not in the Database.
- EFI_INVALID_PARAMETER: PrimaryLanguage or SecondaryLanguagesSize is NULL.
- EFI_INVALID_PARAMETER: The value referenced by SecondaryLanguagesSize is not zero and SecondaryLanguages is NULL.

34.4 Image Protocol

EFI_HII_IMAGE_PROTOCOL

Summary
Protocol which allow access to images in the images database.

GUID
#define EFI_HII_IMAGE_PROTOCOL_GUID\
{ 0x31a6406a, 0x6bdf, 0x4e46,\
  { 0xb2, 0xa2, 0xeb, 0xaa, 0x89, 0xc4, 0x9, 0x20 } }
Protocol

typedef struct _EFI_HII_IMAGE_PROTOCOL {
    EFI_HII_NEW_IMAGE NewImage;
    EFI_HII_GET_IMAGE GetImage;
    EFI_HII_SET_IMAGE SetImage;
    EFI_HII_DRAW_IMAGE DrawImage;
    EFI_HII_DRAW_IMAGE_ID DrawImageId;
} EFI_HII_IMAGE_PROTOCOL;

Members

    NewImage
    Add a new image.

    GetImage
    Retrieve an image and related font information.

    SetImage
    Change an image.

EFI_HII_IMAGE_PROTOCOL.NewImage()

Summary
Creates a new image and add it to images from a specific package list.

Prototype

typedef
    EFI_STATUS
    (EFIAPI *EFI_HII_NEW_IMAGE) (
        IN CONST EFI_HII_IMAGE_PROTOCOL *This,
        IN EFI_HII_HANDLE PackageList,
        OUT EFI_IMAGE_ID *ImageId
        IN CONST EFI_IMAGE_INPUT *Image
    );

Parameters

    This
    A pointer to the EFI_HII_IMAGE_PROTOCOL instance.

    PackageList
    Handle of the package list where this image will be added.

    ImageId
    On return, contains the new image id, which is unique within PackageList.

    Image
    Points to the image.
Description
This function adds the image `Image` to the group of images owned by `PackageList`, and returns a new image identifier (`ImageId`).

Related Definitions
```c
typedef UINT16 EFI_IMAGE_ID;
typedef struct 
    {
        UINT32 Flags;
        UINT16 Width;
        UINT16 Height;
        EFI_GRAPHICS_OUTPUT_BLT_PIXEL *Bitmap;
    } EFI_IMAGE_INPUT;
```

Flags
Describe image characteristics. If `EFI_IMAGE_TRANSPARENT` is set, then the image was designed for transparent display.

```c
#define EFI_IMAGE_TRANSPARENT  0x00000001
```

Width
Image width, in pixels.

Height
Image height, in pixels.

Bitmap
A pointer to the actual bitmap, organized left-to-right, top-to-bottom. The size of the bitmap is `Width * Height * sizeof(EFI_GRAPHICS_OUTPUT_BLT_PIXEL)`.

Status Codes Returns
- `EFI_SUCCESS` The new image was added successfully
- `EFI_OUT_OF_RESOURCES` Could not add the image.
- `EFI_INVALID_PARAMETER` `Image` is NULL or `ImageId` is NULL.
- `EFI_NOT_FOUND` The `PackageList` could not be found.

`EFI_HII_IMAGE_PROTOCOL.GetImage()`

Summary
Returns information about an image, associated with a package list.
Prototype

```c
typedef EFI_STATUS (EFIAPI *EFI_HII_GET_IMAGE) (
    IN CONST EFI_HII_IMAGE_PROTOCOL *This,
    IN EFI_HII_HANDLE PackageList,
    IN EFI_IMAGE_ID ImageId,
    OUT EFI_IMAGE_INPUT *Image
);
```

Parameters

- `This`  
  A pointer to the `EFI_HII_IMAGE_PROTOCOL` instance.
- `PackageList`  
  The package list in the HII database to search for the specified image.
- `ImageId`  
  The image’s id, which is unique within `PackageList`.
- `Image`  
  Points to the new image.

Description

This function retrieves the image specified by `ImageId` which is associated with the specified `PackageList` and copies it into the buffer specified by `Image`.

If the image specified by `ImageId` is not present in the specified `PackageList`, then `EFI_NOT_FOUND` is returned.

The actual bitmap (`Image->Bitmap`) should not be freed by the caller and should not be modified directly.

Status Codes Returned

- `EFI_SUCCESS`  
  The image was returned successfully.
- `EFI_NOT_FOUND`  
  The image specified by `ImageId` is not available. The specified `PackageList` is not in the Database.
- `EFI_INVALID_PARAMETER`  
  `Image` was NULL.
- `EFI_OUT_OF_RESOURCES`  
  The bitmap could not be retrieved because there was not enough memory.

`EFI_HII_IMAGE_PROTOCOL.SetImage()`

Summary

Change information about the image.
Prototype

typedef
EFI_STATUS
(EIFIAPI *EFI_HII_SET_IMAGE) (
    IN CONST EFI_HII_IMAGE_PROTOCOL *This,
    IN EFI_HII_HANDLE PackageList,
    IN EFI_IMAGE_ID ImageId,
    IN CONST EFI_IMAGE_INPUT *Image,
);

Parameters

This
    A pointer to the EFI_HII_IMAGE_PROTOCOL instance.

PackageList
    The package list containing the images.

ImageId
    The image id, which is unique within PackageList.

Image
    Points to the image.

Description
This function updates the image specified by ImageId in the specified PackageListHandle to the image specified by Image.

Status Codes Returned

EFI_SUCCESS The image was successfully updated.
EFI_NOT_FOUND The image specified by ImageId is not in the database. The specified PackageList is not in the Database.
EFI_INVALID_PARAMETER The Image was NULL.

EFI_HII_IMAGE_PROTOCOL.DrawImage()

Summary
Renders an image to a bitmap or to the display.
Prototype

typedef
  EFI_STATUS
  (EFI_APIC *EFI_HII_DRAW_IMAGE) (  
    IN CONST EFI_HII_IMAGE_PROTOCOL *This,
    IN EFI_HII_DRAW_FLAGS Flags,
    IN CONST EFI_IMAGE_INPUT *Image,
    IN OUT EFI_IMAGE_OUTPUT **Blt,
    IN UINTN BltX,
    IN UINTN BltY,
  );

Parameters

  This

    A pointer to the EFI_HII_IMAGE_PROTOCOL instance.

  Flags

    Describes how the image is to be drawn. EFI_HII_DRAW_FLAGS is defined in Related Definitions, below.

  Image

    Points to the image to be displayed.

  Blt

    If this points to a non-NULL on entry, this points to the image, which is Width pixels wide and Height pixels high. The image will be drawn onto this image and EFI_HII_DRAW_FLAG_CLIP is implied. If this points to a NULL on entry, then a buffer will be allocated to hold the generated image and the pointer updated on exit. It is the caller’s responsibility to free this buffer.

    BltX, BltY

    Specifies the offset from the left and top edge of the image of the first pixel in the image.

Description

This function renders an image to a bitmap or the screen using the specified color and options. It draws the image on an existing bitmap, allocates a new bitmap or uses the screen. The images can be clipped.

If EFI_HII_DRAW_FLAG_CLIP is set, then all pixels drawn outside the bounding box specified by Width and Height are ignored.

The EFI_HII_DRAW_FLAG_TRANSPARENT flag determines whether the image will be drawn transparent or opaque. If EFI_HII_DRAW_FLAG_FORCE_TRANS is set then the image’s pixels will be drawn so that all “off” pixels in the image will be drawn using the pixel value from BLT and all other pixels will be copied. If EFI_HII_DRAW_FLAG_FORCE_OPAQUE is set, then the image’s pixels will be copied directly to the destination. If EFI_HII_DRAW_FLAG_DEFAULT is set, then the image will be drawn
transparently or opaque, depending on the image’s transparency setting (see `EFI_IMAGE_TRANSPARENT`). Images cannot be drawn transparently if `Blt` is NULL.

If `EFI_HII_DIRECT_TO_SCREEN` is set, then the image will be written directly to the output device specified by `Screen`. Otherwise the image will be rendered to the bitmap specified by `Bitmap`.

**Status Codes Returned**

- **EFI_SUCCESS** The image was successfully updated.
- **EFI_OUT_OF_RESOURCES** Unable to allocate an output buffer for `Blt`.
- **EFI_INVALID_PARAMETER** The `Image` or `Blt` was NULL.

**EFI_HII_IMAGE_PROTOCOL.DrawLineId()**

**Summary**

Render an image to a bitmap or the screen containing the contents of the specified image.

**Prototype**

```c
typedef EFI_STATUS (EFIAPI *EFI_HII_DRAW_IMAGE_ID) (
    IN CONST EFI_HII_IMAGE_PROTOCOL *This,
    IN EFI_HII_DRAW_FLAGS Flags,
    IN EFI_HII_HANDLE PackageList,
    IN EFI_IMAGE_ID ImageId,
    IN OUT EFI_IMAGE_OUTPUT **Blt,
    IN UINTN BltX,
    IN UINTN BltY,
);
```

**Parameters**

- **This**
  
  A pointer to the `EFI_HII_IMAGE_PROTOCOL` instance.

- **Flags**
  
  Describes how the image is to be drawn. `EFI_HII_DRAW_FLAGS` is defined in Related Definitions, below.

- **PackageList**
  
  The package list in the HII database to search for the specified image.

- **ImageId**
  
  The image’s id, which is unique within `PackageList`.

- **Blt**
  
  If this points to a non-NULL on entry, this points to the image, which is `Width` pixels wide and `Height` pixels high. The image will be drawn onto this image and
**EFI_HII_DRAW_FLAG_CLIP** is implied. If this points to a NULL on entry, then a buffer will be allocated to hold the generated image and the pointer updated on exit. It is the caller’s responsibility to free this buffer.

*Bltx, Blty*

Specifies the offset from the left and top edge of the output image of the first pixel in the image.

**Description**

This function renders an image to a bitmap or the screen using the specified color and options. It draws the image on an existing bitmap, allocates a new bitmap or uses the screen. The images can be clipped.

If **EFI_HII_DRAW_FLAG_CLIP** is set, then all pixels drawn outside the bounding box specified by **Width** and **Height** are ignored.

The **EFI_HII_DRAW_FLAG_TRANSPARENT** flag determines whether the image will be drawn transparent or opaque. If **EFI_HII_DRAW_FLAG_FORCE_TRANS** is set, then the image will be drawn so that all “off” pixels in the image will be drawn using the pixel value from **Blt** and all other pixels will be copied. If **EFI_HII_DRAW_FLAG_FORCE_OPAQUE** is set, then the image’s pixels will be copied directly to the destination. If **EFI_HII_DRAW_FLAG_DEFAULT** is set, then the image will be drawn transparently or opaque, depending on the image’s transparency setting (see **EFI_IMAGE_TRANSPARENT**). Images cannot be drawn transparently if **Blt** is NULL.

If **EFI_HII_DIRECT_TO_SCREEN** is set, then the image will be written directly to the output device specified by **Screen**. Otherwise the image will be rendered to the bitmap specified by **Bitmap**.

**Related Definitions**

```c
typedef UINT32 EFI_HII_DRAW_FLAGS;
#define EFI_HII_DRAW_FLAG_CLIP           0x00000001
#define EFI_HII_DRAW_FLAG_TRANSPARENT    0x00000030
#define EFI_HII_DRAW_FLAG_DEFAULT       0x00000000
#define EFI_HII_DRAW_FLAG_FORCE_TRANS   0x00000010
#define EFI_HII_DRAW_FLAG_FORCE_OPAQUE  0x00000020
#define EFI_HII_DIRECT_TO_SCREEN         0x00000080
```

**Status Codes Returned**

- **EFI_SUCCESS** The image was successfully updated.
- **EFI_OUT_OF_RESOURCES** Unable to allocate an output buffer for **RowInfoArray** or **Blt**.
- **EFI_NOT_FOUND** The image specified by **ImageId** is not in the database. The specified **PackageList** is not in the Database.
- **EFI_INVALID_PARAMETER** The **Image** or **Blt** was NULL.

### 34.5 EFI HII Image Ex Protocol

The EFI HII Image Ex protocol defines an extension to the EFI HII Image protocol which enables various new capabilities described in this section.
EFI_HII_IMAGE_EX_PROTOCOL

Summary
Protocol which allows access to the images in the images database

GUID
#define EFI_HII_IMAGE_EX_PROTOCOL_GUID \
{0x1a1241e6, 0x8f19, 0x41a9, 0xbc, \
{0xe, 0xe8, 0xef,0x39, 0xe0, 0x65, 0x46}

Protocol
typedef struct _EFI_HII_IMAGE_EX_PROTOCOL {
  EFI_HII_NEW_IMAGE_EX    NewImageEx;
  EFI_HII_GET_IMAGE_EX    GetImageEx;
  EFI_HII_SET_IMAGE_EX    SetImageEx;
  EFI_HII_DRAW_IMAGE_EX   DrawImageEx;
  EFI_HII_DRAW_IMAGE_ID_EX  DrawImageIdEx;
  EFI_HII_GET_IMAGE_INFO  GetImageInfo;
} EFI_HII_IMAGE_EX_PROTOCOL;

Members
  NewImageEx          Add a new image. This protocol invokes the original 
                     EFI_HII_IMAGE_PROTOCOL.NewImage() implicitly.
  GetImageEx          Retrieve an image and the related image information. This 
                     function will try to locate the 
                     EFI_HII_IMAGE_DECODER_PROTOCOL if the image decoder for 
                     the image is not supported by the EFI HII image EX protocol.
  SetImageEx          Change information about the image, this protocol invokes original 
                     EFI_HII_IMAGE_PROTOCOL.SetImage() implicitly.
  DrawImageEx         Renders an image to a bitmap or the display, this protocol 
                     invokes original EFI_HII_IMAGE_PROTOCOL.DrawImage() implicitly.
  DrawImageIdEx       Renders an image to a bitmap or the screen containing the 
                     contents of the specified image, this protocol invokes original 
                     EFI_HII_IMAGE_PROTOCOL.DrawImageId() implicitly.
  GetImageInfo        This function retrieves the image information specified by the 
                     image ID which is associated with the specified HII package 
                     list. This function only returns the geometry of the image 
                     instead of allocating the memory buffer and decoding the 
                     image to the buffer.

EFI_HII_IMAGE_EX_PROTOCOL.NewImageEx()

Summary
The prototype of this extension function is the same with EFI_HII_IMAGE_PROTOCOL.NewImage().
Protocol

typedef
EFI_STATUS
(EIFIAPI *EFI_HII_NEW_IMAGE_EX)(
    IN CONST EFI_HII_IMAGE_EX_PROTOCOL *This,
    IN EFI_HII_HANDLE PackageList,
    OUT EFI_IMAGE_ID *ImageId
    IN OUT EFI_IMAGE_INPUT *Image
    );

Parameters
Same with EFI_HII_IMAGE_PROTOCOL.NewImage().

Description
Same with EFI_HII_IMAGE_PROTOCOL.NewImage(). This protocol invokes EFI_HII_IMAGE_PROTOCOL.NewImage() implicitly.

Status Codes Returned
Same as EFI_HII_IMAGE_PROTOCOL.NewImage().

EFI_HII_IMAGE_EX_PROTOCOL.GetImageEx()

Summary
Return the information about the image, associated with the package list. The prototype of this extension function is the same with EFI_HII_IMAGE_PROTOCOL.GetImage().

Protocol

typedef
EFI_STATUS
(EIFIAPI *EFI_HII_GET_IMAGE_EX)(
    IN CONST EFI_HII_IMAGE_EX_PROTOCOL *This,
    IN EFI_HII_HANDLE PackageList,
    IN EFI_IMAGE_ID ImageId,
    OUT EFI_IMAGE_INPUT *Image
    );

Parameters
Same with EFI_HII_IMAGE_PROTOCOL.GetImage()

Description
This function is similar to EFI_HII_IMAGE_PROTOCOL.GetImage(). The difference is that this function will locate all EFI_HII_IMAGE_DECODER_PROTOCOL instances installed in the system if the decoder of the certain image type is not supported by the EFI_HII_IMAGE_EX_PROTOCOL. The function will
attempt to decode the image to the `EFI_IMAGE_INPUT` using the first `EFI_HII_IMAGE_DECODER_PROTOCOL` instance that supports the requested image type.

**Status Codes Returned**

Same as `EFI_HII_IMAGE_PROTOCOL.GetImage()`.

### EFI_HII_IMAGE_EX_PROTOCOL.SetImageEx()

**Summary**

Change the information about the image. The prototype of this extension function is the same with `EFI_HII_IMAGE_PROTOCOL.SetImage()`.

**Protocol**

```c
typedef EFI_STATUS
  (EFIAPI *EFI_HII_SET_IMAGE_EX)(
    IN CONST EFI_HII_IMAGE_EX_PROTOCOL *This,
    IN EFI_HII_HANDLE PackageList,
    IN EFI_IMAGE_ID ImageId,
    IN CONST EFI_IMAGE_INPUT *Image
  );
```

**Parameters**

Same with `EFI_HII_IMAGE_PROTOCOL.SetImage()`.

**Description**

Same with `EFI_HII_IMAGE_PROTOCOL.SetImage()`, this protocol invokes `EFI_HII_IMAGE_PROTOCOL.SetImage()` implicitly.

**Status Codes Returned**

Same as `EFI_HII_IMAGE_PROTOCOL.SetImage()`.

### EFI_HII_IMAGE_EX_PROTOCOL.DrawImageEx()

**Summary**

Renders an image to a bitmap or to the display. The prototype of this extension function is the same with `EFI_HII_IMAGE_PROTOCOL.DrawImage()`.
Protocol

typedef

EFI_STATUS

(EFIAPI *EFI_HII_DRAW_IMAGE_EX)(

    IN CONST EFI_HII_IMAGE_EX_PROTOCOL *This,
    IN EFI_HII_DRAW_FLAGS Flags,
    IN CONST EFI_IMAGE_INPUT *Image,
    IN OUT EFI_IMAGE_OUTPUT **Blt,
    IN UINTN BltX,
    IN UINTN BltY
)

Parameters

Same with EFI_HII_IMAGE_PROTOCOL.DrawImageId().

Description

Same with EFI_HII_IMAGE_PROTOCOL.DrawImage(), this protocol invokes

    EFI_HII_IMAGE_PROTOCOL.DrawImage() implicitly.

Status Codes Returned

Same as EFI_HII_IMAGE_PROTOCOL.DrawImage().

EFI_HII_IMAGE_EX_PROTOCOL.DrawImageIdEx() 

Summary

Renders an image to a bitmap or the screen containing the contents of the specified image. The prototype of this extension function is the same with EFI_HII_IMAGE_PROTOCOL.DrawImageId().
Description

This function is similar to EFI_HII_IMAGE_PROTOCOL.DrawImageId(). The difference is that this function will locate all EFI_HII_IMAGE_DECODER_PROTOCOL instances installed in the system if the decoder of the certain image type is not supported by the EFI_HII_IMAGE_EX_PROTOCOL. The function will attempt to decode the image to the EFI_IMAGE_INPUT using the first EFI_HII_IMAGE_DECODER_PROTOCOL instance that supports the requested image type.

Status Codes Returned

Same as EFI_HII_IMAGE_PROTOCOL.DrawImageId().

EFI_HII_IMAGE_EX_PROTOCOL.GetImageInfo()

Summary

The function returns the information of the image. This function is differ from the EFI_HII_IMAGE_EX_PROTOCOL.GetImageEx() This function only returns the geometry of the image instead of decoding the image to the buffer.

Protocol

```c
typedef EFI_STATUS
(EFIAPI *EFI_HII_GET_IMAGE_INFO)(
    IN CONST EFI_HII_IMAGE_EX_PROTOCOL *This,
    IN EFI_HII_HANDLE PackageList,
    IN EFI_IMAGE_ID ImageId,
    OUT EFI_IMAGE_OUTPUT *Image
);
```

Parameters

- **This**: EFI_HII_IMAGE_EX_PROTOCOL instance.
- **PackageList**: The HII package list.
- **ImageId**: The HII image ID.
- **Image**: EFI_IMAGE_OUTPUT to retrieve the image information. Only `Image.Width` and `Image.Height` will be updated by this function. `Image.Bitmap` is always set to NULL.

Description

This function returns the image information to EFI_IMAGE_OUTPUT. Only the width and height are returned to the EFI_IMAGE_OUTPUT instead of decoding the image to the buffer. This function is used to get the geometry of the image. This function will try to locate all of the EFI_HII_IMAGE_DECODER_PROTOCOL installed on the system if the decoder of image type is not supported by the EFI_HII_IMAGE_EX_PROTOCOL.
### Status Codes Returned

#### 34.6 EFI HII Image Decoder Protocol

For those HII image block types which don’t have the corresponding image decoder supported in EFI HII image EX protocol, `EFI_HII_IMAGE_DECODER_PROTOCOL` can be used to provide the proper image decoder. There may be more than one `EFI_HII_IMAGE_DECODER_PROTOCOL` instance installed in the system. Each image decoder can decode more than one HII image block types. Whether or not the HII image block type of image is supported by the certain image decoder is reported through the `EFI_HII_IMAGE_DECODER_PROTOCOL` `GetImageDecoderName()` method. Caller can invoke this function to verify the image is supported by the image decoder before sending the image raw data to the image decoder. There are two image decoder names defined in this specification: `EFI_HII_IMAGE_DECODER_NAME_JPEG` and `EFI_HII_IMAGE_DECODER_NAME_PNG`.

The image decoder protocol can publish the support for additional image decoder names other than the ones defined in this specification. This allows the image decoder to support additional image formats that are not defined by the HII image block types. In that case, callers can send the image raw data to the image decoder protocol instance to retrieve the image information or decode the image. Since the HII image block type of such images is not defined, the image may or may not be decoded by that decoder. The decoder can use the signature or data structures in the image raw data is check the format before it processes the image.

The `EFI_HII_IMAGE_EX_PROTOCOL` uses `EFI_HII_IMAGE_DECODER_PROTOCOL` as follows:
Figure 34-2 How EFI_HII_IMAGE_EX_PROTOCOL uses EFI_HII_IMAGE_DECODER_PROTOCOL

**EFI_HII_IMAGE_DECODER_PROTOCOL.DecodeImage()**

**Summary**
Provides the image decoder for specific image file formats.

**GUID**
```c
#define EFI_HII_IMAGE_DECODER_PROTOCOL_GUID 
{0x9E66F251, 0x727C, 0x418C, 
{0xBF, 0xD6, 0xC2, 0xB4, 0x25, 0x28, 0x18, 0xEA}}
```

**Protocol**
```c
typedef struct _EFI_HII_IMAGE_DECODER_PROTOCOL {
    EFI_HII_IMAGE_DECODER_GET_NAME GetImageDecoderName;
    EFI_HII_IMAGE_DECODER_GET_IMAGE_INFO GetImageInfo;
    EFI_HII_IMAGE_DECODER_DECODER GetName;
} EFI_HII_IMAGE_DECODER_PROTOCOL;
```

**Members**
GetImageDecodeName — The function returns the decoder name.
GetImageInfo — The function returns the image information
DecodeImage — The function decodes the image to the `EFI_IMAGE_INPUT`

### Status Codes Returned

</tbody>
</table>

#### EFI_HII_IMAGE_DECODER_PROTOCOL.GetImageDecoderName()

**Summary**

This function returns the decoder name.

**Protocol**

```c
typedef EFI_STATUS (EFIAPICALLTYPE EFI_HII_IMAGE_DECODER_GET_NAME)(
    IN CONST EFI_HII_IMAGE_DECODER_PROTOCOL *This,
    IN OUT EFI_GUID **DecoderName,
    OUT UINT16 *NumberOfDecoderName
);
```

**Parameters**

- **This** — `EFI_HII_IMAGE_DECODER_PROTOCOL` instance.
- **DecoderName** — Pointer to a dimension to retrieve the decoder names in `EFI_GUID` format. The number of the decoder names is returned in `NumberOfDecoderName`.
- **NumberOfDecoderName** — Pointer to retrieve the number of decoders which supported by this decoder driver.

**Description**

There could be more than one `EFI_HII_IMAGE_DECODER_PROTOCOL` instances installed in the system for different image formats. This function returns the decoder name which callers can use to find the proper image decoder for the image. It is possible to support multiple image formats in one `EFI_HII_IMAGE_DECODER_PROTOCOL`. The capability of the supported image formats is returned in `DecoderName` and `NumberOfDecoderName`. 
Related Definitions

```c
//******************************************************************
// EFI_HII_IMAGE_DECODER_NAME
//******************************************************************
#define EFI_HII_IMAGE_DECODER_NAME_JPEG_GUID
{0xefefd093, 0xd9b, 0x46eb, 0xa8, 
  {0x56, 0x48, 0x35, 0x7, 0x0, 0xc9, 0x8}}

</table>

EFI_HII_IMAGE_DECODER_PROTOCOL.GetImageInfo()

Summary
The function returns the EFI_HII_IMAGE_DECODER_IMAGE_INFO to the caller.

Protocol

```c
typedef EFI_STATUS
(EIFIAPI *EFI_HII_IMAGE_DECODER_GET_IMAGE_INFO)(
  IN CONST EFI_HII_IMAGE_DECODER_PROTOCOL *This, 
  IN VOID *Image, 
  IN UINTN SizeOfImage, 
  IN OUT EFI_HII_IMAGE_DECODER_IMAGE_INFO **ImageInfo
);
```

Parameters

- **This**: EFI_HII_IMAGE_DECODER_PROTOCOL instance.
- **Image**: Pointer to the image raw data
- **SizeOfImage**: Size of the entire image raw data
- **ImageInfo**: Pointer to receive the EFI_HII_IMAGE_DECODER_IMAGE_INFO

Description
This function returns the image information of the given image raw data. This function first checks whether the image raw data is supported by this decoder or not. This function may go through the first few bytes in the image raw data for the specific data structure or the image signature. If the image is not supported by this image decoder, this function returns EFI_UNSUPPORTED to the caller. Otherwise, this
function returns the proper image information to the caller. It is the caller’s responsibility to free the `ImageInfo`.

**Status Codes Returned**

Reserved Reserved

Channels Number of channels in the PNG image.

Reserved Reserved

ImageExtension The string of the image file extension. For example, "GIF", "TIFF" or others.
**EFI_HII_IMAGE_DECODER_PROTOCOL.Decode()**

**Summary**
The function decodes the image

**Protocol**
```c
typedef EFI_STATUS
(EFIAPI *EFI_HII_IMAGE_DECODER_DECODER)(
    IN CONST EFI_HII_IMAGE_DECODER_PROTOCOL *This,
    IN VOID *Image,
    IN UINTN ImageRawDataSize,
    IN OUT EFI_IMAGE_OUTPUT **Bitmap,
    IN BOOLEAN Transparent
);
```

**Parameters**
- **This**: EFI_HII_IMAGE_DECODER_PROTOCOL instance.
- **Image**: Pointer to the image raw data
- **ImageRawDataSize**: Size of the entire image raw data
- **Bitmap**: EFI_IMAGE_OUTPUT to receive the image or overlap the image on the original buffer.
- **Transparent**: BOOLEAN value indicates whether the image decoder has to handle the transparent image or not.

**Description**
This function decodes the image which the image type of this image is supported by this EFI_HII_IMAGE_DECODER_PROTOCOL. If *Bitmap* is not NULL, the caller intends to put the image in the given image buffer. That allows the caller to put an image overlap on the original image. The transparency is handled by the image decoder because the transparency capability depends on the image format. Callers can set **Transparent** to FALSE to force disabling the transparency process on the image. Forcing **Transparent** to FALSE may also improve the performance of the image decoding because the image decoder can skip the transparency processing.

If *Bitmap* is NULL, the image decoder allocates the memory buffer for the EFI_IMAGE_OUTPUT and decodes the image to the image buffer. It is the caller’s responsibility to free the memory for EFI_IMAGE_OUTPUT. Image decoder doesn’t have to handle the transparency in this case because there is no background image given by the caller. The background color in this case is all black (#00000000).

### 34.7 Font Glyph Generator Protocol

The EFI HII Font glyph generator protocol generates font glyphs of the requested characters according to the given font information. This protocol is utilized by the EFI_HII_FONT_EX_PROTOCOL when the character can’t be found in the existing glyph database. That is when glyph is not found in any HII font package,
EFI_HII_FONT_EX_PROTOCOL locates EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL to generate glyph block and insert glyph block into HII font package. The HII font package can be an existing HII font package or a new HII font package. This protocol can be provided by any driver that knows how to generate the glyph for a specific font family. For example, EFI application or driver may provide "Times new roman" font glyph generator driver. With this driver, platform can have "Times new roman" font supported on system.

**EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL**

**Summary**

EFI HII Font glyph generator protocol generates the glyph of the character according to the given font information.

**GUID**

```c
#define EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL_GUID 
  { 0xf7102853, 0x7787, 0x4dc2, 0xa8, 
    {0xa8, 0x21, 0xb5, 0xdd, 0x5, 0xc8, 0x9b } }
```

**Protocol**

```c
typedef struct _EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL {
  EFI GENERATE_GLYPH GenerateGlyph;
  EFI GENERATE_IMAGE GenerateGlyphImage;
} EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL;
```

**Members**

- **GenerateGlyph** The function generates the glyph information according to the given font information.
- **GenerateGlyphImage** The function generates the glyph image according to the given font information.

**EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL.GenerateGlyph()**

**Summary**

The function generates the glyph information according to the given font information. This function returns the glyph block in EFI_HII_GIBT_GLYPH_VARIABILITY type.
Protocol

typedef

EFI_STATUS
(EIFI_API *EFI_HII_GENERATE_GLYPH)(
  IN CONST EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL *This,
  IN CHAR16 Char,
  IN CONST EFI_FONT_DISPLAY_INFO *FontInfo,
  OUT EFI_HII_GIBT_VARIABILITY_BLOCK *GlyphBlock
);

Parameters

This EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL instance.
Char Character to retrieve.
FontInfo Font display information of this character.
GlyphBlock Pointer to retrieve the EFI_HII_GIBT_VARIABILITY_BLOCK

Description

This function generates the glyph information of the character in the specific font family. EFI_HII_GIBT_VARIABILITY_BLOCK is returned to GlyphBlock if GlyphBlock is not NULL. GlyphBlock can be called by EFI_HII_FONT_EX_PROTOCOL to retrieve the glyph information which are provided by the font family specific driver, or can be used to build up the HII font package if the HII font package with the specific font family does not exist in the HII database.

EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL.GenerateGlyphImage()

Summary

The function generates the glyph image according to the given font information. This function returns EFI_GRAPHICS_OUTPUT_BLT_PIXEL points to the EFI_IMAGE_OUTPUT buffer. This function is used for glyphs which are reported in the font database as EFI_HII_GIBT_GLYPH_VARIABILITY glyph blocks.
Protocol

typedef

EFI_STATUS

(EFIAPI *EFI_HII_GENERATE_GLYPH_IMAGE)(

    IN CONST EFI_FONT_DISPLAY_INFO *FontInfo,
    IN OUT EFI_IMAGE_OUTPUT *Image,
    IN INT32 *BltX,
    IN INT32 *BltY,
    IN BOOLEAN Transparent
);

Parameters

This       EFI_HII_FONT_GLYPH_GENERATOR_PROTOCOL instance.
Cell       Pointer to EFI_HII_GLYPH_INFO
GlyphBuffer The buffer points to the bitmap of glyph. This pointer points to
             GlyphBlock.BitmapData which returned from
             GenerateGlyph()function
FontInfo   Font display information of this glyph.
Image      Image output buffer to retrieve the glyph image.
BltX       Together with BltY, specifies the offset from the left and top
             edge of the image of the first character cell in the *Image.
BltY       Together with BltX, specifies the offset from the left and top
             edge of the image of the first character cell in the *Image.
Transparent If TRUE, the Background color is ignored and all"off" pixels in
             the character's drawn will use the pixel value from *Image.

Description

This function generates the glyph image of the character in the specific font family on the given
EFI_IMAGE_OUTPUT

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The glyph image was generated in Image.</td>
</tr>
<tr>
<td>EFI_OUT_OF_RESOURCE</td>
<td>Not enough memory to generate image of the given glyph.</td>
</tr>
</tbody>
</table>
| EFI_UNSUPPORTED              | The font glyph generator can't generate the glyph for the given FontInfo. This may
                                caused by the unsupported font name, font style or font size. |
| EFI_INVALID_PARAMETER        | One or more parameters of Cell, GlyphBuffer, FontInfo, Image, BltX or BltY was NULL. |
34.8 Database Protocol

**EFI_HII_DATABASE_PROTOCOL**

**Summary**
Database manager for HII-related data structures.

**GUID**

```
#define EFI_HII_DATABASE_PROTOCOL_GUID \
{ 0xef9fc172, 0xa1b2, 0x4693,\ 
  { 0xb3, 0x27, 0x6d, 0x32, 0xfc, 0x41, 0x60, 0x42 }}
```

**Protocol**

```c
typedef struct _EFI_HII_DATABASE_PROTOCOL {
  EFI_HII_DATABASE_NEW_PACK    NewPackageList;
  EFI_HII_DATABASE_REMOVE_PACK RemovePackageList;
  EFI_HII_DATABASE_UPDATE_PACK UpdatePackageList;
  EFI_HII_DATABASE_LIST_PACKS ListPackageLists;
  EFI_HII_DATABASE_EXPORT_PACKS ExportPackageLists;
  EFI_HII_DATABASE_REGISTER_NOTIFY RegisterPackageNotify;
  EFI_HII_DATABASE_UNREGISTER_NOTIFY UnregisterPackageNotify;
  EFI_HII_FIND_KEYBOARD_LAYOUTS FindKeyboardLayouts;
  EFI_HII_GET_KEYBOARD_LAYOUT GetKeyboardLayout;
  EFI_HII_SET_KEYBOARD_LAYOUT SetKeyboardLayout;
  EFI_HII_DATABASE_GET_PACK_HANDLE GetPackageListHandle;
} EFI_HII_DATABASE_PROTOCOL;
```

**Members**

- **NewPackageList**
  Add a new package list to the HII database.

- **RemovePackageList**
  Remove a package list from the HII database.

- **UpdatePackageList**
  Update a package list in the HII database.

- **ListPackageLists**
  List the handles of the package lists within the HII database.

- **ExportPackageLists**
  Export package lists from the HII database.

- **RegisterPackageNotify**
  Register notification when packages of a certain type are installed.

- **UnregisterPackageNotify**
  Unregister notification of packages.
FindKeyboardLayout

Retrieves a list of the keyboard layouts in the system.

GetKeyboardLayout

Allows a program to extract the current keyboard layout. See the GetKeyboardLayout() function description.

SetKeyboardLayout

Changes the current keyboard layout. See the SetKeyboardLayout() function description.

GetPackageListHandle

Return the EFI handle associated with a given package list.

EFI_HII_DATABASE_PROTOCOL.NewPackageList()

Summary

Adds the packages in the package list to the HII database.

Prototype

typedef
EFI_STATUS
(EIFIAPI *EFI_HII_DATABASE_NEW_PACK) (   
   IN CONST EFI_HII_DATABASE_PROTOCOL *This,   
   IN CONST EFI_HII_PACKAGE_LIST_HEADER *PackageList,   
   IN CONST EFI_HANDLE DriverHandle, OPTIONAL   
   OUT EFI_HII_HANDLE *Handle
);

Parameters

This

A pointer to the EFI_HII_DATABASE_PROTOCOL instance.

PackageList

A pointer to an EFI_HII_PACKAGE_LIST_HEADER structure.

DriverHandle

Associate the package list with this EFI handle

Handle

A pointer to the EFI_HII_HANDLE instance. Type EFI_HII_HANDLE is defined in "Related Definitions" below.

Description

This function adds the packages in the package list to the database and returns a handle. If there is a EFI_DEVICE_PATH_PROTOCOL associated with the DriverHandle, then this function will create a package of type EFI_PACKAGE_TYPE_DEVICE_PATH and add it to the package list.
For each package in the package list, registered functions with the notification type \texttt{NEW\_PACK} and having the same package type will be called.

For each call to \texttt{NewPackageList()}, there should be a corresponding call to \texttt{EFI\_HII\_DATABASE\_PROTOCOL.RemovePackageList()}. 

\textbf{Related Definitions} 
\begin{verbatim}
typedef VOID *EFI\_HII\_HANDLE;
\end{verbatim}

\textbf{Status Codes Returns} 
\begin{itemize}
\item \texttt{EFI\_SUCCESS} \hspace{1cm} The package list associated with the \texttt{Handle} was added to the HII database.
\item \texttt{EFI\_OUT\_OF\_RESOURCES} \hspace{1cm} Unable to allocate necessary resources for the new database contents.
\item \texttt{EFI\_INVALID\_PARAMETER} \hspace{1cm} \texttt{PackageList} is NULL or \texttt{Handle} is \texttt{NULL}.
\end{itemize}

\texttt{EFI\_HII\_DATABASE\_PROTOCOL.RemovePackageList()} 

\textbf{Summary} 
Removes a package list from the HII database.

\textbf{Prototype} 
\begin{verbatim}
typedef EFI\_STATUS
(EIFIAPI *EFI\_HII\_DATABASE\_REMOVE\_PACK) (
  IN CONST EFI\_HII\_DATABASE\_PROTOCOL *This,
  IN EFI\_HII\_HANDLE Handle
);
\end{verbatim}

\textbf{Parameters} 
\begin{itemize}
\item \textit{This} \hspace{1cm} A pointer to the \texttt{EFI\_HII\_DATABASE\_PROTOCOL} instance.
\item \textit{Handle} \hspace{1cm} The handle that was registered to the data that is requested for removal. Type \texttt{EFI\_HII\_HANDLE} is defined in \texttt{EFI\_HII\_DATABASE\_PROTOCOL.NewPackageList()} in the Packages section.
\end{itemize}

\textbf{Description} 
This function removes the package list that is associated with a handle \texttt{Handle} from the HII database. Before removing the package, any registered functions with the notification type \texttt{REMOVE\_PACK} and the same package type will be called.

For each call to \texttt{EFI\_HII\_DATABASE\_PROTOCOL.NewPackageList()}, there should be a corresponding call to \texttt{RemovePackageList()}. 

Status Codes Returned

- **EFI_SUCCESS**: The data associated with the Handle was removed from the HII database.
- **EFI_NOT_FOUND**: The specified Handle is not in the Database.

### EFI_HII_DATABASE_PROTOCOL.UpdatePackageList()

**Summary**
Update a package list in the HII database.

**Prototype**
```c
typedef
EFI_STATUS
(EFIAPI *EFI_HII_DATABASE_UPDATE_PACK) (    
  IN CONST EFI_HII_DATABASE_PROTOCOL *This,    
  IN EFI_HII_HANDLE Handle,    
  IN CONST EFI_HII_PACKAGE_LIST_HEADER *PackageList,
);
```

**Parameters**
- **This**: A pointer to the EFI_HII_DATABASE_PROTOCOL instance.
- **Handle**: The handle that was registered to the data that is requested to be updated. Type EFI_HII_HANDLE is defined in EFI_HII_DATABASE_PROTOCOL.NewPackageList() in the Packages section.
- **PackageList**: A pointer to an instance of EFI_HII_PACKAGE_LIST_HEADER.

**Description**
This function updates the existing package list (which has the specified Handle) in the HII databases, using the new package list specified by PackageList. The update process has the following steps:

Collect all the package types in the package list specified by PackageList. A package type consists of the Type field of EFI_HII_PACKAGE_HEADER and, if the Type is EFI_HII_PACKAGE_TYPE_GUID, the Guid field, as defined in EFI_HII_GUID_PACKAGE_HDR.

Iterate through the packages within the existing package list in the HII database specified by Handle. If a package’s type matches one of the types collected in step 1, then perform the following steps:

- Call any functions registered with the notification type REMOVE_PACK.
- Remove the package from the package list and the HII database.

Add all of the packages within the new package list specified by PackageList, using the following steps:

- Add the package to the package list and the HII database.
Call any functions registered with the notification type **ADD_PACK**.

**Status Codes Returned**

- **EFI_SUCCESS**
  The HII database was successfully updated.
- **EFI_OUT_OF_RESOURCES**
  Unable to allocate enough memory for the updated database.
- **EFI_INVALID_PARAMETER**
  PackageList was **NULL**.
- **EFI_NOT_FOUND**
  The specified Handle is not in the Database.

**EFI_HII_DATABASE_PROTOCOL.ListPackageLists()**

**Summary**
Determines the handles that are currently active in the database.

**Prototype**

```c
typedef
EFI_STATUS
(EFIAPI *EFI_HII_DATABASE_LIST_PACKS) (  
  IN CONST EFI_HII_DATABASE_PROTOCOL *This,
  IN UINT8 PackageType,
  IN CONST EFI_GUID *PackageGuid,
  IN OUT UINTN *HandleBufferLength,
  OUT EFI_HII_HANDLE *Handle
);
```

**Parameters**

**This**
A pointer to the **EFI_HII_DATABASE_PROTOCOL** instance.

**PackageType**
Specifies the package type of the packages to list or **EFI_HII_PACKAGE_TYPE_ALL** for all packages to be listed.

**PackageGuid**
If PackageType is **EFI_HII_PACKAGE_TYPE_GUID**, then this is the pointer to the GUID which must match the Guid field of **EFI_HII_GUID_PACKAGE_HDR**. Otherwise, it must be NULL.

**HandleBufferLength**
On input, a pointer to the length of the handle buffer. On output, the length of the handle buffer that is required for the handles found.

**Handle**
An array of **EFI_HII_HANDLE** instances returned. Type **EFI_HII_HANDLE** is defined in **EFI_HII_DATABASE_PROTOCOL.NewPackageList()** in the Packages section.
Description
This function returns a list of the package handles of the specified type that are currently active in the database. The pseudo-type \texttt{EFI\_HII\_PACKAGE\_TYPE\_ALL} will cause all package handles to be listed.

Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>A list of Packages was placed in \texttt{Handle} successfully. \texttt{HandleBufferLength} is updated with the actual length.</td>
</tr>
<tr>
<td>EFI_BUFFER_TOO_SMALL</td>
<td>The \texttt{HandleBufferLength} parameter indicates that \texttt{Handle} is too small to support the number of handles. \texttt{HandleBufferLength} is updated with a value that will enable the data to fit.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>\texttt{HandleBufferLength} was \texttt{NULL}.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>The value referenced by \texttt{HandleBufferLength} was not zero and \texttt{Handle} was NULL.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>\texttt{PackageType} is a \texttt{EFI_HII_PACKAGE_TYPE_GUID} but \texttt{PackageGuid} is not \texttt{NULL}.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>\texttt{PackageType} is a \texttt{EFI_HII_PACKAGE_TYPE_GUID} but \texttt{PackageGuid} is \texttt{NULL}.</td>
</tr>
<tr>
<td>EFI_NOT_FOUND</td>
<td>No matching handles were found</td>
</tr>
</tbody>
</table>

\textbf{EFI\_HII\_DATABASE\_PROTOCOL.ExportPackageLists()}

Summary
Exports the contents of one or all package lists in the HII database into a buffer.

Prototype

```c
typedef EFI\_STATUS
\( (\text{EFIAPI} *\text{EFI\_HII\_DATABASE\_EXPORT\_PKCS}) (\)
\( \text{IN \text{CONST}} \text{EFI\_HII\_DATABASE\_PROTOCOL} *\text{This}, \)
\( \text{IN \text{EFI\_HII\_HANDLE}} \quad \text{Handle}, \)
\( \text{IN \text{OUT}} \text{UINTN} \quad *\text{BufferSize}, \)
\( \text{OUT \text{EFI\_HII\_PACKAGE\_LIST\_HEADER}} \quad *\text{Buffer} \)
\) ;
```

Parameters

\texttt{This}  
A pointer to the \texttt{EFI\_HII\_DATABASE\_PROTOCOL} instance.

\texttt{Handle}  
An \texttt{EFI\_HII\_HANDLE} that corresponds to the desired package list in the HII database to export or NULL to indicate all package lists should be exported.
BufferSize
On input, a pointer to the length of the buffer. On output, the length of the buffer that is required for the exported data.

Buffer
A pointer to a buffer that will contain the results of the export function.

Description
This function will export one or all package lists in the database to a buffer. For each package list exported, this function will call functions registered with `EXPORT_PACK` and then copy the package list to the buffer. The registered functions may call `EFI_HII_DATABASE_PROTOCOL.UpdatePackageList()` to modify the package list before it is copied to the buffer.

If the specified `BufferSize` is too small, then the status `EFI_BUFFER_TOO_SMALL` will be returned and the actual package size will be returned in `Buffer`. 

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>Package exported.</td>
</tr>
<tr>
<td>EFI_BUFFER_TOO_SMALL</td>
<td>BufferSize is too small to hold the package.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>BufferSize was NULL</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>The value referenced by BufferSize was not zero and Buffer was NULL.</td>
</tr>
<tr>
<td>EFI_NOT_FOUND</td>
<td>The specified Handle could not be found in the current database.</td>
</tr>
</tbody>
</table>

`EFI_HII_DATABASE_PROTOCOL.RegisterPackageNotify()`

Summary
Registers a notification function for HII database-related events.

Prototype

```c
typedef
EFI_STATUS
(EIFIAPI *EFI_HII_DATABASE_REGISTER_NOTIFY) (  
    IN CONST EFI_HII_DATABASE_PROTOCOL *This,  
    IN UINT8 PackageType,  
    IN CONST EFI_GUID *PackageGuid,  
    IN CONST EFI_HII_DATABASE_NOTIFY PackageNotifyFn,  
    IN EFI_HII_DATABASE_NOTIFY_TYPE NotifyType,  
    OUT EFI_HANDLE *NotifyHandle  
);  
```

Parameters

`This`
A pointer to the `EFI_HII_DATABASE_PROTOCOL` instance.
**PackageType**

The package type. See `EFI_HII_PACKAGE_TYPE_x` in `EFI_HII_PACKAGE_HEADER`.

**PackageGuid**

If `PackageType` is `EFI_HII_PACKAGE_TYPE_GUID`, then this is the pointer to the GUID which must match the `Guid` field of `EFI_HII_GUID_PACKAGE_HDR`. Otherwise, it must be NULL.

**PackageNotifyFn**

Points to the function to be called when the event specified by `NotificationType` occurs. See `EFI_HII_DATABASE_NOTIFY`.

**NotifyType**

Describes the types of notification which this function will be receiving. See `EFI_HII_DATABASE_NOTIFY_TYPE` for more a list of types.

**NotifyHandle**

Points to the unique handle assigned to the registered notification. Can be used in `EFI_HII_DATABASE_PROTOCOL.UnregisterPackageNotify()` to stop notifications.

**Description**

This function registers a function which will be called when specified actions related to packages of the specified type occur in the HII database. By registering a function, other HII-related drivers are notified when specific package types are added, removed or updated in the HII database.

Each driver or application which registers a notification should use `EFI_HII_DATABASE_PROTOCOL.UnregisterPackageNotify()` before exiting.

If a driver registers a `NULL PackageGuid` when `PackageType` is `EFI_HII_PACKAGE_TYPE_GUID`, a notification will occur for every package of type `EFI_HII_PACKAGE_TYPE_GUID` that is registered.

**Related Definitions**

- `EFI_HII_PACKAGE_HEADER` is defined in `EFI_HII_PACKAGE_HEADER`.
- `EFI_HII_DATABASE_NOTIFY` is defined in `EFI_HII_DATABASE_NOTIFY`.
- `EIF_HII_DATABASE_NOTIFY_TYPE` is defined in `EFI_HII_DATABASE_NOTIFY_TYPE`. 
Returned Status Codes

EFI_SUCCESS  
Notification registered successfully.

EFI_OUT_OF_RESOURCES  
Unable to allocate necessary data structures.

EFI_INVALID_PARAMETER  
NotifyHandle is NULL.

EFI_INVALID_PARAMETER  
PackageType is not a EFI_HII_PACKAGE_TYPE_GUID but PackageGuid is not NULL.

EFI_INVALID_PARAMETER  
PackageType is a EFI_HII_PACKAGE_TYPE_GUID but PackageGuid is NULL.

EFI_HII_DATABASE_PROTOCOL.UnregisterPackageNotify()

Summary
Removes the specified HII database package-related notification.

Prototype

typedef  
EFI_STATUS  
(EFIAPI *EFI_HII_DATABASE_UNREGISTER_NOTIFY) (  
    IN CONST EFI_HII_DATABASE_PROTOCOL *This,  
    IN EFI_HANDLE NotificationHandle  
);

Parameters

This
A pointer to the EFI_HII_DATABASE_PROTOCOL instance.

NotificationHandle
The handle of the notification function being unregistered.

Returned Status Codes

EFI_SUCCESS  
Invalidated

EFI_NOT_FOUND  
The NotificationHandle could not be found in the database.

EFI_HII_DATABASE_PROTOCOL.FindKeyboardLayouts()

Summary
Retrieves a list of the keyboard layouts in the system.
Prototype

```c
typedef EFI_STATUS (EFIAPI *EFI_HII_FIND_KEYBOARD_LAYOUTS) (IN CONST EFI_HII_DATABASE_PROTOCOL *This,
   IN OUT UINT16    *KeyGuidBufferLength,
   OUT EFI_GUID     *KeyGuidBuffer);
```

Parameters

- **This**
  A pointer to the **EFI_HII_DATABASE_PROTOCOL** instance.

- **KeyGuidBufferLength**
  On input, a pointer to the length of the keyboard GUID buffer. On output, the length of the handle buffer that is required for the handles found.

- **KeyGuidBuffer**
  An array of keyboard layout GUID instances returned.

Description

This routine retrieves an array of GUID values for each keyboard layout that was previously registered in the system.

Status Codes Returned

- **EFI_SUCCESS**
  KeyGuidBuffer was updated successfully.

- **EFI_BUFFER_TOO_SMALL**
  The **KeyGuidBufferLength** parameter indicates that **KeyGuidBuffer** is too small to support the number of GUIDs. **KeyGuidBufferLength** is updated with a value that will enable the data to fit.

- **EFI_INVALID_PARAMETER**
  **KeyGuidBufferLength** is **NULL**.

- **EFI_INVALID_PARAMETER**
  The value referenced by **KeyGuidBufferLength** is not zero and **KeyGuidBuffer** is **NULL**.

**EFI_HII_DATABASE_PROTOCOL.GetKeyboardLayout()**

Summary

Retrieves the requested keyboard layout.
Prototype

Prototype

```c
typedef
EFI_STATUS
(EFI_API *EFI_HII_GET_KEYBOARD_LAYOUT) (
    IN CONST EFI_HII_DATABASE_PROTOCOL *This,
    IN EFI_GUID *KeyGuid,
    IN_OUT UINT16 *KeyboardLayoutLength,
    OUT EFI_HII_KEYBOARD_LAYOUT *KeyboardLayout
);
```

Parameters

This

A pointer to the `EFI_HII_DATABASE_PROTOCOL` instance.

KeyGuid

A pointer to the unique ID associated with a given keyboard layout. If `KeyGuid` is `NULL` then the current layout will be retrieved.

KeyboardLayout

A pointer to a buffer containing the retrieved keyboard layout. below.

KeyboardLayoutLength

On input, a pointer to the length of the KeyboardLayout buffer. On output, the length of the data placed into KeyboardLayout.

Description

This routine retrieves the requested keyboard layout. The layout is a physical description of the keys on a keyboard and the character(s) that are associated with a particular set of key strokes.

Related Definitions

```c
//********************************************************************************
// EFI_HII_KEYBOARD_LAYOUT
//********************************************************************************
typedef struct {
    UINT16 LayoutLength;
    EFI_GUID Guid;
    UINT32 LayoutDescriptorStringOffset;
    UINT8 DescriptorCount;
    EFI_KEY_DESCRIPTOR Descriptors[];
} EFI_HII_KEYBOARD_LAYOUT;
```

`LayoutLength`

The length of the current keyboard layout.

`Guid`

The unique ID associated with this keyboard layout.
**LayoutDescriptorStringOffset**

An offset location (0 is the beginning of the `EFI_KEYBOARD_LAYOUT` instance) of the string which describes this keyboard layout. The data that is being referenced is in `EFI_DESCRIPTION_STRING_BUNDLE` format.

**DescriptorCount**

The number of Descriptor entries in this layout.

**Descriptors**

An array of key descriptors.

```c
//**********************************************************
// EFI_DESCRIPTION_STRING - byte packed data
//**********************************************************
CHAR16  Language[];
CHAR16   Space;
//CHAR16  DescriptionString[];

Language

The language in RFC 4646 format to associate with DescriptionString.

**Space**

A space (U-0x0020) character to force as a separator between the Language field and the formal description string.

**DescriptionString**

A null-terminated description string.

```c
//**********************************************************
// EFI_DESCRIPTION_STRING_BUNDLE - byte packed data
// Example: 2en-US English Keyboard<null>es-ES Keyboard en ingles<null>
//<null> = U-0000
//**********************************************************
UINT16   DescriptionCount;
EFI_DESCRIPTION_STRING   DescriptionString[];

DescriptionCount

The number of description strings.

**DescriptionString**

An array of language-specific description strings.
typedef struct {
  EFI_KEY    Key;
  CHAR16    Unicode;
  CHAR16    ShiftedUnicode;
  CHAR16    AltGrUnicode;
  CHAR16    ShiftedAltGrUnicode;
  UINT16    Modifier;
  UINT16    AffectedAttribute;
} EFI_KEY_DESCRIPTOR;

// A key which is affected by all the standard shift modifiers.  
// Most keys would be expected to have this bit active.  
#define EFI_AFFECTED_BY_STANDARD_SHIFT 0x0001

// This key is affected by the caps lock so that if a keyboard  
// driver would need to disambiguate between a key which had a  
// "1" defined versus a "a" character. Having this bit turned on  
// would tell the keyboard driver to use the appropriate shifted // state or  
not.  
#define EFI_AFFECTED_BY_CAPS_LOCK 0x0002

// Similar to the case of CAPS lock, if this bit is active, the  
// key is affected by the num lock being turned on.  
#define EFI_AFFECTED_BY_NUM_LOCK 0x0004

Key
Used to describe a physical key on a keyboard. Type EFI_KEY is defined below.

Unicode
Unicode character code for the Key.

ShiftedUnicode
Unicode character code for the key with the shift key being held down.

AltGrUnicode
Unicode character code for the key with the Alt-GR being held down.

ShiftedAltGrUnicode
Unicode character code for the key with the Alt-GR and shift keys being held down.

Modifier
Modifier keys are defined to allow for special functionality that is not necessarily accomplished by a printable character. Many of these modifier keys are flags to
toggle certain state bits on and off inside of a keyboard driver. Values for Modifier are defined below.

```c
//***************************************************
// EFI_KEY
//************************************************************************
typedef enum {
  EfiKeyLCtrl, EfiKeyA0, EfiKeyLAlt, EfiKeySpaceBar, EfiKeyA2, EfiKeyA3,
  EfiKeyA4, EfiKeyRCtrl, EfiKeyLeftArrow, EfiKeyDownArrow, EfiKeyRightArrow,
  EfiKeyZero, EfiKeyPeriod, EfiKeyEnter, EfiKeyLShift, EfiKeyB0, EfiKeyB1,
  EfiKeyB2, EfiKeyB3, EfiKeyB4, EfiKeyB5, EfiKeyB6, EfiKeyB7, EfiKeyB8,
  EfiKeyB9, EfiKeyB10, EfiKeyRShift, EfiKeyUpArrow, EfiKeyOne, EfiKeyTwo,
  EfiKeyThree, EfiKeyCapsLock, EfiKeyC1, EfiKeyC2, EfiKeyC3, EfiKeyC4,
  EfiKeyC5, EfiKeyC6, EfiKeyC7, EfiKeyC8, EfiKeyC9, EfiKeyC10, EfiKeyC11,
  EfiKeyC12, EfiKeyFour, EfiKeyFive, EfiKeySix, EfiKeyPlus, EfiKeyTab,
  EfiKeyD1, EfiKeyD2, EfiKeyD3, EfiKeyD4, EfiKeyD5, EfiKeyD6, EfiKeyD7,
  EfiKeyD8, EfiKeyD9, EfiKeyD10, EfiKeyD11, EfiKeyD12, EfiKeyD13, EfiKeyDel,
  EfiKeyEnd, EfiKeyPgDn, EfiKeySeven, EfiKeyEight, EfiKeyNine, EfiKeyE0,
  EfiKeyE1, EfiKeyE2, EfiKeyE3, EfiKeyE4, EfiKeyE5, EfiKeyE6, EfiKeyE7,
  EfiKeyE8, EfiKeyE9, EfiKeyE10, EfiKeyE11, EfiKeyE12, EfiKeyBackSpace,
  EfiKeyIns, EfiKeyHome, EfiKeyPgUp, EfiKeyNlck, EfiKeySlash, EfiKeyAsterisk,
  EfiKeyMinus, EfiKeyEsc, EfiKeyF1, EfiKeyF2, EfiKeyF3, EfiKeyF4, EfiKeyF5,
  EfiKeyF6, EfiKeyF7, EfiKeyF8, EfiKeyF9, EfiKeyF10, EfiKeyF11, EfiKeyF12,
  EfiKeyPrint, EfiKeySlck, EfiKeyPause, EfiKeyIntl0, EfiKeyIntl1,
  EfiKeyIntl2, EfiKeyIntl3, EfiKeyIntl4, EfiKeyIntl5, EfiKeyIntl6,
  EfiKeyIntl7, EfiKeyIntl8, EfiKeyIntl9
} EFI_KEY;
```

See the figure below for which key corresponds to the values in the enumeration above. For example, **EfiKeyLCtrl** corresponds to the left control key in the lower-left corner of the keyboard, **EfiKeyFour** corresponds to the 4 key on the numeric keypad, and **EfiKeySLck** corresponds to the Scroll Lock key in the upper-right corner of the keyboard.

#define EFI_MENU_MODIFIER         0x0029

Status Codes Returned

- **EFI_SUCCESS**
  The keyboard layout was retrieved successfully.

- **EFI_NOT_FOUND**
  The requested keyboard layout was not found.

- **EFI_BUFFER_TOO_SMALL**
  The `KeyboardLayoutLength` parameter indicates the `KeyboardLayout` is too small to hold the keyboard layout.

- **EFI_INVALID_PARAMETER**
  `KeyboardLayoutLength` is **NULL**

- **EFI_INVALID_PARAMETER**
  The value referenced by `KeyboardLayoutLength` is not zero and `KeyboardLayout` is NULL.

### EFI_HII_DATABASE_PROTOCOL.SetKeyboardLayout()

**Summary**

Sets the currently active keyboard layout.

**Prototype**

```c
typedef
 EFI_STATUS
 (EFIAPI *EFI_HII_SET_KEYBOARD_LAYOUT) ( 
    IN CONST EFI_HII_DATABASE_PROTOCOL   *This, 
    IN EFI_GUID                           *KeyGuid 
);
```

**Parameters**

- **This**
  A pointer to the **EFI_HII_DATABASE_PROTOCOL** instance.

- **KeyGuid**
  A pointer to the unique ID associated with a given keyboard layout.

**Description**

This routine sets the default keyboard layout to the one referenced by **KeyGuid**. When this routine is called, an event will be signaled of the **EFI_HII_SET_KEYBOARD_LAYOUT_EVENT_GUID** group type. This is so that agents which are sensitive to the current keyboard layout being changed can be notified of this change.
Related Definitions

GUID

```c
#define EFI_HII_SET_KEYBOARD_LAYOUT_EVENT_GUID \
   { 0x14982a4f, 0xb0ed, 0x45b8, \
     { 0xa8, 0x11, 0x5a, 0x7a, 0x9b, 0xc2, 0x32, 0xdf }}
```

Status Codes Returned

- **EFI_SUCCESS** The current keyboard layout was successfully set.
- **EFI_NOT_FOUND** The referenced keyboard layout was not found, so action was taken.
- **EFI_INVALID_PARAMETER** 
  
  `KeyGuid` is NULL.

**EFI_HII_DATABASE_PROTOCOL.GetPackageListHandle()**

**Summary**

Return the EFI handle associated with a package list.

**Prototype**

```c
typedef EFI_STATUS 
(EFIAPI *EFI_HII_DATABASE_GET_PACK_HANDLE) ( 
   IN CONST EFI_HII_DATABASE_PROTOCOL *This, 
   IN EFI_HII_HANDLE PackageListHandle, 
   OUT EFI_HANDLE *DriverHandle 
);
```

**Parameters**

- **This**
  A pointer to the **EFI_HII_DATABASE_PROTOCOL** instance.

- **PackageListHandle**
  An **EFI_HII_HANDLE** that corresponds to the desired package list in the HII database.

- **DriverHandle**
  On return, contains the **EFI_HANDLE** which was registered with the package list in **NewPackageList()**.
Status Codes Returned

EFI_SUCCESS
The DriverHandle was returned successfully.
EFI_INVALID_PARAMETER
The PackageListHandle was not valid.
EFI_INVALID_PARAMETER
The DriverHandle must not be NULL.

34.8.1 Database Structures

EFI_HII_DATABASE_NOTIFY

Summary
Handle a registered notification for a package change to the database.

Prototype
typedef
EFI_STATUS
(EFI_API *EFI_HII_DATABASE_NOTIFY) (  
IN UINT8 PackageType,
IN CONST EFI_GUID *PackageGuid,
IN CONST EFI_HII_PACKAGE_HEADER *Package,
IN EFI_HII_HANDLE Handle,
IN EFI_HII_DATABASE_NOTIFY_TYPE NotifyType
);

Parameters

PackageType
Package type of the notification.

PackageGuid
If PackageType is EFI_HII_PACKAGE_TYPE_GUID, then this is the pointer to the
GUID from the Guid field of EFI_HII_GUID_PACKAGE_HDR. Otherwise, it must be
NULL.

Package
Points to the package referred to by the notification

Handle
The handle of the package list which contains the specified package.

NotifyType
The type of change concerning the database. See
EFI_HII_DATABASE_NOTIFY_TYPE.
Description

Functions which are registered to receive notification of database events have this prototype. The actual event is encoded in NotifyType. The following table describes how PackageType, PackageGuid, Handle, and Package are used for each of the notification types.

<table>
<thead>
<tr>
<th>Notification Type</th>
<th>Parameter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NEW_PACK</td>
<td>PackageType and PackageGuid are the type of the new package. Package points to the new package. Handle is the handle of the package list which is being added to the database.</td>
</tr>
<tr>
<td>REMOVE_PACK</td>
<td>PackageType and PackageGuid are the type of the package which is being removed. Package points to the package being removed. Handle is the package list from which the package is being removed.</td>
</tr>
<tr>
<td>EXPORT_PACK</td>
<td>PackageType and PackageGuid are the type of the package being exported. Package points to the existing package in the database. Handle is the package list being exported.</td>
</tr>
<tr>
<td>ADD_PACK</td>
<td>PackageType and PackageGuid are the type of the package being added. Package points to the package being added. Handle is the package list to which the package is being added.</td>
</tr>
</tbody>
</table>

#define EFI_HII_DATABASE_NOTIFY_ADD_PACK  0x00000008
35 - HII Configuration Processing and Browser Protocol

35.1 Introduction
This section describes the data and APIs used to manage the system’s configuration: the actual data that describes the knobs and settings.

35.1.1 Common Configuration Data Format
The configuration data is stored as name / value string pairs. As in e.g. HTML, the name and value are separated by ‘=’ and the pairs are separated one from the next by ‘&’. The configuration data structures are thus variable length UNICODE (UCS-2) strings.

Certain names and values have limitations on their syntax to manage routing and to enable extended support for common storage mechanisms.

35.1.2 Data Flow
There is a two-way flow through the hierarchy of drivers and protocols that parallels the flow in other parts of HII. Initially, the flow is from the drivers up to the HII database and on to configuration applications. When changes to configuration are accepted, the flow reverses itself, going from the configuration applications through the HII database protocols back to the drivers through separate protocols.

The flow from driver up consists of the current and alternative (default) configurations. The flow down from the configuration applications consists of changed configurations.

The protocol managed by the HII Database is known as the EFI HII Configuration Routing Protocol, while the one presented by the drivers themselves is known as the EFI HII Configuration Access Protocol. The HII Configuration Routing Protocol is the only one that outside callers should invoke.

35.2 Configuration Strings
The configuration strings follow the same general format as HTTP argument strings, which is to say ‘&’ separated name / value pairs. The name and value are separated by ‘=’. The strings are a subset of full HTML argument strings and do not require quoting, the ‘%’ character sequences used to insert spaces, ampersands, equal signs, and the like into HTTP argument strings.

35.2.1 String Syntax
Assumptions are typical for BNF with the following extensions
Characters in single quotes, e.g. ‘a’, indicate terminals.
Square brackets immediately followed by a number n indicate that the contents are to be repeated n times, so [‘a’]4 would be “aaaa”.
An italicized non-terminal, e. g. <All Printable ASCII Characters> is used to indicate a set of terminals whose definition is outside the scope of this document.

The syntax for configuration strings is as follows.
35.2.1.1 Basic forms

<Dec19> ::= '1' | '2' | ... | '9'
<DecCh> ::= '0' | <Dec19>
<HexAf> ::= 'a' | 'b' | 'c' | 'd' | 'e' | 'f'
<Hex1f> ::= <Dec19> | <HexAf>
<HexCh> ::= <DecCh> | <HexAf>
<Number> ::= <HexCh>+<Dec19>
<Alpha> ::= 'a' | ... | 'z' | 'A' | ... | 'Z'

35.2.1.2 Types

<Guid> ::= <HexCh>32
<LabelStart> ::= <Alpha> | "_"
<LabelBody> ::= <LabelStart> | <DecCh>
<label> ::= <LabelStart> [<LabelBody]*
<Char> ::= <HexCh>4
<String> ::= [<Char>]+
<AltCfgId> ::= <HexCh>4

35.2.1.3 Routing elements

<GuidHdr> ::= 'GUID='<Guid>
<NameHdr> ::= 'NAME='<String>
<PathHdr> ::= 'PATH='<UEFI binary Device Path represented as hex number>
<DescHdr> ::= 'ALTCFG=<AltCfgId>
<ConfigHdr> ::= <GuidHdr>'&'<NameHdr>'&'<PathHdr>
<AltConfigHdr> ::= <ConfigHdr> '&'<DescHdr>

35.2.1.4 Body elements

<ConfigBody> ::= <ConfigElement>*
<ConfigElement> ::= '&'<BlockConfig> | '&'<NvConfig>
<BlockName> ::= 'OFFSET='<Number>'&WIDTH='<Number>
<BlockConfig> ::= <BlockName>'&VALUE='<Number>
<RequestElement> ::= '&'<BlockName> | '&'<Label>
<NvConfig> ::= <Label>'='<String> | <Label>'='<Number>

35.2.1.5 Configuration strings

<ConfigRequest> ::= <ConfigHdr><RequestElement>*
<MultiConfigRequest> ::= <ConfigRequest>['&'<ConfigRequest>]*
<ConfigResp> ::= <ConfigHdr><ConfigBody>
<AltResp> ::= <AltConfigHdr><ConfigBody>
<ConfigAltResp> ::= <ConfigResp> ['&'<AltResp>]*
<MultiConfigAltResp> ::= <ConfigAltResp> ['&'<ConfigAltResp>]*
<MultiConfigResp> ::= <ConfigResp> ['&'<ConfigResp>]*

Notes:
The `<Number>` represents a data buffer and is encoded as a sequence of bytes in the format %02x in the same order as the buffer bytes reside in memory.

The `<Guid>` represents a hex encoding of GUID and is encoded as a sequence of bytes in the format %02x in the same order as the GUID bytes reside in memory.

The syntax for a `<Label>` is the C label (e.g. Variable) syntax.

The `<ConfigHdr>` provides routing information. The name field is required even if non-block storage is targeted. In these cases, it may be used as a way to distinguish like storages from one another when a driver is being used.

The `<BlockName>` provides addressing information for managing block (e.g. UEFI Variable) storage. The first number provides the byte offset into the block while the second provides the length of bytes.

The `<PathHdr>` presents a hex encoding of a UEFI device path. This is not the printable path since the printable path is optional in UEFI and to enable simpler comparisons. The data is encoded as strings with the format %02x bytes in the same order as the device path resides in RAM memory.

The `<ConfigRequest>` provides a mechanism to request the current configuration for one or more elements.

The `<AltCfgId>` is the identifier of a configuration declared in the corresponding IFR.

The name ‘GUID’ is also used to separate `<String>` or `<ConfigRequest>` elements in the equivalent Multi version. That is:

```
GUID=...&NAME=...&...&fred=12&GUID=...&NAME=...&...&goyle=11
```

Indicates two `<String>`, with one ending with fred=12.

The following are reserved `<name>`s and cannot be used as names in a `<ConfigElement>`:

- GUID
- NAME
- PATH
- ALTCFG
- OFFSET
- WIDTH
- VALUE
35.2.1.6 Keyword strings

<table>

</tr>
<tr>
<td>&lt;MultiKeywordResp&gt;</td>
<td>::= &lt;KeywordResp&gt;['&amp;&lt;KeywordResp&gt;*]</td>
</tr>
</tbody>
</table>

**Note:** For Keyword definitions, see the UEFI Configuration Namespace Registry document on [http://uefi.org/uefi](http://uefi.org/uefi).
The `<NameSpaceId>` element is equivalent to the platform configuration language being used for the keyword definition.

The `<Keyword>` element uses the ‘KEYWORD=’ name to designate that immediately following the reserved name is a string value associated with a configuration namespace keyword as defined in the Configuration NameSpace Registry document (http://uefi.org/uefi).

Typically, when a Keyword is defined, the value is a solitary string such as “BIOSVendor”. However, when certain Keywords are intended to represent a setting that may have multiple instances (e.g. ChipsetSATAPortEnable), that is when a “<DecCh>({1/4})” suffix will be appended to the keyword definition. In that case, we might see something like: “ChipsetSATAPortEnable:5” if a particular platform had at least five SATA ports and one of the questions was represented by the aforementioned string. It would also be reasonable to expect that there might also be a “ChipsetSATAPortEnable:1” and a “:2”, “:3” etc.

If the `<PathHdr>` element within `<KeywordRequest>` is omitted, then all instances are returned.

If the Keyboard Handler protocol knows or detects that a particular Keyword is read-only, then the `<KeywordResp>` must include the “&READONLY” tag.

The `<DataFilter>` element specifies the optional filter based on data type to use when a request is made. If no filtering is desired, then this element must be omitted from the `<KeywordRequest>`. Filtering is not guaranteed to work on any platform configuration language that isn’t defined in the UEFI Configuration Namespace Document.

**DataFilter.Buffer**

HII questions with EFI_IFR_TYPE_BUFFER type are treated as this type. This is most commonly represented in ‘C’ as a VOID type, or as a more complex type. Other than the EFI_IFR_TYPE_BOOLEAN and EFI_IFR_TYPE_NUM_x data types, all of the HII configuration data types are treated as a sequence of data.

**DataFilter.Numeric**

A sequence of data that must be interpreted as a one, two, four, or eight-byte wide numeric value. For instance, a definition of “Numeric:2” would indicate that the keyword is a two-byte numeric value. If no byte-size designation is specified, then the value may vary in size.

**DataFilter.String**

HII questions with EFI_IFR_TYPE_STRING type are treated as this type.

**DataFilter.Boolean**

HII questions with EFI_IFR_TYPE_BOOLEAN type are treated as this type.

**DataFilter.Date**

HII questions with EFI_IFR_TYPE_DATE type are treated as this type.

**DataFilter.Time**

HII questions with EFI_IFR_TYPE_TIME type are treated as this type.
The <UsageFilter> element defines the optional filter to use based on usage type when a request is made. If no filtering is desired, then this element must be omitted from the <KeywordRequest>.

**UsageType.ReadOnly**

The data for the keyword cannot be changed. It is intended solely for informational purposes, and can be used to read a setting that may be static or dynamic (e.g. CPU temperature).

**UsageType.ReadWrite**

The data for the keyword can be changed.

The <KeywordInfoRequest> element allows the callers to request some additional information of the keyword to be returned. <KeywordInfoRequest> element is used when user doesn’t know the information about the keyword and wants to get more information about this keyword. When <KeywordInfoRequest> element is specified with <KeywordRequest>, the <KeywordInfoResp> element will be specified with <KeywordResp> to return the info requested by <KeywordInfoRequest>.

The <KeywordInfoFilter> element is used to specify the additional information that caller wants to know about the keyword. Caller can specify any type of additional information he/she wants to know. When ‘All’ is specified, means all the supported information need to be returned.

The <DataType> element specifies the data type of a keyword, can refer to <DataFilter> for the detailed info the data types.

The <ValueAttribute> element specifies the value attribute of a keyword. Such as the value range of a keyword or the selectable values for a keyword.

<ValueRange> element specifies the variation range of a keyword value. Such as it can be specified for a keyword used in EFI_IFR_NUMERIC_OP, EFI_IFR_STRING_OP opcode. For EFI_IFR_NUMERIC_OP opcode, it specifies the maximum value, minimum value and increment or decrement step. For EFI_IFR_STRING_OP opcode, it specifies the maximum length and minimum length of the string can be input.

<ValueOption> element specifies all the (selectable) values and related string representation of these values for a keyword. Such as it can be specified for keyword used in EFI_IFR_ONE_OF_OP, EFI_IFR_ORDERED_LIST_OP opcode. For EFI_IFR_ONE_OF_OP, it specifies the all selectable values and the string representation of the values. The keyword value can be one of them.

For EFI_IFR_ORDERED_LIST_OP, it specifies all values and the string representation of the values. The keyword value can be the permutation and combination of these values. And for EFI_IFR_ORDERED_LIST_OP, its data type is Buffer, so can return the value type in a <ValueOption> to indicate the data stored in the Buffer is numeric as a one, two, four, or eight-byte wide.

The <Default> element specifies the default value of a keyword. Only the three standard defaults stores are supported including the standard defaults, the manufacturing defaults and the Safe defaults. If the keyword doesn’t have any type of defaults, then there is no default info returned. And if the keyword only has the standard default, then only the standard default information will be returned.

The <Display> element specifies the displayed prompt string of this keyword in the UI page.
35.2.1.6.1 An example of some basic keyword-related strings:

<KeywordRequest> to retrieve the current BIOS Vendor name:

   KEYWORD=BIOSVendor

35.2.1.6.2 A possible response might look like:

   x-UEFI-ns&KEYWORD=BIOSVendor&VALUE=AcmeBIOSCompany

If a request was made to retrieve all of the settings for a platform, a user would initiate a call to KeywordHandler->GetData() with the KeywordString and NamespaceId being NULL.

35.2.1.6.3 A possible response might look like:

   x-UEFI-ns&KEYWORD=BIOSVendor&VALUE=AcmeBIOSCompany&x-UEFI-extension-ACME&KEYWORD=SpecialSettingX&VALUE=3

In this case, the string returned tells us that there was one discovered keyword called “BIOSVendor” under the standard UEFI namespace and its value was “AcmeBIOS”. There was also an ACME branded namespace element which was discovered that had a keyword called “SpecialSettingX” whose value was 3.

35.2.1.6.4 An example to get more information of a keyword:

   KEYWORD=BIOSVendor&KEYWORDINFO=All

A possible response might look like:

   x-UEFI-ns&KEYWORD=BIOSVendor&VALUE=AcmeBIOSCompany&DataType=String&MAX=30&MIN=6&STANDARDDEFAULT=AcmeBIOSCompany&MFGDEFAULT=AcmeBIOSCompany

35.2.2 String Types

There are six string types. As can be seen from the BNF, the syntax of all is quite similar. The first three are used in communications between drivers and HII. The last three are used for analogous communication between external applications and HII.

<ConfigRequest>: This string is used by HII to request the current and any alternative configurations from a driver. It consists of routing information and only ampersand separated names.

<ConfigAltResp>: A string in this format is returned by the driver in response to a request to fill in a <ConfigRequest> string. The string consists of the current configuration followed by possibly several alternative configurations. The alternative configurations have the ALTCFG name / value pair in addition to the usual GUID, NAME, and PATH entries in the routing prefix. The ALTCFG value is a Default ID which is used to describe the alternative default configuration.

<ConfigResp>: A string in this format is handed by the HII to the driver to cause the driver to change its configuration. It consists of routing information and name / value pairs which correspond to the questions in the driver’s IFR. Only <ConfigResp> strings which refer to a driver in question may be handed to that driver. The driver shall reject all others.
<MultiConfigRequest>: A string in this format is handed to HII by an external application in order to request the current an alternate configurations of the system’s drivers. The format of this string is a series of <ConfigRequest> strings separated by ampersands. The HII’s job is to separate the requests and hand them off to the appropriate drivers (as indicated by the routing headers).

<MultiConfigAltResp>: A string in this format is handed back to an external application which has requested the current and alternate configurations of the system’s drivers. The format of this string is a series of <ConfigAltResp> strings separated by ampersands. The HII creates this string by concatenating the current and alternate configuration strings provided by each driver.

<MultiConfigResp>: A string in this format is handed to the HII in order to update the system’s configuration. Analogous to the other “Multi” string formats, its syntax is a series of ampersand separated <ConfigResp> strings. Upon receipt, the HII routes the <ConfigResp> strings to the corresponding drivers.

35.3 EFI Configuration Keyword Handler Protocol

This section provides a detailed description of the EFI Configuration Keyword Handler Protocol.

EFI_CONFIG_KEYWORD_HANDLER_PROTOCOL

Summary

The EFI_CONFIG_KEYWORD_HANDLER_PROTOCOL provides the mechanism to set and get the values associated with a keyword exposed through a x-UEFI- prefixed configuration language namespace.

GUID

```
#define EFI_CONFIG_KEYWORD_HANDLER_PROTOCOL_GUID \
{ 0xa8bad5, 0x3b8, 0xd19, \ 
{0xb1, 0x28, 0x7b, 0x8f, 0xe0, 0xda, 0xa5, 0x96 }}
```

Protocol Interface Structure

```
typedef struct _EFI_CONFIG_KEYWORD_HANDLER_PROTOCOL {
    EFI_CONFIG_KEYWORD_HANDLER_SET_DATA  SetData;
    EFI_CONFIG_KEYWORD_HANDLER_GET_DATA   GetData;
} EFI_CONFIG_KEYWORD_HANDLER_PROTOCOL;
```

Parameters

- **SetData**: Set the data associated with a particular configuration namespace keyword.
- **GetData**: Get the data associated with a particular configuration namespace keyword.

Description

The EFI_CONFIG_KEYWORD_HANDLER_PROTOCOL allows other components in the platform (e.g. Browser, Manageability Software, etc.) to retrieve and set configuration settings within the system.
Keywords are text elements which are associated with a particular configuration option within the platform. These keywords are intended to add semantic meaning to the configuration option they are attached to. The text associated for the keyword would be encoded in a UEFI configuration language. These languages are like French or German or Japanese, but are not designed for display purposes for an end-user. Instead each language serves as a namespace for the purposes of grouping and manipulating groups of platform configurations options. See Section 33.2.11.2 (Working with a UEFI Configuration Language) for more information.

Note: Not all configuration options will be associated with a keyword. Associating a keyword with a configuration option is at the discretion of the platform and/or the hardware vendor. For more information about keyword definitions associated with a UEFI namespace, see the UEFI Keyword Namespace Registry link in the UEFI Link Document.

**EFI_KEYвоORD_HANDLER _PROTOCOL.SetData()**

**Summary**
Set the data associated with a particular configuration namespace keyword.

**Prototype**
```
typedef
  EFI_STATUS
  (EFIAPI *EFI_KEYвоORD_HANDLER _SET_DATA) (    
    IN EFI_KEYвоORD_HANDLER_PROTOCOL *This,
    IN CONST EFI_STRING KeywordString,
    OUT EFI_STRING *Progress,
    OUT UINT32 *ProgressErr
  );
```

**Parameters**
- **This**
  Pointer to the EFI_KEYвоORD_HANDLER _PROTOCOL instance.
- **KeywordString**
  A null-terminated string in `<MultiKeywordResp>` format.
- **Progress**
  On return, points to a character in the KeywordString. Points to the string’s NULL terminator if the request was successful. Points to the most recent ‘&’ before the first failing name / value pair (or the beginning of the string if the failure is in the first name / value pair) if the request was not successful.
- **ProgressErr**
  If during the processing of the KeywordString there was a failure, this parameter gives additional information about the possible source of the problem. The various errors are defined in “Related Definitions” below.

**Description**
This function accepts a `<MultiKeywordResp>` formatted string, finds the associated keyword owners, creates a `<MultiConfigResp>` string from it and forwards it to the EFI_HII_ROUTING_PROTOCOL.RouteConfig function.
If there is an issue in resolving the contents of the `KeywordString`, then the function returns an error and also sets the `Progress` and `ProgressErr` with the appropriate information about where the issue occurred and additional data about the nature of the issue.

In the case when `KeywordString` containing multiple keywords, when an `EFI_NOT_FOUND` error is generated during processing the second or later keyword element, the system storage associated with earlier keywords is not modified. All elements of the `KeywordString` must successfully pass all tests for format and access prior to making any modifications to storage.

In the case when `EFI DEVICE_ERROR` is returned from the processing of a `KeywordString` containing multiple keywords, the state of storage associated with earlier keywords is undefined.

Related Definitions

```
//***********************************************************
// Progress Errors
//***********************************************************
#define KEYWORD_HANDLER_NO_ERROR          0x00000000
#define KEYWORD_HANDLER_NAMESPACE_ID_NOT_FOUND   0x00000001
#define KEYWORD_HANDLER_MALFORMED_STRING      0x00000002
#define KEYWORD_HANDLER_KEYWORD_NOT_FOUND      0x00000004
#define KEYWORD_HANDLER_INCOMPATIBLE_VALUE_DETECTED 0x00000008
#define KEYWORD_HANDLER_ACCESS_NOT_PERMITTED    0x00000010
#define KEYWORD_HANDLER_UNDEFINED_PROCESSING_ERROR 0x80000000
```

The `KEYWORD_HANDLER_x` values describe the error values returned in the `ProgressErr` field.

If no errors were encountered, then `KEYWORD_HANDLER_NO_ERROR` is returned with no bits are set.

If the `<NameSpaceId>` specified by the `KeywordString` was not found in any of the registered configuration data, the `KEYWORD_HANDLER_NAMESPACE_ID_NOT_FOUND` bit is set.

If there was an error in the parsing of the `KeywordString`, the `KEYWORD_HANDLER_MALFORMED_STRING` bit is set.

If there was a keyword specified in the `KeywordString` which was not found in any of the registered configuration data, `KEYWORD_HANDLER_KEYWORD_NOT_FOUND` bit is set.

If the value either passed into `KeywordString` (during a SetData operation) or the value discovered for the Keyword (during a GetData operation) did not match what was known to be valid for the defined keyword, the `KEYWORD_HANDLER_INCOMPATIBLE_VALUE_DETECTED` bit is set.

If there was an error as a result of a violation of system policy. For example trying to write a read-only element, the `KEYWORD_HANDLER_ACCESS_NOT_PERMITTED` bit is set.

If there was an undefined type of error in processing the passed in data, the `KEYWORD_HANDLER_UNDEFINED_PROCESSING_ERROR` bit is set.

### EFI_KEYWONRD_HANDLER _PROTOCOL.GetData()

**Summary**

Get the data associated with a particular configuration namespace keyword.

**Prototype**

```c
typedef
EFI_STATUS
(EFIAPI *EFI_KEYWORD_HANDLER _GET_DATA) (  
  IN EFI_KEYWORD_HANDLER_PROTOCOL *This,
  IN CONST EFI_STRING NameSpaceId, OPTIONAL
  IN CONST EFI_STRING KeywordString, OPTIONAL
  OUT EFI_STRING *Progress,
  OUT UINT32 *ProgressErr,
  OUT EFI_STRING *Results
);
```

**Parameters**

- **This**  
  Pointer to the **EFI_KEYWONRD_HANDLER _PROTOCOL** instance.

- **NamespaceId**  
  A null-terminated string containing the platform configuration language to search through in the system. If a NULL is passed in, then it is assumed that any platform configuration language with the prefix of “x-UEFI-” are searched.

- **KeywordString**  
  A null-terminated string in `<MultiKeywordRequest>` format. If a NULL is passed in the KeywordString field, all of the known keywords in the system for the NameSpaceId specified are returned in the Results field.

- **Progress**  
  On return, points to a character in the KeywordString. Points to the string’s NULL terminator if the request was successful. Points to the most recent ‘&’ before the first failing name /
value pair (or the beginning of the string if the failure is in the first name / value pair) if the request was not successful.

**ProgressErr**

If during the processing of the **KeywordString** there was a failure, this parameter gives additional information about the possible source of the problem. See the definitions in **SetData()** for valid value definitions.

**Results**

A null-terminated string in **<MultiKeywordResp>** format is returned which has all the values filled in for the keywords in the **KeywordString**. This is a callee-allocated field, and must be freed by the caller after being used.

**Description**

This function accepts a **<MultiKeywordRequest>** formatted string, finds the underlying keyword owners, creates a **<MultiConfigRequest>** string from it and forwards it to the **EFI_HII_ROUTING_PROTOCOL.ExtractConfig** function.

If there is an issue in resolving the contents of the **KeywordString**, then the function returns an **EFI_INVALID_PARAMETER** and also set the **Progress** and **ProgressErr** with the appropriate information about where the issue occurred and additional data about the nature of the issue.

In the case when **KeywordString** is NULL, or contains multiple keywords, or when **EFI_NOT_FOUND** is generated while processing the keyword elements, the **Results** string contains values returned for all keywords processed prior to the keyword generating the error but no values for the keyword with error or any following keywords.

35.4 EFI HII Configuration Routing Protocol

EFI_HII_CONFIG_ROUTING_PROTOCOL

Summary
The EFI HII Configuration Routing Protocol manages the movement of configuration data from drivers to configuration applications. It then serves as the single point to receive configuration information from configuration applications, routing the results to the appropriate drivers.

GUID
#define EFI_HII_CONFIG_ROUTING_PROTOCOL_GUID  
   { 0x587e72d7, 0xcc50, 0x4f79,  
   { 0x82, 0x09, 0xca, 0x29, 0x1f, 0xc1, 0xa1, 0x0f } }

Protocol Interface Structure
typedef struct {
   EFI_HII_EXTRACT_CONFIG     ExtractConfig;
   EFI_HII_EXPORT_CONFIG      ExportConfig
   EFI_HII_ROUTE_CONFIG       RouteConfig;
   EFI_HII_BLOCK_TO_CONFIG    BlockToConfig;
   EFI_HII_CONFIG_TO_BLOCK    ConfigToBlock;
   EFI_HII_GET_ALT_CFG        GetAltConfig;
} EFI_HII_CONFIG_ROUTING_PROTOCOL;

Related Definitions
None

Parameters

Description
This protocol defines the configuration routing interfaces between external applications and the HII. There may only be one instance of this protocol in the system.

EFI_HII_CONFIG_ROUTING_PROTOCOL.ExtractConfig()

Summary
This function allows a caller to extract the current configuration for one or more named elements from one or more drivers.
Prototype

```c
typedef EFI_STATUS (EFIAPICALLTYPE EFI_HII_EXTRACT_CONFIG ) (  
    IN CONST EFI_HII_CONFIG_ROUTING_PROTOCOL *This,  
    IN CONST EFI_STRING Request,  
    OUT EFI_STRING *Progress,  
    OUT EFI_STRING *Results  
);  
```

Parameters

This

Points to the `EFI_HII_CONFIG_ROUTING_PROTOCOL` instance.

Request

A null-terminated string in `<MultiConfigRequest>` format.

Progress

On return, points to a character in the Request string. Points to the string’s null terminator if request was successful. Points to the most recent ‘&’ before the first failing name / value pair (or the beginning of the string if the failure is in the first name / value pair) if the request was not successful.

Results

A null-terminated string in `<MultiConfigAltResp>` format which has all values filled in for the names in the Request string.

Description

This function allows the caller to request the current configuration for one or more named elements from one or more drivers. The resulting string is in the standard HII configuration string format. If Successful Results contains an equivalent string with “=“ and the values associated with all names added in.

The expected implementation is for each `<ConfigRequest>` substring in the Request, call the HII Configuration Access Protocol `ExtractConfig` function for the driver corresponding to the `<ConfigHdr>` at the start of the `<ConfigRequest>` substring. The request fails if no driver matches the `<ConfigRequest>` substring.

Note: Alternative configuration strings may also be appended to the end of the current configuration string. If they are, they must appear after the current configuration. They must contain the same routing (GUID, NAME, PATH) as the current configuration string. They must have an additional description indicating the type of alternative configuration the string represents, “ALT_CFG=<AltCfgId>“. The `<AltCfgId>` is a reference to a Default ID which stipulates the type of Default being referenced such as `EFI_HII_DEFAULT_CLASS_STANDARD`.

As an example, assume that the Request string is:

```
GUID=…&PATH=…&Fred&George&Ron&Neville
```

A result might be:
GUID=...&PATH=...&Fred=16&George=16&Ron=12&Neville=11
GUID=...&PATH=...&ALTCFG=0037&Fred=12&Neville=7

Note: For the output Results, the value filled in the names in the Request string with
<MultiConfigAltResp> format may change when called multiple times due to some data
being of a dynamic nature.

Status Codes Returned

EFI_SUCCESS The Results string is filled with the values corresponding to all requested names.
EFI_OUT_OF_RESOURCES Not enough memory to store the parts of the results that must be stored awaiting possible future protocols.
EFI_NOT_FOUND Routing data doesn’t match any known driver. Progress set to the “G” in “GUID” of the routing header that doesn’t match. Note: There is no requirement that all routing data be validated before any configuration extraction.
EFI_INVALID_PARAMETER Illegal syntax. Progress set to most recent “&” before the error or the beginning of the string.
EFI_INVALID_PARAMETER The ExtractConfig function of the underlying HII Configuration Access Protocol returned EFI_INVALID_PARAMETER. Progress set to most recent “&” before the error or the beginning of the string.
EFI_ACCESS_DENIED The action violated a system policy.

EFI_HII_CONFIG_ROUTING_PROTOCOL.ExportConfig()

Summary
This function allows the caller to request the current configuration for the entirety of the current HII database and returns the data in a null-terminated string.

Prototype

typedef

EFI_STATUS

(EIFIAPIC * EFI_HII_EXPORT_CONFIG ) (  
    IN CONST EFI_HII_CONFIG_ROUTING_PROTOCOL *This,
    OUT EFI_STRING *Results
);

Parameters

This

Points to the EFI_HII_CONFIG_ROUTING_PROTOCOL instance.

Results

A null-terminated string in <MultiConfigAltResp> format which has all values filled in for the entirety of the current HII database.
Description
This function allows the caller to request the current configuration for all of the current HII database. The results include both the current and alternate configurations as described in `ExtractConfig()` above.

`EFI_HII_CONFIG_ACCESS_PROTOCOL.ExtractConfig()` interfaces below.

Status Codes Returned

<table>
<thead>

`EFI_HII_CONFIG_ROUTING_PROTOCOL.RouteConfig()`

Summary
This function processes the results of processing forms and routes it to the appropriate handlers or storage.

Prototype
```c
typedef EFI_STATUS
(EFIAPI * EFI_HII_ROUTE_CONFIG ) ( 
    IN CONST EFI_HII_CONFIG_ROUTING_PROTOCOL *This,
    IN CONST EFI_STRING Configuration,
    OUT EFI_STRING *Progress
);
```

Parameters
- **This**
  Points to the `EFI_HII_CONFIG_ROUTING_PROTOCOL` instance.
- **Configuration**
  A null-terminated string in `<MultiConfigResp>` format.
- **Progress**
  A pointer to a string filled in with the offset of the most recent ‘&’ before the first failing name / value pair (or the beginning of the string if the failure is in the first name / value pair) or the terminating NULL if all was successful.

Description
This function routes the results of processing forms to the appropriate targets. It scans for `<ConfigHdr>` within the string and passes the header and subsequent body to the driver whose location is described in the `<ConfigHdr>`. Many `<ConfigHdr>`s may appear as a single request.
The expected implementation is to hand off the various `<ConfigResp>` substrings to the Configuration Access Protocol `RouteConfig` routine corresponding to the driver whose routing information is defined by the `<ConfigHdr>` in turn.

### Status Codes Returned

- **EFI_SUCCESS**: The results have been distributed or are awaiting distribution.
- **EFI_OUT_OF_RESOURCES**: Not enough memory to store the parts of the results that must be stored awaiting possible future protocols.
- **EFI_INVALID_PARAMETERS**: Passing in a NULL for the `Configuration` parameter would result in this type of error.
- **EFI_NOT_FOUND**: Target for the specified routing data was not found.
- **EFI_ACCESS_DENIED**: The action violated a system policy.

### EFI_HII_CONFIG_ROUTING_PROTOCOL.BlockToConfig()

#### Summary
This helper function is to be called by drivers to map configuration data stored in byte array (“block”) formats such as UEFI Variables into current configuration strings.

#### Prototype

```c
typedef EFI_STATUS
(EIFIAPI * EFI_HII_BLOCK_TO_CONFIG ) (  
    IN CONST EFI_HII_CONFIG_ROUTING_PROTOCOL *This,  
    IN CONST EFI_STRING ConfigRequest,  
    IN CONST UINT8 *Block,  
    IN CONST UINTN BlockSize,  
    OUT EFI_STRING *Config,  
    OUT EFI_STRING *Progress  
);  
```

#### Parameters

- **This**: Points to the `EFI_HII_CONFIG_ROUTING_PROTOCOL` instance.
- **ConfigRequest**: A null-terminated string in `<ConfigRequest>` format.
- **Block**: Array of bytes defining the block’s configuration.
- **BlockSize**: Length in bytes of `Block`. 
Config
Filled-in configuration string. String allocated by the function. Returned only if call is successful. The null-terminated string will be in `<ConfigResp>` format.

Progress
A pointer to a string filled in with the offset of the most recent ‘&’ before the first failing name / value pair (or the beginning of the string if the failure is in the first name / value pair) or the terminating NULL if all was successful.

Description
This function extracts the current configuration from a block of bytes. To do so, it requires that the ConfigRequest string consists of a list of `<BlockName>` formatted names. It uses the offset in the name to determine the index into the Block to start the extraction and the width of each name to determine the number of bytes to extract. These are mapped to a string using the equivalent of the C “%x” format (with optional leading spaces).

The call fails if, for any (offset, width) pair in ConfigRequest, offset+value >= BlockSize.

Status Codes Returned

EFI_SUCCESS The request succeeded. Progress points to the null terminator at the end of the ConfigRequest string.

EFI_OUT_OF_RESOURCES Not enough memory to allocate Config. Progress points to the first character of ConfigRequest.

EFI_INVALID_PARAMETERS Passing in a NULL for the ConfigRequest or Block parameter would result in this type of error. Progress points to the first character of ConfigRequest.

EFI_NOT_FOUND Target for the specified routing data was not found. Progress points to the “G” in "GUID" of the errant routing data.

EFI_DEVICE_ERROR Block not large enough. Progress undefined.

EFI_INVALID_PARAMETER Encountered non `<BlockName>` formatted string. Block is left updated and Progress points at the ‘&’ preceding the first non-<BlockName>.

EFI_HII_CONFIG_ROUTING_PROTOCOL.ConfigToBlock()

Summary
This helper function is to be called by drivers to map configuration strings to configurations stored in byte array ("block") formats such as UEFI Variables.
Prototype

typedef

EFI_STATUS

(EIFIAPI * EFI_HII_CONFIG_TO_BLOCK ) (  
IN   CONST EFI_HII_CONFIG_ROUTING_PROTOCOL *This,
IN   CONST EFI_STRING *ConfigResp,
IN OUT CONST UINT8 *Block,
IN OUT UINTN *BlockSize,
OUT  EFI_STRING *Progress
);

Parameters

This
Points to the EFI_HII_CONFIG_ROUTING_PROTOCOL instance.

ConfigResp
A null-terminated string in <ConfigResp> format.

Block
A possibly null array of bytes representing the current block. Only bytes referenced
in the ConfigResp string in the block are modified. If this parameter is null or if the
*BlockSize parameter is (on input) shorter than required by the Configuration
string, only the BlockSize parameter is updated and an appropriate status (see
below) is returned.

BlockSize
The length of the Block in units of UINT8. On input, this is the size of the Block. On
output, if successful, contains the largest index of the modified byte in the Block, or
the required buffer size if the Block is not large enough.

Progress
On return, points to an element of the ConfigResp string filled in with the offset of
the most recent ‘&’ before the first failing name / value pair (or the beginning of the
string if the failure is in the first name / value pair) or the terminating NULL if all was
successful.

Description
This function maps a configuration containing a series of <BlockConfig> formatted name value pairs in
ConfigResp into a Block so it may be stored in a linear mapped storage such as a UEFI Variable. If
present, the function skips GUID, NAME, and PATH in <ConfigResp>. It stops when it finds a non-
<BlockConfig> name / value pair (after skipping the routing header) or when it reaches the end of the
string.

Example
Assume an existing block containing:

00 01 02 03 04 05

And the ConfigResp string is:
The results are

55 AA 02 07 04 05

Status Codes Returned

- **EFI_SUCCESS**: The request succeeded. Progress points to the null terminator at the end of the `ConfigResp` string.
- **EFI_OUT_OF_RESOURCES**: Not enough memory to allocate `Config`. Progress points to the first character of `ConfigResp`.
- **EFI_INVALID_PARAMETER**: Passing in a NULL for the `ConfigResp` or `Block` parameter would result in this type of error. Progress points to the first character of `ConfigResp`.
- **EFI_NOT_FOUND**: Target for the specified routing data was not found. Progress points to the “G” in “GUID” of the errant routing data.
- **EFI_BUFFER_TOO_SMALL**: Block not large enough. Progress undefined. `BlockSize` is updated with the required buffer size.
- **EFI_INVALID_PARAMETER**: Encountered non `<BlockName>` formatted name / value pair. `Block` is left updated and Progress points at the `&` preceding the first non- `<BlockName>`.

**EFI_HII_CONFIG_ROUTING_PROTOCOL.GetAltCfg()**

**Summary**

This helper function is to be called by drivers to extract portions of a larger configuration string.

**Prototype**

```c
typedef EFI_STATUS (EFIAPI *EFI_HII_GET_ALT_CFG)(
  IN   CONST EFI_HII_CONFIG_ROUTING_PROTOCOL *This,
  IN   CONST EFI_STRING     ConfigResp,
  IN   CONST EFI_GUID       *Guid,
  IN   CONST EFI_STRING     Name,
  IN   CONST EFI_DEVICE_PATH_PROTOCOL *DevicePath,
  IN   CONST EFI_STRING     AltCfgId,
  OUT  EFI_STRING           *AltCfgResp
);
```

**Parameters**

- **This**
  
  Points to the `EFI_HII_CONFIG_ROUTING_PROTOCOL` instance.

- **ConfigResp**
  
  A null-terminated string in `<ConfigAltResp>` format.
Guid

A pointer to the GUID value to search for in the routing portion of the ConfigResp string when retrieving the requested data. If Guid is NULL, then all GUID values will be searched for.

Name

A pointer to the NAME value to search for in the routing portion of the ConfigResp string when retrieving the requested data. If Name is NULL, then all Name values will be searched for.

DevicePath

A pointer to the PATH value to search for in the routing portion of the ConfigResp string when retrieving the requested data. If DevicePath is NULL, then all DevicePath values will be searched for.

AltCfgId

A pointer to the ALTCFG value to search for in the routing portion of the ConfigResp string when retrieving the requested data. If this parameter is NULL, then the current setting will be retrieved.

AltCfgResp

A pointer to a buffer which will be allocated by the function which contains the retrieved string as requested. This buffer is only allocated if the call was successful. The null-terminated string will be in <ConfigResp> format.

Description

This function retrieves the requested portion of the configuration string from a larger configuration string. This function will use the Guid, Name, and DevicePath parameters to find the appropriate section of the ConfigResp string. Upon finding this portion of the string, it will use the AltCfgId parameter to find the appropriate instance of data in the ConfigResp string. Once found, the found data will be copied to a buffer which is allocated by the function so that it can be returned to the caller. The caller is responsible for freeing this allocated buffer.

Status Codes Returned

EFI_SUCCESS The request succeeded. The requested data was extracted and placed in the newly allocated AltCfgResp buffer.

EFI_OUT_OF_RESOURCES Not enough memory to allocate AltCfgResp.

EFI_INVALID_PARAMETER Passing in a NULL for the ConfigResp or AltCfgResp would result in this type of error.
35.5 EFI HII Configuration Access Protocol

**EFI_HII_CONFIG_ACCESS_PROTOCOL**

**Summary**

The EFI HII configuration routing protocol invokes this type of protocol when it needs to forward requests to a driver’s configuration handler. This protocol is published by drivers providing and receiving configuration data from HII. The `ExtractConfig()` and `RouteConfig()` functions are typically invoked by the driver which implements the HII Configuration Routing Protocol. The `Callback()` function is typically invoked by the Forms Browser.

If the protocol functions modify active form set, they must not change layout and size of the existing variable stores. The forms browser processes updated IFR package in accordance with the following rules:

1. If active form set no longer exists, the behavior is browser specific. The browser identifies form set using a combination of the form set GUID and device path associated with the package list containing the form set.
2. If form set update has been initiated by the `Callback()` function, the browser executes action requested by the function. See `EFI_HII_CONFIG_ACCESS_PROTOCOL.CallBack()` section for additional details regarding browser action requests.

**Note:** *If browser action implies saving of the modified questions values, the browser will use uncommitted data associated with the old form set instance. The HII Configuration Access implementation is responsible for properly handling such requests.*

3. The browser performs standard processing steps that are performed on a form set prior to displaying it (including reading question values and generating `EFI_BROWSER_ACTION_FORM_OPEN` and `EFI_BROWSER_ACTION_FORM_RETRIEVE` callbacks).
4. If there is an uncommitted browser data associated with an active form set, the browser applies it, matching variable stores by their identifiers. If variable store no longer exists, the uncommitted data for this store is discarded.

**Note:** *Changing layout or size of the existing variable stores during form set update is not allowed and can lead to unpredictable results.*

5. The browser applies prior browsing history, matching forms by their identifiers. If a form saved in the browsing history no longer exists, the behavior is browser-specific.
6. If all forms in the browsing history have been matched, the browser sets selection on a question that was active prior to the form set update, matching question by its identifier. If question does not exist, the first question on the form is selected.
GUID

#define EFI_HII_CONFIG_ACCESS_PROTOCOL_GUID
{ 0x330d4706, 0xf2a0, 0x4e4f, \
 {0xa3,0x69, 0xb6, 0x6f,0xa8, 0xd5, 0x43, 0x85}}

Protocol Interface Structure

typedef struct {
 EFI_HII_ACCESS_EXTRACT_CONFIG ExtractConfig;
 EFI_HII_ACCESS_ROUTE_CONFIG RouteConfig;
 EFI_HII_ACCESS_FORM_CALLBACK Callback;
 } EFI_HII_CONFIG_ACCESS_PROTOCOL;

Related Definitions
None

Parameters

ExtractConfig
This function breaks apart the request strings routing them to the appropriate
drivers. This function is analogous to the similarly named function in the HII Routing
Protocol.

RouteConfig
This function breaks apart the results strings and returns configuration information
as specified by the request.

Callback
This function is called from the configuration browser to communicate certain
activities that were initiated by a user.

Description
This protocol provides a callable interface between the HII and drivers. Only drivers which provide IFR
data to HII are required to publish this protocol.

EFI_HII_CONFIG_ACCESS_PROTOCOL.ExtractConfig()

Summary
This function allows a caller to extract the current configuration for one or more named elements from
the target driver.
Prototype

typedef
EFI_STATUS
(EFIAPI * EFI_HII_ACCESS_EXTRACT_CONFIG ) ( 
IN CONST EFI_HII_CONFIG_ACCESS_PROTOCOL   *This,
IN CONST EFI_STRING Request,
OUT EFI_STRING *Progress,
OUT EFI_STRING *Results
);

Parameters

This

Points to the EFI_HII_CONFIG_ACCESS_PROTOCOL.

Request

A null-terminated string in ConfigRequest format. Note that this includes the routing information as well as the configurable name / value pairs. It is invalid for this string to be in MultiConfigRequest format.

If a NULL is passed in for the Request field, all of the settings being abstracted by this function will be returned in the Results field. In addition, if a ConfigHdr is passed in with no request elements, all of the settings being abstracted for that particular ConfigHdr reference will be returned in the Results Field.

Progress

On return, points to a character in the Request string. Points to the string’s null terminator if request was successful. Points to the most recent ‘&’ before the first failing name / value pair (or the beginning of the string if the failure is in the first name / value pair) if the request was not successful.

Results

A null-terminated string in MultiConfigAltResp format which has all values filled in for the names in the Request string. String to be allocated by the called function.

Description

This function allows the caller to request the current configuration for one or more named elements. The resulting string is in ConfigResp format.

In order to support forms processors other than a Forms Browser, the configuration returned by this function must not depend on context in which the function is used. In particular, it must not depend on the current state of the Forms Browser (including any uncommitted state information) and actions performed by the driver callbacks invoked prior to the ExtractConfig call. Section 33.2.1.8 provides additional details regarding forms browser/processor.

Any and all alternative configuration strings shall also be appended to the end of the current configuration string. If they are, they must appear after the current configuration. They must contain the same routing (GUID, NAME, PATH) as the current configuration string. They must have an additional description indicating the type of alternative configuration the string represents,
"ALTCFG=<AltCfgId>". The <AltCfgId> is a reference to a Default ID which stipulates the type of Default being referenced such as EFI_HII_DEFAULT_CLASS_STANDARD.

As an example, assume that the Request string is:

```
GUID=...&PATH=...&Fred&George&Ron&Neville
```

A result might be:

```
GUID=...&PATH=...&Fred=16&George=16&Ron=12&Neville=11&GUID=...&PATH=...&ALTCFG=0037&Fred=12&Neville=7
```

This function allows the caller to request the current configuration for one or more named elements. The resulting string is in <ConfigAltResp> format.

Any and all alternative configuration strings shall also be appended to the end of the current configuration string. If they are, they must appear after the current configuration. They must contain the same routing (GUID, NAME, PATH) as the current configuration string. They must have an additional description indicating the type of alternative configuration the string represents, “ALTCFG=<AltCfgId>”. The <AltCfgId> is a reference to a Default ID which stipulates the type of Default being referenced such as EFI_HII_DEFAULT_CLASS_STANDARD.

As an example, assume that the Request string is:

```
GUID=...&PATH=...&Fred&George&Ron&Neville
```

A result might be:

```
GUID=...&PATH=...&Fred=16&George=16&Ron=12&Neville=11&GUID=...&PATH=...&ALTCFG=0037&Fred=12&Neville=7
```

**Note:** For the output Results, the value filled in the names in the Request string with <ConfigAltResp> format may change when called multiple times due to some data being of a dynamic nature.

**Status Codes Returned**

- **EFI_SUCCESS**
  
  The Results string is filled with the values corresponding to all requested names.

- **EFI_OUT_OF_RESOURCES**
  
  Not enough memory to store the parts of the results that must be stored awaiting possible future protocols.

- **EFI_NOT_FOUND**
  
  A configuration element matching the routing data is not found. Progress set to the first character in the routing header.

- **EFI_INVALID_PARAMETER**
  
  Illegal syntax. Progress set to most recent "&" before the error or the beginning of the string.

- **EFI_INVALID_PARAMETER**
  
  Unknown name. Progress points to the "&" before the name in question.

- **EFI_INVALID_PARAMETER**
  
  If Results or Progress is NULL.

- **EFI_ACCESS_DENIED**
  
  The action violated a system policy.

- **EFI_DEVICE_ERROR**
  
  Failed to extract the current configuration for one or more named elements.
EFI_HII_CONFIG_ACCESS_PROTOCOL.RouteConfig()

Summary
This function processes the results of changes in configuration for the driver that published this protocol.

Prototype

```c
typedef
    EFI_STATUS
    (EFIAPI * EFI_HII_ACCESS_ROUTE_CONFIG ) (  
        IN CONST EFI_HII_CONFIG_ACCESS_PROTOCOL  *This,
        IN CONST EFI_STRING  Configuration,
        OUT EFI_STRING  *Progress
    );
```

Parameters

- **This**
  Points to the `EFI_HII_CONFIG_ACCESS_PROTOCOL`

- **Configuration**
  A null-terminated string in `<ConfigResp>` format.

- **Progress**
  a pointer to a string filled in with the offset of the most recent ‘&’ before the first failing name / value pair (or the beginning of the string if the failure is in the first name / value pair) or the terminating NULL if all was successful.

Description
This function applies changes in a driver's configuration. Input is a **Configuration**, which has the routing data for this driver followed by name / value configuration pairs. The driver must apply those pairs to its configurable storage.

In order to support forms processors other than a Forms Browser, the way in which configuration data is applied must not depend on context in which the function is used. In particular, it must not depend on the current state of the Forms Browser (including any uncommitted state information) and actions performed by the driver callbacks invoked prior to the **RouteConfig** call. Section 33.2.1.8 provides additional details regarding forms browser/processor.

If the driver's configuration is stored in a linear block of data and the driver's name / value pairs are in `<BlockConfig>` format, it may use the `ConfigToBlock` helper function (above) to simplify the job.

EFI_HII_CONFIG_ACCESS_PROTOCOL.CallBack()

Summary
This function is called to provide results data to the driver.

Prototype
typedef
    EFI_STATUS
(EFI_API *EFI_HII_ACCESS_FORM_CALLBACK) (  
    IN   CONST EFI_HII_CONFIG_ACCESS_PROTOCOL *This,
    IN   EFI_BROWSER_ACTION Action,
    IN   EFI_QUESTION_ID QuestionId,
    IN   UINT8 Type
    IN OUT EFI_IFR_TYPE_VALUE *Value,
    OUT   EFI_BROWSER_ACTION_REQUEST *ActionRequest,
);

Parameters

This
Points to the EFI_HII_CONFIG_ACCESS_PROTOCOL.

Action
Specifies the type of action taken by the browser. See EFI_BROWSER_ACTION_x in “Related Definitions” below.

QuestionId
A unique value which is sent to the original exporting driver so that it can identify the type of data to expect. The format of the data tends to vary based on the opcode that generated the callback.

Type
The type of value for the question. See EFI_IFR_TYPE_x in EFI_IFR_ONE_OF_OPTION.

Value
A pointer to the data being sent to the original exporting driver. The type is specified by Type. Type EFI_IFR_TYPE_VALUE is defined in EFI_IFR_ONE_OF_OPTION.
**ActionRequest**

On return, points to the action requested by the callback function. Type `EFI_BROWSER_ACTION_REQUEST` is specified in `SendForm()` in the Form Browser Protocol.

**Description**

This function is called by the forms browser in response to a user action on a question which has the `EFI_IFR_FLAG_CALLBACK` bit set in the `EFI_IFR_QUESTION_HEADER`. The user action is specified by `Action`. Depending on the action, the browser may also pass the question value using `Type` and `Value`. Upon return, the callback function may specify the desired browser action.

The browser maintains uncommitted browser data (modified and unsaved question values) across Callback function boundaries. Callback function may change unsaved question values using one of the following methods:

- Current question's value may be changed by updating the `Value` parameter.
- Values of other questions from the active formset can be changed using `EFI_FORM_BROWSER2_PROTOCOL.BrowserCallback()` interface.

**Note:** Modification of the question values by the Callback function without notifying the browser using one of the above mentioned methods can lead to unpredictable browser behavior.

Callback function may request configuration update from the browser by returning an appropriate `ActionRequest`.

In order to save uncommitted data, driver should return one of the `_SUBMIT` actions or `_APPLY` action. The browser will then write all modified question values (in case of the `_SUBMIT` actions) or modified question values from an active form (in case of the `_APPLY` action) to storage using `RouteConfig()` function. This will include questions modified prior to an invocation of the `Callback()` function as well as questions modified by the `Callback()` function.

The behavior of the `ExtractConfig` and `RouteConfig` functions must not depend on the actions performed by this function.

Callback functions should return `EFI_UNSUPPORTED` for all values of `Action` that they do not support.

</tr>
</tbody>
</table>
The value **EFI_BROWSER_ACTION_CHANGING** is called before the browser changes the value in the display (for questions which have a value) or takes an action (in the case of an action button or cross-reference). If the callback returns **EFI_UNSUPPORTED**, then the browser will use the value passed to `Callback()` and ignore the value returned by `Callback()`. If the callback returns **EFI_SUCCESS**, then the browser will use the value returned by `Callback()`. If any other error is returned, then the browser will not update the current question value. `ActionRequest` is used. The `Value` represents the updated value. The changes here should not be finalized until the user submits the results.

The value **EFI_BROWSER_ACTION_CHANGED** is called after the browser has changed its internal copy of the question value and displayed it (if appropriate). For action buttons, this is called after the value has been processed. For cross-references, this is never called. Errors returned are ignored. `ActionRequest` is used. The changes here should not be finalized until the user submits the results.

The value **EFI_BROWSER_ACTION_RETRIEVE** is called after the browser has read the current question value, but before it has been displayed. If the callback returns **EFI_UNSUPPORTED** or any other error then the original value is used. If **EFI_SUCCESS** is returned, then the updated value is used.

The value **EFI_BROWSER_ACTION_FORM_OPEN** is called for each question on a form prior to its value being retrieved or displayed. If a question appears on more than one form, and the Forms Browser supports more than one form being active simultaneously, this may be called more than once, even prior to any **EFI_BROWSER_ACTION_FORM_CLOSE** callback.

**NOTE:** **EFI_FORM_BROWSER2_PROTOCOL::BrowserCallback()** cannot be used with this browser action because question values have not been retrieved yet.

The value **EFI_BROWSER_ACTION_FORM_CLOSE** is called for each question on a form after the processing of any submit actions for that form. If a question appears on more than one form, and the Forms Processor supports more than one form being active simultaneously, this will be called more than once.

The value **EFI_BROWSER_ACTION_SUBMITTED** is called after Browser submits the modified question value. `ActionRequest` is ignored.

When `Action` specifies one of the "default" actions, such as **EFI_BROWSER_ACTION_DEFAULT_STANDARD**, etc. it indicates that the Forms Processor is attempting to retrieve the default value for the specified question. The proposed default value is passed in using `Type` and `Value` and reflects the value which the Forms Processor was able to select based on the lower-priority defaulting methods (see Section 33.2.5.8). If the function returns **EFI_SUCCESS**, then the updated value will be used. If the function does not have an updated default value for the specified question or specified default store, or does not provide any support for the actions, it should return **EFI_UNSUPPORTED**, and the returned value will be ignored.

The **DEFAULT_PLATFORM**, **DEFAULT_HARDWARE** and **DEFAULT_FIRMWARE** represent ranges of 4096 (0x1000) possible default store identifiers. The **DEFAULT_STANDARD** represents the range of 4096 possible action values reserved for UEFI-defined default store identifiers. See Section 33.2.5.8 for more information on defaults.
typedef UINTN EFI_BROWSER_ACTION_REQUEST;

#define EFI_BROWSER_ACTION_REQUEST_NONE 0
#define EFI_BROWSER_ACTION_REQUEST_RESET 1
#define EFI_BROWSER_ACTION_REQUEST_SUBMIT 2
#define EFI_BROWSER_ACTION_REQUEST_EXIT 3
#define EFI_BROWSER_ACTION_REQUEST_FORM_SUBMIT_EXIT 4
#define EFI_BROWSER_ACTION_REQUEST_FORM_DISCARD_EXIT 5
#define EFI_BROWSER_ACTION_REQUEST_FORM_APPLY 6
#define EFI_BROWSER_ACTION_REQUEST_FORM_DISCARD 7
#define EFI_BROWSER_ACTION_REQUEST_RECONNECT 8
#define EFI_BROWSER_ACTION_REQUEST_QUESTION_APPLY 9

If the callback function returns with the ActionRequest set to _NONE, then the Forms Browser will take no special behavior.

If the callback function returns with the ActionRequest set to _RESET, then the Forms Browser will exit and request the platform to reset.

If the callback function returns with the ActionRequest set to _SUBMIT, then the Forms Browser will save all modified question values to storage and exit.

If the callback function returns with the ActionRequest set to _EXIT, then the Forms Browser will discard all modified question values and exit.

If the callback function returns with the ActionRequest set to _FORM_SUBMIT_EXIT, then the Forms Browser will write all modified question values on the selected form to storage and then exit the selected form.

If the callback function returns with the ActionRequest set to _FORM_DISCARD_EXIT, then the Forms Browser will discard the modified question values on the selected form and then exit the selected form.

If the callback function returns with the ActionRequest set to _FORM_APPLY, then the Forms Browser will write all modified current question values on the selected form to storage.

If the callback function returns with the ActionRequest set to _FORM_DISCARD, then the Forms Browser will discard the current question values on the selected form and replace them with the original question values.

If the callback function returns with the ActionRequest set to _RECONNECT, a hardware and/or software configuration change was performed by the user, and the controller needs to be reconnected for the driver to recognize the change. Upon the user exiting the formset or the browser, the Forms Browser is required to call the EFI Boot Service DisconnectController() followed by the EFI Boot Service ConnectController() to reconnect the controller. The controller handle passed to DisconnectController() and ConnectController() is the handle on which this EFI_HII_CONFIG_ACCESS_PROTOCOL is installed.

If the callback function returns with the ActionRequest set to _QUESTION_APPLY, then the Forms Browser will write the current modified question value on the selected form to storage.

35.6 Form Browser Protocol

The **EFI_FORM_BROWSER2_PROTOCOL** is the interface to call for drivers to leverage the EFI configuration driver interface.

**EFI_FORM_BROWSER2_PROTOCOL**

**Summary**

The **EFI_FORM_BROWSER2_PROTOCOL** is the interface to the UEFI configuration driver. This interface will allow the caller to direct the configuration driver to use either the HII database or use the passed-in packet of data.

**GUID**

```c
#define EFI_FORM_BROWSER2_PROTOCOL_GUID \
{ 0xb9d4c360, 0xbcfb, 0x4f9b, \ 
{ 0x92, 0x98, 0x53, 0xc1, 0x36, 0x98, 0x22, 0x58 } }
```

**Protocol Interface Structure**

```c
typedef struct _EFI_FORM_BROWSER2_PROTOCOL {
    EFI_SEND_FORM2 SendForm;
    EFI_BROWSER_CALLBACK2 BrowserCallback;
} EFI_FORM_BROWSER2_PROTOCOL;
```

**Parameters**

- **SendForm**
  
  Browse the specified configuration forms. See the **SendForm()** function description.

- **BrowserCallback**
  
  Routine used to expose internal configuration state of the browser. This is primarily used by callback handler routines which were called by the browser and in-turn need to get additional information from the browser itself. See the **BrowserCallback()** function description.

**Description**

This protocol is the interface to call for drivers to leverage the EFI configuration driver interface.

**EFI_FORM_BROWSER2_PROTOCOL.SendForm()**

**Summary**

Initialize the browser to display the specified configuration forms.
Prototype

```c
typedef
EFI_STATUS
(EFIAPI *EFI_SEND_FORM2) (  
  IN CONST EFI_FORM_BROWSER2_PROTOCOL *This,
  IN EFI_HII_HANDLE *Handles,
  IN UINTN HandleCount,
  IN CONST EFI_GUID *FormsetGuid, OPTIONAL
  IN EFI_FORM_ID FormId, OPTIONAL
  IN CONST EFI_SCREEN_DESCRIPTOR *ScreenWidth, OPTIONAL
  OUT EFI_BROWSER_ACTION_REQUEST *ActionRequest OPTIONAL
);
```

Parameters

**This**
A pointer to the `EFI_FORM_BROWSER2_PROTOCOL` instance.

**Handles**
A pointer to an array of HII handles to display. This value should correspond to the value of the HII form package that is required to be displayed. Type `EFI_HII_HANDLE` is defined in `EFI_HII_DATABASE_PROTOCOL.NewPackageList()` in Section 33.3.1.

**HandleCount**
The number of handles in the array specified by `Handle`.

**FormsetGuid**
This field points to the `EFI_GUID` which must match the `Guid` field or one of the elements of the ClassId field in the `EFI_IFR_FORM_SET` op-code. If `FormsetGuid` is `NULL`, then this function will display the form set class `EFI_HII_PLATFORM_SETUP_FORMSET_GUID`.

**FormId**
This field specifies the identifier of the form within the form set to render as the first displayable page. If this field has a value of 0x0000, then the Forms Browser will render the first enabled form in the form set.

**ScreenWidth**
Points to recommended form dimensions, including any non-content area, in characters. Type `EFI_SCREEN_DESCRIPTOR` is defined in "Related Definitions" below.

**ActionRequested**
Points to the action recommended by the form.

Description
This function is the primary interface to the Forms Browser. The Forms Browser displays the forms specified by `FormsetGuid` and `FormId` from all of HII handles specified by `Handles`. If more than one
form can be displayed, the Forms Browser will provide some means for the user to navigate between the forms in addition to that provided by cross-references in the forms themselves.

If *ScreenDimensions* is non-NULL, then it points to a recommended display size for the form. If browsing in text mode, then these are recommended character positions. If browsing in graphics mode, then these values are converted to pixel locations using the standard font size (8 pixels per horizontal character cell and 19 pixels per vertical character cell). If *ScreenDimensions* is NULL the browser may choose the size based on platform policy. The browser may choose to ignore the size based on platform policy.

If *ActionRequested* is non-NULL, then upon return, it points to an enumerated value (see *EFI_BROWSER_ACTION* in “Related Definitions” below) which describes the action requested by the user. If set to *EFI_BROWSER_ACTION_NONE*, then no specific action was requested by the form. If set to *EFI_BROWSER_ACTION_RESET*, then the form requested that the platform be reset. The browser may, based on platform policy, ignore such action requests.

If *FormsetGuid* is set to *EFI_HII_PLATFORM_SETUP_FORMSET_GUID*, it indicates that the form set contains forms designed to be used for platform configuration. If *FormsetGuid* is set to *EFI_HII_DRIVER_HEALTH_FORMSET_GUID*, it indicates that the form set contains forms designed to be used for support of the Driver Health Protocol (see Section 11.10). If FormsetGuid is set to *EFI_HII_USER_CREDENTIAL_FORMSET_GUID*, it indicates that the form set contains forms designed to be used for support of the User Credential Protocol (see Section 36.3.2). If *FormsetGuid* is set to *EFI_HII_REST_STYLE_FORMSET_GUID*, it indicates that the form set contains forms designed to be used for support configuration of REST architectural style (see Section 29.7) Other values may be used for other applications.

### Related Definitions

```c
typedef struct {
    UINTN LeftColumn;
    UINTN RightColumn;
    UINTN TopRow;
    UINTN BottomRow;
} EFI_SCREEN_DESCRIPTOR;
```

*LeftColumn*  
Value that designates the text column where the browser window will begin from the left-hand side of the screen

*RightColumn*  
Value that designates the text column where the browser window will end on the right-hand side of the screen.

*TopRow*  
Value that designates the text row from the top of the screen where the browser window will start.
typedef UINTN EFI_BROWSER_ACTION_REQUEST;

#define EFI_BROWSER_ACTION_REQUEST_NONE 0
#define EFI_BROWSER_ACTION_REQUEST_RESET 1
#define EFI_BROWSER_ACTION_REQUEST_SUBMIT 2
#define EFI_BROWSER_ACTION_REQUEST_EXIT 3

The value EFI_BROWSER_ACTION_REQUEST_NONE indicates that no specific caller action is required. The value EFI_BROWSER_ACTION_REQUEST_RESET indicates that the caller requested a platform reset. The value EFI_BROWSER_ACTION_REQUEST_SUBMIT indicates that a callback requested that the browser submit all values and exit. The value EFI_BROWSER_ACTION_REQUEST_EXIT indicates that a callback requested that the browser exit without saving all values.

#define EFI_HII_PLATFORM_SETUP_FORMSET_GUID \

  { 0x91, 0x70, 0x5f, 0xf7, 0x11, 0x31, 0x8b, 0x27 } } 

Status Codes Returned

EFI_SUCCESS The function completed successfully
EFI_NOT_FOUND No valid forms could be found to display.
EFI_INVALID_PARAMETER One of the parameters has an invalid value.

EFI_FORM_BROWSER2_PROTOCOL.BrowserCallback()

Summary
This function is called by a callback handler to retrieve uncommitted state data from the browser.
Prototype

```
EFI_STATUS (EFIAPI *EFI_BROWSER_CALLBACK2 ) ( 
    IN   CONST EFI_FORM_BROWSER2_PROTOCOL   *This,
    IN OUT UINTN    *ResultsDataSize,
    IN OUT EFI_STRING   ResultsData,
    IN BOOLEAN   RetrieveData,
    IN   CONST EFI_GUID   *VariableGuid, OPTIONAL
    IN   CONST CHAR16    *VariableName OPTIONAL
    ) ;
```

Parameters

- **This**
  A pointer to the EFI_FORM_BROWSER2_PROTOCOL instance.

- **ResultsDataSize**
  A pointer to the size of the buffer associated with ResultsData. On input, the size in bytes of ResultsData. On output, the size of data returned in ResultsData.

- **ResultsData**
  A string returned from an IFR browser or equivalent. The results string will have no routing information in them.

- **RetrieveData**
  A BOOLEAN field which allows an agent to retrieve (if RetrieveData = TRUE) data from the uncommitted browser state information or set (if RetrieveData = FALSE) data in the uncommitted browser state information.

- **VariableGuid**
  An optional field to indicate the target variable GUID name to use.

- **VariableName**
  An optional field to indicate the target human-readable variable name.

Description

This service is typically called by a driver's callback routine which was in turn called by the browser. The routine called this service in the browser to retrieve or set certain uncommitted state information that resides in the open formsets.

Status Codes Returned

- **EFI_SUCCESS**
  The results have been distributed or are awaiting distribution.

- **EFI_BUFFER_TOO_SMALL**
  The ResultsDataSize specified was too small to contain the results data.

- **EFI_UNSUPPORTED**
  Uncommitted browser state is not available at the current stage of execution.
35.7 HII Popup Protocol

EFI_HII_POPUP_PROTOCOL

Summary
This protocol provides services to display a popup window.
The protocol is typically produced by the forms browser and consumed by a driver’s callback handler.

GUID
#define EFI_HII_POPUP_PROTOCOL_GUID \
{ 0x4311edc0, 0x6054, 0x46d4, { 0x9e, 0x40, 0x89, 0x3e, 0xa9, 0x52, 0xfc, 0xcc }
}

Protocol Interface Structure
typedef struct {
    UINT64 Revision;
    EFI_HII_CREATE_POPUP CreatePopup;
} EFI_HII_POPUP_PROTOCOL;

Parameters
Revision
Protocol revision
CreatePopup
Displays a popup window

Related Definitions
#define EFI_HII_POPUP_PROTOCOL_REVISION 1

EFI_HII_POPUP_PROTOCOL.CreatePopup()

Summary
Displays a popup window.

Prototype
typedef
EFI_STATUS
(EFIAPI * EFI_HII_CREATE_POPUP) (
    IN EFI_HII_POPUP_PROTOCOL *This,
    IN EFI_HII_POPUP_STYLE PopupStyle,
    IN EFI_HII_POPUP_TYPE PopupType,
    EFI_HII_HANDLE HiiHandle
    IN EFI_STRING_ID Message,
    OUT EFI_HII_POPUP_SELECTION *UserSelectionOPTIONAL,
    );
Parameters

This
A pointer to the \texttt{EFI_HII_POPUP_PROTOCOL} instance.

PopupStyle
Popup style to use. \texttt{EFI_HII_POPUP_STYLE} is defined in the “Related Definitions” below.

PopupType
Type of the popup to display. \texttt{EFI_HII_POPUP_TYPE} is defined in the “Related Definitions” below.

HiiHandle
HII handle of the string pack containing \texttt{Message}.

Message
A message to display in the popup box.

UserSelection
User selection. \texttt{EFI_HII_POPUP_SELECTION} is defined in the “Related Definitions” below.

Description

The \texttt{CreatePopup()} function displays a modal message box that contains string specified by \texttt{Message}. Explicit line break characters can be used to specify a multi-line message (see \texttt{Section 33.2.6.2.4}). A popup window may contain user selectable options. The option selected by a user is returned via an optional \texttt{UserSelection} parameter.

A list of options presented to a user is defined by the \texttt{PopupType}.

The \texttt{PopupStyle} provides a hint to protocol implementation regarding nature of the message being displayed. The function may optionally use \texttt{PopupStyle} to customize visual appearance of the message box.

\texttt{EfiHiiPopupTypeOk} is a simple popup window with a single user selectable option that can be used to acknowledge the message. If \texttt{UserSelection} is specified, it is set to \texttt{EfiHiiPopupSelectionOk}.

\texttt{EfiHiiPopupTypeOkCancel} is a popup window with two user selectable options: OK and Cancel.

\texttt{EfiHiiPopupTypeYesNo} is a popup window with two user selectable options: Yes and No.

\texttt{EfiHiiPopupTypeYesNoCancel} is a popup window with three user selectable options: Yes, No, and Cancel.
Related Definitions

typedef enum {
    EfiHiiPopupStyleInfo,

typedef enum {
    EfiHiiPopupSelectionOk,
    EfiHiiPopupSelectionCancel,
    EfiHiiPopupSelectionYes,
    EfiHiiPopupSelectionNo
} EFI_HII_POPUP_SELECTION;

Status Codes Returned

EFI_SUCCESS The popup box was successfully displayed

EFI_INVALID_PARAMETER HiiHandle and Message do not define is a valid HII string.

EFI_INVALID_PARAMETER PopupType is not one of the values defined by this specification.

EFI_OUT_OF_RESOURCES There are not enough resources available to display the popup box.
36 - User Identification

36.1 User Identification Overview

This section describes services which describe the current user of the platform. A user is the entity which is controlling the behavior of the machine. The user may be an individual, a class or group of individuals or another machine.

Each user has a user profile. There is always at least one user profile for a machine. This profile governs the behavior of the user identification process until another user has been selected. The nature and definition of these privileges are beyond the scope of this section. One user profile is always active and describes the platform’s current user.

New user profiles are introduced into the system through enrollment. During enrollment, information about a new user is gathered. Some of this information identifies the user for specific purposes, such as a user’s name or a user’s network domain. Other information is gathered in the form of credentials, which is information which can be used at a later time to verify the identity of a user. Credentials are generally divided into three categories: something you know (password), something you have (smart card, smart token, RFID), something you are (fingerprint). The means by which a platform determines the user’s identity based on credentials is user identification.

In the simplest case, a single set of credentials are required to establish a user’s identity. This is called single-factor authentication. In more rigorous cases, multiple credentials might be required to establish a user’s identity or different privilege levels given if only a single factor is available. This is called multi-factor authentication.

If the credentials are checked only once, this is called static authentication. For example, a sign-on box where the user enters a password and provides a fingerprint would be examples of static authentication. However, if credentials (and thus the user’s identity) can be changed during system execution, this is called dynamic authentication. For example, a smart token which can be hot-removed from the system or an RFID tag which is moved in and out of range would be examples of dynamic authentication.

The user identity manager is the optional UEFI driver which manages the process of determining the user’s identity and storing information about the user.

The user enrollment manager is the optional application which adds or enrolls new users, gathering the necessary information to ascertain their identity in the future.

The credential provider driver manages a single class of credentials. Examples include a USB fingerprint sensor, a smart card or a password. The means by which these drivers are selected and invoked is beyond the scope of this specification.

36.1.1 User Identify

The process of identifying the user occurs after platform initialization has made the services described in the EFI System Table available. Before the Boot Manager behavior described in chapter 3, a user profile must be established. The user profile established might be:

- A default user profile, giving a standard set of privileges. This is similar to a “guest” login.
• A *default* user profile, based on a User Credential Provider where `Default()` returns `AutoLogon = TRUE`.

• A specific user profile, established using the `Identify()` function of the User Manager.

Every time the user profile is modified, the User Identity Manager will signal the `EFI_EVENT_GROUP_USER_PROFILE_CHANGED` event. The current user profile can only be changed by calling the User Identity Manager’s `Identify()` function or as the result of a credential provider calling the `Notify()` function (when dynamic authentication is supported). The `Identify()` function changes the current user profile after examining the credentials provided by the various credential providers and comparing these against those found in the user profile database.

When the UEFI Boot Manager signals the `EFI_EVENT_GROUP_READY_TO_BOOT` event group, the User Identity Manager publishes the current user profile information in the EFI System Configuration Table.

Depending on the security considerations in the implementation (see Section 36.1.4), user identification can continue into different phases of execution.

1. **Boot Manager, Once.** In this scenario, identification is permitted until the `EFI_EVENT_GROUP_READY_TO_BOOT` is signaled by the Boot Manager. After this time, user identification is not allowed again. This is the simplest, since the user profile database can be locked at this time using a simple one-time lock.

2. **Boot Manager, Multiple.** In this scenario, identification is permitted until the `EFI_EVENT_GROUP_READY_TO_BOOT` is signaled by the Boot Manager. After this time, if the boot option returns back into the Boot Manager, identification is allowed again. This scenario requires that the user profile database only be updatable while in the Boot Manager.
3. Until ExitBootServices. In this scenario, identification is permitted until the EFI_EVENT_GROUP_EXIT_BOOT_SERVICES is signaled by the Boot Manager. This scenario requires that the user profile database cannot be updated by unauthorized executables.

36.1.2 User Profiles

The user profiles are collections of information about users. There is always a current user (and thus, a currently selected user profile). The user profiles are stored in a user profile database.

Each user profile has the following attributes:

§ User Identifier

User identifiers are unique to a particular user profile. The uniqueness of the user profile identifier must persist across reboots. Credentials return this identifier during the identification process.

§ User Identification Policy

The user identification policy determines which credentials must be presented in order to establish the user’s identity and set the user profile as the current user profile. The policy consists of a boolean expression consisting of credential handles and the operators AND, OR and NOT. This allows the user profile to be selected, for example, depending on a password credential OR a fingerprint credential. Or the profile might be selected depending on a password credential AND a fingerprint credential.

§ User Privileges

The user privileges control what the user can and cannot do. For example, can the user enroll other users, boot off of a selected device, etc.

§ User Information

User information consists of typed data records attached to the user profile handle. Some of this information is non-volatile. Some of this information may be provided by a specific credential driver. User information is classified as public, private or protected:

• Public user information is available at any time.
• Private user information is only available while it is part of the current user profile.
• Protected user information is only available once user has been authenticated by a credential provider.

Drivers and applications can be notified when the current user profile is changed, by using the UEFI Boot Service CreateEventEx() and the EFI_EVENT_GROUP_USER_PROFILE_CHANGED

User profiles are available while the User Identity Manager is running, but only the current user profile is available after the UEFI Boot Manager has started execution.
36.1.2.1 User Profile Database

The user profile database is a repository of all users known to the user identity manager. The user profile database should be maintained in non-volatile memory and this memory must be protected against corruption and erasure.

The user profile database is considered “open” if the user profile database can still be updated and the current profile can still be changed using the EFI User Manager Protocol. The user profile database is considered “closed” if the user profile database cannot be updated nor the current user profile changes using the EFI User Manager Protocol.

36.1.2.2 User Identification Policy

The user identification policy is a boolean expression which determines which class of credential or which credential providers must assert the user’s identity in order to a user profile to be eligible for selection as the current user profile.

For example, assume that you want a password:

\[\text{CredentialClass(Password)}\]

This expression would assert true if any credential provider asserts that a user has successfully entered a password.

\[\text{CredentialClass(Password)} \&\& \text{CredentialClass(Fingerprint)}\]

This expression would require the user to present both a fingerprint AND a password in order to select this user profile.

\[\text{CredentialClass(Password)} \mid\| \text{CredentialClass(Fingerprint)}\]

This expression, on the other hand, allows the user to present a fingerprint OR a password in order to select this user profile.

Let’s say you only want the Phoenix password provider:

\[\text{CredentialClass(Password)} \&\& \text{CredentialProvider(Phoenix)}\]

In all of these cases, the class of credential and the provider of the credential are actually GUIDs. The standard credential class GUIDs are assigned by this specification. The credential provider identifiers are generated by the companies creating the credential providers.

36.1.3 Credential Providers

The User Credential Provider drivers follow the UEFI driver model. During initialization, they install an instance of the EFI Driver Binding Protocol. For hardware devices, the User Credential Provider may consume the bus I/O protocol and produce the User Credential Protocol. For software-based User Credential Providers, the User Credential Protocol could be installed on the image handler. The exact implementation depends on the number of separate credential types that the User Identity Manager will display.

When \text{Start()} is called, they:
1. Install one instance of the `EFI_USER_CREDENTIAL2_PROTOCOL` for each simultaneous user which might be authenticated. For example, if more than one smart token were inserted, then one instance might be created for each token. However, for a fingerprint sensor, one instance might be created for all fingerprint sensors managed by the same driver.

2. Install the user-interface forms used for interacting with the user using the HII Database Protocol. The form must be encoded using the GUID `EFI_USER_CREDENTIAL2_PROTOCOL_GUID`.

3. Install the EFI HII Configuration Access Protocol to handle interaction with the UEFI forms browser. This protocol is called to retrieve the current information from the credential provider. It is also called when the user presses OK to save the current form values. It also provides the callback functionality which allows real-time processing of the form values.

User Credential Providers are responsible to creating a one-to-one mapping between a device, fingerprint or password and a user identifier.

This specification does not explicitly support passing of user credential information related to operating system logon to an OS-present environment. For example, User Credential Providers may encrypt the user credential information and pass it, either as a part of the User Information Table or the EFI System Configuration Table, to an OS-present driver or application.

This specification does not explicitly support OS-present update of user credential information or user identification policy. Such support may be implemented in many ways, including the usage of write-authenticated EFI variables (see `SetVariable()` or capsules (see `UpdateCapsule()`).

### 36.1.4 Security Considerations

Since the current profile details a number of security-related privileges, it is important that the User Identity Manager and User Credential Providers and the environment in which they execute are trusted.

This includes:

- Protecting the storage area where these drivers are stored.
- Protecting the means by which these drivers are selected.
- Protecting the execution environment of these drivers from unverified drivers.
- The data structures used by these drivers should not be corrupted by unauthorized drivers while they are still being used.
In many cases, the User Identity Manager, the User Credential drivers and the on-board drivers are located in a protected location (e.g. a write-protected flash device) and the platform policy for these locations allows them to be trusted.

However, other drivers may be loaded from unprotected location or may be loaded from devices (such as PCI cards) or a hard drive which are easily replaced. Therefore, all drivers loaded prior to the User Identity Manager should be verified. No unverified drivers or applications should be allowed to execute while decisions based on the current user policy are still being made.

For example, either the default platform policy must successfully be able to verify drivers listed in the \texttt{Driver\\#\\#} load options, or else the user must be identified prior to processing these drivers. Otherwise, the drivers’ execution should be deferred. If the user profile is changed through a subsequent call to \texttt{Identify()} or through dynamic authentication, the \texttt{Driver\\#\\#} options may not be processed again.

In systems where the user profile database and current user profile can be protected from corruption, the user profile database is closed when the system signals the event \texttt{EFI_EXIT_BOOT_SERVICES\_EVENT\_GUID}. In systems where the user profile database and current user profile cannot be protected from corruption, the user profile database is closed when the system signals the event \texttt{EFI\_READY\_TO\_BOOT\_EVENT\_GUID}. 

### 36.1.5 Deferred Execution

The platform may need to defer the execution of an image because of security considerations. For example, see LoadImage(). Information about the images which are not executed because of security considerations may be recorded and then reported by installing an instance of the `EFI_DEFERRED_IMAGE_LOAD_PROTOCOL` (see Section 36.3.3). There may be more than one producer of the protocol.

The firmware’s boot manager may use the instances of this protocol in order to automatically load drivers whose execution was deferred because of inadequate privileges once the current user profile contains adequate security privileges.

This boot manager can reevaluate the deferred images each time that the event `EFI_EVENT_GROUP_USER.IDENTITY_CHANGED` is signaled.

Images which have been loaded may not be unloaded when the current user profile is changed, even if the new user profile would have prevented that driver from being loaded.

### 36.2 User Identification Process

This section describes the typical initialization steps required for the user identification process.

#### 36.2.1 User Identification Process

1. The User Identity Manager is launched. This driver reads all of the user profiles from the user profile database, sets the default user profile as the current profile, and installs an instance of the `EFI_USER_MANAGER_PROTOCOL`.
2. Each credential provider driver registers their user-interface related forms and installs an instance of the `EFI_USER_CREDENTIAL2_PROTOCOL`.
3. The User Identity Manager’s `Identify()` function is called to select the current user.
4. The User Identity Manager enumerates all of the User Credential Providers required by the User Identification Policy:
   a. Select the User Credential Provider which returns `Default = TRUE` from the `Default()` function. If more than one return TRUE or none return TRUE, choose a default based on implementation-specific criteria (last-logged-on, etc.)
   b. If that credential provider also returns `AutoLogon = TRUE` from the `Default()` function, then call `User()`. If no error was returned and a user profile with the specified user identifier exists, select the specified user profile as the current user profile and jump to step 9.
5. The User Identity Manager enumerates all of the User Credential Providers required by the User Identification Policy:
   a. Call the `Title()` and (optionally) the `Tile()` function to retrieve the text and image indicated for each User Credential Provider.
   b. Call the `Form()` function to retrieve the form indicated for each User Credential Provider.
   c. Create the user interface to allow the user to select between the different User Credential Providers.
Highlight the default User Credential Provider, as specified in step 4.a.

6. If the user selects one of the User Credential Providers, call `Select()`. If `AutoLogon = TRUE` on return, then call `User()`. If no error was returned and a user profile with the specified user identifier exists, select the specified user profile as the current user profile and jump to step 9.

7. Interact with the user. Regular interaction can occur using the `Callback()` functions. If another User Credential Provider is selected then `Deselect()` is called for the current User Credential Provider and `Select()` is called for the newly selected User Credential Provider.

8. If the user presses OK then the User Manager will saved settings using the EFI Configuration Access protocol. Then it will call the `User()` function of each credential provider. If it returns successfully and one of the user policies evaluates to true, then select the specified user profile as the current user profile and go to step 9. Otherwise display an error and go back.

9. Go through all of the credential providers using `GetNextInfo()` and `GetInfo()` and add the information to the current user profile.

10. Exit

### 36.2.2 Changing The Current User Profile

This section describes the typical actions taken when the current user profile is changed.

1. If there was already a valid current user profile, then all records marked as `private` in that profile are no longer available.
2. All records marked as `private` in the new user profile will be available.
3. The handle of the current user profile is changed.
4. An event with the GUID `EFI_EVENT_GROUP_USER_IDENTITY_CHANGED` is signaled to indicate that the current user profile has been changed.

### 36.2.3 Ready To Boot

Before the boot manager is read to pass control to the boot option and signals the `EFI_EVENT_GROUP_READY_TO_BOOT` event group, the User Identity Manager will publish the current user profile into the EFI System Configuration Table with the `EFI_USER_MANAGER_PROTOCOL_GUID`. The format is described in the User Information Table (Section 36.5). It will also save all non-volatile profile information.

User Credential drivers with non-volatile storage should also store non-volatile credential information which has changed.
36.3 Code Definitions

36.3.1 User Manager Protocol

**EFI_USER_MANAGER_PROTOCOL**

**Summary**

Reports information about a user.

**GUID**

```c
#define EFI_USER_MANAGER_PROTOCOL_GUID \
{ 0x6fd5b00c, 0xd426, 0x4283, \ 
{ 0x98, 0x87, 0x6c, 0xf5, 0xcf, 0x1c, 0xb1, 0xfe } };
```

**Protocol Interface Structure**

```c
typedef struct _EFI_USER_MANAGER_PROTOCOL {
    EFI_USER_PROFILE_CREATE Create;
    EFI_USER_PROFILE_DELETE Delete;
    EFI_USER_PROFILE_GET_NEXT GetNext;
    EFI_USER_PROFILE_CURRENT Current;
    EFI_USER_PROFILE_IDENTIFY Identify;
    EFI_USER_PROFILE_FIND Find;
    EFI_USER_PROFILE_NOTIFY Notify;
    EFI_USER_PROFILE_GET_INFO GetInfo;
    EFI_USER_PROFILE_SET_INFO SetInfo;
    EFI_USER_PROFILE_DELETE_INFO DeleteInfo;
    EFI_USER_PROFILE_GET_NEXT_INFO GetNextInfo;
} EFI_USER_MANAGER_PROTOCOL;
```

**Parameters**

- **Create**
  Create a new user profile.

- **Delete**
  Delete an existing user profile.

- **GetNext**
  Cycle through all user profiles.

- **Current**
  Return the current user profile.

- **Identify**
  Identify a user and set the current user profile using credentials.

- **Find**
  Find a user by a piece of user information.
Notify

Notify the user manager driver that credential information has changed.

GetInfo

Return information from a user profile.

SetInfo

Change information in a user profile.

DeleteInfo

Delete information from a user profile.

GetNextInfo

Cycle through all information from a user profile.

Description

This protocol manages user profiles.

**EFI_USER_MANAGER_PROTOCOL.Create()**

**Summary**

Create a new user profile.

**Prototype**

```c
typedef EFI_STATUS
    (EFIAPI *EFI_USER_PROFILE_CREATE) (
    IN CONST EFI_USER_MANAGER_PROTOCOL *This,
    OUT EFI_USER_PROFILE_HANDLE *User
    );
```

**Parameters**

*This

Points to this instance of the **EFI_USER_MANAGER_PROTOCOL**.

*User

On return, points to the new user profile handle. The user profile handle is unique only during this boot.

**Description**

This function creates a new user profile with only a new user identifier attached and returns its handle. The user profile is non-volatile, but the handle *User can change across reboots.

If the current user profile does not permit creation of new user profiles then **EFI_ACCESS_DENIED** will be returned. If creation of new user profiles is not supported, then **EFI_UNSUPPORTED** is returned.
Related Definitions

typedef VOID *EFI_USER_PROFILE_HANDLE;

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>User profile was successfully created.</td>
</tr>
<tr>
<td>EFI_ACCESS_DENIED</td>
<td>Current user does not have sufficient permissions to create a user profile.</td>
</tr>
<tr>
<td>EFI_UNSUPPORTED</td>
<td>Creation of new user profiles is not supported.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>User is NULL.</td>
</tr>
</tbody>
</table>

EFI_USER_MANAGER_PROTOCOL.Delete()

Summary
Delete an existing user profile.

Prototype

```
typedef
EFI_STATUS
(EIFIAPI *EFI_USER_PROFILE_DELETE) (                          
  IN CONST EFI_USER_MANAGER_PROTOCOL *This,
  IN EFI_USER_PROFILE_HANDLE User
);
```

Parameters

- **This**
  Points to this instance of the EFI_USER_MANAGER_PROTOCOL.
- **User**
  User profile handle. Type EFI_USER_PROFILE_HANDLE is defined in Create().

Description
Delete an existing user profile. If the current user profile does not permit deletion of user profiles then EFI_ACCESS_DENIED will be returned. If there is only a single user profile then EFI_ACCESS_DENIED will be returned. If deletion of user profiles is not supported, then EFI_UNSUPPORTED will be returned.

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>User profile was successfully deleted.</td>
</tr>
<tr>
<td>EFI_ACCESS_DENIED</td>
<td>Current user does not have sufficient permissions to delete a user profile or there is only one user profile.</td>
</tr>
<tr>
<td>EFI_UNSUPPORTED</td>
<td>Deletion of new user profiles is not supported.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>User does not refer to a valid user profile.</td>
</tr>
</tbody>
</table>
EFI_USER_MANAGER_PROTOCOL.GetNext()

Summary
Enumerate all of the enrolled users on the platform.

Prototype

```c
typedef EFI_STATUS (EFIAPI *EFI_USER_PROFILE_GET_NEXT)(
    IN   CONST EFI_USER_MANAGER_PROTOCOL *This,
    IN OUT EFI_USER_PROFILE_HANDLE *User
);
```

Parameters

- **This**
  Points to the instance of this EFI_USER_MANAGER_PROTOCOL.

- **User**
  On entry, points to the previous user profile handle or NULL to start enumeration. On exit, points to the next user profile handle or NULL if there are no more user profiles.

Description

This function returns the next enrolled user profile. To retrieve the first user profile handle, point User at a NULL. Each subsequent call will retrieve another user profile handle until there are no more, at which point User will point to NULL.

**Note:** There is always at least one user profile.

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>Next enrolled user profile successfully returned.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>User is NULL.</td>
</tr>
<tr>
<td>EFI_ACCESS_DENIED</td>
<td>Next enrolled user profile was not successfully returned.</td>
</tr>
</tbody>
</table>

EFI_USER_MANAGER_PROTOCOL.Current()

Summary
Return the current user profile handle.
Prototype

typedef
EFI_STATUS
(EIFIAPI *EFI_USER_PROFILE_CURRENT)(
    IN CONST EFI_USER_MANAGER_PROTOCOL *This,
    OUT EFI_USER_PROFILE_HANDLE *CurrentUser
);

Parameters

    This

    Points to this instance of the EFI_USER_MANAGER_PROTOCOL.

    CurrentUser

    On return, points to the current user profile handle.

Description

This function returns the current user profile handle.

Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>Current user profile handle returned successfully.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>CurrentUser is NULL.</td>
</tr>
</tbody>
</table>

EFI_USER_MANAGER_PROTOCOL.Identify()

Summary

Identify a user.

Prototype

typedef
EFI_STATUS
(EIFIAPI *EFI_USER_IDENTIFY) (
    IN   CONST EFI_USER_MANAGER_PROTOCOL *This,
    OUT  EFI_USER_PROFILE_HANDLE *User
);

Parameters

    This

    Points to the instance of the EFI_USER_MANAGER_PROTOCOL.

    User

    On return, points to the user profile handle for the current user profile.

Description

Identify the user and, if authenticated, returns the user handle and changes the current user profile.
All user information marked as private in a previously selected profile is no longer available for inspection.

Whenever the current user profile is changed then the an event with the GUID ` EFI_EVENT_GROUP_USER_PROFILE_CHANGED` is signaled.

The function can only be called at `TPL_APPLICATION`.

Related Definitions

```c
#define EFI_EVENT_GROUP_USER_PROFILE_CHANGED \  { 0xbaf1e6de, 0x209e, 0x4adb, \  { 0x8d, 0x96, 0xfd, 0x8b, 0x71, 0xf3, 0xf6, 0x83 } }
```

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>User was successfully identified.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>User is NULL.</td>
</tr>
<tr>
<td>EFI_ACCESS_DENIED</td>
<td>User was not successfully identified.</td>
</tr>
</tbody>
</table>

EFI_USER_MANAGER_PROTOCOL.Find()

Summary

Find a user using a user information record.

Prototype

```c
typedef EFI_STATUS
(EFI_API *EFI_USER_PROFILE_FIND)(
    IN   CONST EFI_USER_MANAGER_PROTOCOL *This,
    IN OUT EFI_USER_PROFILE_HANDLE *User,
    IN OUT EFI_USER_INFO_HANDLE *UserInfo OPTIONAL,
    IN   CONST EFI_USER_INFO *Info,
    IN   UINTN               InfoSize
);
```

Parameters

`This`

Points to this instance of the `EFI_USER_MANAGER_PROTOCOL`.

`User`

On entry, points to the previously returned user profile handle or `NULL` to start searching with the first user profile. On return, points to the user profile handle or `NULL` if not found.
**UserInfo**

On entry, points to the previously returned user information handle or **NULL** to start searching with the first. On return, points to the user information handle of the user information record or **NULL** if not found. Can be **NULL**, in which case only one user information record per user can be returned. Type **EFI_USER_INFO_HANDLE** is defined in “Related Definitions” below.

**Info**

Points to the buffer containing the user information to be compared to the user information record. If the user information record data is empty, then only the user information record type is compared.

If **InfoSize** is 0, then the user information record data must be empty.

**InfoSize**

The size of **Info**, in bytes.

**Description**

This function searches all user profiles for the specified user information record. The search starts with the user information record handle following **UserInfo** and continues until either the information is found or there are no more user profiles.

A match occurs when the **Info.InfoType** field matches the user information record type and the user information record data matches a portion of **Info**.

**Status Codes Returned**

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>User information was found. <strong>User</strong> points to the user profile handle and <strong>UserInfo</strong> points to the user information handle.</td>
</tr>
<tr>
<td>EFI_NOT_FOUND</td>
<td>User information was not found. <strong>User</strong> points to NULL and <strong>UserInfo</strong> points to NULL.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td><strong>User</strong> is <strong>NULL</strong>. Or <strong>Info</strong> is <strong>NULL</strong>.</td>
</tr>
</tbody>
</table>

**Related Definitions**

```c
typedef VOID *EFI_USER_INFO_HANDLE;
```

**EFI_USER_MANAGER_PROTOCOL.Notify()**

**Summary**

Called by credential provider to notify of information change.
Prototype

typedef
EFI_STATUS
(EIFIAPI *EFI_USER_PROFILE_NOTIFY)(
    IN CONST EFI_USER_MANAGER_PROTOCOL *This,
    IN EFI_HANDLE Changed
);

Parameters

This
Points to this instance of the EFI_USER_MANAGER_PROTOCOL.

Changed
Handle on which is installed an instance of the EFI_USER_CREDENTIAL2_PROTOCOL where the user has changed.

Description

This function allows the credential provider to notify the User Identity Manager when user status has changed.

If the User Identity Manager doesn’t support asynchronous changes in credentials, then this function should return EFI_UNSUPPORTED.

If current user does not exist, and the credential provider can identify a user, then make the user to be current user and signal the EFI_EVENT_GROUP_USER_PROFILE_CHANGED event.

If current user already exists, and the credential provider can identify another user, then switch current user to the newly identified user, and signal the EFI_EVENT_GROUP_USER_PROFILE_CHANGED event.

If current user was identified by this credential provider and now the credential provider cannot identify current user, then logout current user and signal the EFI_EVENT_GROUP_USER_PROFILE_CHANGED event.

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The User Identity Manager has handled the notification.</td>
</tr>
<tr>
<td>EFI_NOT_READY</td>
<td>The function was called while the specified credential provider was not selected.</td>
</tr>
<tr>
<td>EFI_UNSUPPORTED</td>
<td>The User Identity Manager doesn’t support asynchronous notifications.</td>
</tr>
</tbody>
</table>
 EFI_USER_MANAGER_PROTOCOL.GetInfo()

Summary
Return information attached to the user.

Prototype

typedef
   EFI_STATUS
   (EFIAPI *EFI_USER_PROFILE_GET_INFO)(
      IN   CONST EFI_USER_MANAGER_PROTOCOL *This,
      IN   EFI_USER_PROFILE_HANDLE       User,
      IN   EFI_USER_INFO_HANDLE         UserInfo,
      OUT  EFI_USER_INFO               *Info,
      IN OUT UINTN  *InfoSize
   );

Parameters

This
Points to this instance of the EFI_USER_MANAGER_PROTOCOL.

User
Handle of the user whose profile will be retrieved.

UserInfo
Handle of the user information data record. Type EFI_USER_INFO_HANDLE is defined in GetInfo().

Info
On entry, points to a buffer of at least *InfoSize bytes. On exit, holds the user information. If the buffer is too small to hold the information, then EFI_BUFFER_TOO_SMALL is returned and InfoSize is updated to contain the number of bytes actually required. Type EFI_USER_INFO is described in “Related Definitions” below.

InfoSize
On entry, points to the size of Info. On return, points to the size of the user information.

Description
This function returns user information. The format of the information is described in User Information. The function may return EFI_ACCESS_DENIED if the information is marked private and the handle specified by User is not the current user profile. The function may return EFI_ACCESS_DENIED if the information is marked protected and the information is associated with a credential provider for which the user has not been authenticated.
Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>Information returned successfully.</td>
</tr>
<tr>
<td>EFI_ACCESS_DENIED</td>
<td>The information about the specified user cannot be accessed by the current user.</td>
</tr>
<tr>
<td>EFI_BUFFER_TOO_SMALL</td>
<td>The number of bytes specified by *InfoSize is too small to hold the returned data. The actual size required is returned in *InfoSize.</td>
</tr>
<tr>
<td>EFI_NOT_FOUND</td>
<td>User does not refer to a valid user profile or UserInfo does not refer to a valid user info handle.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>Info is NULL or InfoSize is NULL</td>
</tr>
</tbody>
</table>

Related Definitions

```c
typedef struct {
  EFI_GUID              Credential;
  UINT8                 InfoType;
  UINT8                 Reserved1;
  EFI_USER_INFO_ATTRIBS InfoAttribs;
  UINT32                InfoSize;
} EFI_USER_INFO;
```

*Credential*

The user credential identifier associated with this user information or else Nil if the information is not associated with any specific credential.

*InfoType*

The type of user information. See `EFI_USER_INFO_x_RECORD` in User Information for a description of the different types of user information.

*Reserved1*

Must be set to 0.

*InfoAttribs*

The attributes of the user profile information.

*InfoSize*

The size of the user information, in bytes, including this header.
typedef UINT16 EFI_USER_INFO_ATTRIBS;

#define EFI_USER_INFO_STORAGE        0x000F
#define EFI_USER_INFO_STORAGE_VOLATILE   0x0000
#define EFI_USER_INFO_STORAGE_CREDENTIAL_NV 0x0001
#define EFI_USER_INFO_STORAGE_PLATFORM_NV  0x0002

#define EFI_USER_INFO_ACCESS        0x0070
#define EFI_USER_INFO_PUBLIC        0x0010
#define EFI_USER_INFO_PRIVATE        0x0020
#define EFI_USER_INFO_PROTECTED       0x0030
#define EFI_USER_INFO_EXCLUSIVE       0x0080

The EFI_USER_INFO_STORAGE_x values describe how the user information should be stored. If EFI_USER_INFO_STORAGE_VOLATILE is specified, then the user profile information will be lost after a reboot. If EFI_USER_INFO_STORAGE_CREDENTIAL_NV is specified, then the information will be stored by the driver which created the handle Credential. If USER_INFO_STORAGE_PLATFORM_NV is specified, then the information will be stored by the User Identity Manager in platform non-volatile storage.

There are three levels of access to information associated with the user profile: public, private or protected. If EFI_USER_INFO_PUBLIC is specified, then the user profile information is available always. If EFI_USER_INFO_PRIVATE is specified, then the user profile information is only available if the user has been authenticated (whether or not they are the current user). If EFI_USER_INFO_PROTECTED is specified, then the user profile information is only available if the user has been authenticated and is the current user.

If EFI_USER_INFO_EXCLUSIVE is specified then there can only be one user information record of this type in the user profile. Attempts to use SetInfo() will fail.

EFI_USER_MANAGER_PROTOCOL.SetInfo()

Summary
Add or update user information.

Prototype
typedef

EFI_STATUS
(EFI_API *EFI_USER_PROFILE_SET_INFO) (  
IN   CONST EFI_USER_MANAGER_PROTOCOL *This,  
IN   EFI_USER_PROFILE_HANDLE User,  
IN OUT EFI_USER_INFO_HANDLE       *UserInfo,  
IN   CONST EFI_USER_INFO *Info,  
IN    UINTN                InfoSize
);
Parameters

This
Points to this instance of the \texttt{EFI\_USER\_MANAGER\_PROTOCOL}.

User
Handle of the user whose profile will be changed.

UserInfo
On entry, points to the handle of the user information record to change or \texttt{NULL} if the user information should be added to the user profile. On exit, points to the handle of the user credential information record.

Info
Points to the user information. See \texttt{EFI\_USER\_INFO} for more information.

InfoSize
The size of \texttt{Info}, in bytes.

Description
This function changes user information. If \texttt{NULL} is pointed to by \texttt{UserInfo}, then a new user information record is created and its handle is returned in \texttt{UserInfo}. Otherwise, the existing one is replaced.

If \texttt{EFI\_USER\_INFO\_IDENTITY\_POLICY\_RECORD} is changed, it is the caller's responsibility to keep it to be synced with the information on credential providers.

If \texttt{EFI\_USER\_INFO\_EXCLUSIVE} is specified in \texttt{Info} and a user information record of the same type already exists in the user profile, then \texttt{EFI\_ACCESS\_DENIED} will be returned and \texttt{UserInfo} will point to the handle of the existing record.

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{EFI_SUCCESS}</td>
<td>User profile information was successfully changed/added.</td>
</tr>
<tr>
<td>\texttt{EFI_ACCESS_DENIED}</td>
<td>The record is exclusive.</td>
</tr>
<tr>
<td>\texttt{EFI_SECURITY_VIOLATION}</td>
<td>The current user does not have permission to change the specified user profile or user information record.</td>
</tr>
<tr>
<td>\texttt{EFI_NOT_FOUND}</td>
<td>User does not refer to a valid user profile or \texttt{UserInfo} does not refer to a valid user info handle.</td>
</tr>
<tr>
<td>\texttt{EFI_INVALID_PARAMETER}</td>
<td>\texttt{Info} is \texttt{NULL} or \texttt{InfoSize} is \texttt{NULL}</td>
</tr>
</tbody>
</table>
 EFI_USER_MANAGER_PROTOCOL.DeleteInfo()

Summary
Delete user information.

Prototype

```c
typedef EFI_STATUS
  (EFIAPI *EFI_USER_PROFILE_DELETE_INFO) (  
    IN   CONST EFI_USER_MANAGER_PROTOCOL   *This,
    IN   EFI_USER_PROFILE_HANDLE          User,
    IN   EFI_USER_INFO_HANDLE            UserInfo
  );
```

Parameters

- **This**
  Points to this instance of the EFI_USER_MANAGER_PROTOCOL.

- **User**
  Handle of the user whose information will be deleted.

- **UserInfo**
  Handle of the user information to remove.

Description
Delete the user information attached to the user profile specified by the UserInfo.

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>User information deleted successfully.</td>
</tr>
<tr>
<td>EFI_NOT_FOUND</td>
<td>User information record UserInfo does not exist in the user profile.</td>
</tr>
<tr>
<td>EFI_ACCESS_DENIED</td>
<td>The current user does not have permission to delete this user information.</td>
</tr>
</tbody>
</table>

EFI_USER_MANAGER_PROTOCOL.GetNextInfo()

Summary
Enumerate all of the enrolled users on the platform.

Prototype

```c
typedef
EFI_STATUS
(EIFIAPI *EFI_USER_PROFILE_GET_NEXT_INFO)(
  IN   CONST EFI_USER_MANAGER_PROTOCOL *This,
  IN   EFI_USER_PROFILE_HANDLE User,
  IN OUT EFI_USER_INFO_HANDLE      *UserInfo
);
```

Parameters

This
Points to the instance of this EFI_USER_MANAGER_PROTOCOL.

User
Handle of the user whose information will be enumerated

UserInfo
On entry, points to the previous user information handle or NULL to start enumeration. On exit, points to the next user information handle or NULL if there is no more user information.

Description
This function returns the next user information record. To retrieve the first user information record handle, point UserInfo at a NULL. Each subsequent call will retrieve another user information record handle until there are no more, at which point UserInfo will point to NULL.

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>User information returned.</td>
</tr>
<tr>
<td>EFI_NOT_FOUND</td>
<td>No more user information found.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>UserInfo is NULL.</td>
</tr>
</tbody>
</table>
36.3.2 Credential Provider Protocols

**EFI_USER_CREDENTIAL2_PROTOCOL**

**Summary**
Provide support for a single class of credentials

**GUID**

```c
#define EFI_USER_CREDENTIAL2_PROTOCOL_GUID \ 
{ 0xe98adb03, 0xb8b9, 0x4af8, \ 
{ 0xba, 0x20, 0x26, 0xe9, 0x11, 0x4c, 0xbc, 0xe5 } }
```

**Prototype**

```c
typedef struct _EFI_USER_CREDENTIAL2_PROTOCOL {
    EFI_GUID Identifier;
    EFI_GUID Type;
    EFI_CREDENTIAL_ENROLL Enroll;
    EFI_CREDENTIAL_FORM Form;
    EFI_CREDENTIAL_TILE Tile;
    EFI_CREDENTIAL_TITLE Title;
    EFI_CREDENTIAL_USER User;
    EFI_CREDENTIAL_SELECT Select;
    EFI_CREDENTIAL_DESELECT Deselect;
    EFI_CREDENTIAL_DEFAULT Default;
    EFI_CREDENTIAL_GET_INFO GetInfo;
    EFI_CREDENTIAL_GET_NEXT_INFO GetNextInfo;
    EFI_CREDENTIAL_CAPABILITIES Capabilities;
    EFI_CREDENTIAL_DELETE Delete;
} EFI_USER_CREDENTIAL2_PROTOCOL;
```

**Parameters**

- **Identifier**
  Uniquely identifies this credential provider.

- **Type**
  Identifies this class of User Credential Provider. See **EFI_CREDENTIAL_CLASS_x** in “Related Definitions” below.

- **Enroll**
  Enroll a user using this credential provider.

- **Form**
  Return the form set and form identifier for the form.

- **Tile**
  Returns an optional bitmap image used to identify this credential provider.
Title

Returns a string used to identify this credential provider.

User

Returns the user profile identifier ascertained by using this credential.

Select

Called when a credential provider is selected.

Deselect

Called when a credential provider is deselected.

Default

Returns whether the credential provider can provide the default credential.

GetInfo

Return user information provided by the credential provider.

GetNextInfo

Cycle through all user information available from the credential provider.

Capabilities

Bitmask which describes the capabilities supported by the credential provider. Type EFI_CREDENTIAL_CAPABILITIES is defined in “Related Definitions” below.

Delete

Delete a user on this credential provider.

Description

Attached to a device handle, this protocol identifies a single means of identifying the user.

If EFI_CREDENTIAL_CAPABILITIES_ENROLL is specified, then this credential provider supports the ability to enroll new user identification information using the Enroll() function.

Related Definitions

EFI_USER_CREDENTIAL2_PROTOCOL.Enroll()

Summary
Enroll a user on a credential provider.

Prototype
typedef

EFI_STATUS

(EFIAP2 *EFI_CREDENTIAL2_ENROLL)(
  IN CONST EFI_USER_CREDENTIAL2_PROTOCOL *This,
  IN EFI_USER_PROFILE_HANDLE User
); 

Parameters
This
Points to this instance of the EFI_USER_CREDENTIAL2_PROTOCOL.

User
The user profile to enroll.

Description
This function enrolls a user on this credential provider. If the user exists on this credential provider, update the user information on this credential provider; otherwise add the user information on credential provider.
**Status Codes Returned**

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>User profile was successfully enrolled</td>
</tr>
<tr>
<td>EFI_ACCESS_DENIED</td>
<td>Current user profile does not permit enrollment on the user profile handle. Either the user profile cannot enroll on any user profile or cannot enroll on a user profile other than the current user profile.</td>
</tr>
<tr>
<td>EFI_UNSUPPORTED</td>
<td>This credential provider does not support enrollment in the pre-OS.</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>The new credential could not be created because of a device error.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>User does not refer to a valid user profile handle.</td>
</tr>
</tbody>
</table>

**EFI_USER_CREDENTIAL2_PROTOCOL.Form()**

**Summary**

Returns the user interface information used during user identification.

**Prototype**

```c
typedef EFI_STATUS
    (EFIAPI *EFI_CREDENTIAL_Form)(
    IN CONST EFI_USER_CREDENTIAL2_PROTOCOL *This,
    OUT EFI_HII_HANDLE *Hii,
    OUT EFI_GUID *FormSetId,
    OUT EFI_FORM_ID *FormId
    );
```

**Parameters**

- **This**
  Points to this instance of the `EFI_USER_CREDENTIAL2_PROTOCOL`.

- **Hii**
  On return, holds the HII database handle. Type `EFI_HII_HANDLE` is defined in `EFI_HII_DATABASE_PROTOCOL.NewPackageList()` in the Packages section.

- **FormSetId**
  On return, holds the identifier of the form set which contains the form used during user identification.

- **FormId**
  On return, holds the identifier of the form used during user identification.

**Description**

This function returns information about the form used when interacting with the user during user identification. The form is the first enabled form in the form-set class `EFI_HII_USER_CREDENTIAL_FORMSET_GUID` installed on the HII handle `HiiHandle`. If the user credential provider does not require a form to identify the user, then this function should return `EFI_NOT_FOUND`. 
Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>Form returned successfully.</td>
</tr>
<tr>
<td>EFI_NOT_FOUND</td>
<td>Form not returned.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td><code>Hii</code> is <code>NULL</code> or <code>FormSetId</code> is <code>NULL</code> or <code>FormId</code> is <code>NULL</code></td>
</tr>
</tbody>
</table>

**EFI_USER_CREDENTIAL2_PROTOCOL.Tile()**

**Summary**

Returns bitmap used to describe the credential provider type.

**Prototype**

```c
typedef
EFI_STATUS
(EIFIAP *EFI_CREDENTIAL_TILE)(
    IN CONST EFI_USER_CREDENTIAL2_PROTOCOL *This,
    IN OUT UINTN       *Width,
    IN OUT UINTN       *Height,
    OUT  EFI_HII_HANDLE  *Hii,
    OUT  EFI_IMAGE_ID   *Image
);
```

**Parameters**

- **This**
  Points to this instance of the `EFI_USER_CREDENTIAL2_PROTOCOL`.

- **Width**
  On entry, points to the desired bitmap width. If `NULL` then no bitmap information will be returned. On exit, points to the width of the bitmap returned.

- **Height**
  On entry, points to the desired bitmap height. If `NULL` then no bitmap information will be returned. On exit, points to the height of the bitmap returned.

- **Hii**
  On return, holds the HII database handle. Type `EFI_HII_HANDLE` is defined in `EFI_HII_DATABASE_PROTOCOL.NewPackageList()` in the Packages section.

- **Image**
  On return, holds the HII image identifier. Type `EFI_IMAGE_ID` is defined in this specification, Section 34.4.

**Description**

This optional function returns a bitmap which is less than or equal to the number of pixels specified by `Width` and `Height`. If no such bitmap exists, then `EFI_NOT_FOUND` is returned.
Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>Image identifier returned successfully.</td>
</tr>
<tr>
<td>EFI_NOT_FOUND</td>
<td>Image identifier not returned.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>Hii is NULL or Image is NULL.</td>
</tr>
</tbody>
</table>

**EFI_USER_CREDENTIAL2_PROTOCOL.Title()**

**Summary**
Returns string used to describe the credential provider type.

**Prototype**
```c
typedef EFI_STATUS
  (EFIAPI *EFI_CREDENTIAL2_PROTOCOL)(
    IN   CONST EFI_USER_CREDENTIAL2_PROTOCOL *This,
    OUT  EFI_HII_HANDLE   *Hii,
    OUT  EFI_STRING_ID    *String
  );
```

**Parameters**
- **This**
  Points to this instance of the **EFI_USER_CREDENTIAL2_PROTOCOL**.
- **Hii**
  On return, holds the HII database handle. TType **EFI_HII_HANDLE** is defined in **EFI_HII_DATABASE_PROTOCOL.NewPackageList()** in the Packages section.
- **String**
  On return, holds the HII string identifier. Type **EFI_STRING_ID** is defined in **Section 33.3.8.2.1**.

**Description**
This function returns a string which describes the credential provider. If no such string exists, then **EFI_NOT_FOUND** is returned.

**Status Codes Returned**

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>String identifier returned successfully.</td>
</tr>
<tr>
<td>EFI_NOT_FOUND</td>
<td>String identifier not returned.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>Hii is NULL or String is NULL.</td>
</tr>
</tbody>
</table>

**EFI_USER_CREDENTIAL2_PROTOCOL.User()**

**Summary**
Return the user identifier associated with the currently authenticated user.
Prototype

```c
typedef
  EFI_STATUS
  (EFIAPIC *EFI_CREDENTIAL_USER)(
    IN   CONST EFI_USER_CREDENTIAL2_PROTOCOL *This,
    IN   EFI_USER_PROFILE_HANDLE User,
    OUT  EFI_USER_INFO_IDENTIFIER *Identifier
  );
```

Parameters

- **This**
  Points to this instance of the `EFI_USER_CREDENTIAL2_PROTOCOL`.

- **User**
  The user profile handle of the user profile currently being considered by the user identity manager. If `NULL`, then no user profile is currently under consideration.

- **Identifier**
  On return, points to the user identifier. Type `EFI_USER_INFO_IDENTIFIER` is defined in “Related Definitions” below.

Description

This function returns the user identifier of the user authenticated by this credential provider. This function is called after the credential-related information has been submitted on a form OR after a call to `Default()` has returned that this credential is ready to log on.

This function can return one of five possible responses:

- If no user profile can yet be identified, then `EFI_NOT_READY` is returned.
- If the user has been locked out, then `EFI_ACCESS_DENIED` is returned.
- If the user specified by `User` is identified, then Identifier returns with the user identifier associated with that handle and `EFI_SUCCESS` is returned.
- If `Identifier` is `NULL`, then `EFI_INVALID_PARAMETER` is returned.
- If specified `User` does not refer to a valid user profile, then `EFI_NOT_FOUND` is returned.

Status Codes Returned

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>User identifier returned successfully.</td>
</tr>
<tr>
<td>EFI_NOT_READY</td>
<td>No user identifier can be returned.</td>
</tr>
<tr>
<td>EFI_ACCESS_DENIED</td>
<td>The user has been locked out of this user credential.</td>
</tr>
<tr>
<td>EFI_NOT_FOUND</td>
<td><code>User</code> is not <code>NULL</code>, and the specified user handle can't be found in user profile database</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>Identifier is <code>NULL</code>.</td>
</tr>
</tbody>
</table>
**EFI_USER_CREDENTIAL2_PROTOCOL.Select()**

**Summary**
Indicate that user interface interaction has begun for the specified credential.

**Prototype**
```c
typedef EFI_STATUS
  (EFIAPI *EFI_CREDENTIAL_SELECT)(
    IN CONST EFI_USER_CREDENTIAL2_PROTOCOL *This,
    OUT EFI_CREDENTIAL_LOGON_FLAGS *AutoLogon
  );
```

**Parameters**
- **This**
  Points to this instance of the `EFI_USER_CREDENTIAL2_PROTOCOL`.
- **AutoLogon**
  On return, points to the credential provider’s capabilities after the credential provider has been selected by the user. Type `EFI_CREDENTIAL_LOGON_FLAGS` is defined in “Related Definitions” below.

**Description**
This function is called when a credential provider is selected by the user. If `AutoLogon` returns `FALSE`, then the user interface will be constructed by the User Identity Manager.

**Related Definitions**
```c
typedef UINT32 EFI_CREDENTIAL_LOGON_FLAGS;
#define EFI_CREDENTIAL_LOGON_FLAG_AUTO  0x00000001
#define EFI_CREDENTIAL_LOGON_FLAG_DEFAULT 0x00000002
```

If `EFI_CREDENTIAL_LOGON_FLAG_AUTO` is set, then the User Identity Manager may use this as a hint to try logging on immediately. If not set, then the User Identity Manager may use this as an indication to wait for the user to submit the information.

If `EFI_CREDENTIAL_LOGON_FLAG_DEFAULT` is set, then the User Identity Manager may use this as a hint to use this credential provider as the default credential provider. If more than one credential provider returns with this set, then the selection is implementation specific. If `EFI_CREDENTIAL_LOGON_FLAG_DEFAULT` is set and `EFI_CREDENTIAL_LOGON_FLAG_AUTO` is set then the User Identity Manager may use this as a hint to log the user on immediately.

**Status Codes Returned**

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>Credential provider successfully selected.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td><code>AutoLogon</code> is <code>NULL</code></td>
</tr>
</tbody>
</table>
**EFI_USER_CREDENTIAL2_PROTOCOL.Deselect()**

**Summary**
Indicate that user interface interaction has ended for the specified credential.

**Prototype**
```c
typedef EFI_STATUS
    (EFIAPI *EFI_CREDENTIAL_DESELECT)(
    IN CONST EFI_USER_CREDENTIAL2_PROTOCOL *This
    );
```

**Parameters**
- **This**
  Points to this instance of the EFI_USER_CREDENTIAL2_PROTOCOL.

**Description**
This function is called when a credential provider is deselected by the user.

**Status Codes Returned**

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>Credential provider successfully selected.</td>
</tr>
</tbody>
</table>

**EFI_USER_CREDENTIAL2_PROTOCOL.Default()**

**Summary**
Return the default logon behavior for this user credential.

**Prototype**
```c
typedef EFI_STATUS
    (EFIAPI *EFI_CREDENTIAL_DEFAULT)(
    IN CONST EFI_USER_CREDENTIAL2_PROTOCOL *This,
    OUT EFI_CREDENTIAL_LOGON_FLAGS *AutoLogon
    );
```

**Parameters**
- **This**
  Points to this instance of the EFI_USER_CREDENTIAL2_PROTOCOL.
- **AutoLogon**
  On return, holds whether the credential provider should be used by default to automatically log on the user. Type EFI_CREDENTIAL_LOGON_FLAGS is defined in EFI_USER_CREDENTIAL2_PROTOCOL.Select().
Description
This function reports the default login behavior regarding this credential provider.

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>Default information successfully returned.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>AutoLogon is NULL</td>
</tr>
</tbody>
</table>

**EFI_USER_CREDENTIAL2_PROTOCOL.GetInfo()**

Summary
Return information attached to the credential provider.

Prototype

```c
typedef
   EFI_STATUS
   (EFIAPIC*EFI_CREDENTIAL_GET_INFO)(
   IN   CONST EFI_USER_CREDENTIAL2_PROTOCOL *This,
   IN   EFI_USER_INFO_HANDLE UserInfo,
   OUT   EFI_USER_INFO *Info,
   IN OUT UINTN *InfoSize
   );
```

Parameters

*This*  
Points to this instance of the **EFI_USER_CREDENTIAL2_PROTOCOL**.

User Info  
Handle of the user information data record. Type **EFI_USER_INFO_HANDLE** is defined in **GetInfo()**.

*Info*  
On entry, points to a buffer of at least *InfoSize bytes. On exit, holds the user information. If the buffer is too small to hold the information, then **EFI_BUFFER_TOO_SMALL** is returned and *InfoSize* is updated to contain the number of bytes actually required. Type **EFI_USER_INFO** is described in “Related Definitions” below.

*InfoSize*  
On entry, points to the size of *Info. On return, points to the size of the user information.

Description
This function returns user information.
Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>Information returned successfully.</td>
</tr>
<tr>
<td>EFI_BUFFER_TOO_SMALL</td>
<td>The size specified by InfoSize is too small to hold all of the user information. The size required is returned in *InfoSize.</td>
</tr>
<tr>
<td>EFI_NOT_FOUND</td>
<td>The specified UserInfo does not refer to a valid user info handle.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>Info is NULL or InfoSize is NULL.</td>
</tr>
</tbody>
</table>

EFI_USER_CREDENTIAL2_PROTOCOL.GetNextInfo()

Summary
Enumerate all of the user information records on the credential provider..

Prototype

```c
typedef EFI_STATUS (EFIAPI *EFI_USER_CREDENTIAL2_PROTOCOL_GET_NEXT_INFO)(
  IN   CONST EFI_USER_CREDENTIAL2_PROTOCOL *This,
  IN OUT EFI_USER_INFO_HANDLE *UserInfo
);
```

Parameters

*This
Points to the instance of this EFI_USER_CREDENTIAL2_PROTOCOL.

*UserInfo
On entry, points to the previous user information handle or NULL to start enumeration. On exit, points to the next user information handle or NULL if there is no more user information.

Description
This function returns the next user information record. To retrieve the first user information record handle, point *UserInfo at a NULL. Each subsequent call will retrieve another user information record handle until there are no more, at which point *UserInfo will point to NULL.

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>User information returned.</td>
</tr>
<tr>
<td>EFI_NOT_FOUND</td>
<td>No more user information found.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>*UserInfo is NULL.</td>
</tr>
</tbody>
</table>

EFI_USER_CREDENTIAL2_PROTOCOL.Delete()

Summary
Delete a user on a credential provider.
Prototype

```c
typedef
EFI_STATUS (EFIAPI *EFI_CREDENTIAL_DELETE)(
    IN CONST EFI_USER_CREDENTIAL2_PROTOCOL *This,
    IN EFI_USER_PROFILE_HANDLE User);
```

Parameters

This

Points to this instance of the `EFI_USER_CREDENTIAL2_PROTOCOL`.

User

The user profile handle to delete.

Description

This function deletes a user on this credential provider.

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>User profile was successfully deleted.</td>
</tr>
<tr>
<td>EFI_ACCESS_DENIED</td>
<td>Current user profile does not permit deletion on the user profile handle. Either the user profile cannot delete on any user profile or cannot delete on a user profile other than the current user profile.</td>
</tr>
<tr>
<td>EFI_UNSUPPORTED</td>
<td>This credential provider does not support deletion in the pre-OS.</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>The new credential could not be deleted because of a device error.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>User does not refer to a valid user profile handle.</td>
</tr>
</tbody>
</table>

36.3.3 Deferred Image Load Protocol

**EFI_DEFERRED_IMAGE_LOAD_PROTOCOL**

Summary

Enumerates images whose load was deferred due to security considerations.

GUID

```c
#define EFI_DEFERRED_IMAGE_LOAD_PROTOCOL_GUID \    
{ 0x15853d7c, 0x3ddf, 0x43e0, \    
{ 0xa1, 0xcb, 0xeb, 0xf8, 0x5b, 0x8f, 0x87, 0x2c } };
```

Protocol Interface Structure

```c
typedef struct _EFI_DEFERRED_IMAGE_LOAD_PROTOCOL {
    EFI_DEFERRED_IMAGE_INFO GetImageInfo();
} EFI_DEFERRED_IMAGE_LOAD_PROTOCOL;
```
Members

GetImageInfo

Return information about a single deferred image. See GetImageInfo() for more information.

Description

This protocol returns information about images whose load was denied because of security considerations. This information can be used by the Boot Manager or another agent to reevaluate the images when the current security profile has been changed, such as when the current user profile changes. There can be more than one instance of this protocol installed.

 EFI_DEFERRED_IMAGE_LOAD_PROTOCOL.GetImageInfo()

Summary

Returns information about a deferred image.

Prototype

typedef
EFI_STATUS
(EIFIAPIC *EFI_DEFERRED_IMAGE_INFO)(
   IN EFI_DEFERRED_IMAGE_LOAD_PROTOCOL *This,
   IN UINTN ImageIndex,
   OUT EFI_DEVICE_PATH_PROTOCOL **ImageDevicePath,
   OUT VOID **Image,
   OUT UINTN *ImageSize,
   OUT BOOLEAN *BootOption
);

Parameters

This

Points to this instance of the EFI_DEFERRED_IMAGE_LOAD_PROTOCOL.

ImageIndex

Zero-based index of the deferred index.

ImageDevicePath

On return, points to a pointer to the device path of the image. The device path should not be freed by the caller.

Image

On return, points to the first byte of the image or NULL if the image is not available. The image should not be freed by the caller unless LoadImage() has been called successfully.

ImageSize

On return, the size of the image, or 0 if the image is not available.
BootOption

On return, points to **TRUE** if the image was intended as a boot option or **FALSE** if it was not intended as a boot option.

**Description**

This function returns information about a single deferred image. The deferred images are numbered consecutively, starting with 0. If there is no image which corresponds to **ImageIndex**, then **EFI_NOT_FOUND** is returned. All deferred images may be returned by iteratively calling this function until **EFI_NOT_FOUND** is returned.

**Image** may be **NULL** and **ImageSize** set to 0 if the decision to defer execution was made because of the location of the executable image rather than its actual contents.

**Status Codes Returned**

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>Image information returned successfully.</td>
</tr>
<tr>
<td>EFI_NOT_FOUND</td>

### 36.4 User Information

This section describes the different user information and the format of the data. Each of the following records is prefixed with the **EFI_USER_INFO** structure. The format of the record is determined by the type specified by the **InfoType** field in the structure, as listed in the table below:

**Table 36-1 Record values and descriptions**

<table>
<thead>
<tr>
<th>Name</th>

36.4.1 EFI_USER_INFO_ACCESS_POLICY_RECORD

Summary
Provides the user’s pre-OS access rights.

Prototype

```
#define EFI_USER_INFO_ACCESS_POLICY_RECORD 0x0E

typedef EFI_USER_INFO_ACCESS_CONTROL EFI_USER_INFO_ACCESS_POLICY;
```

Description
This structure described the access policy for the user. There can be, at most, one access policy record per credential (including `NULL` credential). Policy records with a credential specified means that the policy is associated specifically with the credential.

The policy is detailed in a series of encapsulated records of type `EFI_USER_INFO_ACCESS_CONTROL`.

Related Definitions

```
typedef struct {
    UINT32 Type;
    UINT32 Size;
} EFI_USER_INFO_ACCESS_CONTROL;
```

<table>

</tr>
<tr>
<td>EFI_USER_INFO_GUID_RECORD</td>
<td>0xFF</td>
<td>Extended profile information, qualified by a GUID in the header.</td>
</tr>
</tbody>
</table>

Type
Specifies the type of user access control. See `EFI_USER_INFO_ACCESS_x` for more information.

Size
Specifies the size of the user access control record, in bytes, including this header.
36.4.1.1 EFI_USER_INFO_ACCESS_FORBID_LOAD

Summary
Forbids the user from booting or loading executables from the specified device path or any child device paths.

Prototype
```
#define EFI_USER_INFO_ACCESS_FORBID_LOAD  0x00000001
```

Description
This record prohibits the user from loading any executables from zero or device paths or any child device paths. The device paths may contain a specific executable name, in which case the prohibition applies to only that executable.

The record is a series of normal UEFI device paths (not multi-instance device paths).

This prohibition is overridden by the EFI_USER_INFO_ACCESS_PERMIT_LOAD record.

36.4.1.2 EFI_USER_INFO_ACCESS_PERMIT_LOAD

Summary
Permits the user from booting or loading executables from the specified device path or any child device paths.

Prototype
```
#define EFI_USER_INFO_ACCESS_PERMIT_LOAD  0x00000002
```

Description
This record allows the user to load executables from locations specified by zero or more device paths or child paths. The device paths may contain specific executable names, in which case, the permission applies only to that executable.

The record is a series of normal UEFI device paths (not multi-instance device paths).

This prohibition overrides any restrictions put in place by the EFI_USER_INFO_ACCESS_FORBID_LOAD record.

36.4.1.3 EFI_USER_INFO_ACCESS_ENROLL_SELF

Summary
Presence of this record indicates that a user can update enrollment information.

Prototype
```
#define EFI_USER_INFO_ACCESS_ENROLL_SELF 0x00000003
```

Description
If this record is present, then the pre-OS environment will allow the user to initiate an update of authentication information for his/her own profile, but not other user information or other user’s information. This would allow, for example, fingerprint update or password change.
There is no data for this record.

36.4.1.4 EFI_USER_INFO_ACCESS_ENROLL_OTHERS

Summary
Presence of this record indicates that a user can enroll new users.

Prototype

```
#define EFI_USER_INFO_ACCESS_ENROLL_OTHERS 0x00000004
```

Description
If this record is present, then the pre-OS environment will allow the user to initiate enrollment of new user profiles. It does not give permission to update existing user profiles.

There is no data for this record.

36.4.1.5 EFI_USER_INFO_ACCESS_MANAGE

Summary
Presence of this record indicates that a user can update the user information of any user.

Prototype

```
#define EFI_USER_INFO_ACCESS_MANAGE 0x00000005
```

Description
If this record is present, then the pre-OS environment will allow the user to update any information about his/her own profile or other profiles.

There is no data for this record.

36.4.1.6 EFI_USER_INFO_ACCESS_SETUP

Summary
Describes permissions usable when configuring the platform.

Prototype

```
#define EFI_USER_INFO_ACCESS_SETUP 0x00000006
```

Description
This record describes access permission for use in configuring the platform using an UEFI Forms Processor using zero or more GUIDs. There are three standard values (see below) and any number of others may be added.

<table>
<thead>
<tr>
<th>EFI_USER_INFO_ACCESS_SETUP_ADMIN_GUID</th>
<th>System administrator only.</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_USER_INFO_ACCESS_SETUP_NORMAL_GUID</td>
<td>Normal user.</td>
</tr>
<tr>
<td>EFI_USER_INFO_ACCESS_SETUP_RESTRICTED_GUID</td>
<td>Restricted user.</td>
</tr>
</tbody>
</table>

36.4.1.7 EFI_USER_INFO_ACCESS_FORBID_CONNECT

Summary
Forbids UEFI drivers from being started from the specified device path(s) or any child device paths.

Prototype
#define EFI_USER_INFO_ACCESS_FORBID_CONNECT  0x00000007

Description
This record prohibits UEFI drivers from being started from the specified device path(s) or any of their child device path(s). This is enforced in the ConnectController() function.

This record prohibits the user from loading a device driver associated with zero or more device paths or their child paths.

The record is a series of normal UEFI device paths (not multi-instance device paths).

This prohibition is overridden by the EFI_USER_INFO_ACCESS_PERMIT_CONNECT record.

36.4.1.8 EFI_USER_INFO_ACCESS_PERMIT_CONNECT

Summary
Permits UEFI drivers to be started on the specified device path(s) or any child device paths.

Prototype
#define EFI_USER_INFO_ACCESS_PERMIT_CONNECT  0x00000008

Description
This record allows loading of device drivers associated with zero or more device paths or their child paths.

The record is a series of normal UEFI device paths (not multi-instance device paths).

This prohibition overrides any restrictions put in place by the EFI_USER_INFO_ACCESS_FORBID_CONNECT record.
36.4.1.9 EFI_USER_INFO_ACCESS_BOOT_ORDER

Summary
Modifies the boot order.

Prototype

```c
#define EFI_USER_INFO_ACCESS_BOOT_ORDER 0x00000009

typedef UINT32 EFI_USER_INFO_ACCESS_BOOT_ORDER_HDR;

#define EFI_USER_INFO_ACCESS_BOOT_ORDER_MASK   0x000F
#define EFI_USER_INFO_ACCESS_BOOT_ORDER_INSERT  0x0000
#define EFI_USER_INFO_ACCESS_BOOT_ORDER_APPEND  0x0001
#define EFI_USER_INFO_ACCESS_BOOT_ORDER_REPLACE 0x0002

#define EFI_USER_INFO_ACCESS_BOOT_ORDER_NODEFAULT 0x0010
```

Description
This exclusive record allows the user profile to insert new boot options at the beginning of the boot order
(EFI_USER_INFO_ACCESS_BOOT_ORDER_INSERT), append new boot options to the end of the boot order
(EFI_USER_INFO_ACCESS_BOOT_ORDER_APPEND) or replace the entire boot order
(EFI_USER_INFO_ACCESS_BOOT_ORDER_REPLACE). If
EFI_USER_INFO_ACCESS_BOOT_ORDER_NODEFAULT is specified then the Boot Manager will not
attempt find a default boot device when the default boot order is does not lead to a bootable device.

The boot options specified by this record are still subject to the permissions specified by
EFI_USER_INFO_ACCESS_FORBID_LOAD and EFI_USER_INFO_ACCESS_PERMIT_LOAD.

The record consists of a single EFI_USER_INFO_ACCESS_BOOT_ORDER_HDR followed by zero or more
UEFI device paths.

36.4.2 EFI_USER_INFO_CBEFF_RECORD

Summary
Provides standard biometric information in the format specified by the ISO 19785 (Common Biometric
Exchange Formats Framework) specification.

Prototype

```c
#define EFI_USER_INFO_CBEFF_RECORD 0x0B

typedef VOID *EFI_USER_INFO_CBEFF;
```

36.4.3 EFI_USER_INFO_CREATE_DATE_RECORD

Summary
Provides the date and time when the user profile was created.
Prototype

```c
#define EFI_USER_INFO_CREATE_DATE_RECORD 0x02
typedef EFI_TIME EFI_USER_INFO_CREATE_DATE;
```

Description
The optional record describing the date and time when the user profile was created. Type `EFI_TIME` is defined in `GetTime()` in this specification.

36.4.4 EFI_USER_INFO_CREDENTIAL_PROVIDER_RECORD

Summary
Specifies the credential provider.

Prototype

```c
#define EFI_USER_INFO_CREDENTIAL_PROVIDER_RECORD 0x08
typedef EFI_GUID EFI_USER_INFO_CREDENTIAL_PROVIDER;
```

Description
This record specifies the credential provider via a unique GUID. The credential’s handle is found in the `EFI_USER_INFO` structure associated with this user information record.

36.4.5 EFI_USER_INFO_CREDENTIAL_PROVIDER_NAME_RECORD

Summary
Specifies the user-readable name of a particular credential’s provider.

Prototype

```c
#define EFI_USER_INFO_CREDENTIAL_PROVIDER_NAME_RECORD 0x09
typedef CHAR16 *EFI_USER_INFO_CREDENTIAL_PROVIDER_NAME;
```

Description
This record specifies the null-terminated name of a particular credential provider. The credential’s handle is found in the `EFI_USER_INFO` structure associated with this user information record.

36.4.6 EFI_USER_INFO_CREDENTIAL_TYPE_RECORD

Summary
Specifies the type of a particular credential associated with the user profile.

Prototype

```c
#define EFI_USER_INFO_CREDENTIAL_TYPE_RECORD 0x06
typedef EFI_GUID EFI_USER_INFO_CREDENTIAL_TYPE;
```

Description
This record specifies the type of a particular credential. The credential’s identifier is found in the Credential field of the EFI_USER_INFO structure. The credential types are listed with the EFI_USER_CREDENTIAL2_PROTOCOL.

36.4.7 EFI_USER_INFO_CREDENTIAL_TYPE_NAME_RECORD

Summary
Specifies the user-readable name of a particular credential type.

Prototype

```c
#define EFI_USER_INFO_CREDENTIAL_TYPE_NAME_RECORD 0x07
typedef CHAR16 *EFI_USER_INFO_CREDENTIAL_TYPE_NAME;
```

Description
This record specifies the null-terminated name of a particular credential type. The credential’ handle is found in the EFI_USER_INFO structure associated with this user information record.

36.4.8 EFI_USER_INFO_GUID_RECORD

Summary
Provides placeholder for additional user profile information identified by a GUID.

Prototype

```c
#define EFI_USER_INFO_GUID_RECORD 0xFF
typedef EFI_GUID EFI_USER_INFO_GUID;
```

Description
This record type provides extensibility by prefixing further data fields in the record with a GUID which identifies the format.

36.4.9 EFI_USER_INFO_FAR_RECORD

Summary
Indicates how close of a match the fingerprint must be in order to be considered a match.

Prototype

```c
#define EFI_USER_INFO_FAR_RECORD 0x0C
typedef UINT8 EFI_USER_INFO_FAR;
```

Description
This record specifies how accurate the fingerprint template match must be in order to be considered a match, as a percentage from 0 (no match) to 100 (perfect match). The accuracy may be for all fingerprint sensors (EFI_USER_INFO.Credential is zero) or for a particular fingerprint sensor (EFI_USER_INFO.Credential is non-zero).
36.4.10 EFI_USER_INFO_IDENTIFIER_RECORD

Summary
Provides a unique non-volatile user identifier for each enrolled user.

Prototype

```c
#define EFI_USER_INFO_IDENTIFIER_RECORD 0x05
typedef UINT8 EFI_USER_INFO_IDENTIFIER[16];
```

Description
The user identifier is unique to each enrolled user and non-volatile. Each user profile must have exactly one of these user information records installed. The format of the value is not specified.

Access
Exclusive:Yes
Modify:Only with user-enrollment permissions.
Visibility:Public.

36.4.11 EFI_USER_INFO_IDENTITY_POLICY_RECORD

Summary
Provides the expression which determines which credentials are required to assert user identity.

Prototype

```c
#define EFI_USER_INFO_IDENTITY_POLICY_RECORD 0x0F
typedef struct {
    UINT32 Type;
    UINT32 Length;
} EFI_USER_INFO_IDENTITY_POLICY;
```

Parameters

- **Type**
  Specifies either an operator or a data item. See `EFI_USER_INFO_IDENTITY_*` in “Related Definitions” below.

- **Length**
  The length of this block, in bytes, including this header.
**Description**

The user identity policy is an expression made up of operators and data items. If the expression evaluates to **TRUE**, then this user profile can be selected as the current profile. If the expression evaluates to **FALSE**, then this user profile cannot be selected as the current profile.

Data items are pushed onto an expression stack. Operators pop items off of the expression stack, perform an operator and push the results back.

**Note:** If there is no user identity policy set for a user profile, then **FALSE** is assumed.

**Access**

Exclusive:Yes

Modify:Only with user-enrollment permissions.

Visibility:Public.

**Related Definitions**

```c
#define EFI_USER_INFO_IDENTITY_FALSE 0x00
#define EFI_USER_INFO_IDENTITY_TRUE 0x01
#define EFI_USER_INFO_IDENTITY_CREDENTIAL_TYPE 0x02
#define EFI_USER_INFO_IDENTITY_CREDENTIAL_PROVIDER 0x03
#define EFI_USER_INFO_IDENTITY_NOT 0x10
#define EFI_USER_INFO_IDENTITY_AND 0x11
#define EFI_USER_INFO_IDENTITY_OR 0x12
```

<table>
<thead>
<tr>
<th>Type Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_USER_INFO_IDENTITY_FALSE</td>
<td>Push <strong>FALSE</strong> on to the expression stack.</td>
</tr>
<tr>

</tr>
<tr>
<td>EFI_USER_INFO_IDENTITY_CREDENTIAL_PROVIDER</td>
<td>If a credential provider with the specified provider identifier asserts the user’s identity, push <strong>TRUE</strong>. Otherwise, push <strong>FALSE</strong>. The EFI_USER_INFO_IDENTITY_POLICY structure is followed immediately by a GUID.</td>
</tr>
<tr>
<td>EFI_USER_INFO_IDENTITY_NOT</td>
<td>Pop a boolean off the stack. If <strong>TRUE</strong>, then push <strong>FALSE</strong>. If <strong>FALSE</strong>, then push <strong>TRUE</strong>.</td>
</tr>
<tr>
<td>EFI_USER_INFO_IDENTITY_AND</td>
<td>Pop two Booleans off the stack. If both are <strong>TRUE</strong>, then push <strong>TRUE</strong>. Otherwise push <strong>FALSE</strong>.</td>
</tr>
</tbody>
</table>
36.4.12 EFI_USER_INFO_NAME_RECORD

Summary
Provide the user’s name for the enrolled user.

Prototype
```c
#define EFI_USER_INFO_NAME_RECORD 0x01
typedef CHAR16 *EFI_USER_INFO_NAME;
```

Description
The user’s name is a NULL-terminated string.

Access
Exclusive:Yes
Visibility:Public.

36.4.13 EFI_USER_INFO_PKCS11_RECORD

Summary
Provides PKCS#11 credential information from a smart card.

Prototype
```c
#define EFI_USER_INFO_PKCS11_RECORD 0x0A
```

36.4.14 EFI_USER_INFO_RETRY_RECORD

Summary
Indicates how many attempts the user has to with a particular credential before the system prevents further attempts.

Prototype
```c
#define EFI_USER_INFO_RETRY_RECORD 0x0D
typedef UINT8 EFI_USER_INFO_RETRY;
```

Description
This record indicates the number of times the user may fail identification with all credential providers (EFI_USER_INFO.Credential is zero) or a particular credential provider (EFI_USER_INFO.Credential is non-zero).

Access:
Exclusive:No
Modify: Only with user-enrollment permissions.

Visibility: Public

### 36.4.15 EFI_USER_INFO_USAGE_DATE_RECORD

**Summary**

Provides the date and time when the user profile was selected.

**Prototype**

```c
#define EFI_USER_INFO_USAGE_DATE_RECORD 0x03
typedef EFI_TIME EFI_USER_INFO_USAGE_DATE;
```

**Description**

The optional record describing the date and time when the user profile was last selected. Type **EFI_TIME** is defined in **GetTime()** in this specification.

### 36.4.16 EFI_USER_INFO_USAGE_COUNT_RECORD

**Summary**

Provides the number of times that the user profile has been selected.

**Prototype**

```c
#define EFI_USER_INFO_USAGE_COUNT 0x04
typedef UINT64 EFI_USER_INFO_USAGE_COUNT;
```

**Description**

The optional record describing the number of times that the user profile was selected.

### 36.5 User Information Table

**Summary**

A collection of **EFI_USER_INFO** records, prefixed with this header.

**Prototype**

```c
typedef struct {
    UINT64 Size;
} EFI_USER_INFO_TABLE;
```

**Members**

- **Size**

  Total size of the user information table, in bytes.

**Description**

This header is followed by a series of records. Each record is prefixed by the **EFI_USER_INFO** structure. The total size of this header and all records is equal to **Size**.
37 - Secure Technologies

37.1 Hash Overview

For the purposes of this specification, a hash function takes a variable length input and generates a fixed length hash value. In general, hash functions are collision-resistant, which means that it is infeasible to find two distinct inputs which produce the same hash value. Hash functions are generally one-way which means that it is infeasible to find an input based on the output hash value.

This specification describes a protocol which allows a driver to produce a protocol which supports zero or more hash functions.

37.1.1 Hash References

The following references define the standard means of creating the hashes used in this specification:

For more information

- see “Links to UEFI-Related Documents” ([http://uefi.org/uefi](http://uefi.org/uefi)) under the heading “Archived FIPS publication”.
- see “Links to UEFI-Related Documents” ([http://uefi.org/uefi](http://uefi.org/uefi)) under the heading “MD5 Message-Digest Algorithm”. EFI Hash Protocols

**EFI_HASH_SERVICE_BINDING_PROTOCOL**

**Summary**

The EFI Hash Service Binding Protocol is used to locate hashing services support provided by a driver and create and destroy instances of the EFI Hash Protocol so that a multiple drivers can use the underlying hashing services.

The EFI Service Binding Protocol that is defined in Section 2.5.8 defines the generic Service Binding Protocol functions. This section discusses the details that are specific to the EFI Hash Protocol.

**GUID**

```c
#define EFI_HASH_SERVICE_BINDING_PROTOCOL_GUID \ 
{0x42881c98,0xa4f3,0x44b0,\ 
{0xa3,0x9d,0xdf,0xa1,0x86,0x67,0xd8,0xcd}}
```

**Description**

An application (or driver) that requires hashing services can use one of the protocol handler services, such as `BS->LocateHandleBuffer()`, to search for devices that publish an EFI Hash Service Binding Protocol.

After a successful call to the `EFI_HASH_SERVICE_BINDING_PROTOCOL.CreateChild()` function, the child EFI Hash Protocol driver instance is ready for use. The instance of `EFI_HASH_PROTOCOL` must be
obtained by performing `HandleProtocol()` against the handle returned by `CreateChild()`. Use of other methods, such as `LocateHandle()`, are not supported.

Once obtained, the driver may use the `EFI_HASH_PROTOCOL` instance for any number of non-overlapping hash operations. Overlapping hash operations require an additional call to `EFI_HASH_SERVICE_BINDING_PROTOCOL.CreateChild()` for a new instance.

Before a driver or application terminates execution, every successful call to the `EFI_HASH_SERVICE_BINDING_PROTOCOL.CreateChild()` function must be matched with a call to the `EFIHASH_SERVICE_BINDING_PROTOCOL.DestroyChild()` function.

**EFI_HASH_PROTOCOL**

**Summary**

This protocol describes standard hashing functions.

**GUID**

```c
#define EFI_HASH_PROTOCOL_GUID \
{0xc5184932,0xdba5,0x46db,\ 
{0xa5,0xba,0xcc,0x0b,0xda,0x9c,0x14,0x35}}
```

**Protocol Interface Structure**

```c
typedef _EFI_HASH_PROTOCOL {
    EFI_HASH_GET_HASH_SIZE GetHashSize;
    EFI_HASH_HASH Hash;
} EFI_HASH_PROTOCOL;
```

**Parameters**

- **GetHashSize**
  Return the size of a specific type of resulting hash.

- **Hash**
  Create a hash for the specified message.

**Description**

This protocol allows creating a hash of an arbitrary message digest using one or more hash algorithms. The `GetHashSize` returns the expected size of the hash for a particular algorithm and whether or not that algorithm is, in fact, supported. The `Hash` actually creates a hash using the specified algorithm.

**Related Definitions**

None.

**EFI_HASH_PROTOCOL.GetHashSize()**

**Summary**

Returns the size of the hash which results from a specific algorithm.
Prototype

```c
EFI_STATUS
EFIAPI
GetHashSize(
    IN CONST EFI_HASH_PROTOCOL *This,
    IN CONST EFI_GUID *HashAlgorithm,
    OUT UINTN *HashSize
);
```

Parameters

- `This` Points to this instance of `EFI_HASH_PROTOCOL`.
- `HashAlgorithm` Points to the `EFI_GUID` which identifies the algorithm to use. See Section 37.1.2.1.
- `HashSize` Holds the returned size of the algorithm's hash.

Description

This function returns the size of the hash which will be produced by the specified algorithm.

Related Definitions

None

Status Codes Returned

<table>

<td><code>HashSize</code> is <code>NULL</code> or <code>HashAlgorithm</code> is <code>NULL</code>.</td>
</tr>
<tr>
<td>EFI_UNSUPPORTED</td>
<td>The algorithm specified by <code>HashAlgorithm</code> is not supported by this driver.</td>
</tr>
</tbody>
</table>

`EFI_HASH_PROTOCOL.Hash()`

Summary

Creates a hash for the specified message text.

Prototype

```c
EFI_STATUS
EFIAPI
Hash(
    IN CONST EFI_HASH_PROTOCOL *This,
    IN CONST EFI_GUID *HashAlgorithm,
    IN BOOLEAN Extend,
    IN CONST UINT8 *Message,
    IN UINT64 MessageSize,
    IN OUT EFI_HASH_OUTPUT *Hash
```
Parameters

This
Points to this instance of EFI_HASH_PROTOCOL.

HashAlgorithm
Points to the EFI_GUID which identifies the algorithm to use. See Section 37.1.2.1.

Extend
Specifies whether to create a new hash (FALSE) or extend the specified existing hash (TRUE).

Message
Points to the start of the message.

MessageSize
The size of Message, in bytes. Must be integer multiple of block size.

Hash
On input, if Extend is TRUE, then this parameter holds a pointer to a pointer to an array containing the hash to extend. If Extend is FALSE, then this parameter holds a pointer to a pointer to a caller-allocated array that will receive the result of the hash computation. On output (regardless of the value of Extend), the array will contain the result of the hash computation.

Description

This function creates the hash of the specified message text based on the specified algorithm HashAlgorithm and copies the result to the caller-provided buffer Hash. If Extend is TRUE, then the hash specified on input by Hash is extended. If Extend is FALSE, then the starting hash value will be that specified by the algorithm.

Note: For the all algorithms used with EFI_HASH_PROTOCOL, the following apply:

- The EFI_HASH_PROTOCOL.Hash() function does not perform padding of message data for these algorithms. Hence, MessageSize shall always be an integer multiple of the HashAlgorithm block size, and the final supplied Message in a sequence of invocations shall contain caller-provided padding. This will ensure that the final Hash output will be the correct hash of the provided message(s).
- The result of a Hash() call for one of these algorithms when the caller does not supply message data whose length is an integer multiple of the algorithm’s block size is a returned error.
- The EFI_HASH_OUTPUT options for these two algorithms shall be EFI_SHA1_HASH and EFI_SHA256_HASH, respectively.
- Callers using these algorithms may consult the aforementioned Secure Hash Standard for details on how to perform proper padding required by standard prior to final invocation.

37.1.2 Other Code Definitions

**EFI_SHA1_HASH, EFI_SHA224_HASH, EFI_SHA256_HASH, EFI_SHA384_HASH, EFI_SHA512HASH, EFI_MD5_HASH**

Summary
Data structure which holds the result of the hash.

Prototype

```c
typedef UINT8 EFI_MD5_HASH[16];
typedef UINT8 EFI_SHA1_HASH[20];
typedef UINT8 EFI_SHA224_HASH[28];
typedef UINT8 EFI_SHA256_HASH[32];
typedef UINT8 EFI_SHA384_HASH[48];
typedef UINT8 EFI_SHA512_HASH[64];
typedef union _EFI_HASH_OUTPUT {
    EFI_MD5_HASH  *Md5Hash;
    EFI_SHA1_HASH *Sha1Hash;
    EFI_SHA224_HASH *Sha224Hash;
    EFI_SHA256_HASH *Sha256Hash;
    EFI_SHA384_HASH *Sha384Hash;
    EFI_SHA512_HASH *Sha512Hash;
} EFI_HASH_OUTPUT;
```

Description
These prototypes describe the expected hash output values from the Hash function of the EFI_HASH_PROTOCOL.

37.1.2.1 EFI Hash Algorithms
The following table gives the EFI_GUID for standard hash algorithms and the corresponding ASN.1 OID (Object Identifier):
**Note:** Use of the following algorithms with EFI_HASH_PROTOCOL is deprecated.

- EFI_HASH_ALGORITHM_SHA1_GUID
- EFI_HASH_ALGORITHM_SHA224_GUID
- EFI_HASH_ALGORITHM_SHA256_GUID
- EFI_HASH_ALGORITHM_SHA384_GUID
- EFI_HASH_ALGORITHM_SHA512_GUID
- EFI_HASH_ALGORITHM_MD5_GUID

### Table 37-1 EFI Hash Algorithms

<table>
<thead>
<tr>
<th>Algorithm</th>
<th>EFW_GUID</th>
<th>OID</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHA-1 (No padding done by implementation)</td>
<td>#define EFI_HASH_ALGORITHM_SHA1_NOPAD_GUID {0x24c5dc2f, 0x53e2, 0x40ca, {0x9e, 0xd6, 0xa5, 0xd9, 0xa4, 0x9f, 0x46, 0x3b}}</td>
<td>id-sha1 OBJECT IDENTIFIER ::= { iso(1) identified-organization(3) oiw(14) secsig(3) algorithms(2) 26 }</td>
</tr>
<tr>
<td>SHA-256 (No padding done by implementation)</td>
<td>#define EFI_HASH_ALGORITHM_SHA256_NOPAD_GUID {0x8628752a, 0x6cb7, 0x4814, {0x96, 0xfc, 0x24, 0xa8, 0x15, 0xac, 0x22, 0x26}}</td>
<td>id-sha256 OBJECT IDENTIFIER ::= { joint-iso-itu-t (2) country (16) us (840) organization (1) gov (101) csor (3) nistalgorithm (4) hashalgs (2) 1 }</td>
</tr>
</tbody>
</table>

**Note:** For the EFI_HASH_ALGORITHM_SHA1_NOPAD_GUID and the EFI_HASH_ALGORITHM_SHA256_NOPAD_GUID, the following apply:

- The EFI_HASH_PROTOCOL.Hash() function does not perform padding of message data for these algorithms. Hence, MessageSize shall always be an integer multiple of the HashAlgorithm block size, and the final supplied Message in a sequence of invocations shall contain caller-provided padding. This will ensure that the final Hash output will be the correct hash of the provided message(s).
- The result of a Hash() call for one of these algorithms when the caller does not supply message data whose length is an integer multiple of the algorithm’s block size is undefined.
- The EFI_HASH_OUTPUT options for these two algorithms shall be EFI_SHA1_HASH and EFI_SHA256_HASH, respectively.
- Callers using these algorithms may consult the aforementioned Secure Hash Standard for details on how to perform proper padding.
37.2 Hash2 Protocols

37.2.1 EFI Hash2 Service Binding Protocol

EFI_HASH2_SERVICE_BINDING_PROTOCOL

Summary
The EFI Hash2 Service Binding Protocol is used to locate EFI_HASH2_PROTOCOL hashing services support provided by a driver and create and destroy instances of the EFI_HASH2_PROTOCOL Protocol so that a multiple drivers can use the underlying hashing services.

The EFI Service Binding Protocol that is defined in Section 2.5.8 defines the generic Service Binding Protocol functions. This section discusses the details that are specific to the EFI Hash Protocol.

GUID

```
#define EFI_HASH2_SERVICE_BINDING_PROTOCOL_GUID
{0xda836f8d, 0x217f, 0x4ca0, 0x99, 0xc2, 0x1c, 0xa4, 0xe1, 0x60, 0x77, 0xea}
```

Description
An application (or driver) that requires hashing services can use one of the protocol handler services, such as BS->LocateHandleBuffer(), to search for devices that publish an EFI_HASH2_SERVICE_BINDING_PROTOCOL.

After a successful call to the EFI_HASH2_SERVICE_BINDING_PROTOCOL member CreateChild() function, the child instance of EFI_HASH2_PROTOCOL Protocol driver instance is ready for use. The instance of EFI_HASH2_PROTOCOL must be obtained by performing HandleProtocol() against the handle returned by CreateChild(). Use of other methods, such as LocateHandle() is not supported.

Once obtained, the driver may use the EFI_HASH2_PROTOCOL instance for any number of non-overlapping hash operations. Overlapping hash operations require an additional call to EFI_HASH_SERVICE_BINDING_PROTOCOL.CreateChild() for a new instance.

Before a driver or application using the instance terminates execution, every successful call to the EFI_HASH_SERVICE_BINDING_PROTOCOL.CreateChild() function must be matched with a call to the EFI_HASH_SERVICE_BINDING_PROTOCOL.DestroyChild() function.

37.2.2 EFI Hash2 Protocol

EFI_HASH2_PROTOCOL

Summary
This protocol describes hashing functions for which the algorithm-required message padding and finalization are performed by the supporting driver. In previous versions of the specification, the algorithms supported by EFI_HASH2_PROTOCOL were also available for use with EFI_HASH_PROTOCOL but this usage has been deprecated.
GUID

```c
#define EFI_HASH2_PROTOCOL_GUID \
{ 0x55b1d734, 0xc5e1, 0x49db, 0x96, 0x47, 0xb1, \n 0xfb, 0xe, 0x30, 0x5b}
```

Protocol Interface Structure

```c
typedef _EFI_HASH2_PROTOCOL {
  EFI_HASH2_GET_HASH_SIZE GetHashSize;
  EFI_HASH2_HASH Hash;
  EFI_HASH2_HASH_INIT HashInit;
  EFI_HASH2_HASH_UPDATE HashUpdate;
  EFI_HASH2_HASH_FINAL HashFinal;
} EFI_HASH2_PROTOCOL;
```

Parameters

- **GetHashSize**
  Return the result size of a specific type of resulting hash.

- **Hash**
  Create a final non-extendable hash for a single message block in a single call.

- **HashInit**
  Initializes an extendable multi-part hash calculation

- **HashUpdate**
  Continues a hash in progress by supplying the first or next sequential portion of the message text

- **HashFinal**
  Finalizes a hash in progress by padding as required by algorithm and returning the hash output.

Description

This protocol allows creating a hash of an arbitrary message digest using one or more hash algorithms. The **GetHashSize()** function returns the expected size of the hash for a supported algorithm and an error if that algorithm is not supported. The **Hash()** function creates a final, non-extendable, hash of a single message block using the specified algorithm. The three functions **HashInit()**, **HashUpdate()**, **HashFinal()**, generates the hash of a multi-part message, with input composed of one or more message pieces.

For a specific handle representing an instance of **EFI_HASH2_PROTOCOL**, if **Hash()** is called after a call to **HashInit()** and prior to the matching call to **HashFinal()**, the multi-part hash started by **HashInit()** will be canceled and calls to **HashUpdate()** or **HashFinal()** will return an error status unless proceeded by a new call to **HashInit()**.

**Note:** Algorithms **EFI_HASH_ALGORITHM_SHA1_NOPAD** and **EFI_HASH_ALGORITHM_SHA256_NOPAD_GUID** are not compatible with **EFI_HASH2_PROTOCOL** and will return **EFI_UNSUPPORTED** if used with any **EFI_HASH2_PROTOCOL** function.

Related Definitions

None
Note: The following hash function invocations will produce identical hash results for all supported EFI_HASH2_PROTOCOL algorithms. The data in quotes is the message.

EFI_HASH2_PROTOCOL.GetHashSize()

Summary
Returns the size of the hash which results from a specific algorithm.

Prototype

```c
EFI_STATUS
EFIAPI
GetHashSize(
    IN CONST EFI_HASH2_PROTOCOL *This,
    IN CONST EFI_GUID *HashAlgorithm,
    OUT UINTN *HashSize
);
```

Parameters

- **This**
  Points to this instance of **EFI_HASH2_PROTOCOL**.
- **HashAlgorithm**
  Points to the **EFI_GUID** which identifies the algorithm to use. See Section 37.2.3
- **HashSize**
  Holds the returned size of the algorithm's hash.

Description
This function returns the size of the hash result buffer which will be produced by the specified algorithm.

**EFI_HASH2_PROTOCOL.Hash()**

**Summary**

Creates a hash for a single message text. The hash is not extendable. The output is final with any algorithm-required padding added by the function.

**Prototype**

```c
EFI_STATUS
EFILEAPI
Hash(
    IN CONST EFI_HASH2_PROTOCOL *This,
    IN CONST EFI_GUID *HashAlgorithm,
    IN CONST UINT8 *Message,
    IN UINTN MessageSize,
    IN OUT EFI_HASH2_OUTPUT *Hash
);```

**Parameters**

- **This**
  Points to this instance of **EFI_HASH2_PROTOCOL**.
- **HashAlgorithm**
  Points to the **EFI_GUID** which identifies the algorithm to use. See Table 37-3.
- **Message**
  Points to the start of the message.
- **MessageSize**
  The size of Message, in bytes.
Hash

On input, points to a caller-allocated buffer of the size returned by \texttt{GetHashSize()} for the specified \texttt{HashAlgorithm}. On output, the buffer holds the resulting hash computed from the message.

Description

This function creates the hash of specified single block message text based on the specified algorithm \texttt{HashAlgorithm} and copies the result to the caller-provided buffer \texttt{Hash}. The resulting hash cannot be extended. All padding required by \texttt{HashAlgorithm} is added by the implementation.

\texttt{EFI_HASH2_PROTOCOL.HashInit()}

Summary

This function must be called to initialize a digest calculation to be subsequently performed using the \texttt{EFI_HASH2_PROTOCOL} functions \texttt{HashUpdate()} and \texttt{HashFinal()}. 

Prototype

\begin{verbatim}
EFI_STATUS
EFIAPI
HashInit(
    IN CONST EFI_HASH2_PROTOCOL *This,
    IN CONST EFI_GUID *HashAlgorithm,
); 
\end{verbatim}

Parameters

\begin{verbatim}
This
HashAlgorithm
\end{verbatim}

Points to instance of \texttt{EFI_HASH2_PROTOCOL}. Points to the \texttt{EFI_GUID} which identifies the algorithm to use. See \texttt{Table 37-3}.

</tbody>
</table>

**EFI_HASH2_PROTOCOL.HashUpdate()**

**Summary**
Updates the hash of a computation in progress by adding a message text.

**Prototype**

```c
EFI_STATUS
EFI_API
HashUpdate(
   IN CONST EFI_HASH2_PROTOCOL *This,
   IN CONST UINT8 *Message,
   IN UINTN MessageSize
);
```

**Parameters**

- **This** Points to instance of EFI_HASH2_PROTOCOL.
- **Message** Points to the start of the message.
- **MessageSize** The size of Message, in bytes.

**Description**
This function extends the hash of ongoing hash operation with the supplied message text. This function should be called one or more times with portions of the total message text to be hashed. A zero-length message input will return EFI_SUCCESS and has no impacts on the ongoing hash instance.

</tbody>
</table>

**EFI_HASH2_PROTOCOL.HashFinal()**

**Summary**
Finalizes a hash operation in progress and returns calculation result. The output is final with any necessary padding added by the function. The hash may not be further updated or extended after HashFinal().

**Prototype**
```c
EFI_STATUS
EFIAPI
HashFinal(
    IN CONST EFI_HASH2_PROTOCOL *This,
    IN OUT EFI_HASH2_OUTPUT *Hash
);
```

**Parameters**
- **This** Points to instance of EFI_HASH2_PROTOCOL.
- **Hash** On input, points to a caller-allocated buffer of the size returned by GetHashSize() for the specified HashAlgorithm specified in preceding HashInit(). On output, the buffer holds the resulting hash computed from the message.

**Description**
This function finalizes the hash of a hash operation in progress. The resulting final hash cannot be extended.

</tbody>
</table>
37.2.3 Other Code Definitions

**EFI_HASH2_OUTPUT**

**Summary**

Data structure which holds the result of the hash operation from `EFI_HASH2_PROTOCOL` hash operations.

**Prototype**

```c
typedef UINT8 EFI_MD5_HASH2[16];
typedef UINT8 EFI_SHA1_HASH2[20];
typedef UINT8 EFI_SHA224_HASH2[28];
typedef UINT8 EFI_SHA256_HASH2[32];
typedef UINT8 EFI_SHA384_HASH2[48];
typedef UINT8 EFI_SHA512_HASH2[64];
typedef union _EFI_HASH2_OUTPUT {
    EFI_MD5_HASH2     Md5Hash;
    EFI_SHA1_HASH2    Sha1Hash;
    EFI_SHA224_HASH2  Sha224Hash;
    EFI_SHA256_HASH2  Sha256Hash;
    EFI_SHA384_HASH2  Sha384Hash;
    EFI_SHA512_HASH2  Sha512Hash;
} EFI_HASH2_OUTPUT;
```

**Note:** SHA-1 and MD5 are included for backwards compatibility. New driver implementations are encouraged to consider stronger algorithms.
Description
These prototypes describe the expected hash output values from the hashing functions of the EFI_HASH2_PROTOCOL.

37.3 Key Management Service

EFI_KEY_MANAGEMENT_SERVICE_PROTOCOL

Summary
The Key Management Service (KMS) protocol provides services to generate, store, retrieve, and manage cryptographic keys. The intention is to specify a simple generic protocol that could be used for many implementations.

The management keys have a simple construct – they consist of key identifier and key data, both of variable size.

A driver implementing the protocol may need to provide basic key service that consists of a key store and cryptographic key generation capability. It may connect to an external key server over the network, or to a Hardware Security Module (HSM) attached to the system it runs on, or anything else that is capable of providing the key management service.

Authentication and access control is not addressed by this protocol. It is assumed it is addressed at the system level and done by the driver implementing the protocol, if applicable to the implementation.

GUID

```
#define EFI_KMS_PROTOCOL_GUID \
{0xEC3A978D,0x7C4E, 0x48FA, \
{0x9A,0xBE,0x6A,0xD9,0x1C,0xC8,0xF8,0x11}}
```

Protocol Interface Structure

```
#define EFI_KMS_DATA_TYPE_NONE  0
#define EFI_KMS_DATA_TYPE_BINARY 1
#define EFI_KMS_DATA_TYPE_ASCII  2
#define EFI_KMS_DATA_TYPE_UNICODE 4
#define EFI_KMS_DATA_TYPE_UTF8  8
```

Where appropriate, EFI_KMS_DATA_TYPE values may be combined using a bitwise ‘OR’ operation to indicate support for multiple data types.
typedef struct _EFI_KMS_SERVICE_PROTOCOL {
    EFI_KMS_GET_SERVICE_STATUS GetServiceStatus;
    EFI_KMS_REGISTER_CLIENT RegisterClient;
    EFI_KMS_CREATE_KEY CreateKey;
    EFI_KMS_GET_KEY GetKey;
    EFI_KMS_ADD_KEY AddKey;
    EFI_KMS_DELETE_KEY DeleteKey;
    EFI_KMS_GET_KEY_ATTRIBUTES GetKeyAttributes;

    EFI_GUID ServiceId;
    CHAR16 *ServiceName;
    UINT32 ServiceVersion;
    BOOLEAN ServiceAvailable;
    BOOLEAN ClientIdSupported;
    BOOLEAN ClientIdRequired;
    UINT16 ClientIdMaxSize;
    UINT8 ClientNameStringTypes;
    BOOLEAN ClientNameRequired;
    UINT16 ClientNameMaxCount;
    BOOLEAN ClientDataSupported;
    UINTN ClientDataMaxSize;
    BOOLEAN KeyIdVariableLenSupported;
    UINTN KeyIdMaxSize;
    UINTN KeyFormatsCount;
    EFI_GUID *KeyFormats;
    BOOLEAN KeyAttributesSupported;
    UINT8 KeyAttributeIdStringTypes;
    UINT16 KeyAttributeIdMaxCount;
    UINTN KeyAttributesCount;
    EFI_KMS_KEY_ATTRIBUTE *KeyAttributes;
} EFI_KMS_PROTOCOL;

Parameters

GetServiceStatus Get the current status of the key management service. If the implementation has not yet connected to the KMS, then a call to this function will initiate a connection. This is the only function that is valid for use prior to the service being marked available.

RegisterClient Register a specific client with the KMS.
CreateKey Request the generation of a new key and retrieve it.
GetKey Retrieve an existing key.
AddKey  Add a local key to the KMS database. If there is an existing key with this key identifier in the KMS database, it will be replaced with the new key.

DeleteKey Delete an existing key from the KMS database.

AddKeyAttributes Add attributes to an existing key in the KMS database.

GetKeyAttributes Get attributes for an existing key in the KMS database.

DeleteKeyAttributes Delete attributes for an existing key in the KMS database.

GetKeyByAttributes Get existing key(s) with the specified attributes.

ProtocolVersion The version of this EFI_KMS_PROTOCOL structure. This must be set to 0x00020040 for the initial version of this protocol.

ServiceId Optional GUID used to identify a specific KMS. This GUID may be supplied by the provider, by the implementation, or may be null. If it is null, then the ServiceName must not be null.

ServiceName Optional pointer to a unicode string which may be used to identify the KMS or provide other information about the supplier.

ServiceVersion Optional 32-bit value which may be used to indicate the version of the KMS provided by the supplier.

ServiceAvailable TRUE if and only if the service is active and available for use. To avoid unnecessary delays in POST, this protocol may be installed without connecting to the service. In this case, the first call to the GetServiceStatus() function will cause the implementation to connect to the supported service and mark it as available. The capabilities of this service as defined in the remainder of this protocol are not guaranteed to be valid until the service has been marked available. FALSE otherwise.

ClientIdSupported TRUE if and only if the service supports client identifiers. Client identifiers may be used for auditing, access control or any other purpose specific to the implementation. FALSE otherwise.

ClientIdRequired TRUE if and only if the service requires a client identifier in order to process key requests. FALSE otherwise.

ClientIdMaxSize The maximum size in bytes for the client identifier.

ClientNameStringTypes The client name string type(s) supported by the KMS service. If client names are not supported, this field will be set to EFI_KMS_DATA_TYPE_NONE. Otherwise, it will be set to the inclusive 'OR' of all client name formats supported. Client names may be used for auditing, access control or any other purpose specific to the implementation.

ClientNameRequired TRUE if and only if the KMS service requires a client name to be supplied to the service. FALSE otherwise.
**ClientNameMaxCount**
The maximum number of characters allowed for the client name.

**ClientDataSupported**

TRUE if and only if the service supports arbitrary client data requests. The use of client data requires the caller to have specific knowledge of the individual KMS service and should be used only if absolutely necessary.
FALSE otherwise.

**ClientDataMaxSize**
The maximum size in bytes for the client data. If the maximum data size is not specified by the KMS or it is not known, then this field must be filled with all ones.

**KeyIdVariableLenSupported**

TRUE if variable length key identifiers are supported.
FALSE if a fixed length key identifier is supported.

**KeyIdMaxLen**
If **KeyIdVariableLenSupported** is TRUE, this is the maximum supported key identifier length in bytes. Otherwise this is the fixed length of key identifier supported. Key ids shorter than the fixed length will be padded on the right with blanks.

**KeyFormatsCount**
The number of key format/size GUIDs returned in the **KeyFormats** field.

**KeyFormats**
A pointer to an array of **EFI_GUID** values which specify key formats/sizes supported by this KMS. Each format/size pair will be specified by a separate **EFI_GUID**. At least one key format/size must be supported. All formats/sizes with the same hashing algorithm must be contiguous in the array, and for each hashing algorithm, the key sizes must be in ascending order. See “Related Definitions” for GUIDs which identify supported key formats/sizes.

‘This list of GUIDs supported by the KMS is not required to be exhaustive, and the KMS may provide support for additional key formats/sizes. Users may request key information using an arbitrary GUID, but any GUID not recognized by the implementation or not supported by the KMS will return an error code of **EFI_UNSUPPORTED**.

**KeyAttributesSupported**

TRUE if key attributes are supported.
FALSE if key attributes are not supported.

**KeyAttributeIdStringTypes**
The key attribute identifier string type(s) supported by the KMS service. If key attributes are not supported, this field will be set to **EFI_KMS_DATA_TYPE_NONE**. Otherwise, it will be set to the inclusive ‘OR’ of all key attribute identifier string types
supported. **EFI_KMS_DATA_TYPE_BINARY** is not valid for this field.

**KeyAttributeIdMaxCount**
- The maximum number of characters allowed for the client name.

**KeyAttributesCount**
- The number of predefined **KeyAttributes** structures returned in the **KeyAttributes** parameter. If the KMS does not support predefined key attributes, or if it does not provide a method to obtain predefined key attributes data, then this field must be zero.

**KeyAttributes**
- A pointer to an array of **KeyAttributes** structures which contains the predefined attributes supported by this KMS. Each structure must contain a valid key attribute identifier and should provide any other information as appropriate for the attribute, including a default value if one exists. This variable must be set to **NULL** if the **KeyAttributesCount** variable is zero. It must point to a valid buffer if the **KeyAttributesCount** variable is non-zero.

This list of predefined attributes is not required to be exhaustive, and the KMS may provide additional predefined attributes not enumerated in this list. The implementation does not distinguish between predefined and used defined attributes, and therefore, predefined attributes not enumerated will still be processed to the KMS.

### Related Definitions

Functions defined for this protocol typically require the caller to provide information about the client, the keys to be processed, and/or attributes of the keys to be processed. Four structures, **EFI_KMS_CLIENTINFO**, **EFI_KMS_KEY_DESCRIPTOR**, **EFI_KMS_DYNAMIC_ATTRIBUTE**, and **EFI_KMS_KEY_ATTRIBUTE** define the information to be passed to these functions.

```c
typedef struct {
    UINT16 ClientIdSize;
    VOID* clientId;
    UINT8 ClientNameType;
    UINT8 ClientNameCount;
    VOID* ClientName;
} EFI_KMS_CLIENTINFO;
```

- **ClientIdSize**: The size in bytes for the client identifier.
- **ClientId**: Pointer to a valid client identifier.
- **ClientNameType**: The client name string type used by this client. The string type set here must be one of the string types reported in the **ClientNameStringTypes** field of the KMS protocol. If the KMS does not support client names, this field should be set to **EFI_KMS_DATA_TYPE_NONE**.
ClientNameCount

The size in characters for the client name. This field will be ignored if ClientNameStringType is set to **EFI_KMS_DATA_TYPE_NONE.** Otherwise, it must contain number of characters contained in the ClientName field.

ClientName

Pointer to a client name. This field will be ignored if ClientNameStringType is set to **EFI_KMS_DATA_TYPE_NONE.** Otherwise, it must point to a valid string of the specified type.

The key formats recognized by the KMS protocol are defined by an **EFI_GUID** which specifies a (key-algorithm, key-size) pair. The names of these GUIDs are in the format **EFI_KMS_KEY_(key-algorithm)_(_key-size)_GUID**, where the key-size is expressed in bits. The key formats recognized fall into three categories, generic (no algorithm), hash algorithms, and encrypted algorithms.

**Generic Key Data:**

The following GUIDs define formats that contain generic key data of a specific size in bits, but which is not associated with any specific key algorithm(s).

```c
#define EFI_KMS_FORMAT_GENERIC_128_GUID \
{0xec8a3d69,0x6ddf,0x4108,\ 
 {0x94,0x76,0x73,0x37,0xfc,0x52,0x21,0x36}}

#define EFI_KMS_FORMAT_GENERIC_160_GUID \
{0xa3b3e6f8,0xefca,0x4bc1,\ 
 {0x88,0xfb,0xcb,0x87,0x33,0x9b,0x25,0x79}}

#define EFI_KMS_FORMAT_GENERIC_256_GUID \
{0x70f64793,0xc323,0x4261,\ 
 {0xac,0x2c,0xd8,0x76,0xf2,0x7c,0x53,0x45}}

#define EFI_KMS_FORMAT_GENERIC_512_GUID \
{0x978fe043,0xd7af,0x422e,\ 
 {0x8a,0x92,0x2b,0x48,0xe4,0x63,0xbd,0xe6}}

#define EFI_KMS_FORMAT_GENERIC_1024_GUID \
{0x978fe043,0xdd7b,0x422e,\ 
 {0xb0,0x9c,0xe5,0xe4,0x63,0xbd,0xe6}}

#define EFI_KMS_FORMAT_GENERIC_2048_GUID \
{0x978fe043,0xdd7b,0x422e,\ 
 {0xb0,0x9c,0xe5,0xe4,0x63,0xbd,0xe6}}

#define EFI_KMS_FORMAT_GENERIC_3072_GUID \
{0x978fe043,0xdd7b,0x422e,\ 
 {0xb0,0x9c,0xe5,0xe4,0x63,0xbd,0xe6}}

#define EFI_KMS_FORMAT_GENERIC_DYNAMIC_GUID \
```

The **EFI_KMS_FORMAT_GENERIC_DYNAMIC_GUID** is defined for the key data with a size not defined by a certain key format GUID. The key value specified by this GUID is in format of structure **EFI_KMS_FORMAT_GENERIC_DYNAMIC**.

```c
typedef struct {
    UINT32  KeySize;
    UINT8    KeyData[1];
} EFI_KMS_FORMAT_GENERIC_DYNAMIC;
```

**KeySize** Length in bytes of the **KeyData**.

**KeyData** The data of the key.

**Hash Algorithm Key Data:**

These GUIDS define key data formats that contain data generated by basic hash algorithms with no cryptographic properties.

```c
#define EFI_KMS_FORMAT_MD2_128_GUID \
    {0x78be11c4,0xee44,0x4a22,\ 
    {0x9f,0x05,0x03,0x85,0x2e,0xc5,0xc9,0x78}}

#define EFI_KMS_FORMAT_MDC2_128_GUID \
    {0xf7ad60f8,0xefa8,0x44a3,\ 
    {0x91,0x13,0x23,0x1f,0x39,0x9e,0xb4,0xc7}}

#define EFI_KMS_FORMAT_MD4_128_GUID \
    {0xd1c17aa1,0xcac5,0x400f,0xbe,\ 
    {0x17,0xe2,0xa2,0xae,0x06,0x67,0x7c}}

#define EFI_KMS_FORMAT_MDC4_128_GUID \
    {0x3fa4f847,0xd8eb,0x4df4,\ 
    {0xbd,0x49,0x10,0x3a,0x0a,0x84,0x7b,0xbc}}

#define EFI_KMS_FORMAT_MD5_128_GUID \
    {0xdcbbc3662,0x9cda,0x4b52,\ 
    {0xa0,0x4c,0x82,0xeb,0x1d,0x23,0x48,0xc7}}

#define EFI_KMS_FORMAT_MD5SHA_128_GUID \
    {0x1c178237,0x6897,0x459e,\ 
    {0x9d,0x36,0x67,0xce,0x8e,0xf9,0x4f,0x76}}

#define EFI_KMS_FORMAT_SHA1_160_GUID \
    {0x453c5e5a,0x482d,0x43f0,\ 
    {0x87,0xc9,0x59,0x41,0xf3,0xa3,0x8a,0xc2}}
```
Encryption Algorithm Key Data:

These GUIDs define key data formats that contain data generated by cryptographic key algorithms. There may or may not be a separate data hashing algorithm associated with the key algorithm.

The encryption algorithms defined above have the following properties:
Table 37-4 Encryption algorithm properties.

typedef struct {
    UINT8     KeyIdentifierSize;
    VOID      *KeyIdentifier;
    EFI_GUID  KeyFormat;
    VOID      *KeyValue;
    EFI_STATUS KeyStatus;
} EFI_KMS_KEY_DESCRIPTOR;

KeyIdentifierSize The size of the KeyIdentifier field in bytes. This field is limited to the range 0 to 255.

KeyIdentifier Pointer to an array of KeyIdentifierType elements.

KeyFormat An EFI_GUID which specifies the algorithm and key value size for this key.

KeyValue Pointer to a key value for a key specified by the KeyFormat field. A NULL value for this field indicates that no key is available.

KeyStatus Specifies the results of KMS operations performed with this descriptor. This field is used to indicate the status of individual operations when a KMS function is called with multiple EFI_KMS_KEY_DESCRIPTOR structures. KeyStatus codes returned for the individual key requests are:

#define EFI_KMS_ATTRIBUTE_TYPE_INTERVAL    0x09
#define EFI_KMS_ATTRIBUTE_TYPE_STRUCTURE   0x0A
#define EFI_KMS_ATTRIBUTE_TYPE_DYNAMIC    0x0B
```

typedef struct {
    UINT32             FieldCount;
    EFI_KMS_DYNAMIC_FIELD Field[1];
} EFI_KMS_DYNAMIC_ATTRIBUTE;

**FieldCount**

The number of members in the `EFI_KMS_DYNAMIC_ATTRIBUTE` structure.

**Field**

An array of `EFI_KMS_DYNAMIC_FIELD` structures.
typedef struct {
    UINT16  Tag;
    UINT16  Type;
    UINT32  Length;
    UINT8   KeyAttributeData[1];
} EFI_KMS_DYNAMIC_FIELD;

Tag           Part of a tag-type-length triplet that identifies the
              KeyAttributeData formatting. The definition of the value is
              outside the scope of this standard and may be defined by the
              KMS.

Type          Part of a tag-type-length triplet that identifies the
              KeyAttributeData formatting. The definition of the value is
              outside the scope of this standard and may be defined by the
              KMS.

Length        Length in bytes of the KeyAttributeData.

KeyAttributeData An array of bytes to hold the attribute data associated with
                  the KeyAttributeIdentifier.

typedef struct {
    UINT8   KeyAttributeIdentifierType;
    UINT8   KeyAttributeIdentifierCount;
    VOID    *KeyAttributeIdentifier;
    UINT16  KeyAttributeInstance;
    UINT16  KeyAttributeType;
    UINT16  KeyAttributeValueSize;
    VOID    *KeyAttributeValue;
    EFI_STATUS  KeyAttributeStatus;
} EFI_KMS_KEY_ATTRIBUTE;

KeyAttributeIdentifierType The data type used for the KeyAttributeIdentifier field.
                             Values for this field are defined by the EFI_KMS_DATA_TYPE
                             constants, except that EFI_KMS_DATA_TYPE_BINARY is not
                             valid for this field.

KeyAttributeIdentifierCount The length of the KeyAttributeIdentifier field in units
                               defined by KeyAttributeIdentifierType field. This field is
                               limited to the range 0 to 255.

KeyAttributeIdentifier Pointer to an array of KeyAttributeIdentifierType
                           elements. For string types, there must not be a null-
                           termination element at the end of the array.
KeyAttributeInstance
The instance number of this attribute. If there is only one instance, the value is set to one. If this value is set to 0xFFFF (all binary 1’s) then this field should be ignored if an output or treated as a wild card matching any value if it is an input. If the attribute is stored with this field, it will match any attribute request regardless of the setting of the field in the request. If set to 0xFFFF in the request, it will match any attribute with the same KeyAttributeIdentifier.

KeyAttributeType
The data type of the KeyAttributeValue (e.g. struct, bool, etc.). See the list of KeyAttributeType definitions.

KeyAttributeValueSize
The size in bytes of the KeyAttribute field. A value of zero for this field indicates that no key attribute value is available.

KeyAttributeValue
Pointer to a key attribute value for the attribute specified by the KeyAttributeIdentifier field. If the KeyAttributeValueSize field is zero, then this field must be NULL.

KeyAttributeStatus
Specifies the results of KMS operations performed with this attribute. This field is used to indicate the status of individual operations when a KMS function is called with multiple EFI_KMS_KEY_ATTRIBUTE structures. KeyAttributeStatus codes returned for the individual key attribute requests are:

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>

<td>Device or key server error.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>A field in the EFI_KMS_KEY_ATTRIBUTE structure is invalid.</td>
</tr>
<tr>
<td>EFI_NOT_FOUND</td>
<td>The key attribute does not exist on the KMS.</td>
</tr>
</tbody>
</table>

Description
The EFI_KMS_SERVICE_PROTOCOL defines a UEFI protocol that can be used by UEFI drivers and applications to access cryptographic keys associated with their operation that are stored and possibly managed by a remote key management service (KMS). For example, a storage device driver may require a set of one or more keys to enable access to regions on the storage devices that it manages.

The protocol can be used to request the generation of new keys from the KMS, to register locally generated keys with the KMS, to retrieve existing keys from the KMS, and to delete obsolete keys from
the KMS. It also allows the device driver to manage attributes associated with individual keys on the KMS, and to retrieve keys based on those attributes.

A platform implementing this protocol may use internal or external key servers to provide the functionality required by this protocol. For external servers, the protocol implementation is expected to supply and maintain the connection parameters required to connect and authenticate to the remote server. The connection may be made during the initial installation of the protocol, or it may be delayed until the first `GetServiceStatus()` request is received.

Each client using the KMS protocol may identify itself to the protocol implementation using a `EFI_KMS_CLIENT_INFO` structure. If the KMS supported by this protocol requires the client to provide a client identifier, then this structure must be provided on all function calls.

While this protocol is intended to abstract the functions associated with storing and managing keys so that the protocol user does not have to be aware of the specific KMS providing the service, it can also be used by callers which must interact directly with a specific KMS. For these users, the protocol manages the connection to the KMS while the user controls the operational interface via a client data pass thru function.

The `EFI_KMS_SERVICE_PROTOCOL` provides the capability for the caller to pass arbitrary data to the KMS or to receive such data back from the KMS via parameters on most functions. The use of such data is at the discretion of the caller, but it should only be used sparingly as it reduces the interoperability of the caller’s software.

**EFI_KMS_PROTOCOL.GetServiceStatus()**

**Summary**

Get the current status of the key management service.

**Prototype**

```c
typedef EFI_STATUS
    (EFIAPI *EFI_KMS_GET_SERVICE_STATUS) (  
      IN EFI_KMS_PROTOCOL  *This
    );
```

**Parameters**

- `This` Pointer to the `EFI_KEY_MANAGEMENT_SERVICE_PROTOCOL` instance.

**Description**

The `GetServiceStatus()` function allows the user to query the current status of the KMS and should be called before attempting any operations to the KMS. If the protocol has not been marked as available, then the user must call this function to attempt to initiate the connection to the KMS as it may have been deferred to the first user by the system firmware.

If the connection to the KMS has not yet been established by the system firmware, then this function will attempt to establish the connection, update the protocol structure content as appropriate, and mark the service as available.

**EFI_KMS_PROTOCOL:RegisterClient()**

**Summary**

Register client information with the supported KMS.

**Prototype**

```c
typedef EFI_STATUS (EFIAPIC *EFI_KMS_PROTOCOL_API) (
  IN EFI_KMS_PROTOCOL *This,
  IN EFI_KMS_CLIENT_INFO *Client,
  IN OUT UINTN *ClientDataSize OPTIONAL,
  IN OUT VOID **ClientData OPTIONAL
);
```

**Parameters**

- **This**
  Pointer to the **EFI_KEY_MANAGEMENT_SERVICE_PROTOCOL** instance.

- **Client**
  Pointer to a valid **EFI_KMS_CLIENT_INFO** structure.

- **ClientDataSize**
  Pointer to the size, in bytes, of an arbitrary block of data specified by the **ClientData** parameter. This parameter may be **NULL**, in which case the **ClientData** parameter will be ignored and no data will be transferred to or from the KMS. If the parameter is not **NULL**, then **ClientData** must be a valid pointer. If the value pointed to is 0, no data will be transferred to the KMS, but data may be returned by the KMS. For all non-zero values **ClientData** will be transferred to the KMS, which may also return data to the caller. In all cases, the value upon return to the caller will be the size of the data block returned to the caller, which will be zero if no data is returned from the KMS.

- **ClientData**
  Pointer to a pointer to an arbitrary block of data of **ClientDataSize** that is to be passed directly to the KMS if it supports the use of client data. This parameter may be **NULL** if and only if the **ClientDataSize** parameter is also **NULL**. Upon return to the caller, **ClientData** points to a block of data of **ClientDataSize** that was returned from the KMS. If the
returned value for *ClientDataSize is zero, then the returned value for *ClientData must be NULL and should be ignored by the caller. The KMS protocol consumer is responsible for freeing all valid buffers used for client data regardless of whether they are allocated by the caller for input to the function or by the implementation for output back to the caller.

Description

The RegisterClient() function registers client information with the KMS using a EFI_KMS_CLIENT_INFO structure.

There are two methods of handling client information. The caller may supply a client identifier in the EFI_KMS_CLIENT_INFO structure prior to making the call along with an optional name string. The client identifier will be passed on to the KMS if it supports client identifiers. If the KMS accepts the client id, then the EFI_KMS_CLIENT_INFO structure will be returned to the caller unchanged. If the KMS does not accept the client id, it may simply reject the request, or it may supply an alternate identifier of its own,

The caller may also request a client identifier from the KMS by passing NULL values in the EFI_KMS_CLIENT_INFO structure. If the KMS supports this action, it will generate the identifier and return it in the structure. Otherwise, the implementation may generate a unique identifier, returning it in the structure, or it may indicate that the function is unsupported.

The ClientDataSize and ClientData parameters allow the caller to pass an arbitrary block of data to/from the KMS for uses such as auditing or access control. The KMS protocol implementation does not alter this data block other than to package it for transmission to the KMS. The use of these parameters is optional.

EFI_KMS_PROTOCOL.CreateKey()

Summary
Request that the KMS generate one or more new keys and associate them with key identifiers. The key value(s) is returned to the caller.

Prototype
```c
typedef
  EFI_STATUS
  (EFIAPI *EFI_KMS_CREATE_KEY) (    
    IN   EFI_KMS_PROTOCOL    *This, 
    IN   EFI_KMS_CLIENT_INFO *Client, 
    IN OUT UINT16            *KeyDescriptorCount, 
    IN OUT EFI_KMS_KEY_DESCRIPTOR *KeyDescriptors, 
    IN OUT UINTN              *ClientDataSize OPTIONAL, 
    IN OUT VOID               **ClientData OPTIONAL  
  );
```

Parameters
- **This**: Pointer to this EFI_KMS_PROTOCOL instance.
- **Client**: Pointer to a valid EFI_KMS_CLIENT_INFO structure.
- **KeyDescriptorCount**: Pointer to a count of the number of key descriptors to be processed by this operation. On return, this number will be updated with the number of key descriptors successfully processed.
- **KeyDescriptors**: Pointer to an array of EFI_KMS_KEY_DESCRIPTOR structures which describe the keys to be generated.

On input, the KeyIdentifierSize and the KeyIdentifier may specify an identifier to be used for the key, but this is not required. The KeyFormat field must specify a key format GUID reported as supported by the KeyFormats field of the EFI_KMS_PROTOCOL. The value for this field in the first key descriptor will be considered the default value for subsequent
key descriptors requested in this operation if those key
descriptors have a NULL GUID in the key format field.

On output, the KeyIdentifierSize and KeyIdentifier
fields will specify an identifier for the key which will be either
the original identifier if one was provided, or an identifier
generated either by the KMS or the KMS protocol
implementation. The KeyFormat field will be updated with the
GUID used to generate the key if it was a NULL GUID, and the
KeyValue field will contain a pointer to memory containing
the key value for the generated key. Memory for both the
KeyIdentifier and the KeyValue fields will be allocated with
the BOOT_SERVICES_DATA type and must be freed by the
caller when it is no longer needed. Also, the KeyStatus field
must reflect the result of the request relative to that key.

ClientDataSize

Pointer to the size, in bytes, of an arbitrary block of data
specified by the ClientData parameter. This parameter may be
NULL, in which case the ClientData parameter will be
ignored and no data will be transferred to or from the KMS. If
the parameter is not NULL, then ClientData must be a valid
pointer. If the value pointed to is 0, no data will be transferred
to the KMS, but data may be returned by the KMS. For all non-
zero values *ClientData will be transferred to the KMS,
which may also return data to the caller. In all cases, the value
upon return to the caller will be the size of the data block
returned to the caller, which will be zero if no data is returned
from the KMS.

ClientData

Pointer to a pointer to an arbitrary block of data of
*ClientDataSize that is to be passed directly to the KMS if it
supports the use of client data. This parameter may be NULL if
and only if the ClientDataSize parameter is also NULL. Upon
return to the caller, *ClientData points to a block of data of
*ClientDataSize that was returned from the KMS. If the
returned value for *ClientDataSize is zero, then the returned
value for *ClientData must be NULL and should be ignored
by the caller. The KMS protocol consumer is responsible for
freeing all valid buffers used for client data regardless of
whether they are allocated by the caller for input to the
function or by the implementation for output back to the
caller.

Description

The CreateKey() method requests the generation of one or more new keys, and key
identifier and key values are returned to the caller. The support of this function is optional
as some key servers do not provide a key generation capability.

The Client parameter identifies the caller to the key management service. This identifier
may be used for auditing or access control. This parameter is optional unless the KMS
requires a client identifier in order to perform the requested action.
The `KeyDescriptorCount` and `KeyDescriptors` parameters are used to specify the key algorithm, size, and attributes for the requested keys. Any number of keys may be requested in a single operation, regardless of whether the KMS supports multiple key definitions in a single request or not. The KMS protocol implementation is responsible for generating the appropriate requests (single/multiple) to the KMS.

The `ClientDataSize` and `ClientData` parameters allow the caller to pass an arbitrary block of data to/from the KMS for uses such as auditing or access control. The KMS protocol implementation does not alter this data block other than to package it for transmission to the KMS. The use of these parameters is optional.

### Status Codes Returned

The `CreateKey()` function will return a status which indicates the overall status of the request. Note that this may be different from the status reported for individual key requests.

<table>
<thead>
<tr>

### EFI_KMS_PROTOCOL.GetKey()

**Summary**

Retrieve an existing key.
Prototype

typedef
    EFI_STATUS
    (EFIAPIC *EFI_KMS_GET_KEY) (  
        IN   EFI_KMS_PROTOCOL     *This,
        IN   EFI_KMS_CLIENT_INFO  *Client,
        IN OUT UINT16             *KeyDescriptorCount,
        IN OUT EFI_KMS_KEY_DESCRIPTOR *KeyDescriptors,
        IN OUT UINTN              *ClientDataSize OPTIONAL,
        IN OUT VOID               **ClientData OPTIONAL);

Parameters

This          Pointer to this EFI_KMS_PROTOCOL instance.
Client        Pointer to a valid EFI_KMS_CLIENT_INFO structure.
KeyDescriptorCount Pointer to a count of the number of keys to be processed by this operation. On return, this number will be updated with number of keys successfully processed.

KeyDescriptors Pointer to an array of EFI_KMS_KEY_DESCRIPTOR structures which describe the keys to be retrieved from the KMS. On input, the KeyIdentifierSize and the KeyIdentifier must specify an identifier to be used to retrieve a specific key. All other fields in the descriptor should be NULL. On output, the KeyIdentifierSize and KeyIdentifier fields will be unchanged, while the KeyFormat and KeyValue fields will be updated values associated with this key identifier. Memory for the KeyValue field will be allocated with the BOOT_SERVICES_DATA type and must be freed by the caller when it is no longer needed. Also, the KeyStatus field will reflect the result of the request relative to the individual key descriptor.

ClientDataSize Pointer to the size, in bytes, of an arbitrary block of data specified by the ClientData parameter. This parameter may be NULL, in which case the ClientData parameter will be ignored and no data will be transferred to or from the KMS. If the parameter is not NULL, then ClientData must be a valid pointer. If the value pointed to is 0, no data will be transferred to the KMS, but data may be returned by the KMS. For all non-zero values *ClientData will be transferred to the KMS, which may also return data to the caller. In all cases, the value upon return to the caller will be the size of the data block returned to the caller, which will be zero if no data is returned from the KMS.

ClientData Pointer to a pointer to an arbitrary block of data of *ClientDataSize that is to be passed directly to the KMS if it supports the use of client data. This parameter may be NULL if and only if the ClientDataSize parameter is also NULL. Upon return to the caller, *ClientData points to a block of data of
*ClientDataSize* that was returned from the KMS. If the returned value for *ClientDataSize* is zero, then the returned value for *ClientData* must be **NULL** and should be ignored by the caller. The KMS protocol consumer is responsible for freeing all valid buffers used for client data regardless of whether they are allocated by the caller for input to the function or by the implementation for output back to the caller.

**Description**

The **GetKey()** function retrieves one or more existing keys from the KMS and returns the key values to the caller. This function must be supported by every KMS protocol instance.

The **Client** parameter identifies the caller to the key management service. It may be used for auditing or access control. The use of this parameter is optional unless the KMS requires it in order to perform the requested action.

The **KeyDescriptorCount** and **KeyDescriptors** parameters are used to specify the identifier(s) to be used to retrieve the key values, which will be returned in the **KeyFormat** and **KeyValue** fields of each **EFI_KMS_KEY_DESCRIPTOR** structure. Any number of keys may be requested in a single operation, regardless of whether the KMS supports multiple key definitions in a single request or not. The KMS protocol implementation is responsible for generating the appropriate requests (single/multiple) to the KMS.

The **ClientDataSize** and **ClientData** parameters allow the caller to pass an arbitrary block of data to/from the KMS for uses such as auditing or access control. The KMS protocol implementation does not alter this data block other than to package it for transmission to the KMS. The use of these parameters is optional.

**Status Codes Returned**

The **GetKey()** function will return a status which indicates the overall status of the request. Note that this may be different from the status reported for individual key requests.

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>

</tr>
</tbody>
</table>
**EFI_KMS_PROTOCOL.AddKey()**

**Summary**

Add a new key.

**Prototype**

```c
typedef EFI_STATUS (EFIAPI *EFI_KMS_PROTOCOL) (EFI_KMS_PROTOCOL *This,
IN EFI_KMS_PROTOCOL *This,
IN EFI_KMS_CLIENT_INFO *Client,
IN OUT UINT16 *KeyDescriptorCount,
IN OUT EFI_KMS_KEY_DESCRIPTOR *KeyDescriptors,
IN OUT UINTN *ClientDataSize OPTIONAL,
IN OUT VOID **ClientData OPTIONAL
);
```

**Parameters**

- **This**: Pointer to this `EFI_KMS_PROTOCOL` instance.
- **Client**: Pointer to a valid `EFI_KMS_CLIENT_INFO` structure.
- **KeyDescriptorCount**: Pointer to a count of the number of keys to be processed by this operation. On normal returns, this number will be updated with number of keys successfully processed.
- **KeyDescriptors**: Pointer to an array of `EFI_KMS_KEY_DESCRIPTOR` structures which describe the keys to be added. On input, the `KeyId` field for first key must contain valid identifier data to be used for adding a key to the KMS. The values for these fields in this key definition will be considered default values for subsequent keys requested in this operation. A value of 0 in any subsequent `KeyId` field will be replaced with the current default value. The `KeyFormat` and `KeyValue` fields for each key to be added must contain consistent values to be associated with the given `KeyId`. On return, the `KeyStatus` field will reflect the result of the operation for each key request.
- **ClientDataSize**: Pointer to the size, in bytes, of an arbitrary block of data specified by the `ClientData` parameter. This parameter may be `NULL`, in which case the `ClientData` parameter will be ignored and no data will be transferred to or from the KMS. If the parameter is not `NULL`, then `ClientData` must be a valid
pointer. If the value pointed to is 0, no data will be transferred to the KMS, but data may be returned by the KMS. For all non-zero values *ClientData will be transferred to the KMS, which may also return data to the caller. In all cases, the value upon return to the caller will be the size of the data block returned to the caller, which will be zero if no data is returned from the KMS.

**ClientData**

Pointer to a pointer to an arbitrary block of data of *ClientDataSize that is to be passed directly to the KMS if it supports the use of client data. This parameter may be **NULL** if and only if the *ClientDataSize parameter is also **NULL**. Upon return to the caller, *ClientData points to a block of data of *ClientDataSize that was returned from the KMS. If the returned value for *ClientDataSize is zero, then the returned value for *ClientData must be **NULL** and should be ignored by the caller. The KMS protocol consumer is responsible for freeing all valid buffers used for client data regardless of whether they are allocated by the caller for input to the function or by the implementation for output back to the caller.

**Description**

The **AddKey()** function registers a new key with the key management service. The support for this method is optional, as not all key servers support importing keys from clients.

The **Client** parameter identifies the caller to the key management service. It may be used for auditing or access control. The use of this parameter is optional unless the KMS requires it in order to perform the requested action.

The **KeyDescriptorCount** and **KeyDescriptors** parameters are used to specify the key identifier, key format and key data to be registered on the. Any number of keys may be registered in a single operation, regardless of whether the KMS supports multiple key definitions in a single request or not. The KMS protocol implementation is responsible for generating the appropriate requests (single/multiple) to the KMS.

The **ClientDataSize** and **ClientData** parameters allow the caller to pass an arbitrary block of data to/from the KMS for uses such as auditing or access control. The KMS protocol implementation does not alter this data block other than to package it for transmission to the KMS. The use of these parameters is optional.

**Status Codes Returned**

The **AddKey()** function will return a status which indicates the overall status of the request. Note that this may be different from the status reported for individual key requests.

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>
## EFI_KMS_PROTOCOL.DeleteKey()

### Summary
Delete an existing key from the KMS database.

### Prototype
```c
typedef
EFI_STATUS
(EIFIAPI *EFI_KMS_DELETE_KEY) (
    IN EFI_KMS_PROTOCOL   *This,
    IN   EFI_KMS_CLIENT_INFO  *Client,
    IN OUT UINT16        *KeyDescriptorCount,
    IN OUT EFI_KMS_KEY_DESCRIPTOR *KeyDescriptors,
    IN OUT UINTN         *ClientDataSize OPTIONAL,
    IN OUT VOID          **ClientData OPTIONAL
);
```

### Parameters
- **This**: Pointer to this EFI_KMS_PROTOCOL instance.
- **Client**: Pointer to a valid EFI_KMS_CLIENT_INFO structure.
- **KeyDescriptorCount**: Pointer to a count of the number of keys to be processed by this operation. On normal returns, this number will be updated with number of keys successfully processed.
- **KeyDescriptors**: Pointer to an array of EFI_KMS_KEY_DESCRIPTOR structures which describe the keys to be deleted. On input, the KeyId field for first key must contain valid identifier data to be used for adding a key to the KMS. The values for these fields in this table:

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_BUFFER_TOO_SMALL</td>
<td>If multiple keys are associated with a single identifier, and the KeyValue buffer does not contain enough structures (KeyDescriptorCount) to contain all the key data, then the available structures will be filled and KeyDescriptorCount will be updated to indicate the number of keys which could not be processed.</td>
</tr>
<tr>
<td>EFI_ACCESS_DENIED</td>
<td>Access was denied by the device or the key server; OR a ClientId is required by the server and either none or an invalid id was provided.</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>Device or key server error. Check individual key request(s) to see which ones may have been processed.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>This is NULL, ClientId is required but it is NULL, KeyDescriptorCount is NULL, or Keys is NULL</td>
</tr>
<tr>
<td>EFI_NOT_FOUND</td>
<td>One or more EFI_KMS_KEY_DESCRIPTOR structures could not be processed properly. KeyDescriptorCount contains the number of structures which were successfully processed. Individual structures will reflect the status of the processing for that structure.</td>
</tr>
<tr>
<td>EFI_UNSUPPORTED</td>
<td>The implementation/KMS does not support this function.</td>
</tr>
</tbody>
</table>
key definition will be considered default values for subsequent keys requested in this operation. A value of 0 in any subsequent KeyId field will be replaced with the current default value. The KeyFormat and KeyValue fields are ignored, but should be 0. On return, the KeyStatus field will reflect the result of the operation for each key request.

**ClientDataSize**  
Pointer to the size, in bytes, of an arbitrary block of data specified by the ClientData parameter. This parameter may be NULL, in which case the ClientData parameter will be ignored and no data will be transferred to or from the KMS. If the parameter is not NULL, then ClientData must be a valid pointer. If the value pointed to is 0, no data will be transferred to the KMS, but data may be returned by the KMS. For all non-zero values *ClientData will be transferred to the KMS, which may also return data to the caller. In all cases, the value upon return to the caller will be the size of the data block returned to the caller, which will be zero if no data is returned from the KMS.

**ClientData**  
Pointer to a pointer to an arbitrary block of data of *ClientDataSize that is to be passed directly to the KMS if it supports the use of client data. This parameter may be NULL if and only if the ClientDataSize parameter is also NULL. Upon return to the caller, *ClientData points to a block of data of *ClientDataSize that was returned from the KMS. If the returned value for *ClientDataSize is zero, then the returned value for *ClientData must be NULL and should be ignored by the caller. The KMS protocol consumer is responsible for freeing all valid buffers used for client data regardless of whether they are allocated by the caller for input to the function or by the implementation for output back to the caller.

**Description**

The **DeleteKey()** function deregisters an existing key from the device or KMS. The support for this method is optional, as not all key servers support deleting keys from clients.

The **Client** parameter identifies the caller to the key management service. It may be used for auditing or access control. The use of this parameter is optional unless the KMS requires it in order to perform the requested action.

The **KeyDescriptorCount** and **KeyDescriptors** parameters are used to specify the key identifier(s) for the keys to be deleted. Any number of keys may be deleted in a single operation, regardless of whether the KMS supports multiple key definitions in a single request or not. The KMS protocol implementation is responsible for generating the appropriate requests (single/multiple) to the KMS.

The **ClientDataSize** and **ClientData** parameters allow the caller to pass an arbitrary block of data to/from the KMS for uses such as auditing or access control. The KMS protocol implementation does not alter this data block other than to package it for transmission to the KMS. The use of these parameters is optional.
Status Codes Returned

The `DeleteKey()` function will return a status which indicates the overall status of the request. Note that this may be different from the status reported for individual key requests.

<table>
<thead>
<tr>
<th>Code</th>

</tbody>
</table>

`EFI_KMS_PROTOCOL.GetKeyAttributes()`

Summary

Get one or more attributes associated with a specified key identifier. If none are found, the returned attributes count contains a value of zero.

Prototype

```c
typedef EFI_STATUS
    (EFIAPI *EFI_KMS_GET_KEY_ATTRIBUTES) (    
    IN   EFI_KMS_PROTOCOL       *This,  
    IN   EFI_KMS_CLIENT_INFO   *Client,  
    IN   UINT8                 *KeyIdentifierSize,  
    IN   CONST VOID            *KeyIdentifier,  
    IN OUT UINT16              *KeyAttributesCount,  
    IN OUT EFI_KMS_KEY_ATTRIBUTE *KeyAttributes,  
    IN OUT UINTN               *ClientDataSize OPTIONAL,  
    IN OUT VOID                **ClientData OPTIONAL);
```

Parameters

- `This` Pointer to this `EFI_KMS_PROTOCOL` instance.
- `Client` Pointer to a valid `EFI_KMS_CLIENT_INFO` structure.
- `KeyIdentifierSize` Pointer to the size in bytes of the `KeyIdentifier` variable.
KeyIdentifier: Pointer to the key identifier associated with this key.

KeyAttributesCount: Pointer to the number of EFI_KMS_KEY_ATTRIBUTE structures associated with the Key identifier. If none are found, the count value is zero on return. On input this value reflects the number of KeyAttributes that may be returned. On output, the value reflects the number of completed KeyAttributes structures found.

KeyAttributes: Pointer to an array of EFI_KMS_KEYgetAttribute structures associated with the Key Identifier. On input, the fields in the structure should be NULL. On output, the attribute fields will have updated values for attributes associated with this key identifier.

ClientDataSize: Pointer to the size, in bytes, of an arbitrary block of data specified by the ClientData parameter. This parameter may be NULL, in which case the ClientData parameter will be ignored and no data will be transferred to or from the KMS. If the parameter is not NULL, then ClientData must be a valid pointer. If the value pointed to is 0, no data will be transferred to the KMS, but data may be returned by the KMS. For all non-zero values *ClientData will be transferred to the KMS, which may also return data to the caller. In all cases, the value upon return to the caller will be the size of the data block returned to the caller, which will be zero if no data is returned from the KMS.

ClientData: Pointer to a pointer to an arbitrary block of data of *ClientDataSize that is to be passed directly to the KMS if it supports the use of client data. This parameter may be NULL if and only if the ClientDataSize parameter is also NULL. Upon return to the caller, *ClientData points to a block of data of *ClientDataSize that was returned from the KMS. If the returned value for *ClientDataSize is zero, then the returned value for *ClientData must be NULL and should be ignored by the caller. The KMS protocol consumer is responsible for freeing all valid buffers used for client data regardless of whether they are allocated by the caller for input to the function or by the implementation for output back to the caller.

Description

The GetKeyAttributes() function returns one or more attributes for a key.

The ClientIdentifierSize and ClientIdentifier parameters identify the caller to the key management service. It may be used for auditing or access control. The use of this parameter is optional unless the KMS requires it in order to perform the requested action.

The KeyIdentifierSize and KeyIdentifier parameters identify the key whose attributes are to be returned by the key management service. They may be used to retrieve additional information about a key, whose format is defined by the KeyAttribute. Attributes returned may be of the same or different names.
The **ClientDataSize** and **ClientData** parameters allow the caller to pass an arbitrary block of data to/from the KMS for uses such as auditing or access control. The KMS protocol implementation does not alter this data block other than to package it for transmission to the KMS. The use of these parameters is optional unless the KMS requires it in order to perform the requested action.

### Status Codes Returned

The **GetKeyAttributes()** function will return a status which indicates the overall status of the request. Note that this may be different from the status reported for individual key attribute requests.

<table>
<thead>

</tbody>
</table>

**EFI_KMS_PROTOCOL.AddKeyAttributes()**

**Summary**

Add one or more attributes to a key specified by a key identifier.
Prototype

```c
typedef
    EFI_STATUS
    (EFI_APPI *EFI_KMS_ADD_KEY_ATTRIBUTES) (
    IN   EFI_KMS_PROTOCOL   *This,
    IN   EFI_KMS_CLIENT_INFO *Client,
    IN   UINT               *KeyIdentifierSize,
    IN   CONST VOID         *KeyIdentifier,
    IN OUT UINT16           *KeyAttributesCount,
    IN OUT EFI_KMS_KEY_ATTRIBUTE *KeyAttributes,
    IN OUT UINTN            *ClientDataSize OPTIONAL,
    IN OUT VOID             **ClientData OPTIONAL);
```

Parameters

- **This**: Pointer to this `EFI_KMS_PROTOCOL` instance.
- **Client**: Pointer to a valid `EFI_KMS_CLIENT_INFO` structure.
- **KeyIdentifierSize**: Pointer to the size in bytes of the `KeyIdentifier` variable.
- **KeyIdentifier**: Pointer to the key identifier associated with this key.
- **KeyAttributesCount**: Pointer to the number of `EFI_KMS_KEY_ATTRIBUTE` structures to associate with the Key. On normal returns, this number will be updated with the number of key attributes successfully processed.
- **KeyAttributes**: Pointer to an array of `EFI_KMS_KEY_ATTRIBUTE` structures providing the attribute information to associate with the key. On input, the values for the fields in the structure are completely filled in. On return the `KeyAttributeStatus` field will reflect the result of the operation for each key attribute request.
- **ClientDataSize**: Pointer to the size, in bytes, of an arbitrary block of data specified by the `ClientData` parameter. This parameter may be `NULL`, in which case the `ClientData` parameter will be ignored and no data will be transferred to or from the KMS. If the parameter is not `NULL`, then `ClientData` must be a valid pointer. If the value pointed to is 0, no data will be transferred to the KMS, but data may be returned by the KMS. For all non-zero values `*ClientData` will be transferred to the KMS, which may also return data to the caller. In all cases, the value upon return to the caller will be the size of the data block returned to the caller, which will be zero if no data is returned from the KMS.
- **ClientData**: Pointer to a pointer to an arbitrary block of data of `*ClientDataSize` that is to be passed directly to the KMS if it supports the use of client data. This parameter may be `NULL` if and only if the `ClientDataSize` parameter is also `NULL`. Upon return to the caller, `*ClientData` points to a block of data of `*ClientDataSize` that was returned from the KMS. If the
returned value for *ClientDataSize is zero, then the returned value for *ClientData must be NULL and should be ignored by the caller. The KMS protocol consumer is responsible for freeing all valid buffers used for client data regardless of whether they are allocated by the caller for input to the function or by the implementation for output back to the caller.

Description

The AddKeyAttributes() function adds one or more key attributes. If this function is not supported by a KMS protocol instance then it is assumed that there is an alternative means available for attribute management in the KMS.

The Client parameters identify the caller to the key management service. It may be used for auditing or access control. The use of this parameter is optional unless the KMS requires it in order to perform the requested action.

The KeyIdentifierSize and KeyIdentifier parameters identify the key whose attributes are to be modified by the key management service.

The KeyAttributesCount and KeyAttributes parameters are used to specify the key attributes data to be registered on the KMS. Any number of attributes may be registered in a single operation, regardless of whether the KMS supports multiple key attribute definitions in a single request or not. The KMS protocol implementation is responsible for generating the appropriate requests (single/multiple) to the KMS. In certain error situations, the status of each attribute is updated indicating if that attribute was successfully registered or not.

The ClientDataSize and ClientData parameters allow the caller to pass an arbitrary block of data to/from the KMS for uses such as auditing or access control. The KMS protocol implementation does not alter this data block other than to package it for transmission to the KMS. The use of these parameters is optional unless the KMS requires it in order to perform the requested action.

Status Codes Returned

The AddKeyAttributes() function will return a status which indicates the overall status of the request. Note that this may be different from the status reported for individual key attribute requests. Status codes returned for AddKeyAttributes() are:

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>Successfully added all requested key attributes.</td>
</tr>
<tr>
<td>EFI_OUT_OF_RESOURCES</td>
<td>Could not allocate required resources.</td>
</tr>
<tr>
<td>EFI_TIMEOUT</td>
<td>Timed out waiting for device or key server. Check individual key attribute request(s) to see which ones may have been processed.</td>
</tr>
<tr>
<td>EFI_BUFFER_TOO_SMALL</td>
<td>If multiple keys attributes are associated with a single key identifier, and the attributes buffer does not contain enough structures (KeyAttributesCount) to contain all the data, then the available structures will be filled and KeyAttributesCount will be updated to indicate the number of key attributes which could not be processed. The status of each key attribute is also updated indicating success or failure for that attribute in case there are other errors for those attributes that could be processed.</td>
</tr>
</tbody>
</table>
EFI_KMS_PROTOCOL.DeleteKeyAttributes()

Summary
Delete attributes to a key specified by a key identifier.

Prototype

define

typedef

(EFI_STATUS EFI_KMS_PROTOCOL *This,
 IN EFI_KMS_CLIENT_INFO *Client,
 IN UINT8 KeyIdentifierSize,
 IN CONST VOID *KeyIdentifier,
 IN OUT UINT16 KeyAttributesCount,
 IN OUT EFI_KMS_KEY_ATTRIBUTE *KeyAttributes,
 IN OUT UINTN ClientDataSize OPTIONAL,
 IN OUT VOID **ClientData OPTIONAL)

Parameters

This Pointer to this EFI_KMS_PROTOCOL instance.
Client Pointer to a valid EFI_KMS_CLIENT_INFO structure.
KeyIdentifierSize Pointer to the size in bytes of the KeyIdentifier variable.
KeyIdentifier Pointer to the key identifier associated with this key.
KeyAttributesCount Pointer to the number of EFI_KMS_KEY_ATTRIBUTE structures associated with the Key. On input, the count value is one or more. On normal returns, this number will be updated with the number of key attributes successfully processed.
KeyAttributes

Pointer to an array of `EFI_KMS_KEY_ATTRIBUTE` structures associated with the key. On input, the values for the fields in the structure are completely filled in. On return the `KeyAttributeStatus` field will reflect the result of the operation for each key attribute request.

ClientDataSize

Pointer to the size, in bytes, of an arbitrary block of data specified by the `ClientData` parameter. This parameter may be `NULL`, in which case the `ClientData` parameter will be ignored and no data will be transferred to or from the KMS. If the parameter is not `NULL`, then `ClientData` must be a valid pointer. If the value pointed to is 0, no data will be transferred to the KMS, but data may be returned by the KMS. For all non-zero values `*ClientData` will be transferred to the KMS, which may also return data to the caller. In all cases, the value upon return to the caller will be the size of the data block returned to the caller, which will be zero if no data is returned from the KMS.

ClientData

Pointer to a pointer to an arbitrary block of data of `*ClientDataSize` that is to be passed directly to the KMS if it supports the use of client data. This parameter may be `NULL` if and only if the `ClientDataSize` parameter is also `NULL`. Upon return to the caller, `*ClientData` points to a block of data of `*ClientDataSize` that was returned from the KMS. If the returned value for `*ClientDataSize` is zero, then the returned value for `*ClientData` must be `NULL` and should be ignored by the caller. The KMS protocol consumer is responsible for freeing all valid buffers used for client data regardless of whether they are allocated by the caller for input to the function or by the implementation for output back to the caller.

Description

The `DeleteKeyAttributes()` function removes key attributes for a key with the key management service.

The `Client` parameter identifies the caller to the key management service. It may be used for auditing or access control. The use of this parameter is optional unless the KMS requires it in order to perform the requested action.

The `KeyIdentifierSize` and `KeyIdentifier` parameters identify the key whose attributes are to be modified by the key management service.

The `KeyAttributesCount` and `KeyAttributes` parameters are used to specify the key attributes data to be deleted on the KMS. Any number of attributes may be deleted in a single operation, regardless of whether the KMS supports multiple key attribute definitions in a single request or not. The KMS protocol implementation is responsible for generating the appropriate requests (single/multiple) to the KMS. In certain error situations, the status of each attribute is updated indicating if that attribute was successfully deleted or not.

The `KeyAttributesCount` and `KeyAttributes` parameters are used to specify the key attributes data to be deleted on the KMS. Any number of attributes may be deleted in a single operation,
regardless of whether the KMS supports multiple key attribute definitions in a single request or not. The KMS protocol implementation is responsible for generating the appropriate requests (single/multiple) to the KMS. In certain error situations, the status of each attribute is updated indicating if that attribute was successfully deleted or not.

The `ClientDataSize` and `ClientData` parameters allow the caller to pass an arbitrary block of data to/from the KMS for uses such as auditing or access control. The KMS protocol implementation does not alter this data block other than to package it for transmission to the KMS. The use of these parameters is optional unless the KMS requires it in order to perform the requested action.

**Status Codes Returned**

The `DeleteKeyAttributes()` function will return a status which indicates the overall status of the request. Note that this may be different from the status reported for individual key attribute requests. Status codes returned for the method are:

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>

EFI_KMS_PROTOCOL.GetKeyByAttributes()

Summary

Retrieve one or more key that has matched all of the specified key attributes.

Prototype

typedef

EFI_STATUS

(EFIAPI *EFI_KMS_GET_KEY_BY_ATTRIBUTES) (  
  IN   EFI_KMS_PROTOCOL    *This,
  IN   EFI_KMS_CLIENT_INFO *Client,
  IN   UINTN               *KeyAttributeCount,
  IN OUT EFI_KMS_KEY_ATTRIBUTE  *KeyAttributes,
  IN OUT UINTN               *KeyDescriptorCount,
  IN OUT EFI_KMS_KEY_DESCRIPTOR *KeyDescriptors,
  IN OUT UINTN               *ClientDataSize OPTIONAL,
  IN OUT VOID                **ClientData OPTIONAL
);

Parameters

This Pointer to this EFI_KMS_PROTOCOL instance.
Client Pointer to a valid EFI_KMS_CLIENT_INFO structure.
KeyAttributeCount Pointer to a count of the number of key attribute structures that must be matched for each returned key descriptor. On input the count value is one or more. On normal returns, this number will be updated with the number of key attributes successfully processed.
KeyAttributes Pointer to an array of EFI_KMS_KEY_ATTRIBUTE structure to search for. On input, the values for the fields in the structure are completely filled in. On return the KeyAttributeStatus field will reflect the result of the operation for each key attribute request.
KeyDescriptorCount Pointer to a count of the number of key descriptors matched by this operation. On entry, this number will be zero. On return, this number will be updated to the number of key descriptors successfully found.
KeyDescriptors Pointer to an array of EFI_KMS_KEY_DESCRIPTOR structures which describe the keys from the KMS having the KeyAttribute(s) specified. On input, this pointer will be NULL. On output, the array will contain an EFI_KMS_KEY_DESCRIPTOR structure for each key meeting the search criteria. Memory for the array and all KeyValue fields will be allocated with the EfiBootServicesData type and must be freed by the caller when it is no longer needed. Also, the KeyStatus field of each descriptor will reflect the result of the request relative to that key descriptor.
**ClientDataSize**

Pointer to the size, in bytes, of an arbitrary block of data specified by the `ClientData` parameter. This parameter may be **NULL**, in which case the `ClientData` parameter will be ignored and no data will be transferred to or from the KMS. If the parameter is not **NULL**, then `ClientData` must be a valid pointer. If the value pointed to is 0, no data will be transferred to the KMS, but data may be returned by the KMS. For all non-zero values `*ClientData` will be transferred to the KMS, which may also return data to the caller. In all cases, the value upon return to the caller will be the size of the data block returned to the caller, which will be zero if no data is returned from the KMS.

**ClientData**

Pointer to a pointer to an arbitrary block of data of `*ClientDataSize` that is to be passed directly to the KMS if it supports the use of client data. This parameter may be **NULL** if and only if the `ClientDataSize` parameter is also **NULL**. Upon return to the caller, `*ClientData` points to a block of data of `*ClientDataSize` that was returned from the KMS. If the returned value for `*ClientDataSize` is zero, then the returned value for `*ClientData` must be **NULL** and should be ignored by the caller. The KMS protocol consumer is responsible for freeing all valid buffers used for client data regardless of whether they are allocated by the caller for input to the function or by the implementation for output back to the caller.

**Description**

The `GetKeyByAttributes()` function returns the keys found by searches for matching key attribute(s). This function must be supported by every KMS protocol instance that supports the use of key attributes as indicated in the protocol's `KeyAttributesSupported` field.

The `Client` parameter identifies the caller to the key management service. It may be used for auditing or access control. The use of this parameter is optional unless the KMS requires it in order to perform the requested action.

The `KeyAttributesCount` and `KeyAttributes` parameters are used to specify the key attributes data to be searched for on the KMS. Any number of attributes may be searched for in a single operation, regardless of whether the KMS supports multiple key attribute definitions in a single request or not. The KMS protocol implementation is responsible for generating the appropriate requests (single/multiple) to the KMS. In certain error situations, the status of each attribute is updated indicating if that attribute was successfully found or not. If an attribute specifies a wildcard `KeyAttributeInstance` value, then the provider returns all instances of the attribute.

The `KeyDescriptorCount` and `KeyDescriptors` parameters are used to return the `EFI_KMS_KEY_DESCRIPTOR` structures for keys meeting the search criteria. Any number of keys may be returned in a single operation, regardless of whether the KMS supports multiple key definitions in a single request or not. The KMS protocol implementation is responsible for generating the appropriate requests (single/multiple) to the KMS.
The ClientDataSize and ClientData parameters allow the caller to pass an arbitrary block of data to/from the KMS for uses such as auditing or access control. The KMS protocol implementation does not alter this data block other than to package it for transmission to the KMS. The use of these parameters is optional unless the KMS requires it in order to perform the requested action.

### Status Codes Returned

The GetKeyByAttributes() function will return a status which indicates the overall status of the request. Note that this may be different from the status reported for individual keys.

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>Successfully retrieved all requested keys.</td>

</tbody>
</table>

### 37.4 PKCS7 Verify Protocol

**EFI_PKCS7_VERIFY_PROTOCOL**

**Summary**

The EFI_PKCS7_VERIFY_PROTOCOL may be used to verify data signed with PKCS#7 formatted authentication. The PKCS#7 data to be verified must be binary DER encoded. Additional information on the supported ASN.1 formatting is provided below.

Drivers that supply PKCS7 verification function should publish the EFI_PKCS7_VERIFY_PROTOCOL. Drivers wishing to use the EFI_PKCS7_VERIFY_PROTOCOL may get a reference with LocateProtocol().
# EFI_PKCS7_VERIFY_PROTOCOL_GUID

```c
#define EFI_PKCS7_VERIFY_PROTOCOL_GUID \
{ 0x47889fb2, 0xd671, 0x4fab, \
 0xa0, 0xca, 0xdf, 0xe, 0x44, \
 0xdf, 0x70, 0xd6 }
```

## Protocol Interface Structure

```c
typedef struct _EFI_PKCS7_VERIFY_PROTOCOL {
  EFI_PKCS7_VERIFY_BUFFER VerifyBuffer;
  EFI_PKCS7_VERIFY_SIGNATURE VerifySignature;
} EFI_PKCS7_VERIFY_PROTOCOL;
```

### Parameters

- **VerifyBuffer**
  Examine a DER-encoded PKCS7-signed memory buffer with signature containing embedded data content, or buffer with detached signature and separate data content buffer, and verify using supplied signature lists.

- **VerifySignature**
  Examine a DER-encoded PKCS7-signed memory buffer with signature and, using caller-supplied hash value for signed data, verify using supplied signature lists.

## Description

The **EFI_PKCS7_VERIFY_PROTOCOL** is used to verify data signed using PKCS7 structure. PKCS7 is a general-purpose cryptographic standard (see references). The PKCS7 data to be verified must be ASN.1 (DER) encoded. Implementation must support SHA256 as digest algorithm with RSA digest encryption. Support of other hash algorithms is optional. See Table 37-5.

### Table 37-5  Details of Supported Signature Format.

PKCS7 is defined by RFC2315. For more information see “Links to UEFI-Related Documents” (http://uefi.org/uefi) under the heading “RFC2315 (defines PKCS7).

EFI_PKCS7_VERIFY_PROTOCOL.VerifyBuffer()

Summary
This function processes a buffer containing binary DER-encoded PKCS7 signature. The signed data content may be embedded within the buffer or separated. Function verifies the signature of the content is valid and signing certificate was not revoked and is contained within a list of trusted signers.

Prototype

typedef
    EFI_STATUS
    (EFIAPI *VerifyBuffer)(
        IN EFI_PKCS7_VERIFY_PROTOCOL *This,
        IN VOID *SignedData,
        IN UINTN SignedDataSize,
        IN VOID *InData OPTIONAL,
        IN UINTN InDataSize
        IN EFI_SIGNATURE_LIST **AllowedDb,
        IN EFI_SIGNATURE_LIST **RevokedDb OPTIONAL,
        IN EFI_SIGNATURE_LIST **TimeStampDb OPTIONAL,
        OUT VOID *Content OPTIONAL,
        IN OUT UINTN *ContentSize
    );

Parameters
This
    Pointer to EFI_PKCS7_VERIFY_PROTOCOL instance.
SignedData
    Points to buffer containing ASN.1 DER-encoded PKCS signature.
SignedDataSize
    The size of SignedData buffer in bytes.
InData
    In case of detached signature, InData points to buffer containing the raw message data previously signed and to be verified by function. In case of SignedData containing embedded data, InData must be NULL.
InDataSize
    When InData is used, the size of InData buffer in bytes. When InData is NULL, this parameter must be 0.
AllowedDb
    Pointer to a list of pointers to EFI_SIGNATURE_LIST structures. The list is terminated by a null pointer. The EFI_SIGNATURE_LIST structures contain lists of X.509 certificates of approved signers. See Chapter 27 for definition of EFI_SIGNATURE_LIST. Function recognizes signer certificates of type EFI_CERT_X509_GUID. Any hash certificate in AllowedDb list is ignored by this function. Function returns
success if signer of the buffer is within this list (and not within `RevokedDb`). This parameter is required.

**RevokedDb**
Optional pointer to a list of pointers to `EFI_SIGNATURE_LIST` structures. The list is terminated by a null pointer. List of X.509 certificates of revoked signers and revoked file hashes. Except as noted in description of `TimeStampDb`, signature verification will always fail if the signer of the file or the hash of the data component of the buffer is in `RevokedDb` list. This list is optional and caller may pass Null or pointer to NULL if not required.

**TimeStampDb**
Optional pointer to a list of pointers to `EFI_SIGNATURE_LIST` structures. The list is terminated by a null pointer. This parameter can be used to pass a list of X.509 certificates of trusted time stamp signers. This list is optional and caller may pass Null or pointer to NULL if not required.

**Content**
On input, points to an optional caller-allocated buffer into which the function will copy the content portion of the file after verification succeeds. This parameter is optional and if NULL, no copy of content from file is performed.

**ContentSize**
On input, points to the size in bytes of the optional buffer `Content` previously allocated by caller. On output, if the verification succeeds, the value referenced by `ContentSize` will contain the actual size of the content from signed file. If `ContentSize` indicates the caller-allocated buffer is too small to contain content, an error is returned, and `ContentSize` will be updated with the required size. This parameter must be 0 if `Content` is Null.

**Description**
This function processes the buffer `SignedData` for PKCS7 verification. The data that was signed using PKCS is referred to as the ‘Message’. In the process of creating a signature of the message, a SHA256 or other hash of the message bytes, called the ‘Message Digest’, is encrypted using a private key held in secret by the signer. The encrypted hash and the X.509 public key certificate of the signer are formatted according to the ASN.1 PKCS#7 Schema (See References). For the buffer type with the embedded data, the ASN.1 syntax is also used to wrap the data and combine the message data with the signature structure.

The `SignedData` buffer must be ASN.1 DER-encoded format with structure according to the subset defined in the introduction to this protocol. Both embedded content and detached signature formats are supported. In case of embedded content, `SignedData` contains both the PKCS7 signature structure and the message content that was signed. In the case of detached signature, `SignedData` contains only the signature data and `InData` is used to supply the data to be verified. To pass verification the X.509 public certificate of the signer of the file must be found in `AllowedDb` and not be present in `RevokedDb`. Additionally if `RevokedDb` contains a specific Hash signature that matches the hash calculated for the content, the file will also fail verification. The message content will be copied to the caller-supplied buffer `Content` (when present) with `ContentSize` updated to reflect the total size in bytes of the extracted content.
The `VerifyBuffer()` function performs several steps. First, the buffer containing the user-provided signature is parsed, the content is located and a hash calculated, and the PKCS7 signature of that hash is verified by decrypting the hash calculated at time of signing. Match of current hash with decrypted hash provides indication the structure contained in buffer has not been modified since signing. Next the protocol function attempts to match the signing certificate included within the signed data again the members of an (optional) list of caller-provided revoked certificates (`RevokedDb`). The hash of the data is also compared against any hash items contained in `RevokedDb` list. Next the signing certificate is matched against the caller-provided list of trusted signatures. If the signature is valid, the certificate or hash are not in the revoked list, and the certificate is in the trusted list, the file passes verification.

When `TimeStampDb` list is present this information modifies the processing of revoked certificates found in both `AllowedDb` and `RevokedDb`. When PCKS7 signings that are time-stamped by trusted signer in `TimeStampDb` list, and which time-stamping occurred prior to the time of certificate revocation noted in certificate in `RevokedDb` list, the signing will be allowed and return `EFI_SUCCESS`. `TimeStampDb` parameter is optional and may be NULL or a pointer to NULL when not used. Except in the processing of certificates found in both `AllowedDb` and `RevokedDb`, `TimeStampDb` is not used and time-stamping is not otherwise required for signings verified by certificate only in `AllowedDb`.

**Note:** This method is intended to be suitable to implement Secure Boot image validation, and as such the contents of `AllowedDb`, `RevokedDb`, and `TimeStampDb` must also conform with the requirements of Authorization Process, bullet item 3 (UEFI Image Validation Succeeded).

The verification function can handle both embedded data or detached signature formats. In case of embedded data, the function will optionally extract the original signed data and supply back to caller in caller-supplied buffer. For a detached signature the caller must provide the original message data in buffer pointed to by `InData`. For consistency, when both `InData` and `Content` are provided, the function will copy contents of `InData` to `Content`.

In case where the `ContentSize` indicated by caller is too small to contain the entire content extracted from the file, `EFI_BUFFER_TOO_SMALL` error is returned, and `ContentSize` is updated to reflect the required size.

**Note:** When signing certificate is matched to `AllowedDb` or `RevokedDb` lists, a match can occur against an entry in the list at any level of the chain of X.509 certificates present in the PCKS certificate list. This supports signing with a certificate that chains to one of the certificates in the `AllowedDb` or `RevokedDb` lists.

### EFI_PKCS7_VERIFY_PROTOCOL.VerifySignature()

#### Summary

This function processes a buffer containing binary DER-encoded detached PKCS7 signature. The hash of the signed data content is calculated and passed by the caller. Function verifies the signature of the content is valid and signing certificate was not revoked and is contained within a list of trusted signers.

Note: the current UEFI specification allows for a variety of hashes. In order to be secure, the users of this protocol should loop over each hash to see if the binary signature is authorized.
Prototype

```c
typedef EFI_STATUS
  (EFIAPI *VerifySignature)(
    IN EFI_PKCS7_VERIFY_PROTOCOL *This,
    IN VOID *Signature,
    IN UINTN SignatureSize,
    IN VOID *InHash,
    IN UINTN InHashSize,
    IN EFI_SIGNATURE_LIST **AllowedDb,
    IN EFI_SIGNATURE_LIST **RevokedDb OPTIONAL,
    IN EFI_SIGNATURE_LIST **TimeStampDb OPTIONAL,
  );
```

Parameters

- **This**: Pointer to `EFI_PKCS7_VERIFY_PROTOCOL` instance.
- **Signature**: Points to buffer containing ASN.1 DER-encoded PKCS detached signature.
- **SignatureSize**: The size of `Signature` buffer in bytes.
- **InHash**: `InHash` points to buffer containing the caller calculated hash of the data. This parameter may not be NULL.
- **InHashSize**: The size in bytes of `InHash` buffer.
- **AllowedDb**: Pointer to a list of pointers to `EFI_SIGNATURE_LIST` structures. The list is terminated by a null pointer. The `EFI_SIGNATURE_LIST` structures contain lists of X.509 certificates of approved signers. See Chapter 27 for definition of `EFI_SIGNATURE_LIST`. Function recognizes signer certificates of type `EFI_CERT_X509_GUID`. Any hash certificate in `AllowedDb` list is ignored by this function. Function returns success if signer of the buffer is within this list (and not within `RevokedDb`). This parameter is required.
- **RevokedDb**: Pointer to a list of pointers to `EFI_SIGNATURE_LIST` structures. The list is terminated by a null pointer. List of X.509 certificates of revoked signers and revoked file hashes. Signature verification will always fail if the signer of the file or the hash of the data component of the buffer is in `RevokedDb` list. This parameter is optional and caller may pass Null if not required.
- **TimeStampDb**: Optional pointer to a list of pointers to `EFI_SIGNATURE_LIST` structures. The list is terminated by a null pointer. This parameter can be used to pass a list of X.509 certificates of trusted time stamp counter-signers.
Description
This function processes the buffer Signature for PKCS7 verification using hash of the data calculated and pass by caller in the InHash buffer. The data that was signed using PKCS is referred to as the ‘Message’. In the process of creating a signature of the message, a hash of the message bytes, called the ‘Message Digest’, is encrypted using a private key held in secret by the signer. The encrypted hash and the X.509 public key certificate of the signer are formatted according to the ASN.1 PKCS#7 Schema (See References). Any data embedded within the PKCS structure is ignored by the function. This function does not support extraction of signature from executable file formats. The address of the PKCS Signature block must be located and passed by the called.

The hash size passed in InHashSize must match the size of the signed hash embedded within the PKCS signature structure or an error is returned.

The SignedData buffer must be ASN.1 DER-encoded format with structure according to the subset defined in the introduction to this protocol. Both embedded content and detached signature formats are supported however embedded data is ignored. To pass verification the X.509 public certificate of the signer of the file must be found in AllowedDb and not be present in RevokedDb. Additionally, if RevokedDb contains a specific Hash signature that matches the hash calculated for the content, the file will also fail verification.

When TimeStampDb list is present this information modifies the processing of revoked certificates found in both AllowedDb and RevokedDb. When PKCS7 signings that are time-stamped by trusted signer in TimeStampDb list, and which time-stamping occurred prior to the time of certificate revocation noted in certificate in RevokedDb list, the signing will be allowed and return EFI_SUCCESS. TimeStampDb parameter is optional and may be NULL or a pointer to NULL when not used. Except in the processing of certificates found in both AllowedDb and RevokedDb, TimeStampDb is not used and time-stamping is not otherwise required for signings verified by certificate only in AllowedDb.

The VerifySignature() function performs several steps. First, the buffer containing the user-provided signature is parsed, (any embedded content is ignored), and the PKCS7 signature of hash data is verified by decrypting the hash calculated at time of signing. Match of caller provided hash with decrypted hash provides indication the signed data has not been modified since signing. Next the protocol function attempts to match the signing certificate included within the signed data again the members of an (optional) list of caller-provided revoked certificates (RevokedDb). The hash of the data is also compared against any hash items contained in RevokedDb list. Next the signing certificate is matched against the caller-provided list of trusted signatures. If the signature is valid, the certificate or hash are not in the revoked list, and the certificate is in the trusted list, the file passes verification.

Note: When a signing certificate is matched to AllowedDb or RevokedDb lists, a match can occur against an entry in the list at any level of the chain of X.509 certificates present in the PKCS certificate list. This supports signing with a certificate that chains to one of the certificates in the AllowedDb or RevokedDb lists.

Note: Because this function uses hashes and the specification contains a variety of hash choices, you should be aware that the check against the RevokedDb list will improperly succeed if the signature is revoked using a different hash algorithm. For this reason, you should either cycle through all UEFI supported hashes to see if one is forbidden, or rely on a single hash choice.
only if the UEFI signature authority only signs and revokes with a single hash (at time of writing, this hash choice is SHA256).

37.5 Random Number Generator Protocol

This section defines the Random Number Generator (RNG) protocol. This protocol is used to provide random numbers for use in applications, or entropy for seeding other random number generators. Consumers of the protocol can ensure that drivers implementing the protocol produce RNG values in a well-known manner.

When a Deterministic Random Bit Generator (DRBG) is used on the output of a (raw) entropy source, its security level must be at least 256 bits.

**EFI_RNG_PROTOCOL**

Summary
This protocol provides standard RNG functions. It can be used to provide random bits for use in applications, or entropy for seeding other random number generators.
GUID

```c
#define EFI_RNG_PROTOCOL_GUID \
{ 0x3152bca5, 0xeade, 0x433d,\n  {0x86, 0x2e, 0xc0, 0x1c, 0xdc, 0x29, 0x1f, 0x44}}
```

Protocol Interface Structure

```c
typedef struct _EFI_RNG_PROTOCOL {
   EFI_RNG_GET_INFO    GetInfo;
   EFI_RNG_GET_RNG     GetRNG;
} EFI_RNG_PROTOCOL;
```

Parameters

- **GetInfo**: Returns information about the random number generation implementation.
- **GetRNG**: Returns the next set of random numbers.

Description

This protocol allows retrieval of RNG values from an UEFI driver. The `GetInfo` service returns information about the RNG algorithms the driver supports. The `GetRNG` service creates a RNG value using an (optionally specified) RNG algorithm.

**EFI_RNG_PROTOCOL.GetInfo**

Summary

Returns information about the random number generation implementation.

Prototype

```c
typedef
EFI_STATUS
(EIFIAP *EFI_RNG_GET_INFO) ( 
    IN EFI_RNG_PROTOCOL    *This,
    IN OUT UINTN           *RNGAlgorithmListSize,
    OUT EFI_RNG_ALGORITHM  *RNGAlgorithmList
);
```

Parameters

- **This**: A pointer to the `EFI_RNG_PROTOCOL` instance.
- **RNGAlgorithmListSize**: On input, the size in bytes of `RNGAlgorithmList`. On output with a return code of `EFI_SUCCESS`, the size in bytes of the data returned in `RNGAlgorithmList`.
- **RNGAlgorithmList**: On output with a return code of `EFI_BUFFER_TOO_SMALL`, the size of `RNGAlgorithmList` required to obtain the list.
- **RNGAlgorithmList**: A caller-allocated memory buffer filled by the driver with one `EFI_RNG_ALGORITHM` element for each supported RNG algorithm. The list must not change across multiple calls to
the same driver. The first algorithm in the list is the default
algorithm for the driver.

Description
This function returns information about supported RNG algorithms.
A driver implementing the RNG protocol need not support more than one RNG algorithm, but shall
support a minimum of one RNG algorithm.

Related Definitions

```c
typedef EFI_GUID EFI_RNG_ALGORITHM;
```

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>

<td>The buffer <code>RNGAlgorithmList</code> is too small to hold the result.</td>
</tr>
</tbody>
</table>

**EFI_RNG_PROTOCOL.GetRNG**

Summary
Produces and returns an RNG value using either the default or specified RNG algorithm.

Prototype

```c
typedef
  EFI_STATUS
  (EFIAPI *EFI_RNG_GET_RNG) (  
    IN EFI_RNG_PROTOCOL *This,
    IN EFI_RNG_ALGORITHM *RNGAlgorithm, OPTIONAL
    IN UINTN RNGValueLength,
    OUT UINT8 *RNGValue
  )
```

Parameters

- **This**
  A pointer to the `EFI_RNG_PROTOCOL` instance.
- **RNGAlgorithm**
  A pointer to the `EFI_RNG_ALGORITHM` that identifies the RNG algorithm to use. May be `NULL` in which case the function will use its default RNG algorithm.
- **RNGValueLength**
  The length in bytes of the memory buffer pointed to by `RNGValue`. The driver shall return exactly this number of bytes.
RNGValue

A caller-allocated memory buffer filled by the driver with the resulting RNG value.

Description

This function fills the RNGValue buffer with random bytes from the specified RNG algorithm. The driver must not reuse random bytes across calls to this function. It is the caller's responsibility to allocate the RNGValue buffer.

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EFI_SUCCESS</td>
<td>The RNG value was returned successfully.</td>
</tr>
<tr>
<td>EFI_UNSUPPORTED</td>
<td>The algorithm specified by RNGAlgorithm is not supported by this driver.</td>
</tr>
<tr>
<td>EFI_DEVICE_ERROR</td>
<td>An RNG value could not be retrieved due to a hardware or firmware error.</td>
</tr>
<tr>
<td>EFI_NOT_READY</td>
<td>There is not enough random data available to satisfy the length requested by RNGValueLength.</td>
</tr>
<tr>
<td>EFI_INVALID_PARAMETER</td>
<td>RNGValue is null or RNGValueLength is zero.</td>
</tr>
</tbody>
</table>

37.5.1 EFI RNG Algorithm Definitions

Summary

This sub-section provides EFI_GUID values for a selection of EFI_RNG_PROTOCOL algorithms. The algorithms listed are optional, not meant to be exhaustive and may be augmented by vendors or other industry standards.

The “raw” algorithm, when supported, is intended to provide entropy directly from the source, without it going through some deterministic random bit generator.
Prototype

#define EFI_RNG_ALGORITHM_SP800_90_HASH_256_GUID \
{0xa7af67cb, 0x603b, 0x4d42,\ 
{0xba, 0x21, 0x70, 0xbf, 0xb6, 0x29, 0x3f, 0x96}}

#define EFI_RNG_ALGORITHM_SP800_90_HMAC_256_GUID \
{0xc5149b43, 0xae85, 0x4f53,\ 
{0x99, 0x82, 0xb9, 0x43, 0x35, 0xd3, 0xa9, 0xe7}}

#define EFI_RNG_ALGORITHM_SP800_90_CTR_256_GUID \
{0x44f0de6e, 0x4d8c, 0x4045,\ 
{0xa8, 0xc7, 0x4d, 0xd1, 0x68, 0x85, 0x6b, 0x9e}}

#define EFI_RNG_ALGORITHM_X9_31_3DES_GUID \
{0x63c4785a, 0xca34, 0x4012,\ 
{0xa3, 0xc8, 0x0b, 0x6a, 0x32, 0x4f, 0x55, 0x46}}

#define EFI_RNG_ALGORITHM_X9_31_AES_GUID \
{0xacd03321, 0x777e, 0x4d3d,\ 
{0xb1, 0xc8, 0x20, 0xcf, 0xd8, 0x88, 0x20, 0xc9}}

#define EFI_RNG_ALGORITHM_RAW \
{0xe43176d7, 0xb6e8, 0x4827,\ 
{0xb7, 0x84, 0x7f, 0xfd, 0xc4, 0xb6, 0x85, 0x61}}

NIST, “Recommended Random Number Generator Based on ANSI X9.31 Appendix A.2.4 Using the 3-Key Triple DES and AES Algorithms,” January 2005. See “Links to UEFI-Related Documents” (http://uefi.org/uefi) under the heading “Recommended Random Number Generator Based on ANSI X9.31”.

37.6

Smart Card Reader and Smart Card Edge Protocols

The UEFI Smart Card Reader Protocol provides an abstraction for device to provide smart card reader support. This protocol is very close to Part 5 of PC/SC workgroup specifications and provides an API to applications willing to communicate with a smart card or a smart card reader.
37.6.1 Smart Card Reader Protocol

**EFI_SMART_CARD_READER_PROTOCOL Summary**

Smart card aware application invokes this protocol to get access to an inserted smart card in the reader or to the reader itself.

**GUID**

```c
#define EFI_SMART_CARD_READER_PROTOCOL_GUID \
{0x2a4d1adf, 0x21dc, 0x4b81,\ 
{0xa4, 0x2f, 0x8b, 0x8e, 0xe2, 0x38, 0x00, 0x60}}
```

**Protocol Interface Structure**

```c
typedef struct _EFI_SMART_CARD_READER_PROTOCOL {
  EFI_SMART_CARD_READER_CONNECT   SCardConnect;
  EFI_SMART_CARD_READER_DISCONNECT SCardDisconnect;
  EFI_SMART_CARD_READER_STATUS    SCardStatus;
  EFI_SMART_CARD_READER_TRANSMIT   SCardTransmit;
  EFI_SMART_CARD_READER_CONTROL   SCardControl;
  EFI_SMART_CARD_READER_GET_ATTRIB SCardGetAttrib;
} EFI_SMART_CARD_READER_PROTOCOL;
```

**Members**

- **SCardConnect** Requests a connection to the smart card or smart card reader.
- **SCardDisconnect** Closes the previously open connection.
- **SCardStatus** Provides informations on smart card status and reader name.
- **SCardTransmit** Exchanges data with smart card or smart card reader.
- **SCardControl** Gives direct control to the smart card reader.
- **SCardGetAttrib** Retrieves reader characteristics.

**Description**

This protocol allows UEFI applications to communicate and get/set all necessary information to the smart card reader.

**Overview**

This document aims at defining a standard way for UEFI applications to use a smart card. The key points are:

- Provide an API as close as possible to Part 5 of the existing PC/SC interface. See “Links to UEFI-Related Documents” ([http://uefi.org/uefi](http://uefi.org/uefi)) under the heading “PC/SC Workgroup Specifications”.
- Remove any unnecessary complexity of PC/SC implementation in a classic OS:
  - Assume no connection sharing
  - No resource manager
  - Reduced set of APIs
Note that this document only focuses on PC/SC Part 5 (access to smart card/smart card reader from an application). Abstracting the smart card (Parts 6/9) is not the scope of this document.

Main differences with existing PC/SC implementation on Linux/MacOS/Windows:

- There is no resource manager, driver exposes Part 5 instead of Part 3
- It is not possible to share a smart card between UEFI applications/drivers
- Reader enumeration is different:
  - On classic PC/SC, SCardListReaders is used
  - In UEFI, reader list is available via OpenProtocol/ScardStatus calls

**EFI_SMART_CARD_READER_PROTOCOL.SCardConnect()**

**Summary**

This function requests connection to the smart card or the reader, using the appropriate reset type and protocol.

**Prototype**

```c
EFI_STATUS
(EIFIAPI *EFI_SMART_CARD_READER_PROTOCOL_CONNECT) (  
  IN EFI_SMART_CARD_READER_PROTOCOL *This,  
  IN UINT32          AccessMode,  
  IN UINT32          CardAction,  
  IN UINT32          PreferredProtocols,  
  OUT UINT32         *ActiveProtocol
);
```

**Parameters**

- **This** Indicates a pointer to the calling context. Type **EFI_SMART_CARD_READER_PROTOCOL** is defined in the **EFI_SMART_CARD_READER_PROTOCOL** description.
- **AccessMode** See “related definitions” below.
- **CardAction** **SCARD_CA_NORESET, SCARD_CA_COLDRESET** or **SCARD_CA_WARMRESET**.
- **PreferredProtocols** Bitmask of acceptable protocols. See “related definitions” below.
- **ActiveProtocol** A flag that indicates the active protocol. See “related definitions” below.
Related Definitions

    //
    // Codes for access mode
    //
    #define SCARD_AM_READER 0x0001 // Exclusive access to reader
    #define SCARD_AM_CARD 0x0002 // Exclusive access to card
    //
    // Codes for card action
    //
    #define SCARD_CA_NORESET 0x0000 // Don’t reset card
    #define SCARD_CA_COLDRESET 0x0001 // Perform a cold reset
    #define SCARD_CA_WARMRESET 0x0002 // Perform a warm reset
    #define SCARD_CA_UNPOWER 0x0003 // Power off the card
    #define SCARD_CA_EJECT 0x0004 // Eject the card
    //
    // Protocol types
    //
    #define SCARD_PROTOCOL_UNDEFINED 0x0000
    #define SCARD_PROTOCOL_T0 0x0001
    #define SCARD_PROTOCOL_T1 0x0002
    #define SCARD_PROTOCOL_RAW 0x0004

Description

The **SCardConnect** function requests access to the smart card or the reader. Upon success, it is then possible to call **SCardTransmit**.

If **AccessMode** is set to **SCARD_AM_READER**, **PreferredProtocols** must be set to **SCARD_PROTOCOL_UNDEFINED** and **CardAction** to **SCARD_CA_NORESET** else function fails with **EFI_INVALID_PARAMETER**.

**EFI_SMART_CARD_READER_PROTOCOL.SCardDisconnect()**

**Summary**

This function releases a connection previously taken by SCardConnect.

**Prototype**

```c
typedef EFI_STATUS
(EFFECTI_API *EFI_SMART_CARD_READER_PROTOCOL_DISCONNECT) (  
  IN EFI_SMART_CARD_READER_PROTOCOL *This,  
  IN UINT32 CardAction
);
```

**Parameters**

- **This**
  Indicates a pointer to the calling context. Type EFI_SMART_CARD_READER_PROTOCOL is defined in the description.

- **CardAction**
  See “related definitions” for CardAction in SCardConnect description.

**Description**

The SCardDisconnect function releases the lock previously taken by SCardConnect. In case the smart card has been removed before this call, this function returns EFI_SUCCESS. If there is no previous call to SCardConnect, this function returns EFI_SUCCESS.
Status Codes Returned

<table>
<thead>

</tbody>
</table>

**EFI_SMART_CARD_READER_PROTOCOL.SCardStatus()**

**Summary**

This function retrieves some basic information about the smart card and reader.

**Prototype**

```c
typedef EFI_STATUS
(EFIAPI *EFI_SMART_CARD_READER_PROTOCOL_STATUS) (
    IN EFI_SMART_CARD_READER_PROTOCOL *This,
    OUT CHAR16            *ReaderName OPTIONAL,
    IN OUT UINTN           *ReaderNameLength OPTIONAL,
    OUT UINT32            *State OPTIONAL,
    OUT UINT32            *CardProtocol OPTIONAL,
    OUT UINT8             *Atr OPTIONAL,
    IN OUT UINTN           *AtrLength OPTIONAL
);
```

**Parameters**

- **This**
  Indicates a pointer to the calling context. Type `EFI_SMART_CARD_READER_PROTOCOL` is defined in the `EFI_SMART_CARD_READER_PROTOCOL` description.

- **ReaderName**
  A pointer to a NULL terminated string that will contain the reader name.

- **ReaderNameLength**
  On input, a pointer to the variable that holds the maximal size, in bytes, of `ReaderName`.
  On output, the required size, in bytes, for `ReaderName`.

- **State**
  Current state of the smart card reader. See “related definitions” below.

- **CardProtocol**
  Current protocol used to communicate with the smart card. See “related definitions” in `SCardConnect`.

- **Atr**
  A pointer to retrieve the ATR of the smart card.

- **AtrLength**
  On input, a pointer to hold the maximum size, in bytes, of `Atr` (usually 33).
  On output, the required size, in bytes, for the smart card ATR.
Related Definitions

```c
//
// Codes for state type
//
#define SCARD_UNKNOWN  0x0000 /* state is unknown */
#define SCARD_ABSENT   0x0001 /* Card is absent */
#define SCARD_INACTIVE 0x0002 /* Card is present and not powered*/
#define SCARD_ACTIVE   0x0003 /* Card is present and powered */
```

Description

The `SCardStatus` function retrieves basic reader and card information.

If `ReaderName`, `State`, `CardProtocol` or `Atr` is NULL, the function does not fail but does not fill in such variables.

If `EFI_SUCCESS` is not returned, `ReaderName` and `Atr` contents shall not be considered as valid.

`EFI_SMART_CARD_READER_PROTOCOL.SCardTransmit()`

Summary

This function sends a command to the card or reader and returns its response.
Prototype

typedef

#include "stddef.h"

EFI_STATUS

(EFIAPI *EFI_SMART_CARD_READER_PROTOCOL_TRANSMIT) ( IN EFI_SMART_CARD_READER_PROTOCOL *This,

IN UINT8 *CAPDU,

IN UINTN CAPDULength,

OUT UINT8 *RAPDU,

IN OUT UINTN *RAPDULength );

Parameters

This Indicates a pointer to the calling context. Type EFI_SMART_CARD_READER_PROTOCOL is defined in the EFI_SMART_CARD_READER_PROTOCOL description.

CAPDU A pointer to a byte array that contains the Command APDU to send to the smart card or reader.

CAPDULength Command APDU size, in bytes.

RAPDU A pointer to a byte array that will contain the Response APDU.

RAPDULength On input, the maximum size, in bytes, of the Response APDU. On output, the size, in bytes, of the Response APDU.

Description

This function sends a command to the card or reader and returns its response. The protocol to use to communicate with the smart card has been selected through SCardConnect call.

In case RAPDULength indicates a buffer too small to hold the response APDU, the function fails with EFI_BUFFER_TOO_SMALL.
Note: the caller has to call previously SCardConnect to make sure the reader/card is not already accessed by another application or driver.

Status Codes Returned

**EFI_SMART_CARD_READER_PROTOCOL.SCardControl()**

**Summary**

This function provides direct access to the reader.

**Prototype**

```c
typedef EFI_STATUS
(EFIAPICALL *EFI_SMART_CARD_READER_PROTOCOL.Control) (EFIAPI *This,
IN EFI_SMART_CARD_READER_PROTOCOL *This,
IN UINT32 ControlCode,
IN UINT8 *InBuffer OPTIONAL,
IN UINTN InBufferLength OPTIONAL,
OUT UINT8 *OutBuffer OPTIONAL,
IN OUT UINTN *OutBufferLength OPTIONAL);
```

**Parameters**

- **This** Indicates a pointer to the calling context. Type EFI_SMART_CARD_READER_PROTOCOL is defined in the EFI_SMART_CARD_READER_PROTOCOL description.
- **ControlCode** The control code for the operation to perform. See “related definitions” below.
- **InBuffer** A pointer to the input parameters.
- **InBufferLength** Size, in bytes, of input parameters.
- **OutBuffer** A pointer to the output parameters.
- **OutBufferLength** On input, maximal size, in bytes, to store output parameters.
On output, the size, in bytes, of output parameters.

**Description**

This function gives direct control to send commands to the driver or the reader.

The **ControlCode** to use is vendor dependant; the only standard code defined is the one to get PC/SC part 10 features. See “related definitions” below.

**InBuffer** and **Outbuffer** may be NULL when **ControlCode** operation does not require them.

**Note:** the caller has to call previously **SCardConnect** to make sure the reader/card is not already accessed by another application or driver.

**Related Definitions**

```
#define SCARD_CTL_CODE(code) (0x42000000 + (code))

**EFI_SMART_CARD_READER_PROTOCOL.SCardGetAttrib()**

**Summary**

*This function retrieves a reader or smart card attribute.*

**Prototype**

```c
typedef
```
EFI_STATUS
(EFIAPI *EFI_SMART_CARD_READER_PROTOCOL_GET_ATTRIB) (  
 IN EFI_SMART_CARD_READER_PROTOCOL *This,  
 IN UINT32 Attrib,  
 OUT UINT8 *OutBuffer,  
 IN OUT UINTN *OutBufferLength  
);

Parameters

This Indicates a pointer to the calling context. Type  
EFI_SMART_CARD_READER_PROTOCOL is defined in the  
EFI_SMART_CARD_READER_PROTOCOL description.

Attrib Identifier for the attribute to retrieve.  
See “related definitions” below. Note that all attributes might  
not be implemented.

OutBuffer A pointer to a buffer that will contain attribute data.

OutBufferLength On input, maximal size, in bytes, to store attribute data.  
On output, the size, in bytes, of attribute data.

Related Definitions

Possibly supported attrib values are listed in the PC/SC Specification, Part 3. See Section Q for  
document access.

Description

The SCardGetAttrib function retrieves an attribute from the reader driver.
37.6.2 Smart Card Edge Protocol

The Smart Card Edge Protocol provides an abstraction for device to provide Smart Card support.

**EFI_SMART_CARD_EDGE_PROTOCOL**

Summary

Smart Card aware application invokes this protocol to get access to an inserted Smart Card in the reader.

**GUID**

```c
#define EFI_SMART_CARD_EDGE_PROTOCOL_GUID \
    { 0xd317f29b, 0xa325, 0x4712,\n        { 0x9b, 0xf1, 0xc6, 0x19, 0x54, 0xdc, 0x19, 0x8c } }
```

**Protocol Interface Structure**

```c
typedef struct _EFI_SMART_CARD_EDGE_PROTOCOL {
    EFI_SMART_CARD_EDGE_GET_CONTEXT GetContext;
    EFI_SMART_CARD_EDGE_CONNECT Connect;
    EFI_SMART_CARD_EDGE_DISCONNECT Disconnect;
    EFI_SMART_CARD_EDGE_GET_CSN GetCsn;
    EFI_SMART_CARD_EDGE_GET_READER_NAME GetReaderName;
    EFI_SMART_CARD_EDGE_VERIFY_PIN VerifyPin;
    EFI_SMART_CARD_EDGE_GET_PIN_REMAINING GetPinRemaining;
    EFI_SMART_CARD_EDGE_GET_DATA GetData;
    EFI_SMART_CARD_EDGE_GET_CREDENTIAL GetCredential;
    EFI_SMART_CARD_EDGE_SIGN_DATA SignData;
    EFI_SMART_CARD_EDGE_DECRYPT_DATA DecryptData;
    EFI_SMART_CARD_EDGE_BUILD_DH_AGREEMENT BuildDHAgreement;
} EFI_SMART_CARD_EDGE_PROTOCOL;
```
Members

- **GetContext**  Request the driver context.
- **Connect**  Request a connection to the Smart Card.
- **Disconnect**  Close a previously open connection.
- **GetCSN**  Get Card Serial Number.
- **GetReaderName**  Get name of Smart Card reader used.
- **VerifyPin**  Verify Smart Card PIN.
- **GetPinRemaining**  Get number of remaining PIN tries.
- **GetData**  Get specific data.
- **GetCredential**  Get credentials the Smart Card holds.
- **SignData**  Sign a data.
- **DecryptData**  Decrypt a data.
- **BuildDHAgreement**  Construct a DH (Diffie Hellman) agreement for key derivation.

Description

This protocol allows UEFI applications to interface with a Smart Card during boot process for authentication or data signing / decryption, especially if the application has to make use of PKI.

Overview

This document aims at defining a standard way for UEFI applications to use a Smart Card in PKI (Public Key Infrastructure) context. The key points are:

- Each Smart Card or set of Smart Card have specific behavior.
- Smart Card applications often interface with PKCS #11 API or other cryptographic interface like CNG.
- During boot process not all the possibility of a cryptographic interface, like PKCS #11, are useful, for example it is neither the moment to perform Smart Card administration or Smart Card provisioning nor to process debit or credit operation with Smart Card.

Consequently this protocol focused on those points:

- Offering standard access to Smart Card functionalities that:
  - Authenticate User
  - Sign data
  - Decrypt data
  - Get certificates
- With an API that is enough close with PKCS#11 API that it could be considered as a brick to build a “tiny PKCS#11”.
- An implementation of the protocol can be dedicated to a specific Smart Card or a specific set of Smart Card.
- An implementation of the protocol shall poll for Smart Card reader attachment and removal.
- An implementation of the protocol shall poll for Smart Card insertion and removal. On insertion the protocol shall check if it supports this Smart Card.
Typically an implementation of this protocol will lean on a Smart Card reader protocol (\texttt{EFI\_SMART\_CARD\_READER\_PROTOCOL}).

\texttt{EFI\_SMART\_CARD\_EDGE\_PROTOCOL.GetContext()}

\textbf{Summary}
This function retrieves the context driver.

\textbf{Prototype}

\begin{verbatim}
typedef EFI_STATUS (EFIAPI *EFI_SMART_CARD_EDGE_GET_CONTEXT) (  
    IN EFI_SMART_CARD_EDGE_PROTOCOL *This,  
    OUT UINTN          *NumberAidSupported,  
    IN OUT UINTN       *AidTableSize OPTIONAL,  
    OUT SMART_CARD_AID *AidTable OPTIONAL,  
    OUT UINTN          *NumberSCPresent,  
    IN OUT UINTN       *CsnTableSize OPTIONAL,  
    OUT SMART_CARD_CSN *CsnTable OPTIONAL,  
    OUT UINT32          *VersionScEdgeProtocol OPTIONAL  
);  
\end{verbatim}

\textbf{Parameters}

\begin{itemize}
  \item \texttt{This} Indicates a pointer to the calling context. Type \texttt{EFI\_SMART\_CARD\_EDGE\_PROTOCOL} is defined in the \texttt{EFI\_SMART\_CARD\_EDGE\_PROTOCOL} description.
  \item \texttt{NumberAidSupported} Number of AIDs this protocol supports.
  \item \texttt{AidTableSize} On input, number of items allocated for the AID table. On output, number of items returned by protocol.
  \item \texttt{AidTable} Table of the AIDs supported by the protocol.
  \item \texttt{NumberSCPresent} Number of currently present Smart Cards that are supported by protocol.
  \item \texttt{CsnTableSize} On input, the number of items the buffer CSN table can contain. On output, the number of items returned by the protocol.
  \item \texttt{CsnTable} Table of the CSN of the Smart Card present and supported by protocol.
  \item \texttt{VersionScEdgeProtocol} \texttt{EFI\_SMART\_CARD\_EDGE\_PROTOCOL} version.
\end{itemize}
Related Definitions

// Parameters type definition
//
typedef UINT8 SMART_CARD_AID[SCARD_AID_MAXSIZE];
typedef UINT8 SMART_CARD_CSN[SCARD_CSN_SIZE];
```

Description

The **GetContext** function returns the context of the protocol, the application identifiers supported by the protocol and the number and the CSN unique identifier of Smart Cards that are present and supported by protocol.

If `AidTableSize`, `AidTable`, `CsnTableSize`, `CsnTable` or `VersionProtocol` is NULL, the function does not fail but does not fill in such variables.

In case `AidTableSize` indicates a buffer too small to hold all the protocol AID table, only the first `AidTableSize` items of the table are returned in `AidTable`.

In case `CsnTableSize` indicates a buffer too small to hold the entire table of Smart Card CSN present, only the first `CsnTableSize` items of the table are returned in `CsnTable`.

**VersionScEdgeProtocol** returns the version of the **EFI_SMART_CARD_EDGE_PROTOCOL** this driver uses. For this protocol specification value is **SMART_CARD_EDGE_PROTOCOL_VERSION_1**.

In case of Smart Card removal the internal CSN list is immediately updated, even if a connection is opened with that Smart Card.

EFI_SMART_CARD_EDGE_PROTOCOL. Connect()

Summary
This function establish a connection with a Smart Card the protocol support.

Prototype

```c
typedef EFI_STATUS (EFIAPI *EFI_SMART_CARD_EDGE_CONNECT)(
    IN EFI_SMART_CARD_EDGE_PROTOCOL *This,
    OUT EFI_HANDLE *SCardHandle,
    IN UINT8 *ScardCsn OPTIONAL,
    OUT UINT8 *ScardAid OPTIONAL
);
```

Parameters

- **This**: Indicates a pointer to the calling context. Type `EFI_SMART_CARD_EDGE_PROTOCOL` is defined in the `EFI_SMART_CARD_EDGE_PROTOCOL` description.
- **SCardHandle**: Handle on Smart Card connection.
- **ScardCsn**: CSN of the Smart Card the connection has to be established.
- **ScardAid**: AID of the Smart Card the connection has been established.

Description

The **Connect** function establishes a connection with a Smart Card.

In case of success the **SCardHandle** can be used.

If the **ScardCsn** is NULL the connection is established with the first Smart Card the protocol finds in its table of Smart Card present and supported. Else it establish context with the Smart Card whose CSN given by **ScardCsn**.

If **ScardAid** is not NULL the function returns the Smart Card AID the protocol supports.

After a successful connect the **SCardHandle** will remain existing even in case Smart Card removed from Smart Card reader, but all function invoking this **SCardHandle** will fail. **SCardHandle** is released only on Disconnect.

</tbody>
</table>

**EFI_SMART_CARD_EDGE_PROTOCOL.Disconnect()**

**Summary**
This function releases a connection previously established by Connect.

**Prototype**
```c
typedef EFI_STATUS (EFIAPI *EFI_SMART_CARD_EDGE_DISCONNECT) (  
    IN EFI_SMART_CARD_EDGE_PROTOCOL *This,  
    IN EFI_HANDLE SCardHandle
);
```

**Parameters**
- `This` Indicates a pointer to the calling context. Type `EFI_SMART_CARD_EDGE_PROTOCOL` is defined in the `EFI_SMART_CARD_EDGE_PROTOCOL` description.
- `SCardHandle` Handle on Smart Card connection to release.

**Description**
The Disconnect function releases the connection previously established by a Connect. In case the Smart Card or the Smart Card reader has been removed before this call, this function returns EFI_SUCCESS.

**EFI_SMART_CARD_EDGE_PROTOCOL.GetCsn**

**Summary**

This function returns the Smart Card serial number.

**Prototype**

```c
typedef EFI_STATUS
    (EFIAPI *EFI_SMART_CARD_EDGE_GET_CSN) (  
    IN EFI_SMART_CARD_EDGE_PROTOCOL *This,   
    IN EFI_HANDLE SCardHandle,              
    OUT UINT8 Csn[SCARD_CSN_SIZE]           
    );
```

**Parameters**

- **This** Indicates a pointer to the calling context. Type `EFI_SMART_CARD_EDGE_PROTOCOL` is defined in the `EFI_SMART_CARD_EDGE_PROTOCOL` description.
- **SCardHandle** Handle on Smart Card connection.
- **Csn** The Card Serial number, 16 bytes array.

**Description**

The `GetCsn` function returns the 16 bytes Smart Card Serial number.

EFI_SMART_CARD_EDGE_PROTOCOL.GetReaderName

Summary
This function returns the name of the Smart Card reader used for this connection.

Prototype

typedef
EFI_STATUS
(EIFIAMI *EFI_SMART_CARD_EDGE_GET_READER_NAME) (
    IN EFI_SMART_CARD_EDGE_PROTOCOL *This,
    IN EFI_HANDLE SCardHandle,
    IN OUT UINTN *ReaderNameLength,
    OUT CHAR16 *ReaderName OPTIONAL
);

Parameters

This Indicates a pointer to the calling context. Type EFI_SMART_CARD_EDGE_PROTOCOL is defined in the EFI_SMART_CARD_EDGE_PROTOCOL description.

SCardHandle Handle on Smart Card connection.

ReaderNameLength On input, a pointer to the variable that holds the maximal size, in bytes, of ReaderName. On output, the required size, in bytes, for ReaderName.

ReaderName A pointer to a NULL terminated string that will contain the reader name.

Description
The GetReaderName function returns the name of the Smart Card reader used for this connection.

Status Codes Returned

<table>
<thead>
<tr>

EFI_SMART_CARD_EDGE_PROTOCOL.VerifyPin()  

Summary
This function authenticates a Smart Card user by presenting a PIN code.
Prototype

typedef EFI_STATUS
(EFI_API *EFI_SMART_CARD_EDGE_VERIFY_PIN) (  
  IN EFI_SMART_CARD_EDGE_PROTOCOL *This,  
  IN EFI_HANDLE SCardHandle,  
  IN INT32 PinSize,  
  IN UINT8 *PinCode,  
  OUT BOOLEAN *PinResult,  
  OUT UINT32 *RemainingAttempts OPTIONAL  
);

Parameters

This   Indicates a pointer to the calling context. Type EFI_SMART_CARD_EDGE_PROTOCOL is defined in the EFI_SMART_CARD_EDGE_PROTOCOL description.
SCardHandle   Handle on Smart Card connection.
PinSize   PIN code buffer size.
PinCode   PIN code to present to the Smart Card.
PinResult   Result of PIN code presentation to the Smart Card.
   TRUE when Smart Card founds the PIN code correct.
RemainingAttempts   Number of attempts still possible.

Description

The VerifyPin function presents a PIN code to the Smart Card.

If Smart Card found the PIN code correct the user is considered authenticated to current application, and the function returns TRUE.

Negative or null PinSize value rejected if PinCode is not NULL

A NULL PinCode buffer means the application didn’t know the PIN, in that case:

• If PinSize value is negative the caller only wants to know if the current chain of the elements Smart Card Edge protocol, Smart Card Reader protocol and Smart Card Reader supports the Secure Pin Entry PCSC V2 functionality.
• If PinSize value is positive or null the caller ask to perform the verify PIN using the Secure PIN Entry functionality.

In PinCode buffer, the PIN value is always given in plaintext, in case of secure messaging the SMART_CARD_EDGE_PROTOCOL will be in charge of all intermediate treatments to build the correct Smart Card APDU.

**EFI_SMART_CARD_EDGE_PROTOCOL.GetPinRemaining()**

**Summary**

This function gives the remaining number of attempts for PIN code presentation.

**Prototype**

```c
typedef EFI_STATUS (EFIAPI *EFI_SMART_CARD_EDGE_GET_PIN_REMAINING) (  
  IN EFI_SMART_CARD_EDGE_PROTOCOL *This,  
  IN EFI_HANDLE SCardHandle,  
  OUT UINT32 RemainingAttempts
);
```

**Parameters**

- **This** Indicates a pointer to the calling context. Type `EFI_SMART_CARD_EDGE_PROTOCOL` is defined in the `EFI_SMART_CARD_EDGE_PROTOCOL` description.
- **SCardHandle** Handle on Smart Card connection.
- **RemainingAttempts** Number of attempts still possible.

**Description**

The number of attempts to present a correct PIN is limited and depends on Smart Card and on PIN. This function will retrieve the number of remaining possible attempts.

**EFI_SMART_CARD_EDGE_PROTOCOL.GetCredentials()**

**Summary**

This function retrieve credentials store into the Smart Card.

**Prototype**

```c
typedef
    EFI_STATUS
    (EFIAPI *EFI_SMART_CARD_EDGE_GET_CREDENTIAL) (    
    IN EFI_SMART_CARD_EDGE_PROTOCOL *This,
    IN EFI_HANDLE SCardHandle,
    IN OUT UINTN *CredentialSize,
    OUT UINT8 *CredentialList OPTIONAL
    );
```

**Parameters**

- **This** Indicates a pointer to the calling context. Type EFI_SMART_CARD_EDGE_PROTOCOL is defined in the EFI_SMART_CARD_EDGE_PROTOCOL description.
- **SCardHandle** Handle on Smart Card connection.
- **CredentialSize** On input, in bytes, the size of buffer to store the list of credential. On output, in bytes, the size of buffer required to store the entire list of credentials.
- **CredentialList** List of credentials stored into the Smart Card. A list of TLV (Tag Length Value) elements organized in containers array.
Related Definitions

// Type of data elements in credentials list

#define SC_EDGE_ECDH_384 0x07     // ECDH agreement
#define SC_EDGE_ECDH_521 0x08     // ECDH agreement

Description

The function returns a series of items in TLV (Tag Length Value) format.
First TLV item is the header item that gives the number of following containers (0x00, 0x01, Nb containers).
All these containers are a series of 4 TLV items:

- The certificate item (0x01, certificate size, certificate)
- The Key identifier item (0x02, 0x01, key index)
- The key type item (0x03, 0x01, key type)
The key size item (0x04, 0x02, key size), key size in number of bits.

Numeric multi-bytes values are on big endian format, most significant byte first:

- The L field value for certificate (2 bytes)
- The L field value for key size (2 bytes)
- The value field for key size (2 bytes)

**EFI_SMART_CARD_EDGE_PROTOCOL.SignData()**

**Summary**

This function signs an already hashed data with a Smart Card private key.

**Prototype**

```c
typedef EFI_STATUS
    (EFIAPIC *EFI_SMART_CARD_EDGE_SIGN_DATA)(
    IN EFI_SMART_CARD_EDGE_PROTOCOL *This,
    IN EFI_HANDLE SCardHandle,
    IN UINTN KeyId,
    IN UINTN KeyType,
    IN EFI_GUID *HashAlgorithm,
    IN EFI_GUID *PaddingMethod,
    IN UINT8 *HashedData,
    OUT UINT8 *SignatureData
    );
```

**Parameters**

- **This** Indicates a pointer to the calling context. Type EFI_SMART_CARD_EDGE_PROTOCOL is defined in the EFI_SMART_CARD_EDGE_PROTOCOL description.
- **SCardHandle** Handle on Smart Card connection.
KeyId
Identifier of the key container, retrieved in a key index item of credentials.

KeyType
The key type, retrieved in a key type item of credentials.

HashAlgorithm
Hash algorithm used to hash the, one of:
- EFI_HASH_ALGORITHM_SHA1_GUID
- EFI_HASH_ALGORITHM_SHA256_GUID
- EFI_HASH_ALGORITHM_SHA384_GUID
- EFI_HASH_ALGORITHM_SHA512_GUID

PaddingMethod
Padding method used jointly with hash algorithm, one of:
- EFI_PADDING_RSASSA_PKCS1V1P5_GUID
- EFI_PADDING_RSASSA_PSS_GUID

HashedData
Hash of the data to sign. Size is function of the HashAlgorithm.

SignatureData
Resulting signature with private key KeyId. Size is function of the KeyType and key size retrieved in the associated key size item of credentials.

Related Definitions

    //
    // Padding methods GUIDs for signature

Description
This function signs data, actually it is the hash of these data that is given to the function.

SignatureData buffer shall be big enough for signature. Signature size is function key size and key type.

### EFI_SMART_CARD_EDGE_PROTOCOL.DecryptData()

#### Summary

This function decrypts data with a PKI/RSA Smart Card private key.

#### Prototype

```c
typedef EFI_STATUS
(DECLSPEC(EFI_FriendlyAPI)) EFI_SMART_CARD_EDGE_PROTOCOL_DecryptData(
    IN EFI_SMART_CARD_EDGE_PROTOCOL *This,
    IN EFI_HANDLE SCardHandle,
    IN UINTN KeyId,
    IN EFI_GUID *HashAlgorithm,
    IN EFI_GUID *PaddingMethod,
    IN UINTN EncryptedSize,
    IN UINT8 *EncryptedData,
    IN OUT UINTN *PlaintextSize,
    OUT UINT8 *PlaintextData
);
```

#### Parameters

- **This**: Indicates a pointer to the calling context. Type EFI_SMART_CARD_EDGE_PROTOCOL is defined in the EFI_SMART_CARD_EDGE_PROTOCOL description.
- **SCardHandle**: Handle on Smart Card connection.
KeyId
Identifier of the key container, retrieved in a key index item of credentials.

HashAlgorithm
Hash algorithm used to hash the, one of:
- EFI_HASH_ALGORITHM_SHA1_GUID
- EFI_HASH_ALGORITHM_SHA256_GUID
- EFI_HASH_ALGORITHM_SHA384_GUID
- EFI_HASH_ALGORITHM_SHA512_GUID

PaddingMethod
Padding method used jointly with hash algorithm, one of:
- EFI_PADDING_NONE_GUID
- EFI_PADDING_RSAES_PKCS1V1P5_GUID
- EFI_PADDING_RSAES_OAEP_GUID

EncryptedSize
Size of data to decrypt

EncryptedData
Data to decrypt

PlaintextSize
On input, in bytes, the size of buffer to store the decrypted data. On output, in bytes, the size of buffer required to store the decrypted data.

PlaintextData
Buffer for decrypted data, padding removed.

Description

The function decrypts some PKI / RSA encrypted data with private key securely stored into the Smart Card.

The **KeyId** must reference a key of type **SC_EDGE_RSA_EXCHANGE**.

**EFI_SMART_CARD_EDGE_PROTOCOL.BuildDHAgreement()**

Summary

This function performs a secret Diffie Hellman agreement calculation that would be used to derive a symmetric encryption / decryption key.

Prototype

```c
typedef
EFI_STATUS
(EIFIAPI *EFI_SMART_CARD_EDGE_BUILD_DH_AGREEMENT) (  
    IN EFI_SMART_CARD_EDGE_PROTOCOL *This,
    IN EFI_HANDLE ScardHandle,
    IN UINTN KeyId,
    IN UINT8 *dataQx,
    IN UINT8 *dataQy,
    OUT UINT8 *DHAgreement
) ;
```
Parameters

This Indicates a pointer to the calling context. Type 
EFI_SMART_CARD_EDGE_PROTOCOL is defined in the 
EFI_SMART_CARD_EDGE_PROTOCOL description.

SCardHandle Handle on Smart Card connection.

KeyId Identifier of the key container, retrieved in a key index item of 
credentials.

dataQx Public key x coordinate. Size is the same as key size for KeyId. 
Stored in big endian format.

dataQy Public key y coordinate. Size is the same as key size for KeyId. 
Stored in big endian format.

DHAgreement Buffer for DH agreement computed. Size must be bigger or 
equal to key size for KeyId.

Description

The function compute a DH agreement that should be diversified to generate a symmetric key to 
proceed encryption or decryption.

The application and the Smart Card shall agree on the diversification process.

The KeyId must reference a key of one of the types: SC_EDGE_ECDH_256, SC_EDGE_ECDH_384 
or SC_EDGE_ECDH_521.

38 - Miscellaneous Protocols

38.1 EFI Timestamp Protocol

EFI_TIMESTAMP_PROTOCOL

Summary
The Timestamp protocol provides a platform independent interface for retrieving a high resolution timestamp counter.

GUID

```c
#define EFI_TIMESTAMP_PROTOCOL_GUID \
{ 0xafbfde41, 0x2e6e, 0x4262,\ 
{ 0xba, 0x65, 0x62, 0xb9, 0x23, 0x6e, 0x54, 0x95 } }
```

Protocol Interface Structure

```c
typedef struct _ EFI_TIMESTAMP_PROTOCOL {
    TIMESTAMP_GET GetTimestamp;
    TIMESTAMP_GET_PROPERTIES GetProperties;
} EFI_TIMESTAMP_PROTOCOL;
```

EFI_TIMESTAMP_PROTOCOL.GetTimestamp()

Summary
Retrieves the current timestamp counter value.

Prototype

```c
typedef UINT64
(EIFIAPI *TIMESTAMP_GET) (VOID);
```

Description
Retrieves the current value of a 64-bit free running timestamp counter.

The counter shall count up in proportion to the amount of time that has passed. The counter value will always roll over to zero. The properties of the counter can be retrieved from GetProperties().

The caller should be prepared for the function to return the same value twice across successive calls. The counter value will not go backwards other than when wrapping, as defined by EndValue in GetProperties().

The frequency of the returned timestamp counter value must remain constant. Power management operations that affect clocking must not change the returned counter frequency. The quantization of counter value updates may vary as long as the value reflecting time passed remains consistent.
Return Value
The current value of the free running timestamp counter.

EFI_TIMESTAMP_PROTOCOL.GetProperties ()

Summary
Obtains timestamp counter properties including frequency and value limits.

Prototype
```c
typedef
EFI_STATUS
(EFIAPI *TIMESTAMP_GET_PROPERTIES) (
    OUT   EFI_TIMESTAMP_PROPERTIES *Properties
);
```

Parameters
- **Properties**
  The properties of the timestamp counter. See "Related Definitions" below.

Description
Retrieves the timestamp counter properties structure.

Related Definitions
```c
typedef struct {
    UINT64   Frequency;
    UINT64   EndValue;
} EFI_TIMESTAMP_PROPERTIES;
```

- **Frequency**
  The frequency of the timestamp counter in Hz.

- **EndValue**
  The value that the timestamp counter ends with immediately before it rolls over. For example, a 64-bit free running counter would have an EndValue of 0xFFFFFFFFFFFFFFFF. A 24-bit free running counter would have an EndValue of 0xFFFFFFFF.
Status Codes Returned

</tbody>
</table>

38.2 Reset Notification Protocol

EFI_RESET_NOTIFICATION_PROTOCOL

Summary
This protocol provides services to register for a notification when ResetSystem is called.

GUID

```c
#define EFI_RESET_NOTIFICATION_PROTOCOL_GUID \
{ 0x9da34ae0, 0xeaf9, 0x4bbf, \n  { 0x8e, 0xc3, 0xfd, 0x60, 0x22, 0x6c, 0x44, 0xbe } }
```

Protocol Interface Structure

```c
typedef struct _EFI_RESET_NOTIFICATION_PROTOCOL {
    EFI_REGISTER_RESET_NOTIFY RegisterResetNotify;
    EFI_UNREGISTER_RESET_NOTIFY UnRegisterResetNotify;
} EFI_RESET_NOTIFICATION_PROTOCOL;
```

Parameters

RegisterResetNotify

Register a notification function to be called when ResetSystem() is called.

UnRegisterResetNotify

Removes a reset notification function that has been previously registered with RegisterResetNotify().

EFI_RESET_NOTIFICATION_PROTOCOL.RegisterResetNotify()

Summary
Register a notification function to be called when ResetSystem() is called.

Prototype

```c
typedef
EFI_STATUS
(EFI_API *EFI_REGISTER_RESET_NOTIFY) ( 
    IN EFI_RESET_NOTIFICATION_PROTOCOL  *This,
    IN EFI_RESET_SYSTEM               *ResetFunction,
);
```
Parameters

This

A pointer to the EFI_RESET_NOTIFICATION_PROTOCOL instance.

ResetFunction

Points to the function to be called when a ResetSystem() is executed.

Description

The RegisterResetNotify() function registers a notification function that is called when ResetSystem() is called and prior to completing the reset of the platform.

The registered functions must not perform a platform reset themselves. These notifications are intended only for the notification of components which may need some special-purpose maintenance prior to the platform resetting.

The list of registered reset notification functions are processed if ResetSystem() is called before ExitBootServices(). The list of registered reset notification functions is ignored if ResetSystem() is called after ExitBootServices().

Status Codes Returned

</tr>
<tr>
<td>EFI_ALREADY_STARTED</td>
<td>The reset notification function specified by ResetFunction has already been registered.</td>
</tr>
</tbody>
</table>

EFI_RESET_NOTIFICATION_PROTOCOL.UnregisterResetNotify()

Summary

Unregister a notification function.

Prototype

```c
typedef
EFI_STATUS
(EIFIAPI *EFI_UNREGISTER_RESET_NOTIFY) (  
    IN EFI_RESET_NOTIFICATION_PROTOCOL*This,
    IN EFI_RESET_SYSTEM *ResetFunction
);
```
Parameters

This

A pointer to the EFI_RESET_NOTIFICATION_PROTOCOL instance.

ResetFunction

The pointer to the ResetFunction being unregistered.

Description

The UnregisterResetNotify() function removes the previously registered notification using RegisterResetNotify().

Status Codes Returned

<table>
<thead>
<tr>
<th>Status Code</th>

</table>
Appendix A - GUID and Time Formats

All EFI GUIDs (Globally Unique Identifiers) have the format described in RFC 4122 and comply with the referenced algorithms for generating GUIDs. It should also be noted that TimeLow, TimeMid, TimeHighAndVersion fields in the EFI are encoded as little endian. The following table defines the format of an EFI GUID (128 bits).

Table A-1 EFI GUID Format

<table>
<thead>
<tr>
<th>Mnemonic</th>
<th>Byte Offset</th>

<td>The low field of the clock sequence.</td>
</tr>
<tr>
<td>Node</td>
<td>10</td>
<td>6</td>
<td>The spatially unique node identifier. This can be based on any IEEE 802 address obtained from a network card. If no network card exists in the system, a cryptographic-quality random number can be used.</td>
</tr>
</tbody>
</table>

This appendix for GUID defines a 60-bit timestamp format that is used to generate the GUID. All EFI time information is stored in 64-bit structures that contain the following format: The timestamp is a 60-bit value containing a count of 100-nanosecond intervals since 00:00:00.00, 15 October 1582 (the date of Gregorian reform to the Christian calendar). This time value will not roll over until the year 3400 AD. It is assumed that a future version of the EFI specification can deal with the year-3400 issue by extending this format if necessary.

This specification also defines a standard text representation of the GUID. This format is also sometimes called the “registry format”. It consists of 36 characters, as follows:

```
aabbccdd-eeff-gghh-iijj-kkllmnnopp
```

The pairs aa – pp are two characters in the range ‘0’-'9', ‘a’-'f' or ‘A’-'F', with each pair representing a single byte hexadecimal value.

The following table describes the relationship between the text representation and a 16-byte buffer, the structure defined in Table A-1 and the EFI_GUID structure.

Appendix B - Console

The EFI console was designed to allow input from a wide variety of devices. This appendix provides examples of the mapping of keyboard input from various types of devices to EFI scan codes. While representative of common console devices in use today, it is not intended to be a comprehensive list. EFI application programmers can use this table to identify the EFI Scan Code generated by a specific key press. The description of the example device input data that generates a EFI Scan Code may be useful to EFI driver writers, as well as showing the limitations on which EFI Scan codes can be generated by different types of console input devices.

The EFI console was designed so that it could map to common console devices. This appendix explains how an EFI console could map to a VGA with PC AT 101/102, PC ANSI, or ANSI X3.64 consoles.

B.1 EFI_SIMPLE_TEXT_INPUT_PROTOCOL and EFI_SIMPLE_TEXT_INPUT_EX_PROTOCOL

Table B-1 and Table B-2 give examples of how input from a set of common input devices is mapped to EFI scan codes. Terminals and terminal emulators generally report function and editing keys as escape or control sequences. These sequences are formed by a control character followed by one or more additional graphic characters that indicate what the sequence means. ANSI X3.64 terminals generally require an ANSI parser to determine how to interpret a sequence and how to determine that the sequence is complete. These terminals can generate sequences using either 8-bit controls or 7-bit control sequences. Older terminal types, such as the VT100+ have a simpler set of sequences that can be interpreted using simple case statements. These terminals usually generate only 7-bit data, and 7-bit control sequences.

In the tables below, the CSI character is the 8-bit control character 0x9B, and is equivalent to the 7-bit control sequence "ESC [" (the 0x1B control ESC followed by the left bracket character 0x5B). The sequences are shown with spaces for readability, but do not contain the space character.

The VT100+ column represents a common class of terminal emulation that is a superset of the Digital Equipment Corporation (DEC) VT100 terminal. This includes VT-UTF8 (Hyperterm) and PC_ANSI terminal types. The ANSI X3.64 column shows the sequences generated by the DEC VT200 through VT500 terminals, which are an ANSI X3.64 / ISO 6429 compliant.

The USB HID and AT 101/102 columns show the scan codes generated by two common directly attached keyboards. These keyboards are generally used in combination with a VGA text display to form a "VGA Console".

In the table below, the cells with N/A contained in them are simply intended to reflect that the key may be defined for that terminal or keyboard, but there is no industry standard or consistent mapping for the key. Some input devices might not implement all of these keys.

Appendix C - Device Path Examples

This appendix presents an example EFI Device Path and explains its relationship to the ACPI name space. An example system design is presented along with its corresponding ACPI name space. These physical examples are mapped back to EFI Device Paths.

C.1 Example Computer System

Figure C-1 represents a hypothetical computer system architecture that will be used to discuss the construction of EFI Device Paths. The system consists of a memory controller that connects directly to the processors’ front side bus. The memory controller is only part of a larger chipset, and it connects to a root PCI host bridge chip, and a secondary root PCI host bridge chip. The secondary PCI host bridge chip produces a PCI bus that contains a PCI to PCI bridge. The root PCI host bridge produces a PCI bus, and also contains USB, ATA66, and AC ‘97 controllers. The root PCI host bridge also contains an LPC bus that is used to connect a SIO (Super IO) device. The SIO contains a PC-AT-compatible floppy disk controller, and other PC-AT-compatible devices like a keyboard controller.

Figure C-1 Example Computer System

The remainder of this appendix describes how to construct a device path for three example devices from the system in Figure C-1. The following is a list of the examples used:

- Legacy floppy
- IDE Disk
- Secondary root PCI bus with PCI to PCI bridge
**Figure C-2** is a partial ACPI name space for the system in Figure C-1. **Figure C-2** is based on Figure 5-3 in the *Advanced Configuration and Power Interface Specification*.

---

**C.2 Legacy Floppy**

The legacy floppy controller is contained in the SIO chip that is connected root PCI bus host bridge chip. The root PCI host bridge chip produces PCI bus 0, and other resources that appear directly to the processors in the system.

In ACPI this configuration is represented in the _SB, system bus tree, of the ACPI name space. PCI0 is a child of _SB and it represents the root PCI host bridge. The SIO appears to the system to be a set of ISA devices, so it is represented as a child of PCI0 with the name ISA0. The floppy controller is represented by FLPY as a child of the ISA0 bus.

The EFI Device Path for the legacy floppy is defined in **Table C-1**. It would contain entries for the following things:

- Root PCI Bridge. ACPI Device Path _HID PNP0A03, _UID 0. ACPI name space \_SB\PCI0
- PCI to ISA Bridge. PCI Device Path with device and function of the PCI to ISA bridge. ACPI name space \_SB\PCI0\ISA0
- Floppy Plug and Play ID. ACPI Device Path _HID PNP0303, _UID 0. ACPI name space \_SB\PCI0\ISA0\FLPY
- End Device Path

C.3 IDE Disk

The IDE Disk controller is a PCI device that is contained in a function of the root PCI host bridge. The root PCI host bridge is a multi function device and has a separate function for chipset registers, USB, and IDE. The disk connected to the IDE ATA bus is defined as being on the primary or secondary ATA bus, and of being the master or slave device on that bus.

In ACPI this configuration is represented in the _SB, system bus tree, of the ACPI name space. PCI0 is a child of _SB and it represents the root PCI host bridge. The IDE controller appears to the system to be a PCI device with some legacy properties, so it is represented as a child of PCI0 with the name IDE0. PRIM is a child of IDE0 and it represents the primary ATA bus of the IDE controller. MAST is a child of PRIM and it represents that this device is the ATA master device on this primary ATA bus.

The EFI Device Path for the PCI IDE controller is defined in Table C-2. It would contain entries for the following things:

- Root PCI Bridge. ACPI Device Path _HID PNP0A03, _UID 0. ACPI name space \_SB\PCI0
- PCI IDE controller. PCI Device Path with device and function of the IDE controller. ACPI name space \_SB\PCI0\IDE0
• ATA Address. ATA Messaging Device Path for Primary bus and Master device. ACPI name space _SB\PCI0\IDE0\PRIM\MAST

• End Device Path

C.4 Secondary Root PCI Bus with PCI to PCI Bridge

The secondary PCI host bridge materializes a second set of PCI buses into the system. The PCI buses on the secondary PCI host bridge are totally independent of the PCI buses on the root PCI host bridge. The only relationship between the two is they must be configured to not consume the same resources. The primary PCI bus of the secondary PCI host bridge also contains a PCI to PCI bridge. There is some arbitrary PCI device plugged in behind the PCI to PCI bridge in a PCI slot.

In ACPI this configuration is represented in the _SB, system bus tree, of the ACPI name space. PCI1 is a child of _SB and it represents the secondary PCI host bridge. The PCI to PCI bridge and the device plugged into the slot on its primary bus are not described in the ACPI name space. These devices can be fully configured by following the applicable PCI specification.

The EFI Device Path for the secondary root PCI bridge with a PCI to PCI bridge is defined in Table C-3. It would contain entries for the following things:
• Root PCI Bridge. ACPI Device Path _HID PNP0A03, _UID 1. ACPI name space \SB\PCI1
• PCI to PCI Bridge. PCI Device Path with device and function of the PCI Bridge. ACPI name space \SB\PCI1, PCI to PCI bridges are defined by PCI specification and not ACPI.
• PCI Device. PCI Device Path with the device and function of the PCI device. ACPI name space \SB\PCI1, PCI devices are defined by PCI specification and not ACPI.
• End Device Path.

C.5 ACPI Terms

Names in the ACPI name space that start with an underscore (“_”) are reserved by the ACPI specification and have architectural meaning. All ACPI names in the name space are four characters in length. The following four ACPI names are used in this specification.

_ADR. The Address on a bus that has standard enumeration. An example would be PCI, where the enumeration method is described in the PCI Local Bus specification.

_CRS. The current resource setting of a device. A _CRS is required for devices that are not enumerated in a standard fashion. _CRS is how ACPI converts nonstandard devices into Plug and Play devices.

_HID. Represents a device’s Plug and Play hardware ID, stored as a 32-bit compressed EISA ID. _HID objects are optional in ACPI. However, a _HID object must be used to describe any device that will be enumerated by the ACPI driver in the OS. This is how ACPI deals with non–Plug and Play devices.

_UID. Is a serial number style ID that does not change across reboots. If a system contains more than one device that reports the same _HID, each device must have a unique _UID. The _UID only needs to be unique for device that have the exact same _HID value.

C.6 EFI Device Path as a Name Space

Figure C-3 shows the EFI Device Path for the example system represented as a name space. The Device Path can be represented as a name space, but EFI does support manipulating the Device Path as a name space. You can only access Device Path information by locating the DEVICE_PATH_INTERFACE from a handle. Not all the nodes in a Device Path will have a handle.
Appendix D - Status Codes

EFI interfaces return an **EFI_STATUS** code. Table D-2, Table D-3, and Table D-4 list these codes for success, errors, and warnings, respectively. The range of status codes that have the highest bit set and the next to highest bit clear are reserved for use by EFI. The range of status codes that have both the highest bit set and the next to highest bit set are reserved for use by OEMs. Success and warning codes have their highest bit clear, so all success and warning codes have positive values. The range of status codes that have both the highest bit clear and the next to highest bit clear are reserved for use by EFI. The range of status code that have the highest bit clear and the next to highest bit set are reserved for use by OEMs. **Table D-1** lists the status code ranges described above.

Appendix E - Universal Network Driver Interfaces

E.1 Introduction

This appendix defines the 32/64-bit H/W and S/W Universal Network Driver Interfaces (UNDIs). These interfaces provide one method for writing a network driver; other implementations are possible.

E.1.1 Definitions

Table E-1 Definitions

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>BC</td>
<td>BaseCode</td>
</tr>
<tr>
<td></td>
<td>The PXE BaseCode, included as a core protocol in EFI, is comprised of a simple network stack (UDP/IP) and a few common network protocols (DHCP, Bootserver Discovery, TFTP) that are useful for remote booting machines.</td>
</tr>
<tr>
<td>LOM</td>
<td>LAN On Motherboard</td>
</tr>
<tr>
<td></td>
<td>This is a network device that is built onto the motherboard (or baseboard) of the machine.</td>
</tr>
<tr>
<td>NBP</td>
<td>Network Bootstrap Program</td>
</tr>
<tr>
<td></td>
<td>This is the first program that is downloaded into a machine that has selected a PXE capable device for remote boot services.</td>
</tr>
<tr>
<td></td>
<td>A typical NBP examines the machine it is running on to try to determine if the machine is capable of running the next layer (OS or application). If the machine is not capable of running the next layer, control is returned to the EFI boot manager and the next boot device is selected. If the machine is capable, the next layer is downloaded and control can then be passed to the downloaded program. Though most NBPs are OS loaders, NBPs can be written to be standalone applications such as diagnostics, backup/restore, remote management agents, browsers, etc.</td>
</tr>
<tr>
<td>NIC</td>
<td>Network Interface Card</td>
</tr>
<tr>
<td></td>
<td>Technically, this is a network device that is inserted into a bus on the motherboard or in an expansion board. For the purposes of this document, the term NIC will be used in a generic sense, meaning any device that enables a network connection (including LOMs and network devices on external busses (USB, 1394, etc.)).</td>
</tr>
<tr>
<td>ROM</td>
<td>Read-Only Memory</td>
</tr>
<tr>
<td></td>
<td>When used in this specification, ROM refers to a nonvolatile memory storage device on a NIC.</td>
</tr>
</tbody>
</table>
When implementing PXE services, protocols, ROMs or drivers, it is a good idea to understand the related network protocols and BIOS specifications. **Table E-2** below includes all of the specifications referenced in this document.

**Table E-2 Referenced Specifications**

<table>
<thead>
<tr>

E.1.3 OS Network Stacks

This is a simplified overview of three OS network stacks that contain three types of network drivers: Custom, S/W UNDI and H/W UNDI. Figure E-1 depicts an application bound to an OS protocol stack, which is in turn bound to a protocol driver that is bound to three NICs. Table E-3 below gives a brief list of pros and cons about each type of driver implementation.

![Figure E-1 Network Stacks with Three Classes of Drivers](image)

### Table E-3 Driver Types: Pros and Cons

<table>
<thead>
<tr>
<th>Driver</th>
<th>Pro</th>
<th>Con</th>
</tr>
</thead>
</table>
| Custom   | • Can be very fast and efficient. NIC vendor tunes driver to OS & device.  
|          | • OS vendor does not have to write NIC driver.                        | • New driver for each OS/architecture must be maintained by NIC vendor.  
|          |                                                                      | • OS vendor must trust code supplied by third-party.                 |
|          |                                                                      | • OS vendor cannot test all possible driver/NIC versions.            |
|          |                                                                      | • Driver must be installed before NIC can be used.                   |
|          |                                                                      | • Possible performance sink if driver is poorly written.             |
|          |                                                                      | • Possible security risk if driver has back door.                    |
| S/W UNDI | • S/W UNDI driver is simpler than a Custom driver. Easier to test outside of the OS environment.  
|          | • OS vendor can tune the universal protocol driver for best OS performance.  
|          | • NIC vendor only has to write one driver per processor architecture. | • Slightly slower than Custom or H/W UNDI because of extra call layer between protocol stack and NIC.  
|          |                                                                      | • S/W UNDI driver must be loaded before NIC can be used.             |
|          |                                                                      | • OS vendor has to write the universal driver.                       |
|          |                                                                      | • Possible performance sink if driver is poorly written.             |
|          |                                                                      | • Possible security risk if driver has back door.                    |
E.2 Overview

There are three major design changes between this specification and the 16-bit UNDI in version 2.1 of the PXE Specification:

- A new architectural hardware interface has been added.
- All UNDI commands use the same command format.
- BC is no longer part of the UNDI ROM.

E.2.1 32/64-bit UNDI Interface

The !PXE structures are used to locate and identify the type of 32/64-bit UNDI interface (H/W or S/W), as shown in Figure E-2. These structures are normally only used by the system BIOS and universal network drivers.

<table>
<thead>
<tr>
<th>Driver</th>
<th>Pro</th>
<th>Con</th>
</tr>
</thead>
</table>
| H/W UNDI | • H/W UNDI provides a common architectural interface to all network devices.  
• OS vendor controls all security and performance issues in network stack.  
• NIC vendor does not have to write any drivers.  
• NIC can be used without an OS or driver installed (preboot management). | • OS vendor has to write the universal driver (this might also be a Pro, depending on your point of view). |
The !PXE structures used for H/W and S/W UNDIs are similar but not identical. The difference in the
format is tied directly to the differences required by the implementation. The !PXE structures for 32/64-bit
UNDIs are not compatible with the !PXE structure for 16-bit UNDI.

The !PXE structure for H/W UNDI is built into the NIC hardware. The first nine fields (from offsets 0x00 to
0x0F) are implemented as read-only memory (or ports). The last three fields (from Len to Len + 0x0F) are
implemented as read/write memory (or ports). The optional reserved field at 0x10 is not defined in this
specification and may be used for vendor data.

The !PXE structure for S/W UNDI can be loaded into system memory from one of three places; ROM on a
NIC, system nonvolatile storage, or external storage. Since there are no direct memory or I/O ports
available in the S/W UNDI !PXE structure, an indirect callable entry point is provided. S/W UNDI
developers are free to make their internal designs as simple or complex as they desire, as long as all of
the UNDI commands in this specification are implemented.

Descriptions of the fields in the !PXE structures is given in Table E-4.

**Table E-4 !PXE Structure Field Definitions**

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Signature</td>
<td>“!PXE”</td>
<td>!PXE structure signature. This field is used to locate an UNDI hardware or software interface in system memory (or I/O) space. ‘!’ is in the first (lowest address) byte, ‘P’ is in the second byte, ‘X’ in the third and ‘E’ in the last. This field must be aligned on a 16-byte boundary (the last address byte must be zero).</td>
</tr>
<tr>
<td>Len</td>
<td>Varies</td>
<td>Number of !PXE structure bytes to checksum. When computing the checksum of this structure the Len field MUST be used as the number of bytes to checksum. The !PXE structure checksum is computed by adding all of the bytes in the structure, starting with the first byte of the structure Signature: ‘!’. If the 8-bit sum of all of the unsigned bytes in this structure is not zero, this is not a valid !PXE structure.</td>
</tr>
<tr>
<td>Fudge</td>
<td>Varies</td>
<td>This field is used to make the 8-bit checksum of this structure equal zero.</td>
</tr>
<tr>
<td>Rev</td>
<td>0x03</td>
<td>Revision of this structure.</td>
</tr>
<tr>
<td>IFcnt</td>
<td>Varies</td>
<td>This field reports the number (minus one) of physical external network connections that are controlled by this !PXE interface. (If there is one network connector, this field is zero. If there are two network connectors, this field is one.) For !PXE structure revision 0x03 or higher, in addition to this field, the value in IFcntExt field must be left-shifted by 8-bits and ORed with IFcnt to get the 16-bit value for the total number (minus one) of physical external network connections that are controlled by this !PXE interface.</td>
</tr>
</tbody>
</table>
| Major      | Varies| UNDI command interface. Minor revision number.  
**0x00 (Alpha):** This version of UNDI does not operate as a runtime driver. The callback interface defined in the UNDI Start command is required.  
**0x10 (Beta):** This version of UNDI can operate as an OS runtime driver. The callback interface defined in the UNDI Start command is required |
| Minor      | Varies| UNDI command interface. Minor revision number.  
**0x00 (Alpha):** This version of UNDI does not operate as a runtime driver. The callback interface defined in the UNDI Start command is required.  
**0x10 (Beta):** This version of UNDI can operate as an OS runtime driver. The callback interface defined in the UNDI Start command is required.
### IFcntExt

</thead>
<tbody>
<tr>
<td>Reserved</td>
<td>Varies</td>
<td>This field is optional and may be used for OEM &amp; vendor unique data. If this field is present its length must be a multiple of 16 bytes and must be included in the IPXE structure checksum. This field, if present, will always start on a 16-byte boundary. <strong>Note:</strong> The size/contents of the IPXE structure may change in future revisions of this specification. Do not rely on OEM &amp; vendor data starting at the same offset from the beginning of the IPXE structure. It is recommended that the OEM &amp; vendor data include a signature that drivers/applications can search for.</td>
</tr>
</tbody>
</table>

Note: The size/contents of the IPXE structure may change in future revisions of this specification. Do not rely on OEM & vendor data starting at the same offset from the beginning of the IPXE structure. It is recommended that the OEM & vendor data include a signature that drivers/applications can search for.
### Status

This is a read-only port. Undefined status bits must be set to zero. Reading this port does NOT clear the status.

### Command

Use to execute commands, clear interrupt status and enable/disable receive levels. This is a read/write port. Read reflects the last write.

</tbody>
</table>

### CDBaddr

Write the physical address of a CDB to this port. (Done with one 64-bit or two 32-bit writes, depending on processor architecture.) When done, use one 32-bit write to the command port to send this address into the command queue. Unused upper address bits must be set to zero.

### S/W UNDI Fields

- **EntryPoint**: S/W UNDI API entry point address. This is either a virtual address or an offset from the start of the IPXE structure. Protocol drivers will push the 64-bit virtual address of a CDB on the stack and then call the UNDI API entry point. When control is returned to the protocol driver, the protocol driver must remove the address of the CDB from the stack.

- **BusTypeCnt**: This field is the count of 4-byte BusType entries in the next field.

- **BusType**: This field defines the type of bus S/W UNDI is written to support: “PCIR,” “PCCR,” “USBR” or “1394.” This field is formatted like the Signature field. If the S/W UNDI supports more than one BusType there will be more than one BusType identifier in this field.
E.2.1.1 Issuing UNDI Commands

How commands are written and status is checked varies a little depending on the type of UNDI (H/W or S/W) implementation being used. The command flowchart shown in Figure E-3 is a high-level diagram on how commands are written to both H/W and S/W UNDI.

Figure E-3 Issuing UNDI Commands

E.2.2 UNDI Command Format

The format of the CDB is the same for all UNDI commands. Figure E-4 shows the structure of the CDB. Some of the commands do not use or always require the use of all of the fields in the CDB. When fields are not used they must be initialized to zero or the UNDI will return an error. The StatCode and StatFlags fields must always be initialized to zero or the UNDI will return an error. All reserved fields (and bit fields) must be initialized to zero or the UNDI will return an error.

Basically, the rule is: Do it right, or don’t do it at all.
Descriptions of the CDB fields are given in Table E-5.

Table E-5 UNDI CDB Field Definitions

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Description</th>
</tr>
</thead>
</table>
| OpCode     | **Operation Code** (Function Number, Command Code, etc.)  
This field is used to identify the command being sent to the UNDI. The meanings of some of the  
bits in the OpFlags and StatFlags fields, and the format of the CPB and DB structures depends on  
the value in the OpCode field. Commands sent with an OpCode value that is not defined in this  
specification will not be executed and will return a StatCode of **PXE_STATCODE_INVALID_CDB**. |
| OpFlags    | Operation Flags  
This bit field is used to enable/disable different features in a specific command operation. It is  
also used to change the format/contents of the CPB and DB structures. Commands sent with  
reserved bits set in the OpFlags field will not be executed and will return a StatCode of  
**PXE_STATCODE_INVALID_CDB**. |
| CPBsize    | Command Parameter Block Size  
This field should be set to a number that is equal to the number of bytes that will be read from  
CPB structure during command execution. Setting this field to a number that is too small will  
cause the command to not be executed and a StatCode of **PXE_STATCODE_INVALID_CDB**  
will be returned.  
The contents of the CPB structure will not be modified. |
| DBsize     | Data Block Size  
This field should be set to a number that is equal to the number of bytes that will be written into  
the DB structure during command execution. Setting this field to a number that is smaller than  
required will cause an error. It may be zero in some cases where the information is not needed. |
<table>
<thead>
<tr>
<th>Identifier</th>
<th>Description</th>
</tr>
</thead>
</table>
| CPBaddr    | Command Parameter Block Address  
  For H/W UNDI, this field must be the physical address of the CPB structure. For S/W UNDI, this field must be the virtual address of the CPB structure. If the operation does not have/use a CPB, this field must be initialized to `PXE_CPBADDR_NOT_USED`. Setting up this field incorrectly will cause command execution to fail and a StatCode of `PXE_STATCODE_INVALID_CDB` will be returned. |
| DBaddr     | Data Block Address  
  For H/W UNDI, this field must be the physical address of the DB structure. For S/W UNDI, this field must be the virtual address of the DB structure. If the operation does not have/use a CPB, this field must be initialized to `PXE_DBADDR_NOT_USED`. Setting up this field incorrectly will cause command execution to fail and a StatCode of `PXE_STATCODE_INVALID_CDB` will be returned. |
| StatCode   | Status Code  
  This field is used to report the type of command completion: success or failure (and the type of failure). This field must be initialized to zero before the command is issued. The contents of this field is not valid until the `PXE_STATFLAGS_COMMAND_COMPLETE` status flag is set. If this field is not initialized to `PXE_STATCODE_INITIALIZE` the UNDI command will not execute and a StatCode of `PXE_STATCODE_INVALID_CDB` will be returned. |
| StatFlags  | Status Flags  
  This bit field is used to report command completion and identify the format, if any, of the DB structure. This field must be initialized to zero before the command is issued. Until the command state changes to error or complete, all other CDB fields must not be changed. If this field is not initialized to `PXE_STATFLAGS_INITIALIZE` the UNDI command will not execute and a StatCode of `PXE_STATCODE_INVALID_CDB` will be returned.  
  Bits 0x0F & 0x0E: Command state: Not started (0), Queued (1), Error (2), Complete (3). |
| IFnum      | Interface Number  
  This field is used to identify which network adapter (S/W UNDI) or network connector (H/W UNDI) this command is being sent to. If an invalid interface number is given, the command will not execute and a StatCode of `PXE_STATCODE_INVALID_CDB` will be returned. |
| Control    | Process Control  
  This bit field is used to control command UNDI inter-command processing. Setting control bits that are not supported by the UNDI will cause the command execution to fail with a StatCode of `PXE_STATCODE_INVALID_CDB`.  
  Bit 0x00: Another CDB follows this one (1) or this is the last or only CDB in the list (0).  
  Bit 0x01: Queue command if busy (1), fail if busy (0). |
E.3 UNDI C Definitions

The definitions in this section are used to aid in the portability and readability of the example 32/64-bit S/W UNDI source code and the rest of this specification.

E.3.1 Portability Macros

These macros are used for storage and communication portability.

E.3.1.1 PXE_INTEL_ORDER or PXE_NETWORK_ORDER

This macro is used to control conditional compilation in the S/W UNDI source code. One of these definitions needs to be uncommented in a common PXE header file.

```c
//#define PXE_INTEL_ORDER 1 // little-endian
//#define PXE_NETWORK_ORDER 1 // big-endian
```

E.3.1.2 PXE_UINT64_SUPPORT or PXE_NO_UINT64_SUPPORT

This macro is used to control conditional compilation in the PXE source code. One of these definitions must to be uncommented in the common PXE header file.

```c
//#define PXE_UINT64_SUPPORT 1 // UINT64 supported
//#define PXE_NO_UINT64_SUPPORT 1 // UINT64 not supported
```

E.3.1.3 PXE_BUSTYPE

Used to convert a 4-character ASCII identifier to a 32-bit unsigned integer.

```c
#if PXE_INTEL_ORDER
#define PXE_BUSTYPE(a,b,c,d)     
(((PXE_UINT32)(d) & 0xFF) << 24) | 
(((PXE_UINT32)(c) & 0xFF) << 16) | 
(((PXE_UINT32)(b) & 0xFF) << 8) | 
((PXE_UINT32)(a) & 0xFF))
#else
#define PXE_BUSTYPE(a,b,c,d)     
(((PXE_UINT32)(a) & 0xFF) << 24) | 
(((PXE_UINT32)(b) & 0xFF) << 16) | 
(((PXE_UINT32)(c) & 0xFF) << 8) | 
((PXE_UINT32)(f) & 0xFF))
#endif
```

//*******************************************************
// UNDI ROM ID and device ID signature
//*******************************************************
#define PXE_BUSTYPE_PXE PXE_BUSTYPE('!', 'P', 'X', 'E')

//*******************************************************
// BUS ROM ID signatures
//*******************************************************
#define PXE_BUSTYPE_PCI PXE_BUSTYPE('P', 'C', 'I', 'R')
#define PXE_BUSTYPE_PC_CARD PXE_BUSTYPE('P', 'C', 'C', 'R')
#define PXE_BUSTYPE_USB PXE_BUSTYPE('U', 'S', 'B', 'R')
#define PXE_BUSTYPE_1394 PXE_BUSTYPE('1', '3', '9', '4')

E.3.1.4 PXE_SWAP_UINT16

This macro swaps bytes in a 16-bit word.

#ifdef PXE_INTEL_ORDER
#define PXE_SWAP_UINT16(n)   
((((PXE_UINT16)(n) & 0x00FF) << 8) | 
(((PXE_UINT16)(n) & 0xFF00) >> 8))
#else
#define PXE_SWAP_UINT16(n) (n)
#endif

E.3.1.5 PXE_SWAP_UINT32

This macro swaps bytes in a 32-bit word.

#ifdef PXE_INTEL_ORDER
#define PXE_SWAP_UINT32(n)         
((((PXE_UINT32)(n) & 0x000000FF) << 24) | 
(((PXE_UINT32)(n) & 0x0000FF00) << 8) |  
(((PXE_UINT32)(n) & 0x00FF0000) >> 8) |  
(((PXE_UINT32)(n) & 0xFF000000) >> 24))
#else
#define PXE_SWAP_UINT32(n)   (n)
#endif

E.3.1.6 PXE_SWAP_UINT64

This macro swaps bytes in a 64-bit word for compilers that support 64-bit words.

#if PXE_UINT64_SUPPORT != 0
#ifdef PXE_INTEL_ORDER
#define PXE_SWAP_UINT64(n)     
((((PXE_UINT64)(n) & 0x00000000000000FF) << 56) | 
(((PXE_UINT64)(n) & 0x000000000000FF00) << 40) |  
(((PXE_UINT64)(n) & 0x0000000000FF0000) << 24) |  
(((PXE_UINT64)(n) & 0x00000000FF000000) << 8) |  
(((PXE_UINT64)(n) & 0x000000FF00000000) >> 8) |  
(((PXE_UINT64)(n) & 0x0000FF0000000000) >> 24) |  
(((PXE_UINT64)(n) & 0x00FF000000000000) >> 40) | 
(((PXE_UINT64)(n) & 0xFF00000000000000) >> 56))
#else
#define PXE_SWAP_UINT64(n) (n)
#endif
#endif // PXE_UINT64_SUPPORT
This macro swaps bytes in a 64-bit word, in place, for compilers that do not support 64-bit words. This version of the 64-bit swap macro cannot be used in expressions.

```c
#if PXE_NO_UINT64_SUPPORT != 0
#if PXE_INTEL.Order
#define PXE_SWAP_UINT64(n)  
{                       
  PXE_UINT32 tmp = (PXE_UINT64)(n)[1];      
  (PXE_UINT64)(n)[1] = PXE_SWAP_UINT32((PXE_UINT64)(n)[0]); 
  (PXE_UINT64)(n)[0] = PXE_SWAP_UINT32(tmp);    
}         
#else
#define PXE_SWAP_UINT64(n) (n)
#endif
#endif // PXE_NO_UINT64_SUPPORT
```

E.3.2 Miscellaneous Macros

E.3.2.1 Miscellaneous

```
#define PXE_CPBSIZE_NOT_USED  0   // zero
#define PXE_DBSIZE_NOT_USED  0   // zero
#define PXE_CPBADDR_NOT_USED  (PXE_UINT64)0 // zero
#define PXE_DBADDR_NOT_USED  (PXE_UINT64)0 // zero
```

E.3.3 Portability Types

The examples given below are just that, examples. The actual typedef instructions used in a new implementation may vary depending on the compiler and processor architecture.

The storage sizes defined in this section are critical for PXE module inter-operation. All of the portability typedefs define little endian (Intel® format) storage. The least significant byte is stored in the lowest memory address and the most significant byte is stored in the highest memory address, as shown in Figure E-5.

![Figure E-5 Storage Types](image-url)
E.3.3.1 PXE_CONST

The const type does not allocate storage. This type is a modifier that is used to help the compiler optimize parameters that do not change across function calls.

#define PXE_CONST const

E.3.3.2 PXE_VOLATILE

The volatile type does not allocate storage. This type is a modifier that is used to help the compiler deal with variables that can be changed by external procedures or hardware events.

#define PXE_VOLATILE volatile

E.3.3.3 PXE_VOID

The void type does not allocate storage. This type is used only to prototype functions that do not return any information and/or do not take any parameters.

typedef void PXE_VOID;

E.3.3.4 PXE_UINT8

Unsigned 8-bit integer.

typedef unsigned char PXE_UINT8;

E.3.3.5 PXE_UINT16

Unsigned 16-bit integer.

typedef unsigned short PXE_UINT16;

E.3.3.6 PXE_UINT32

Unsigned 32-bit integer.

typedef unsigned PXE_UINT32;

E.3.3.7 PXE_UINT64

Unsigned 64-bit integer.

#if PXE_UINT64_SUPPORT != 0
typedef unsigned long PXE_UINT64;
#endif // PXE_UINT64_SUPPORT

If a 64-bit integer type is not available in the compiler being used, use this definition:

#if PXE_NO_UINT64_SUPPORT != 0
typedef PXE_UINT32 PXE_UINT64[2];
#endif // PXE_NO_UINT64_SUPPORT
E.3.3.8 PXE_UINTN

Unsigned integer that is the default word size used by the compiler. This needs to be at least a 32-bit unsigned integer.

```c
typedef unsigned PXE_UINTN;
```

E.3.4 Simple Types

The PXE simple types are defined using one of the portability types from the previous section.

E.3.4.1 PXE_BOOL

Boolean (true/false) data type. For PXE zero is always false and nonzero is always true.

```c
typedef PXE_UINT8 PXE_BOOL;
#define PXE_FALSE 0 // zero
#define PXE_TRUE (!PXE_FALSE)
```

E.3.4.2 PXE_OPCODE

UNDI OpCode (command) descriptions are given in the next chapter. There are no BC OpCodes, BC protocol functions are discussed later in this document.

```c
typedef PXE_UINT16 PXE_OPCODE;

// Return UNDI operational state.
#define PXE_OPCODE_GET_STATE 0x0000

// Change UNDI operational state from Stopped to Started.
#define PXE_OPCODE_START 0x0001

// Change UNDI operational state from Started to Stopped.
#define PXE_OPCODE_STOP 0x0002

// Get UNDI initialization information.
#define PXE_OPCODE_GET_INIT_INFO 0x0003

// Get NIC configuration information.
#define PXE_OPCODE_GET_CONFIG_INFO 0x0004

// Changed UNDI operational state from Started to Initialized.
#define PXE_OPCODE_INITIALIZE 0x0005

// Reinitialize the NIC H/W.
#define PXE_OPCODE_RESET 0x0006

// Change the UNDI operational state from Initialized to Started.
#define PXE_OPCODE_SHUTDOWN 0x0007
```
// Read & change state of external interrupt enables.
#define PXE_OPCODE_INTERRUPT_ENABLES   0x0008

// Read & change state of packet receive filters.
#define PXE_OPCODE_RECEIVE_FILTERS   0x0009

// Read & change station MAC address.
#define PXE_OPCODE_STATION_ADDRESS   0x000A

// Read traffic statistics.
#define PXE_OPCODE_STATISTICS    0x000B

// Convert multicast IP address to multicast MAC address.
#define PXE_OPCODE_MCAST_IP_TO_MAC   0x000C

// Read or change nonvolatile storage on the NIC.
#define PXE_OPCODE_NVDATA     0x000D

// Get & clear interrupt status.
#define PXE_OPCODE_GET_STATUS    0x000E

// Fill media header in packet for transmit.
#define PXE_OPCODE_FILL_HEADER    0x000F

// Transmit packet(s).
#define PXE_OPCODE_TRANSMIT     0x0010

// Receive packet.
#define PXE_OPCODE_RECEIVE     0x0011

// Last valid PXE UNDI OpCode number.
#define PXE_OPCODE_LAST_VALID    0x0011

E.3.4.3 PXE_OPFLAGS

typedef PXE_UINT16 PXE_OPFLAGS;

#define PXE_OPFLAGS_NOT_USED    0x0000

// UNDI Get State

// No OpFlags

// UNDI Start
// No OpFlags

// UNDI Stop
// No OpFlags

// UNDI Get Init Info
// No Opflags

// UNDI Get Config Info
// No Opflags

// UNDI Initialize
//*******************************************************************************

#define PXE_OPFLAGS_INITIALIZE_CABLE_DETECT_MASK  0x0001
#define PXE_OPFLAGS_INITIALIZE_DETECT_CABLE   0x0000
#define PXE_OPFLAGS_INITIALIZE_DO_NOT_DETECT_CABLE 0x0001

//*******************************************************************************
// UNDI Reset
//*******************************************************************************

#define PXE_OPFLAGS_RESET_DISABLE_INTERRUPTS  0x0001
#define PXE_OPFLAGS_RESET_DISABLE_FILTERS    0x0002

//*******************************************************************************
// UNDI Shutdown
//*******************************************************************************

// No OpFlags

//*******************************************************************************
// UNDI Interrupt Enables
//*******************************************************************************
// Select whether to enable or disable external interrupt signals. Setting both enable and disable will return PXE_STATCODE_INVALID_OPFLAGS.

#define PXE_OPFLAGS_INTERRUPT_OPMASK    0xC000
#define PXE_OPFLAGS_INTERRUPT_ENABLE    0x8000
#define PXE_OPFLAGS_INTERRUPT_DISABLE    0x4000
#define PXE_OPFLAGS_INTERRUPT_READ     0x0000

// Enable receive interrupts. An external interrupt will be generated after a complete non-error packet has been received.

#define PXE_OPFLAGS_INTERRUPT_RECEIVE    0x0001

// Enable transmit interrupts. An external interrupt will be generated after a complete non-error packet has been transmitted.

#define PXE_OPFLAGS_INTERRUPT_TRANSMIT    0x0002

// Enable command interrupts. An external interrupt will be generated when command execution stops.

#define PXE_OPFLAGS_INTERRUPT_COMMAND    0x0004

// Generate software interrupt. Setting this bit generates an external interrupt, if it is supported by the hardware.

#define PXE_OPFLAGS_INTERRUPT_SOFTWARE    0x0008

UNDI Receive Filters

// Select whether to enable or disable receive filters. Setting both enable and disable will return PXE_STATCODE_INVALID_OPCODE.

#define PXE_OPFLAGS_RECEIVE_FILTER_OPMASK   0xC000
#define PXE_OPFLAGS_RECEIVE_FILTER_ENABLE   0x8000
#define PXE_OPFLAGS_RECEIVE_FILTER_DISABLE   0x4000
#define PXE_OPFLAGS_RECEIVE_FILTER_READ    0x0000

// To reset the contents of the multicast MAC address filter list, set this OpFlag:

#define PXE_OPFLAGS_RECEIVE_FILTERS_RESET_MCAST_LIST 0x2000
// Enable unicast packet receiving. Packets sent to the
// current station MAC address will be received.
#define PXE_OPFLAGS_RECEIVE_FILTER_UNICAST 0x0001

// Enable broadcast packet receiving. Packets sent to the
// broadcast MAC address will be received.
#define PXE_OPFLAGS_RECEIVE_FILTER_BROADCAST 0x0002

// Enable filtered multicast packet receiving. Packets sent to
// any of the multicast MAC addresses in the multicast MAC
// address filter list will be received. If the filter list is
// empty, no multicast
#define PXE_OPFLAGS_RECEIVE_FILTER_FILTERED_MULTICAST 0x0004

// Enable promiscuous packet receiving. All packets will be
// received.
#define PXE_OPFLAGS_RECEIVE_FILTER_PROMISCUOUS 0x0008

// Enable promiscuous multicast packet receiving. All multicast
// packets will be received.
#define PXE_OPFLAGS_RECEIVE_FILTER_ALL_MULTICAST 0x0010

// UNDI Station Address

// UNDI Station Address
#define PXE_OPFLAGS_STATION_ADDRESS_READ 0x0000
#define PXE_OPFLAGS_STATION_ADDRESS_WRITE 0x0000
#define PXE_OPFLAGS_STATION_ADDRESS_RESET 0x0001

#define PXE_FRAME_TYPE_PROMISCUOUS 0x04
#define PXE_FRAME_TYPE_PROMISCUOUS_MULTICAST 0x05
E.3.4.9 PXE_IPV4
This storage type is always big endian, not little endian.

```c
typedef PXE_UINT32 PXE_IPV4;
```

E.3.4.10 PXE_IPV6
This storage type is always big endian, not little endian.

```c
typedef struct s_PXE_IPV6 {
    PXE_UINT32 num[4];
} PXE_IPV6;
```

E.3.4.11 PXE_MAC_ADDR
This storage type is always big endian, not little endian.

```c
typedef struct {
    PXE_UINT8 num[32];
} PXE_MAC_ADDR;
```

E.3.4.12 PXE_IFTYPE
The interface type is returned by the Get Initialization Information command and is used by the BC DHCP protocol function. This field is also used for the low order 8-bits of the H/W type field in ARP packets. The high order 8-bits of the H/W type field in ARP packets will always be set to 0x00 by the BC.

```c
typedef PXE_UINT8 PXE_IFTYPE;
```

// This information is from the ARP section of RFC 3232.

```c
//  1 Ethernet (10Mb)
//  2 Experimental Ethernet (3Mb)
//  3 Amateur Radio AX.25
//  4 Proteon ProNET Token Ring
//  5 Chaos
//  6 IEEE 802 Networks
//  7 ARCNET
//  8 Hyperchannel
//  9 Lanstar
// 10 Autonet Short Address
// 11 LocalTalk
// 12 LocalNet (IBM PCNet or SYTEK LocalNET)
// 13 Ultra link
// 14 SMDS
// 15 Frame Relay
// 16 Asynchronous Transmission Mode (ATM)
// 17 HDLC
// 18 Fibre Channel
// 19 Asynchronous Transmission Mode (ATM)
```
// 20 Serial Line
// 21 Asynchronous Transmission Mode (ATM)

#define PXE_IFTYPE_ETHERNET     0x01
#define PXE_IFTYPE_TOKENRING    0x04
#define PXE_IFTYPE_FIBRE_CHANNEL 0x12

E.3.4.13 PXE_MEDIA_PROTOCOL
Protocol type. This will be copied into the media header without doing byte swapping. Protocol type numbers can be obtained from the assigned numbers RFC 3232.

typedef UINT16   PXE_MEDIA_PROTOCOL;

E.3.5 Compound Types
All PXE structures must be byte packed.

E.3.5.1 PXE_HW_UNDI
This section defines the C structures and #defines for the PXE H/W UNDI interface.

#pragma pack(1)
typedef struct s_pxe_hw_undi {
    PXE_UINT32   Signature;  // PXE_ROMID_SIGNATURE
    PXE_UINT8    Len;        // sizeof(PXE_HW_UNDI)
    PXE_UINT8    Fudge;      // makes 8-bit checksum equal zero
    PXE_UINT8    Rev;        // PXE_ROMID_REV
    PXE_UINT8    IFcnt;      // physical connector count
        lower byte

#define PXE_HWCMD_CLEAR_PACKET_RX_INT    0x00000002
#define PXE_HWCMD_CLEAR_CMD_COMPLETE_INT   0x00000001

E.3.5.2 PXE_SW_UNDI

This section defines the C structures and #defines for the !PXE S/W UNDI interface.

#pragma pack(1)
typedef struct s_pxe_sw_undi {
    PXE_UINT32 Signature;  // PXE_ROMID_SIGNATURE
    PXE_UINT8 Len;  // sizeof(PXE_SW_UNDI)
    PXE_UINT8 Fudge;  // makes 8-bit checksum zero
    PXE_UINT8 Rev;  // PXE_ROMID_REV
    PXE_UINT8 IFcnt;  // physical connector count
    lower byte
    PXE_UINT8 MajorVer;  // PXE_ROMID_MAJORVER
    PXE_UINT8 MinorVer;  // PXE_ROMID_MINORVER
    PXE_UINT8 IFcntExt;  // physical connector count
    upper byte
    PXE_UINT8 reserved1;  // zero, not used
    PXE_UINT32 Implementation;  // Implementation flags
    PXE_UINT64 EntryPoint;  // API entry point
    PXE_UINT8 reserved2[3];  // zero, not used
    PXE_UINT8 BusCnt;  // number of bustypes supported
    PXE_UINT32 BusType[1];  // list of supported bustypes
} PXE_SW_UNDI;
#pragma pack()

E.3.5.3 PXE_UNDI

PXE_UNDI combines both the H/W and S/W UNDI types into one typedef and has #defines for common fields in both H/W and S/W UNDI types.

#pragma pack(1)
typedef union u_pxe_undi {
    PXE_HW_UNDI hw;
    PXE_SW_UNDI sw;
} PXE_UNDI;
#pragma pack()
#define PXE_ROMID_SIGNATURE PXE_BUSTYPE ('!', 'P', 'X', 'E')

// !PXE structure format revision )
// See “Links to UEFI-Related Documents” (http://uefi.org/uefi)
// under the heading “UDP over IPv6”.

#define PXE_ROMID_REV 0x02

// UNDI command interface revision. These are the values that
// get sent in option 94 (Client Network Interface Identifier) in
// the DHCP Discover and PXE Boot Server Request packets.
// See “Links to UEFI-Related Documents” (http://uefi.org/uefi)
// under the heading “IETF Organization”.

#define PXE_ROMID_MAJORVER 0x03
#define PXE_ROMID_MINORVER 0x01

// Implementation flags

#define PXE_ROMID_IMP_HW_UNDI 0x80000000
#define PXE_ROMID_IMP_SW_VIRT_ADDR 0x40000000
#define PXE_ROMID_IMP_64BIT_DEVICE 0x00010000
#define PXE_ROMID_IMP_FRAG_SUPPORTED 0x00008000
#define PXE_ROMID_IMP_CMD_LINK_SUPPORTED 0x00004000
#define PXE_ROMID_IMP_CMD_QUEUE_SUPPORTED 0x00002000
#define PXE_ROMID_IMP_MULTI_FRAME_SUPPORTED 0x00001000
#define PXE_ROMID_IMP_NVDATA_SUPPORT_MASK 0x00000C00
#define PXE_ROMID_IMP_NVDATA_BULK_WRITABLE 0x00000C00
#define PXE_ROMID_IMP_NVDATA_SPARSE_WRITABLE 0x00000800
#define PXE_ROMID_IMP_NVDATA_READ_ONLY 0x00000400
#define PXE_ROMID_IMP_NVDATA_NOT_AVAILABLE 0x00000000
#define PXE_ROMID_IMP_STATISTICS_SUPPORTED 0x00000200
#define PXE_ROMID_IMP_STATION_ADDR_SETTABLE 0x00000100
#define PXE_ROMID_IMP_PROMISCUOUS_MULTICAST_RX_SUPPORTED 0x00000080
#define PXE_ROMID_IMP_PROMISCUOUS_RX_SUPPORTED 0x00000040
#define PXE_ROMID_IMP_BROADCAST_RX_SUPPORTED 0x00000020
#define PXE_ROMID_IMP_FILTERED_MULTICAST_RX_SUPPORTED 0x00000010
#define PXE_ROMID_IMP_SOFTWARE_INT_SUPPORTED 0x00000008
#define PXE_ROMID_IMP_TX_COMPLETE_INT_SUPPORTED 0x00000004
#define PXE_ROMID_IMP_PACKET_RX_INT_SUPPORTED 0x00000002
#define PXE_ROMID_IMP_CMD_COMPLETE_INT_SUPPORTED 0x00000001
E.3.5.4 PXE_CDB

PXE UNDI command descriptor block.

```c
#pragma pack(1)
typedef struct s_pxe_cdb {
    PXE_OPCODE     OpCode;
    PXE_OPFLAGS    OpFlags;
    PXE_UINT16     CPBsize;
    PXE_UINT16     DBsize;
    PXE_UINT64     CPBaddr;
    PXE_UINT64     DBaddr;
    PXE_STATCODE   StatCode;
    PXE_STATFLAGS  StatFlags;
    PXE_UINT16     IFnum;
    PXE_CONTROL    Control;
} PXE_CDB;
#pragma pack()
```

If the UNDI driver enables hardware VLAN support, UNDI driver could use `IFnum` to identify the real NICs and VLAN created virtual NICs.

E.3.5.5 PXE_IP_ADDR

This storage type is always big endian, not little endian.

```c
#pragma pack(1)
typedef union u_pxe_ip_addr {
    PXE_IPV6     IPv6;
    PXE_IPV4     IPv4;
} PXE_IP_ADDR;
#pragma pack()
```
E.3.5.6 PXE_DEVICE

This typedef is used to identify the network device that is being used by the UNDI. This information is returned by the Get Config Info command.

```c
#pragma pack(1)
typedef union pxe_device {

    // PCI and PC Card NICs are both identified using bus, device
    // and function numbers. For PC Card, this may require PC
    // Card services to be loaded in the BIOS or preboot
    // environment.
    struct {
        // See S/W UNDI ROMID structure definition for PCI and
        // PCC BusType definitions.
        PXE_UINT32  BusType;

        // Bus, device & function numbers that locate this device.
        PXE_UINT16  Bus;
        PXE_UINT8   Device;
        PXE_UINT8   Function;
    } PCI, PCC;

} PXE_DEVICE;
#pragma pack()
```

E.4 UNDI Commands

All 32/64-bit UNDI commands use the same basic command format, the CDB (Command Descriptor Block). CDB fields that are not used by a particular command must be initialized to zero by the application/driver that is issuing the command. (See “Links to UEFI-Related Documents” (http://uefi.org/uefi) under the heading “DMTF BIOS specifications”.)

All UNDI implementations must set the command completion status (**PXE_STATFLAGS_COMMAND_COMPLETE**) after command execution completes. Applications and drivers must not alter or rely on the contents of any of the CDB, CPB or DB fields until the command completion status is set.

All commands return status codes for invalid CDB contents and, if used, invalid CPB contents. Commands with invalid parameters will not execute. Fix the error and submit the command again.

**Figure E-6** describes the different UNDI states (Stopped, Started and Initialized), shows the transitions between the states and which UNDI commands are valid in each state.
Figure E-6 UNDI States, Transitions & Valid Commands

**Note:** All memory addresses including the CDB address, CPB address, and the DB address submitted to the S/W UNDI by the protocol drivers must be processor-based addresses. All memory addresses submitted to the H/W UNDI must be device based addresses.

**Note:** Additional requirements for S/W UNDI implementations: Processor register contents must be unchanged by S/W UNDI command execution (The application/driver does not have to save processor registers when calling S/W UNDI). Processor arithmetic flags are undefined (application/driver must save processor arithmetic flags if needed). Application/driver must remove CDB address from stack after control returns from S/W UNDI.

**Note:** Additional requirements for 32-bit network devices: All addresses given to the S/W UNDI must be 32-bit addresses. Any address that exceeds 32 bits (4 GiB) will result in a return of one of the following status codes: PXE_STATCODE_INVALID_PARAMETER, PXE_STATCODE_INVALID_CDB or PXE_STATCODE_INVALID_CPB.

When executing linked commands, command execution will stop at the end of the CDB list (when the PXE_CONTROL_LINK bit is not set) or when a command returns an error status code.
**Note:** Buffers requested via the MemoryRequired field in `s_pxe_db_get_init_info` (see Appendix E.4.5.5) will be allocated via `PCI_IO.AllocateBuffer()`. However, the buffers passed to various UNDI commands are not guaranteed to be allocated via `AllocateBuffer()`.

**Note:** Calls to `Map_Mem()` of type `TO_AND_FROM_DEVICE` must only be used for common DMA buffers. Such buffers must be requested via the MemoryRequired field in `s_pxe_db_get_init_info` and provided through the Initialize command.

### E.4.1 Command Linking and Queuing

When linking commands, the CDBs must be stored consecutively in system memory without any gaps in between. Do not set the Link bit in the last CDB in the list. As shown in Figure E-7, the Link bit must be set in all other CDBs in the list.

![Linked CDBs](image)

*Figure E-7 Linked CDBs*

When the H/W UNDI is executing commands, the State bits in the Status field in the IPXE structure will be set to Busy (3).

When H/W or S/W UNDI is executing commands and a new command is issued, a StatCode of `PXE_STATCODE_BUSY` and a StatFlag of `PXE_STATFLAG_COMMAND_FAILURE` is set in the CDB. For linked commands, only the first CDB will be set to Busy, all other CDBs will be unchanged. When a linked command fails, execution on the list stops. Commands after the failing command will not be run.

As shown in Figure E-8, when queuing commands, only the first CDB needs to have the Queue Control flag set. If queuing is supported and the UNDI is busy and there is room in the command queue, the command (or list of commands) will be queued.
When a command is queued a StatFlag of PXE_STATFLAG_COMMAND_QUEUED is set (if linked commands are queued only the StatFlag of the first CDB gets set). This signals that the command was added to the queue. Commands in the queue will be run on a first-in, first-out, basis. When a command fails, the next command in the queue is run. When a linked command in the queue fails, execution on the list stops. The next command, or list of commands, that was added to the command queue will be run.

**E.4.2 Get State**

This command is used to determine the operational state of the UNDI. An UNDI has three possible operational states:

- **Stopped.** A stopped UNDI is free for the taking. When all interface numbers (IFnum) for a particular S/W UNDI are stopped, that S/W UNDI image can be relocated or removed. A stopped UNDI will accept Get State and Start commands.

- **Started.** A started UNDI is in use. A started UNDI will accept Get State, Stop, Get Init Info, and Initialize commands.

- **Initialized.** An initialized UNDI is in use. An initialized UNDI will accept all commands except: Start, Stop, and Initialize.

Drivers and applications must not start using UNDIs that have been placed into the Started or Initialized states by another driver or application.

3.0 and 3.1 S/W UNDI: No callbacks are performed by this UNDI command.
### E.4.2.1 Issuing the Command

To issue a Get State command, create a CDB and fill it in as shown in the table below:

<table>
<thead>
<tr>
<th>CDB Field</th>
<th>How to initialize the CDB structure for a Get State command</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpCode</td>
<td>PXE_OPCODE_GET_STATE</td>
</tr>
<tr>
<td>OpFlags</td>
<td>PXE_OPFLAGS_NOT_USED</td>
</tr>
<tr>
<td>CPBsize</td>
<td>PXE_CPBSIZE_NOT_USED</td>
</tr>
<tr>
<td>DBSize</td>
<td>PXE_DBSIZE_NOT_USED</td>
</tr>
<tr>
<td>CPBaddr</td>
<td>PXE_CPBADDR_NOT_USED</td>
</tr>
<tr>
<td>DBaddr</td>
<td>PXE_DBADDR_NOT_USED</td>
</tr>
<tr>
<td>StatCode</td>
<td>PXE_STATCODE_INITIALIZE</td>
</tr>
<tr>
<td>StatFlags</td>
<td>PXE_STATFLAGS_INITIALIZE</td>
</tr>
<tr>
<td>IFnum</td>
<td>A valid interface number from zero to ((!\text{PXE.IFcnt}</td>
</tr>
<tr>
<td>Control</td>
<td>Set as needed</td>
</tr>
</tbody>
</table>

### E.4.2.2 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the CDB.StatFlags field. Until these bits change to report PXE_STATFLAGS_COMMAND_COMPLETE or PXE_STATFLAGS_COMMAND_FAILED, the command has not been executed by the UNDI.

<table>
<thead>
<tr>
<th>StatFlags</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMAND_COMPLETE</td>
<td>Command completed successfully. StatFlags contain operational state.</td>
</tr>
<tr>
<td>COMMAND_QUEUED</td>
<td>Command has been queued. All other fields are unchanged.</td>
</tr>
<tr>
<td>INITIALIZE</td>
<td>Command has not been executed or queued.</td>
</tr>
</tbody>
</table>

### E.4.2.3 Checking Command Execution Results

After command execution completes, either successfully or not, the CDB.StatCode field contains the result of the command execution.

<table>
<thead>
<tr>
<th>StatCode</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUCCESS</td>
<td>Command completed successfully. StatFlags contain operational state.</td>
</tr>
<tr>
<td>INVALID_CDB</td>
<td>One of the CDB fields was not set correctly.</td>
</tr>
<tr>
<td>BUSY</td>
<td>UNDI is already processing commands. Try again later.</td>
</tr>
<tr>
<td>QUEUE_FULL</td>
<td>Command queue is full. Try again later.</td>
</tr>
</tbody>
</table>
If the command completes successfully, use **PXE_STATFLAGS_GET_STATE_MASK** to check the state of the UNDI.

<table>
<thead>
<tr>
<th>StatFlags</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>STOPPED</td>
<td>The UNDI is stopped.</td>
</tr>
<tr>
<td>STARTED</td>
<td>The UNDI is started, but not initialized.</td>
</tr>
<tr>
<td>INITIALIZED</td>
<td>The UNDI is initialized.</td>
</tr>
</tbody>
</table>

**E.4.3 Start**

This command is used to change the UNDI operational state from stopped to started. No other operational checks are made by this command. Protocol driver makes this call for each network interface supported by the UNDI with a set of call back routines and a unique identifier to identify the particular interface. UNDI does not interpret the unique identifier in any way except that it is a 64-bit value and it will pass it back to the protocol driver as a parameter to all the call back routines for any particular interface. If this is a S/W UNDI, the callback functions Delay(), Virt2Phys(), Map_Mem(), UnMap_Mem(), and Sync_Mem() functions will not be called by this command.

**E.4.3.1 Issuing the Command**

To issue a Start command for H/W UNDI, create a CDB and fill it in as shows in the table below:

<table>
<thead>
<tr>
<th>CDB Field</th>
<th>How to initialize the CDB structure for a H/W UNDI Start command</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpCode</td>
<td>PXE_OPCODE_START</td>
</tr>
<tr>
<td>OpFlags</td>
<td>PXE_OPFLAGS_NOT_USED</td>
</tr>
<tr>
<td>CPBsize</td>
<td>PXE_CPBSIZE_NOT_USED</td>
</tr>
<tr>
<td>DBsize</td>
<td>PXE_DBSIZE_NOT_USED</td>
</tr>
<tr>
<td>CPBaddr</td>
<td>PXE_CPBADDR_NOT_USED</td>
</tr>
<tr>
<td>DBaddr</td>
<td>PXE_DBADDR_NOT_USED</td>
</tr>
<tr>
<td>StatCode</td>
<td>PXE_STATCODE_INITIALIZE</td>
</tr>
<tr>
<td>StatFlags</td>
<td>PXE_STATFLAGS_INITIALIZE</td>
</tr>
<tr>
<td>IFnum</td>
<td>A valid interface number from zero to (!PXE.IFcnt</td>
</tr>
<tr>
<td>Control</td>
<td>Set as needed</td>
</tr>
</tbody>
</table>
To issue a Start command for S/W UNDI, create a CDB and fill it in as shows in the table below:

<table>
<thead>
<tr>
<th>CDB Field</th>
<th>How to initialize the CDB structure for a S/W UNDI Start command</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpCode</td>
<td>PXE_OPCODE_START</td>
</tr>
<tr>
<td>OpFlags</td>
<td>PXE_OPFLAGS_NOT_USED</td>
</tr>
<tr>
<td>CPBsize</td>
<td>sizeof(struct s_pxe_cpb_start_31)</td>
</tr>
<tr>
<td>DBsize</td>
<td>PXE_DBSIZE_NOT_USED</td>
</tr>
<tr>
<td>CPBaddr</td>
<td>Address of a PXE_CPB_START structure.</td>
</tr>
<tr>
<td>DBaddr</td>
<td>PXE_DBADDR_NOT_USED</td>
</tr>
<tr>
<td>StatCode</td>
<td>PXE_STATCODE_INITIALIZE</td>
</tr>
<tr>
<td>StatFlags</td>
<td>PXE_STATFLAGS_INITIALIZE</td>
</tr>
<tr>
<td>IFnum</td>
<td>A valid interface number from zero to (!PXE.IFcnt</td>
</tr>
<tr>
<td>Control</td>
<td>Set as needed</td>
</tr>
</tbody>
</table>

E.4.3.2 Preparing the CPB

For the 3.1 S/W UNDI Start command, the CPB structure shown below must be filled in and the CDB must be set to sizeof(struct s_pxe_cpb_start_31).

```c
#pragma pack(1)
typedef struct s_pxe_cpb_start_31 {
    UINT64  Delay;
    // // Address of the Delay() callback service.
    // // This field cannot be set to zero.
    // // // VOID
    // Delay(
    // IN UINT64  UniqueId,
    // IN UINT64  Microseconds);
    // // UNDI will never request a delay smaller than 10 microseconds
    // and will always request delays in increments of 10
    // microseconds. The Delay() callback routine must delay
    // between n and n + 10 microseconds before returning control
    // to the UNDI.
    // //
    
    UINT64  Block;
    // // Address of the Block() callback service.
    // // This field cannot be set to zero.
    // // // VOID
    // Block(
```
// IN UINT64 UniqueId,
// IN UINT32 Enable);
//
// UNDI may need to block multithreaded/multiprocessor access
// to critical code sections when programming or accessing the
// network device. When UNDI needs a block, it will call the
// Block() callback service with Enable set to a non-zero value.
// When UNDI no longer needs the block, it will call Block()
// with Enable set to zero.
//
UINT64 Virt2Phys;
//
// Convert a virtual address to a physical address.
// This field can be set to zero if virtual and physical
// addresses are identical.
//
// VOID
// Virt2Phys(
// IN UINT64 UniqueId,
// IN UINT64 Virtual,
// OUT UINT64 PhysicalPtr);
//
// UNDI will pass in a virtual address and a pointer to storage
// for a physical address. The Virt2Phys() service converts
// the virtual address to a physical address and stores the
// resulting physical address in the supplied buffer. If no
// conversion is needed, the virtual address must be copied
// into the supplied physical address buffer.
//
UINT64 Mem_IO;
//
// Read/Write network device memory and/or I/O register space.
// This field cannot be set to zero.
//
// VOID
// Mem_IO(
// IN UINT64 UniqueId,
// IN UINT8 AccessType,
// IN UINT8 Length,
// IN UINT64 Port,
// IN OUT UINT64 BufferPtr);
//
// UNDI uses the Mem_IO() service to access the network device
// memory and/or I/O registers. The AccessType is one of the
// PXE_IO_xxx or PXE_MEM_xxx constants defined at the end of
// this section. The Length is 1, 2, 4 or 8. The Port number
// is relative to the base memory or I/O address space for this
// device. BufferPtr points to the data to be written to the
// Port or will contain the data that is read from the Port.
//
UINT64 Map_Mem;
//
// Map virtual memory address for DMA.
// This field can be set to zero if there is no mapping
// service.
//
// VOID
// Map_Mem(
//  IN UINT64 UniqueId,
//  IN UINT64 Virtual,
//  IN UINT32 Size,
//  IN UINT32 Direction,
//  OUT UINT64 PhysicalPtr);
//
// When UNDI needs to perform a DMA transfer it will request a
// virtual-to-physical mapping using the Map_Mem() service. The
// Virtual parameter contains the virtual address to be mapped.
// The minimum Size of the virtual memory buffer to be mapped.
// Direction is one of the TO_DEVICE, FROM_DEVICE or
// TO_AND_FROM_DEVICE constants defined at the end of this
// section. PhysicalPtr contains the mapped physical address or
// a copy of the Virtual address if no mapping is required.
//
UINT64 UnMap_Mem;
//
// Un-map previously mapped virtual memory address.
// This field can be set to zero only if the Map_Mem() service
// is also set to zero.
//
// VOID
// UnMap_Mem(
//  IN UINT64 UniqueId,
//  IN UINT64 Virtual,
//  IN UINT32 Size,
//  IN UINT32 Direction,
//  IN UINT64 PhysicalPtr);
//
// When UNDI is done with the mapped memory, it will use the
// UnMap_Mem() service to release the mapped memory.
UINT64 Sync_Mem;
//
// Synchronise mapped memory.
// This field can be set to zero only if the Map_Mem() service
// is also set to zero.
//
// VOID
// Sync_Mem(
//  IN UINT64  UniqueId,
//  IN UINT64  Virtual,
//  IN UINT32  Size,
//  IN UINT32  Direction,
//  IN UINT64  PhysicalPtr);
//
// When the virtual and physical buffers need to be
// synchronized, UNDI will call the Sync_Mem() service.
//
UINT64 UniqueId;
//
// UNDI will pass this value to each of the callback services.
// A unique ID number should be generated for each instance of
// the UNDI driver that will be using these callback services.
//
} PXE_CPB_START_31;
#pragma pack()
#pragma pack(1)

typedef struct s_pxe_cpb_start_30 {
  UINT64  Delay;
  //
  // Address of the Delay() callback service.
  // This field cannot be set to zero.
  //
  // VOID
  // Delay(
  //  IN UINT64  Microseconds);
  //
  // UNDI will never request a delay smaller than 10 microseconds
  // and will always request delays in increments of 10.
  // microseconds The Delay() callback routine must delay between
  // n and n + 10 microseconds before returning control to the
  // UNDI.
  //
  UINT64  Block;
  //
  // Address of the Block() callback service.
  // This field cannot be set to zero.
  //
  // VOID
  // Block(
  //  IN UINT32  Enable);
  //
  // UNDI may need to block multithreaded/multiprocessor access
  // to critical code sections when programming or accessing the
  // network device. When UNDI needs a block, it will call the
  // Block()callback service with Enable set to a non-zero value.
  // When UNDI no longer needs the block, it will call Block()
  // with Enable set to zero.
  //
  UINT64  Virt2Phys;
  //
  // Convert a virtual address to a physical address.
  // This field can be set to zero if virtual and physical
  // addresses are identical.
  //
  // VOID
  // Virt2Phys(
  //  IN UINT64  Virtual,
  //  OUT UINT64  PhysicalPtr);
  //
  // UNDI will pass in a virtual address and a pointer to storage
// for a physical address. The Virt2Phys() service converts
// the virtual address to a physical address and stores the
// resulting physical address in the supplied buffer. If no
// conversion is needed, the virtual address must be copied
// into the supplied physical address buffer.

UINT64 Mem_IO;

// Read/Write network device memory and/or I/O register space.
// This field cannot be set to zero.

VOID Mem_IO(
    IN UINT8AccessType,
    IN UINT8Length,
    IN UINT64Port,
    IN OUT UINT64BufferPtr);

UNDI uses the Mem_IO() service to access the network device
memory and/or I/O registers. The AccessType is one of the
PXE_IO_xxx or PXE_MEM_xxx constants defined at the end of
this section. The Length is 1, 2, 4 or 8. The Port number
is relative to the base memory or I/O address space for this
device. BufferPtr points to the data to be written to the
Port or will contain the data that is read from the Port.

#pragma pack() gunman
#define TO_AND_FROM_DEVICE 0
// Provides both read and write access to system memory by both
// the processor and a bus master. The buffer is coherent from
// both the processor's and the bus master's point of view.

#define FROM_DEVICE 1
// Provides a write operation to system memory by a bus master.

#define TO_DEVICE 2
// Provides a read operation from system memory by a bus master.
E.4.3.3 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the CDB.StatFlags field. Until these bits change to report PXE_STATFLAGS_COMMAND_COMPLETE or PXE_STATFLAGS_COMMAND_FAILED, the command has not been executed by the UNDI.

<table>
<thead>
<tr>
<th>StatFlags</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMAND_COMPLETE</td>
<td>Command completed successfully. UNDI is now started.</td>
</tr>
<tr>
<td>COMMAND_QUEUED</td>
<td>Command has been queued.</td>
</tr>
<tr>
<td>INITIALIZE</td>
<td>Command has been not executed or queued.</td>
</tr>
</tbody>
</table>

E.4.3.4 Checking Command Execution Results

After command execution completes, either successfully or not, the CDB.StatCode field contains the result of the command execution.

<table>
<thead>
<tr>
<th>StatCode</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUCCESS</td>
<td>Command completed successfully. UNDI is now started.</td>
</tr>
<tr>
<td>INVALID_CDB</td>
<td>One of the CDB fields was not set correctly.</td>
</tr>
<tr>
<td>BUSY</td>
<td>UNDI is already processing commands. Try again later.</td>
</tr>
<tr>
<td>QUEUE_FULL</td>
<td>Command queue is full. Try again later.</td>
</tr>
<tr>
<td>ALREADY_STARTED</td>
<td>The UNDI is already started.</td>
</tr>
</tbody>
</table>

E.4.4 Stop

This command is used to change the UNDI operational state from started to stopped.

E.4.4.1 Issuing the Command

To issue a Stop command, create a CDB and fill it in as shows in the table below:

<table>
<thead>
<tr>
<th>CDB Field</th>
<th>How to initialize the CDB structure for a Stop command</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpCode</td>
<td>PXE_OPCODE_STOP</td>
</tr>
<tr>
<td>OpFlags</td>
<td>PXE_OPFLAGS_NOT_USED</td>
</tr>
<tr>
<td>CPBsize</td>
<td>PXE_CPSIZE_NOT_USED</td>
</tr>
<tr>
<td>DBsize</td>
<td>PXE_DBSIZE_NOT_USED</td>
</tr>
<tr>
<td>CPBaddr</td>
<td>PXE_CPBADDR_NOT_USED</td>
</tr>
<tr>
<td>DBaddr</td>
<td>PXE_DBADDR_NOT_USED</td>
</tr>
<tr>
<td>StatCode</td>
<td>PXE_STATCODE_INITIALIZE</td>
</tr>
<tr>
<td>StatFlags</td>
<td>PXE_STATFLAGS_INITIALIZE</td>
</tr>
<tr>
<td>IFnum</td>
<td>A valid interface number from zero to (!PXE.IFCnt</td>
</tr>
<tr>
<td>Control</td>
<td>Set as needed</td>
</tr>
</tbody>
</table>
E.4.4.2 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the \texttt{CDB.StatFlags} field. Until these bits change to report \texttt{PXE_STATFLAGS_COMMAND_COMPLETE} or \texttt{PXE_STATFLAGS_COMMAND_FAILED}, the command has not been executed by the UNDI.

<table>
<thead>
<tr>
<th>StatFlags</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMAND_COMPLETE</td>
<td>Command completed successfully. UNDI is now stopped.</td>
</tr>
<tr>
<td>COMMAND_QUEUED</td>
<td>Command has been queued.</td>
</tr>
<tr>
<td>INITIALIZE</td>
<td>Command has not been executed or queued.</td>
</tr>
</tbody>
</table>

E.4.4.3 Checking Command Execution Results

After command execution completes, either successfully or not, the \texttt{CDB.StatCode} field contains the result of the command execution.

<table>
<thead>
<tr>
<th>StatCode</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUCCESS</td>
<td>Command completed successfully. UNDI is now stopped.</td>
</tr>
<tr>
<td>INVALID_CDB</td>
<td>One of the CDB fields was not set correctly.</td>
</tr>
<tr>
<td>BUSY</td>
<td>UNDI is already processing commands. Try again later.</td>
</tr>
<tr>
<td>QUEUE_FULL</td>
<td>Command queue is full. Try again later.</td>
</tr>
<tr>
<td>NOT_STARTED</td>
<td>The UNDI is not started.</td>
</tr>
<tr>
<td>NOT_SHUTDOWN</td>
<td>The UNDI is initialized and must be shutdown before it can be stopped.</td>
</tr>
</tbody>
</table>

E.4.5 Get Init Info

This command is used to retrieve initialization information that is needed by drivers and applications to initialized UNDI.

E.4.5.1 Issuing the Command

To issue a Get Init Info command, create a CDB and fill it in as shows in the table below:

<table>
<thead>
<tr>
<th>CDB Field</th>
<th>How to initialize the CDB structure for a Get Init Info command</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpCode</td>
<td>\texttt{PXE_OPCODE_GET_INIT_INFO}</td>
</tr>
<tr>
<td>OpFlags</td>
<td>\texttt{PXE_OPFLAGS_NOT_USED}</td>
</tr>
<tr>
<td>CPBsize</td>
<td>\texttt{PXE_CPBSIZE_NOT_USED}</td>
</tr>
<tr>
<td>DBsize</td>
<td>sizeof(\texttt{PXE_DB_INIT_INFO})</td>
</tr>
<tr>
<td>CPBaddr</td>
<td>\texttt{PXE_CPBADDR_NOT_USED}</td>
</tr>
<tr>
<td>DBaddr</td>
<td>Address of a \texttt{PXE_DB_INIT_INFO} structure.</td>
</tr>
<tr>
<td>StatCode</td>
<td>\texttt{PXE_STATCODE_INITIALIZE}</td>
</tr>
<tr>
<td>StatFlags</td>
<td>\texttt{PXE_STATFLAGS_INITIALIZE}</td>
</tr>
<tr>
<td>IFnum</td>
<td>A valid interface number from zero to ((!\texttt{PXE.IFcnt}</td>
</tr>
</tbody>
</table>
E.4.5.2 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the CDB.StatFlags field. Until these bits change to report PXE_STATFLAGS_COMMAND_COMPLETE or PXE_STATFLAGS_COMMAND_FAILED, the command has not been executed by the UNDI.

<table>
<thead>
<tr>
<th>StatFlags</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMAND_COMPLETE</td>
<td>Command completed successfully. DB can be used.</td>
</tr>
<tr>
<td>COMMAND_QUEUED</td>
<td>Command has been queued.</td>
</tr>
<tr>
<td>INITIALIZE</td>
<td>Command has been not executed or queued.</td>
</tr>
</tbody>
</table>

E.4.5.3 Checking Command Execution Results

After command execution completes, either successfully or not, the CDB.StatCode field contains the result of the command execution.

<table>
<thead>
<tr>
<th>StatCode</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUCCESS</td>
<td>Command completed successfully. DB can be used.</td>
</tr>
<tr>
<td>INVALID_CDB</td>
<td>One of the CDB fields was not set correctly.</td>
</tr>
<tr>
<td>BUSY</td>
<td>UNDI is already processing commands. Try again later.</td>
</tr>
<tr>
<td>QUEUE_FULL</td>
<td>Command queue is full. Try again later.</td>
</tr>
<tr>
<td>NOT_STARTED</td>
<td>The UNDI is not started.</td>
</tr>
</tbody>
</table>

E.4.5.4 StatFlags

To determine if cable detection is supported by this UNDI/NIC, use these macros with the value returned in the CDB.StatFlags field:

```
PXE_STATFLAGS_CABLE_DETECT_MASK
PXE_STATFLAGS_CABLE_DETECT_NOT_SUPPORTED
PXE_STATFLAGS_CABLE_DETECT_SUPPORTED
PXE_STATFLAGS_GET_STATUS_NO_MEDIA_MASK
PXE_STATFLAGS_GET_STATUS_NO_MEDIA_NOT_SUPPORTED
PXE_STATFLAGS_GET_STATUS_NO_MEDIA_SUPPORTED
```

E.4.5.5 DB

```
#pragma pack(1)
typedef struct s_pxe_db_get_init_info {

    // Minimum length of locked memory buffer that must be given to
    // the Initialize command. Giving UNDI more memory will
    // generally give better performance.

    // If MemoryRequired is zero, the UNDI does not need and will
```
// not use system memory to receive and transmit packets.

PXE_UINT32 MemoryRequired;

// Maximum frame data length for Tx/Rx excluding the media
// header.
//
PXE_UINT32 FrameDataLen;

// Supported link speeds are in units of mega bits. Common
// ethernet values are 10, 100 and 1000. Unused LinkSpeeds[]
// entries are zero filled.

PXE_UINT32 LinkSpeeds[4];

// Number of nonvolatile storage items.

PXE_UINT32 NvCount;

// Width of nonvolatile storage item in bytes. 0, 1, 2 or 4

PXE_UINT16 NvWidth;

// Media header length. This is the typical media header
// length for this UNDI. This information is needed when
// allocating receive and transmit buffers.

PXE_UINT16 MediaHeaderLen;

// Number of bytes in the NIC hardware (MAC) address.

PXE_UINT16 HWaddrLen;

// Maximum number of multicast MAC addresses in the multicast
// MAC address filter list.

PXE_UINT16 MCastFilterCnt;

// Default number and size of transmit and receive buffers that
// will be allocated by the UNDI. If MemoryRequired is
// nonzero, this allocation will come out of the memory buffer
// given to the Initialize command. If MemoryRequired is zero,
// this allocation will come out of memory on the NIC.

PXE_UINT16 TxBufCnt;
PXE_UINT16 TxBufSize;
PXE_UINT16 RxBufCnt;
PXE_UINT16 RxBufSize;
// Hardware interface types defined in the Assigned Numbers RFC
// and used in DHCP and ARP packets.
// See the PXE_IFTYPE typedef and PXE_IFTYPE_xxx macros.

PXE_UINT8 IFtype;

// Supported duplex options. This can be one or a combination
// of more than one constants defined as PXE_DUPLEX_xxxxx
// below. This value indicates the ability of UNDI to
// change/control the duplex modes of the NIC.

PXE_UINT8 SupportedDuplexModes;

// Supported loopback options. This field can be one or a
// combination of more than one constants defined as
// PXE_LOOPBACK_xxxxx #defines below. This value indicates
// the ability of UNDI to change/control the loopback modes
// of the NIC

PXE_UINT8 SupportedLoopBackModes;

} PXE_DB_GET_INIT_INFO;
#pragma pack()
E.4.6.2 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the `CDB.StatFlags` field. Until these bits change to report `PXE_STATFLAGS_COMMAND_COMPLETE` or `PXE_STATFLAGS_COMMAND_FAILED`, the command has not been executed by the UNDI.

<table>
<thead>
<tr>
<th>StatFlags</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMAND_COMPLETE</td>
<td>Command completed successfully. DB has been written.</td>
</tr>
<tr>
<td>COMMAND_QUEUED</td>
<td>Command has been queued.</td>
</tr>
<tr>
<td>INITIALIZE</td>
<td>Command has been not executed or queued.</td>
</tr>
</tbody>
</table>

E.4.6.3 Checking Command Execution Results

After command execution completes, either successfully or not, the `CDB.StatCode` field contains the result of the command execution.

<table>
<thead>
<tr>
<th>StatCode</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUCCESS</td>
<td>Command completed successfully. DB has been written.</td>

<td>One of the CDB fields was not set correctly.</td>
</tr>
<tr>
<td>BUSY</td>
<td>UNDI is already processing commands. Try again later.</td>
</tr>
<tr>
<td>QUEUE_FULL</td>
<td>Command queue is full. Try again later.</td>
</tr>
<tr>
<td>NOT_STARTED</td>
<td>The UNDI is not started.</td>
</tr>
</tbody>
</table>

E.4.6.4 DB

```c
#pragma pack(1)
typedef struct s_pxe_pci_config_info {

    // This is the flag field for the PXE_DB_GET_CONFIG_INFO union.
    // For PCI bus devices, this field is set to PXE_BUSTYPE_PCI.

    PXE_UINT32 BusType;

    // This identifies the PCI network device that this UNDI
    // interface is bound to.
```
PXE_UINT16 Bus;
PXE_UINT8 Device;
PXE_UINT8 Function;

// This is a copy of the PCI configuration space for this
// network device.
union {
    PXE_UINT8 Byte[256];
    PXE_UINT16 Word[128];
    PXE_UINT32 Dword[64];
} Config;
} PXE_PCI_CONFIG_INFO;
#pragma pack()
#pragma pack(1)
typedef struct s_pxe_pcc_config_info {
    // This is the flag field for the PXE_DB_GET_CONFIG_INFO union.
    // For PCC bus devices, this field is set to PXE_BUSTYPE_PCC.
    PXE_UINT32 BusType;

    // This identifies the PCC network device that this UNDI
    // interface is bound to.
    PXE_UINT16 Bus;
PXE_UINT8 Device;
PXE_UINT8 Function;

    // This is a copy of the PCC configuration space for this
    // network device.
    union {
        PXE_UINT8 Byte[256];
        PXE_UINT16 Word[128];
        PXE_UINT32 Dword[64];
    } Config;
} PXE_PCC_CONFIG_INFO;
#pragma pack()
#pragma pack(1)
typedef union u_pxe_db_get_config_info {
    PXE_PCI_CONFIG_INFO pci;
PXE_PCC_CONFIG_INFO pcc;
} PXE_DB_GET_CONFIG_INFO;
#pragma pack()
E.4.7 Initialize

This command resets the network adapter and initializes UNDI using the parameters supplied in the CPB. The Initialize command must be issued before the network adapter can be setup to transmit and receive packets. This command will not enable the receive unit or external interrupts.

Once the memory requirements of the UNDI are obtained by using the Get Init Info command, a block of kernel (nonswappable) memory may need to be allocated by the protocol driver. The address of this kernel memory must be passed to UNDI using the Initialize command CPB. This memory is used for transmit and receive buffers and internal processing.

Initializing the network device will take up to four seconds for most network devices and in some extreme cases (usually poor cables) up to twenty seconds. Control will not be returned to the caller and the `COMMAND_COMPLETE` status flag will not be set until the NIC is ready to transmit.

E.4.7.1 Issuing the Command

To issue an Initialize command, create a CDB and fill it in as shows in the table below:

<table>
<thead>
<tr>
<th>CDB Field</th>
<th>How to initialize the CDB structure for an Initialize command</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpCode</td>
<td>PXE_OPCODE_INITIALIZE</td>
</tr>
<tr>
<td>OpFlags</td>
<td>Set as needed.</td>
</tr>
<tr>
<td>CPBsize</td>
<td>sizeof(PXE_CPB_INITIALIZE)</td>
</tr>
<tr>
<td>DBsize</td>
<td>sizeof(PXE_DB_INITIALIZE)</td>
</tr>
<tr>
<td>CPBaddr</td>
<td>Address of a PXE_CPB_INITIALIZE structure.</td>
</tr>
<tr>
<td>Dbaddr</td>
<td>Address of a PXE_DB_INITIALIZE structure.</td>
</tr>
<tr>
<td>StatCode</td>
<td>PXE_STATCODE_INITIALIZE</td>
</tr>
<tr>
<td>StatFlags</td>
<td>PXE_STATFLAGS_INITIALIZE</td>
</tr>
<tr>
<td>Ifnum</td>
<td>A valid interface number from zero to (!PXE.IFcnt</td>
</tr>
<tr>
<td>Control</td>
<td>Set as needed.</td>
</tr>
</tbody>
</table>

E.4.7.2 OpFlags

Cable detection can be enabled or disabled by setting one of the following OpFlags:

- PXE_OPFLAGS_INITIALIZE_CABLE_DETECT
- PXE_OPFLAGS_INITIALIZE_DO_NOT_DETECT_CABLE

E.4.7.3 Preparing the CPB

If the `MemoryRequired` field returned in the PXE_DB_GET_INIT_INFO structure is zero, the Initialize command does not need to be given a memory buffer or even a CPB structure. If the `MemoryRequired` field is nonzero, the Initialize command does need a memory buffer.

```c
#pragma pack(1)
typedef struct s_pxe_cpb_initialize {
```
// Address of first (lowest) byte of the memory buffer.
// This buffer must be in contiguous physical memory and cannot
// be swapped out. The UNDI will be using this for transmit
// and receive buffering. This address must be a processor-
// based address for S/W UNDI and a device-based address for
// H/W UNDI.

PXE_UINT64 MemoryAddr;

// MemoryLength must be greater than or equal to MemoryRequired
// returned by the Get Init Info command.

PXE_UINT32 MemoryLength;

// Desired link speed in Mbit/sec. Common ethernet values are
// 10, 100 and 1000. Setting a value of zero will auto-detect
// and/or use the default link speed (operation depends on
// UNDI/NIC functionality).

PXE_UINT32 LinkSpeed;

// Suggested number and size of receive and transmit buffers to
// allocate. If MemoryAddr and MemoryLength are nonzero, this
// allocation comes out of the supplied memory buffer. If
// MemoryAddr and MemoryLength are zero, this allocation comes
// out of memory on the NIC.

// If these fields are set to zero, the UNDI will allocate
// buffer counts and sizes as it sees fit.

PXE_UINT16 TxBufCnt;
PXE_UINT16 TxBufSize;
PXE_UINT16 RxBufCnt;
PXE_UINT16 RxBufSize;

// The following configuration parameters are optional and must
// be zero to use the default values.
// The possible values for these parameters are defined below.

PXE_UINT8 DuplexMode;
PXE_UINT8 LoopBackMode;

// define PXE_DUPLEX_AUTO_DETECT 0x00
#define PXE_FORCE_FULL_DUPLEX 0x01
#define PXE_FORCE_HALF_DUPLEX 0x02

```c
#define PXE_LOOPBACK_NORMAL 0
#define PXE_LOOPBACK_INTERNAL 1
#define PXE_LOOPBACK_EXTERNAL 2
```

### E.4.7.4 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the `CDB.StatFlags` field. Until these bits change to report `PXE_STATFLAGS_COMMAND_COMPLETE` or `PXE_STATFLAGS_COMMAND_FAILED`, the command has not been executed by the UNDI.

<table>
<thead>
<tr>
<th>StatFlags</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMAND_COMPLETE</td>
<td>Command completed successfully. UNDI and network device is now initialized. DB has been written.</td>
</tr>
<tr>
<td>COMMAND_QUEUED</td>
<td>Command has been queued.</td>
</tr>
<tr>
<td>INITIALIZE</td>
<td>Command has been not executed or queued.</td>
</tr>
</tbody>
</table>

### E.4.7.5 Checking Command Execution Results

After command execution completes, either successfully or not, the `CDB.StatCode` field contains the result of the command execution.

<table>
<thead>
<tr>
<th>StatCode</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUCCESS</td>
<td>Command completed successfully. UNDI and network device is now initialized. DB has been written. Check StatFlags.</td>
</tr>
<tr>
<td>INVALID_CDB</td>
<td>One of the CDB fields was not set correctly.</td>
</tr>
<tr>
<td>INVALID_CPB</td>
<td>One of the CPB fields was not set correctly.</td>
</tr>
<tr>
<td>BUSY</td>
<td>UNDI is already processing commands. Try again later.</td>
</tr>
<tr>
<td>QUEUE_FULL</td>
<td>Command queue is full. Try again later.</td>
</tr>
<tr>
<td>NOT_STARTED</td>
<td>The UNDI is not started.</td>
</tr>
<tr>
<td>ALREADY_INITIALIZED</td>
<td>The UNDI is already initialized.</td>
</tr>
<tr>
<td>DEVICE_FAILURE</td>
<td>The network device could not be initialized.</td>
</tr>
<tr>
<td>NVDATA_FAILURE</td>
<td>The nonvolatile storage could not be read.</td>
</tr>
</tbody>
</table>

### E.4.7.6 StatFlags

Check the StatFlags to see if there is an active connection to this network device. If the no media StatFlag is set, the UNDI and network device are still initialized.
PXE_STATFLAGS_INITIALIZED_NO_MEDIA

E.4.7.7 Before Using the DB

#define pack(1)
typedef struct s_pxe_db_initialize {
  // Actual amount of memory used from the supplied memory
  // buffer. This may be less that the amount of memory
  // supplied and may be zero if the UNDI and network device
  // do not use external memory buffers. Memory used by the
  // UNDI and network device is allocated from the lowest
  // memory buffer address.

  PXE_UINT32 MemoryUsed;

  // Actual number and size of receive and transmit buffers that
  // were allocated.

  PXE_UINT16 TxBufCnt;
  PXE_UINT16 TxBufSize;
  PXE_UINT16 RxBufCnt;
  PXE_UINT16 RxBufSize
} PXE_DB_INITIALIZE;
#define pack()
E.4.8.2 OpFlags

Normally the settings of the receive filters and external interrupt enables are unchanged by the Reset command. These two OpFlags will alter the operation of the Reset command.

- PXE_OPFLAGS_RESET_DISABLE_INTERRUPTS
- PXE_OPFLAGS_RESET_DISABLE_FILTERS

E.4.8.3 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the CDB.StatFlags field. Until these bits change to report PXE_STATFLAGS_COMMAND_COMPLETE or PXE_STATFLAGS_COMMAND_FAILED, the command has not been executed by the UNDI.

<table>
<thead>
<tr>
<th>StatFlags</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMAND_COMPLETE</td>
<td>Command completed successfully. UNDI and network device have been reset. Check StatFlags.</td>
</tr>
<tr>
<td>COMMAND_QUEUED</td>
<td>Command has been queued.</td>
</tr>
<tr>
<td>INITIALIZE</td>
<td>Command has been not executed or queued.</td>
</tr>
</tbody>
</table>

E.4.8.4 Checking Command Execution Results

After command execution completes, either successfully or not, the CDB.StatCode field contains the result of the command execution.

<table>
<thead>
<tr>
<th>StatCode</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUCCESS</td>
<td>Command completed successfully. UNDI and network device have been reset. Check StatFlags.</td>
</tr>
<tr>
<td>INVALID_CDB</td>
<td>One of the CDB fields was not set correctly.</td>
</tr>
<tr>
<td>BUSY</td>
<td>UNDI is already processing commands. Try again later.</td>
</tr>
<tr>
<td>QUEUE_FULL</td>
<td>Command queue is full. Try again later.</td>
</tr>
<tr>
<td>NOT_STARTED</td>
<td>The UNDI is not started.</td>
</tr>
<tr>
<td>NOT_INITIALIZED</td>
<td>The UNDI is not initialized.</td>
</tr>
<tr>
<td>DEVICE_FAILURE</td>
<td>The network device could not be initialized.</td>
</tr>
<tr>
<td>NVDATA_FAILURE</td>
<td>The nonvolatile storage is not valid.</td>
</tr>
</tbody>
</table>

E.4.8.5 StatFlags

Check the StatFlags to see if there is an active connection to this network device. If the no media StatFlag is set, the UNDI and network device are still reset.
E.4.9 Shutdown

The Shutdown command resets the network adapter and leaves it in a safe state for another driver to initialize. Any pending transmits or receives are lost. Receive filters and external interrupt enables are reset (disabled). The memory buffer assigned in the Initialize command can be released or reassigned.

Once UNDI has been shutdown, it can then be stopped or initialized again. The Shutdown command changes the UNDI operational state from initialized to started.

E.4.9.1 Issuing the Command

To issue a Shutdown command, create a CDB and fill it in as shown in the table below:

<table>
<thead>
<tr>
<th>CDB Field</th>
<th>How to initialize the CDB structure for a Shutdown command</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpCode</td>
<td>PXE_OPCODE_SHUTDOWN</td>
</tr>
<tr>
<td>OpFlags</td>
<td>PXE_OPFLAGS_NOT_USED</td>
</tr>
<tr>
<td>CPBsize</td>
<td>PXE_CPBSIZE_NOT_USED</td>
</tr>
<tr>
<td>DBsize</td>
<td>PXE_DBSIZE_NOT_USED</td>
</tr>
<tr>
<td>CPBaddr</td>
<td>PXE_CPBSIZE_NOT_USED</td>
</tr>
<tr>
<td>DBaddr</td>
<td>PXE_DBSIZE_NOT_USED</td>
</tr>
<tr>
<td>StatCode</td>
<td>PXE_STATCODE_INITIALIZE</td>
</tr>
<tr>
<td>StatFlags</td>
<td>PXE_STATFLAGS_INITIALIZE</td>
</tr>
<tr>
<td>IFnum</td>
<td>A valid interface number from zero to ('!PXE.IFcnt</td>
</tr>
<tr>
<td>Control</td>
<td>Set as needed.</td>
</tr>
</tbody>
</table>

E.4.9.2 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the CDB.StatFlags field. Until these bits change to report PXE_STATFLAGS_COMMAND_COMPLETE or PXE_STATFLAGS_COMMAND_FAILED, the command has not been executed by the UNDI.

<table>
<thead>
<tr>
<th>StatFlags</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMAND_COMPLETE</td>
<td>Command completed successfully. UNDI and network device are shutdown.</td>
</tr>
<tr>
<td>COMMAND_QUEUE</td>
<td>Command has been queued.</td>
</tr>
<tr>
<td>INITIALIZE</td>
<td>Command has been not executed or queued.</td>
</tr>
</tbody>
</table>
E.4.9.3 Checking Command Execution Results

After command execution completes, either successfully or not, the `CDB.StatCode` field contains the result of the command execution.

<table>
<thead>
<tr>
<th>StatCode</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUCCESS</td>
<td>Command completed successfully. UNDI and network device are shutdown.</td>
</tr>
<tr>
<td>INVALID_CDB</td>
<td>One of the CDB fields was not set correctly.</td>
</tr>
<tr>
<td>BUSY</td>
<td>UNDI is already processing commands. Try again later.</td>
</tr>
<tr>
<td>QUEUE_FULL</td>
<td>Command queue is full. Try again later.</td>
</tr>
<tr>
<td>NOT_STARTED</td>
<td>The UNDI is not started.</td>
</tr>
<tr>
<td>NOT_INITIALIZED</td>
<td>The UNDI is not initialized.</td>
</tr>
</tbody>
</table>

E.4.10 Interrupt Enables

The Interrupt Enables command can be used to read and/or change the current external interrupt enable settings. Disabling an external interrupt enable prevents an external (hardware) interrupt from being signaled by the network device, internally the interrupt events can still be polled by using the Get Status command.

E.4.10.1 Issuing the Command

To issue an Interrupt Enables command, create a CDB and fill it in as shows in the table below:

<table>
<thead>
<tr>
<th>CDB Field</th>
<th>How to initialize the CDB structure for an Interrupt Enables command</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpCode</td>
<td>PXE_OPCODE_INTERRUPT_ENABLES</td>
</tr>
<tr>
<td>OpFlags</td>
<td>Set as needed.</td>
</tr>
<tr>
<td>CPBsize</td>
<td>PXE_CPBSIZE_NOT_USED</td>
</tr>
<tr>
<td>DBsize</td>
<td>PXE_DBSIZE_NOT_USED</td>
</tr>
<tr>
<td>CPBaddr</td>
<td>PXE_CPBADDR_NOT_USED</td>
</tr>
<tr>
<td>DBaddr</td>
<td>PXE_DBADDR_NOT_USED</td>
</tr>
<tr>
<td>StatCode</td>
<td>PXE_STATCODE_INITIALIZE</td>
</tr>
<tr>
<td>StatFlags</td>
<td>PXE_STATFLAGS_INITIALIZE</td>
</tr>
<tr>
<td>IFnum</td>
<td>A valid interface number from zero to `(!PXE.IFcnt</td>
</tr>
<tr>
<td>Control</td>
<td>Set as needed.</td>
</tr>
</tbody>
</table>
E.4.10.2 OpFlags

To read the current external interrupt enables settings set \texttt{CDB.OpFlags} to:

\texttt{PXE\_OPFLAGS\_INTERRUPT\_READ}

To enable or disable external interrupts set one of these OpFlags:

\texttt{PXE\_OPFLAGS\_INTERRUPT\_DISABLE}
\texttt{PXE\_OPFLAGS\_INTERRUPT\_ENABLE}

When enabling or disabling interrupt settings, the following additional OpFlag bits are used to specify which types of external interrupts are to be enabled or disabled:

\texttt{PXE\_OPFLAGS\_INTERRUPT\_RECEIVE}
\texttt{PXE\_OPFLAGS\_INTERRUPT\_TRANSMIT}
\texttt{PXE\_OPFLAGS\_INTERRUPT\_COMMAND}
\texttt{PXE\_OPFLAGS\_INTERRUPT\_SOFTWARE}

Setting \texttt{PXE\_OPFLAGS\_INTERRUPT\_SOFTWARE} does not enable an external interrupt type, it generates an external interrupt.

E.4.10.3 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the \texttt{CDB.StatFlags} field. Until these bits change to report \texttt{PXE\_STATFLAGS\_COMMAND\_COMPLETE} or \texttt{PXE\_STATFLAGS\_COMMAND\_FAILED}, the command has not been executed by the UNDI.

<table>
<thead>
<tr>
<th>StatFlags</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMAND_COMPLETE</td>
<td>Command completed successfully. Check StatFlags.</td>
</tr>
<tr>
<td>COMMAND_QUEUED</td>
<td>Command has been queued.</td>
</tr>
<tr>
<td>INITIALIZE</td>
<td>Command has been not executed or queued.</td>
</tr>
</tbody>
</table>

E.4.10.4 Checking Command Execution Results

After command execution completes, either successfully or not, the \texttt{CDB.StatCode} field contains the result of the command execution.

<table>
<thead>
<tr>
<th>StatCode</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUCCESS</td>
<td>Command completed successfully. Check StatFlags.</td>
</tr>
<tr>
<td>INVALID_CDB</td>
<td>One of the CDB fields was not set correctly.</td>
</tr>
<tr>
<td>BUSY</td>
<td>UNDI is already processing commands. Try again later.</td>
</tr>
<tr>
<td>QUEUE_FULL</td>
<td>Command queue is full. Try again later.</td>
</tr>
<tr>
<td>NOT_STARTED</td>
<td>The UNDI is not started.</td>
</tr>
<tr>
<td>NOT_INITIALIZED</td>
<td>The UNDI is not initialized.</td>
</tr>
</tbody>
</table>
E.4.10.5 StatFlags

If the command was successful, the CDB.StatFlags field reports which external interrupt enable types are currently set. Possible CDB.StatFlags bit settings are:

- PXE_STATFLAGS_INTERRUPT_RECEIVE
- PXE_STATFLAGS_INTERRUPT_TRANSMIT
- PXE_STATFLAGS_INTERRUPT_COMMAND

The bits set in CDB.StatFlags may be different than those that were requested in CDB.OpFlags. For example: If transmit and receive share an external interrupt line, setting either the transmit or receive interrupt will always enable both transmit and receive interrupts. In this case both transmit and receive interrupts will be reported in CDB.StatFlags. Always expect to get more than you ask for!

E.4.11 Receive Filters

This command is used to read and change receive filters and, if supported, read and change the multicast MAC address filter list. Control will not be returned to the caller and the COMMAND_COMPLETE status flag will not be set until the NIC is ready to receive.

E.4.11.1 Issuing the Command

To issue a Receive Filters command, create a CDB and fill it in as shows in the table below:

<table>
<thead>
<tr>
<th>CDB Field</th>
<th>How to initialize the CDB structure for a Receive Filters command</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpCode</td>
<td>PXE_OPCODE_RECEIVE_FILTERS</td>
</tr>
<tr>
<td>OpFlags</td>
<td>Set as needed.</td>
</tr>
<tr>
<td>CPBsize</td>
<td>sizeof(PXE_CPB_RECEIVE_FILTERS)</td>
</tr>
<tr>
<td>DBsize</td>
<td>sizeof(PXE_DB_RECEIVE_FILTERS)</td>
</tr>
<tr>
<td>CPBaddr</td>
<td>Address of PXE_CPB_RECEIVE_FILTERS structure.</td>
</tr>
<tr>
<td>DBaddr</td>
<td>Address of PXE_DB_RECEIVE_FILTERS structure.</td>
</tr>
<tr>
<td>StatCode</td>
<td>PXE_STATCODE_INITIALIZE</td>
</tr>
<tr>
<td>StatFlags</td>
<td>PXE_STATFLAGS_INITIALIZE</td>
</tr>
<tr>
<td>IFnum</td>
<td>A valid interface number from zero to (!PXE.IFcnt</td>
</tr>
<tr>
<td>Control</td>
<td>Set as needed.</td>
</tr>
</tbody>
</table>

E.4.11.2 OpFlags

To read the current receive filter settings set the CDB.OpFlags field to:

- PXE_OPFLAGS_RECEIVE_FILTER_READ

To change the current receive filter settings set one of these OpFlag bits:

- PXE_OPFLAGS_RECEIVE_FILTER_ENABLE
- PXE_OPFLAGS_RECEIVE_FILTER_DISABLE

When changing the receive filter settings, at least one of the OpFlag bits in this list must be selected:
• PXE_OPFLAGS_RECEIVE_FILTER_UNICAST
• PXE_OPFLAGS_RECEIVE_FILTER_BROADCAST
• PXE_OPFLAGS_RECEIVE_FILTER_FILTERED_MULTICAST
• PXE_OPFLAGS_RECEIVE_FILTER_PROMISCUOUS
• PXE_OPFLAGS_RECEIVE_FILTER_ALL_MULTICAST

To clear the contents of the multicast MAC address filter list, set this OpFlag:

• PXE_OPFLAGS_RECEIVE_FILTER_RESET_MCAST_LIST

E.4.11.3 Preparing the CPB

The receive filter CPB is used to change the contents multicast MAC address filter list. To leave the multicast MAC address filter list unchanged, set the CDB.CPBsize field to PXE_CPBSIZE_NOT_USED and CDB.CPBaddr to PXE_CPBADDR_NOT_USED.

To change the multicast MAC address filter list, set CDB.CPBsize to the size, in bytes, of the multicast MAC address filter list and set CDB.CPBaddr to the address of the first entry in the multicast MAC address filter list.

```c
typedef struct s_pxe_cpb_receive_filters {
    // List of multicast MAC addresses. This list, if present,
    // will replace the existing multicast MAC address filter list.
    PXE_MAC_ADDR MCastList[n];
} PXE_CPB_RECEIVE_FILTERS;
```

E.4.11.4 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the CDB.StatFlags field. Until these bits change to report PXE_STATFLAGS_COMMAND_COMPLETE or PXE_STATFLAGS_COMMAND_FAILED, the command has not been executed by the UNDI.

<table>
<thead>
<tr>
<th>StatFlags</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMAND_COMPLETE</td>
<td>Command completed successfully. Check StatFlags. DB is written.</td>
</tr>
<tr>
<td>COMMAND_QUEUED</td>
<td>Command has been queued.</td>
</tr>
<tr>
<td>INITIALIZE</td>
<td>Command has been not executed or queued.</td>
</tr>
</tbody>
</table>

E.4.11.5 Checking Command Execution Results

After command execution completes, either successfully or not, the CDB.StatCode field contains the result of the command execution.

<table>
<thead>
<tr>
<th>StatCode</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUCCESS</td>
<td>Command completed successfully. Check StatFlags. DB is written.</td>
</tr>
<tr>
<td>INVALID_CDB</td>
<td>One of the CDB fields was not set correctly.</td>
</tr>
</tbody>
</table>
E.4.11.6 StatFlags

The receive filter settings in CDB.StatFlags are:

- PXE_STATFLAGS_RECEIVE_FILTER_UNICAST
- PXE_STATFLAGS_RECEIVE_FILTER_BROADCAST
- PXE_STATFLAGS_RECEIVE_FILTER_FILTERED_MULTICAST
- PXE_STATFLAGS_RECEIVE_FILTER_PROMISCUOUS
- PXE_STATFLAGS_RECEIVE_FILTER_ALL_MULTICAST

Unsupported receive filter settings in OpFlags are promoted to the next more liberal receive filter setting. For example: If broadcast or filtered multicast are requested and are not supported by the network device, but promiscuous is; the promiscuous status flag will be set.

E.4.11.7 DB

The DB is used to read the current multicast MAC address filter list. The CDB.DBSIZE and CDB.DBaddr fields can be set to PXE_DBSIZE_NOT_USED and PXE_DBADDR_NOT_USED if the multicast MAC address filter list does not need to be read. When reading the multicast MAC address filter list extra entries in the DB will be filled with zero.

```c
typedef struct s_pxe_db_receive_filters {
    /* Filtered multicast MAC address list. */
    PXE_MAC_ADDR MCastList[n];
} PXE_DB_RECEIVE_FILTERS;
```
E.4.12 Station Address

This command is used to get current station and broadcast MAC addresses and, if supported, to change the current station MAC address.

E.4.12.1 Issuing the Command

To issue a Station Address command, create a CDB and fill it in as shows in the table below:

<table>
<thead>
<tr>
<th>CDB Field</th>
<th>How to initialize the CDB structure for a Station Address command</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpCode</td>
<td>PXE_OPCODE_STATION_ADDRESS</td>
</tr>
<tr>
<td>OpFlags</td>
<td>Set as needed.</td>
</tr>
<tr>
<td>CPBsize</td>
<td>sizeof(PXE_CPB_STATION_ADDRESS)</td>
</tr>
<tr>
<td>DBsize</td>
<td>sizeof(PXE_DB_STATION_ADDRESS)</td>
</tr>
<tr>
<td>CPBaddr</td>
<td>Address of PXE_CPB_STATION_ADDRESS structure.</td>
</tr>
<tr>
<td>DBaddr</td>
<td>Address of PXE_DB_STATION_ADDRESS structure.</td>
</tr>
<tr>
<td>StatCode</td>
<td>PXE_STATCODE_INITIALIZE</td>
</tr>
<tr>
<td>StatFlags</td>
<td>PXE_STATFLAGS_INITIALIZE</td>
</tr>
<tr>
<td>IFnum</td>
<td>A valid interface number from zero to (!PXE.IFcnt</td>
</tr>
<tr>
<td>Control</td>
<td>Set as needed.</td>
</tr>
</tbody>
</table>

E.4.12.2 OpFlags

To read current station and broadcast MAC addresses set the OpFlags field to:

- PXE_OPFLAGS_STATION_ADDRESS_READ

To change the current station to the address given in the CPB set the OpFlags field to:

- PXE_OPFLAGS_STATION_ADDRESS_WRITE

To reset the current station address back to the power on default, set the OpFlags field to:

- PXE_OPFLAGS_STATION_ADDRESS_RESET

E.4.12.3 Preparing the CPB

To change the current station MAC address the CDB.CPBsize and CDB.CPBaddr fields must be set.

```c
typedef struct s_pxe_cpb_station_address {
    // If supplied and supported, the current station MAC address
    // will be changed.

    PXE_MAC_ADDR StationAddr;
} PXE_CPB_STATION_ADDRESS;
```
E.4.12.4 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the CDB.StatFlags field. Until these bits change to report PXE_STATFLAGS_COMMAND_COMPLETE or PXE_STATFLAGS_COMMAND_FAILED, the command has not been executed by the UNDI.

<table>
<thead>
<tr>
<th>StatFlags</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMAND_COMPLETE</td>
<td>Command completed successfully. DB is written.</td>
</tr>
<tr>
<td>COMMAND_QUEUED</td>
<td>Command has been queued.</td>
</tr>
<tr>
<td>INITIALIZE</td>
<td>Command has been not executed or queued.</td>
</tr>
</tbody>
</table>

E.4.12.5 Checking Command Execution Results

After command execution completes, either successfully or not, the CDB.StatCode field contains the result of the command execution.

<table>
<thead>
<tr>
<th>StatCode</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUCCESS</td>
<td>Command completed successfully.</td>
</tr>
<tr>
<td>INVALID_CDB</td>
<td>One of the CDB fields was not set correctly.</td>
</tr>
<tr>
<td>INVALID_CPB</td>
<td>One of the CPB fields was not set correctly.</td>
</tr>
<tr>
<td>BUSY</td>
<td>UNDI is already processing commands. Try again later.</td>
</tr>
<tr>
<td>QUEUE_FULL</td>
<td>Command queue is full. Try again later.</td>
</tr>
<tr>
<td>NOT_STARTED</td>
<td>The UNDI is not started.</td>
</tr>
<tr>
<td>NOT_INITIALIZED</td>
<td>The UNDI is not initialized.</td>
</tr>
<tr>
<td>UNSUPPORTED</td>
<td>The requested operation is not supported.</td>
</tr>
</tbody>
</table>

E.4.12.6 Before Using the DB

The DB is used to read the current station, broadcast and permanent station MAC addresses. The CDB.DBsize and CDB.DBaddr fields can be set to PXE_DBSIZE_NOT_USED and PXE_DBADDR_NOT_USED if these addresses do not need to be read.

```c
typedef struct s_pxe_db_station_address {
    // Current station MAC address.
    PXE_MAC_ADDR StationAddr;

    // Station broadcast MAC address.
    PXE_MAC_ADDR BroadcastAddr;

    // Permanent station MAC address.
    PXE_MAC_ADDR PermanentAddr;
} PXE_DB_STATION_ADDRESS;
```
E.4.13 Statistics

This command is used to read and clear the NIC traffic statistics. Before using this command check to see if statistics is supported in the `!PXE.Implementation` flags.

E.4.13.1 Issuing the Command

To issue a Statistics command, create a CDB and fill it in as shown in the table below:

<table>
<thead>
<tr>
<th>CDB Field</th>
<th>How to initialize the CDB structure for a Statistics command</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpCode</td>
<td>PXE_OPCODE_STATISTICS</td>
</tr>
<tr>
<td>OpFlags</td>
<td>Set as needed.</td>
</tr>
<tr>
<td>CPBsize</td>
<td>PXE_CPBSIZE_NOT_USED</td>
</tr>
<tr>
<td>DBsize</td>
<td>sizeof(PXE_DB_STATISTICS)</td>
</tr>
<tr>
<td>CPBaddr</td>
<td>PXE_CPBADDR_NOT_USED</td>
</tr>
<tr>
<td>DBaddr</td>
<td>Address of PXE_DB_STATISTICS structure.</td>
</tr>
<tr>
<td>StatCode</td>
<td>PXE_STATCODE_INITIALIZE</td>
</tr>
<tr>
<td>StatFlags</td>
<td>PXE_STATFLAGS_INITIALIZE</td>
</tr>
<tr>
<td>IFnum</td>
<td>A valid interface number from zero to (!PXE.IFcnt</td>
</tr>
<tr>
<td>Control</td>
<td>Set as needed.</td>
</tr>
</tbody>
</table>

E.4.13.2 OpFlags

To read the current statistics counters set the OpFlags field to:

`PXE_OPFLAGS_STATISTICS_READ`

To reset the current statistics counters set the OpFlags field to:

`PXE_OPFLAGS_STATISTICS_RESET`

E.4.13.3 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the CDB.StatFlags field. Until these bits change to report PXE_STATFLAGS_COMMAND_COMPLETE or PXE_STATFLAGS_COMMAND_FAILED, the command has not been executed by the UNDI.

<table>
<thead>
<tr>
<th>StatFlags</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMAND_COMPLETE</td>
<td>Command completed successfully. DB is written.</td>
</tr>
<tr>
<td>COMMAND_QUEUED</td>
<td>Command has been queued.</td>
</tr>
<tr>
<td>INITIALIZE</td>
<td>Command has been not executed or queued.</td>
</tr>
</tbody>
</table>
E.4.13.4 Checking Command Execution Results

After command execution completes, either successfully or not, the `CDB.StatCode` field contains the result of the command execution.

<table>
<thead>
<tr>
<th>StatCode</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUCCESS</td>
<td>Command completed successfully. DB is written.</td>
</tr>
<tr>
<td>INVALID_CDB</td>
<td>One of the CDB fields was not set correctly.</td>
</tr>
<tr>
<td>BUSY</td>
<td>UNDI is already processing commands. Try again later.</td>
</tr>
<tr>
<td>QUEUE_FULL</td>
<td>Command queue is full. Try again later.</td>
</tr>
<tr>
<td>NOT_STARTED</td>
<td>The UNDI is not started.</td>
</tr>
<tr>
<td>NOT_INITIALIZED</td>
<td>The UNDI is not initialized.</td>
</tr>
<tr>
<td>UNSUPPORTED</td>
<td>This command is not supported.</td>
</tr>
</tbody>
</table>

E.4.13.5 DB

Unsupported statistics counters will be zero filled by UNDI.

```c
typedef struct s_pxe_db_statistics {
    // Bit field identifying what statistic data is collected by
    // the UNDI/NIC.
    // If bit 0x00 is set, Data[0x00] is collected.
    // If bit 0x01 is set, Data[0x01] is collected.
    // If bit 0x20 is set, Data[0x20] is collected.
    // If bit 0x21 is set, Data[0x21] is collected.
    // Etc.
    PXE_UINT64 Supported;
    // Statistic data.
    PXE_UINT64 Data[64];
} PXE_DB_STATISTICS;
```

- `#define PXE_STATISTICS_RX_TOTAL_FRAMES   0x00`
  // Total number of frames received. Includes frames with errors
  // and dropped frames.
- `#define PXE_STATISTICS_RX_GOOD_FRAMES    0x01`
  // Number of valid frames received and copied into receive
  // buffers.
- `#define PXE_STATISTICS_RX_UNDERSIZE_FRAMES   0x02`
  // Number of frames below the minimum length for the media.
  // This would be <64 for ethernet.
- `#define PXE_STATISTICS_RX_OVERSIZE_FRAMES   0x03`
  // Number of frames longer than the maximum length for the
  // media. This would be >1500 for ethernet.

#define PXE_STATISTICS_RX_OVERSIZE_FRAMES 0x03

// Valid frames that were dropped because receive buffers
// were full.
#define PXE_STATISTICS_RX_DROPPED_FRAMES 0x04

// Number of valid unicast frames received and not dropped.
#define PXE_STATISTICS_RX_UNICAST_FRAMES 0x05

// Number of valid broadcast frames received and not dropped.
#define PXE_STATISTICS_RX_BROADCAST_FRAMES 0x06

// Number of valid multicast frames received and not dropped.
#define PXE_STATISTICS_RX_MULTICAST_FRAMES 0x07

// Number of frames w/ CRC or alignment errors.
#define PXE_STATISTICS_RX_CRC_ERROR_FRAMES 0x08

// Total number of bytes received. Includes frames with errors
// and dropped frames.
#define PXE_STATISTICS_RX_TOTAL_BYTES 0x09

// Transmit statistics.
#define PXE_STATISTICS_TX_TOTAL_FRAMES 0xA
#define PXE_STATISTICS_TX_GOOD_FRAMES 0xB
#define PXE_STATISTICS_TX_UNDERSIZE_FRAMES 0xC
#define PXE_STATISTICS_TX_OVERSIZE_FRAMES 0xD
#define PXE_STATISTICS_TX_DROPPED_FRAMES 0xE
#define PXE_STATISTICS_TX_UNICAST_FRAMES 0xF
#define PXE_STATISTICS_TX_BROADCAST_FRAMES 0x10
#define PXE_STATISTICS_TX_MULTICAST_FRAMES 0x11
#define PXE_STATISTICS_TX_CRC_ERROR_FRAMES 0x12
#define PXE_STATISTICS_TX_TOTAL_BYTES 0x13

// Number of collisions detection on this subnet.
#define PXE_STATISTICS_COLLISIONS 0x14

// Number of frames destined for unsupported protocol.
#define PXE_STATISTICS_UNSUPPORTED_PROTOCOL 0x15

// Number of valid frames received that were duplicated.
#define PXE_STATISTICS_RX_DUPLICATED_FRAMES 0x16

// Number of encrypted frames received that failed to decrypt.
#define PXE_STATISTICS_RX_DECRYPT_ERROR_FRAMES 0x17

// Number of frames that failed to transmit after exceeding the
// retry limit.
#define PXE_STATISTICS_TX_ERROR_FRAMES 0x18

// Number of frames transmitted successfully after more than one
// attempt.
#define PXE_STATISTICS_TX_RETRY_FRAMES 0x19

E.4.14 MCast IP To MAC

Translate a multicast IPv4 or IPv6 address to a multicast MAC address.

E.4.14.1 Issuing the Command

To issue a MCast IP To MAC command, create a CDB and fill it in as shown in the table below:

<table>
<thead>
<tr>
<th>CDB Field</th>
<th>How to initialize the CDB structure for a MCast IP To MAC command</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpCode</td>
<td>PXE_OPCODE_MCAST_IP_TO_MAC</td>
</tr>
<tr>
<td>OpFlags</td>
<td>Set as needed.</td>
</tr>
<tr>
<td>CPBsize</td>
<td>sizeof(PXE_CPB_MCAST_IP_TO_MAC)</td>
</tr>
<tr>
<td>DBsize</td>
<td>sizeof(PXE_DB_MCAST_IP_TO_MAC)</td>
</tr>
<tr>
<td>CPBaddr</td>
<td>Address of PXE_CPB_MCAST_IP_TO_MAC structure.</td>
</tr>
<tr>
<td>Dbaddr</td>
<td>Address of PXE_DB_MCAST_IP_TO_MAC structure.</td>
</tr>
<tr>
<td>StatCode</td>
<td>PXE_STATCODE_INITIALIZE</td>
</tr>
<tr>
<td>StatFlags</td>
<td>PXE_STATFLAGS_INITIALIZE</td>
</tr>
<tr>
<td>Ifnum</td>
<td>A valid interface number from zero to !PXE.IFcnt</td>
</tr>
<tr>
<td>Control</td>
<td>Set as needed.</td>
</tr>
</tbody>
</table>

E.4.14.2 OpFlags

To convert a multicast IP address to a multicast MAC address the UNDI needs to know the format of the IP address. Set one of these OpFlags to identify the format of the IP addresses in the CPB:

PXE_OPFLAGS_MCAST_IPV4_TO_MAC
PXE_OPFLAGS_MCAST_IPV6_TO_MAC

E.4.14.3 Preparing the CPB

Fill in an array of one or more multicast IP addresses. Be sure to set the CDB.CPBsize and CDB.CPBaddr fields accordingly.

typedef struct s_pxe_cpb_mcast_ip_to_mac {

    // Multicast IP address to be converted to multicast
    // MAC address.
    PXE_IP_ADDR IP[n];
} PXE_CPB_MCAST_IP_TO_MAC;
E.4.14.4 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the CDB.StatFlags field. Until these bits change to report PXE_STATFLAGS_COMMAND_COMPLETE or PXE_STATFLAGS_COMMAND_FAILED, the command has not been executed by the UNDI.

<table>
<thead>
<tr>
<th>StatFlags</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMAND_COMPLETE</td>
<td>Command completed successfully. DB is written.</td>
</tr>
<tr>
<td>COMMAND_QUEUED</td>
<td>Command has been queued.</td>
</tr>
<tr>
<td>INITIALIZE</td>
<td>Command has not executed or queued.</td>
</tr>
</tbody>
</table>

E.4.14.5 Checking Command Execution Results

After command execution completes, either successfully or not, the CDB.StatCode field contains the result of the command execution.

<table>
<thead>
<tr>
<th>StatCode</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUCCESS</td>
<td>Command completed successfully. DB is written.</td>
</tr>
<tr>
<td>INVALID_CDB</td>
<td>One of the CDB fields was not set correctly.</td>
</tr>
<tr>
<td>INVALID_CPB</td>
<td>One of the CPB fields was not set correctly.</td>
</tr>
<tr>
<td>BUSY</td>
<td>UNDI is already processing commands. Try again later.</td>
</tr>
<tr>
<td>QUEUE_FULL</td>
<td>Command queue is full. Try again later.</td>
</tr>
<tr>
<td>NOT_STARTED</td>
<td>The UNDI is not started.</td>
</tr>
<tr>
<td>NOT_INITIALIZED</td>
<td>The UNDI is not initialized.</td>
</tr>
</tbody>
</table>

E.4.14.6 Before Using the DB

The DB is where the multicast MAC addresses will be written.

```c
typedef struct s_pxe_db_mcast_ip_to_mac {
    // Multicast MAC address.
    PXE_MAC_ADDR MAC[n];
} PXE_DB_MCAST_IP_TO_MAC;
```

E.4.15 NvData

This command is used to read and write (if supported by NIC H/W) nonvolatile storage on the NIC. Nonvolatile storage could be EEPROM, FLASH or battery backed RAM.
E.4.15.1 Issuing the Command

To issue a NvData command, create a CDB and fill it in as shown in the table below:

<table>
<thead>
<tr>
<th>CDB Field</th>
<th>How to initialize the CDB structure for a NvData command</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpCode</td>
<td>PXE_OPCODE_NVDATA</td>
</tr>
<tr>
<td>OpFlags</td>
<td>Set as needed.</td>
</tr>
<tr>
<td>CPBsize</td>
<td>sizeof(PXE_CPB_NVDATA)</td>
</tr>
<tr>
<td>DBsize</td>
<td>sizeof(PXE_DB_NVDATA)</td>
</tr>
<tr>
<td>CPBaddr</td>
<td>Address of PXE_CPB_NVDATA structure.</td>
</tr>
<tr>
<td>Dbaddr</td>
<td>Address of PXE_DB_NVDATA structure.</td>
</tr>
<tr>
<td>StatCode</td>
<td>PXE_STATCODE_INITIALIZE</td>
</tr>
<tr>
<td>StatFlags</td>
<td>PXE_STATFLAGS_INITIALIZE</td>
</tr>
</tbody>
</table>
| Ifnum       | A valid interface number from zero to 

\(!PXE.IFcnt | (!PXE.IFcntExt << 8))

| Control     | Set as needed.                                           |

E.4.15.2 Preparing the CPB

There are two types of nonvolatile data CPBs, one for sparse updates and one for bulk updates. Sparse updates allow updating of single nonvolatile storage items. Bulk updates always update all nonvolatile storage items. Check the \!PXE.Implementation flags to see which type of nonvolatile update is supported by this UNDI and network device.

If you do not need to update the nonvolatile storage set the CDB.CPBsize and CDB.CPBaddr fields to PXE_CPBSIZE_NOT_USED and PXE_CPBADDR_NOT_USED.

E.4.15.2.1 Sparse NvData CPB

typedef struct s_pxe_cpb_nvdata_sparse {
    // NvData item list. Only items in this list will be updated.

    struct {

        // Nonvolatile storage address to be changed.
        PXE_UINT32 Addr;

        // Data item to write into above storage address.
        union {
            PXE_UINT8 Byte;
            PXE_UINT16 Word;
            PXE_UINT32 Dword;
        } Data;
    } Item[n];

    } PXE_CPB_NVDATA SPARSE;
E.4.15.2.2 Bulk NvData CPB

// When using bulk update, the size of the CPB structure must be
// the same size as the nonvolatile NIC storage.

typedef union u_pxe_cpb_nvdata_bulk {

    // Array of byte-wide data items.
    PXE_UINT8 Byte[n];

    // Array of word-wide data items.
    PXE_UINT16 Word[n];

    // Array of dword-wide data items.
    PXE_UINT32 Dword[n];
} PXE_CPB_NVDATA_BULK;

E.4.15.3 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the CDB.StatFlags field. Until these bits change to report PXE_STATFLAGS_COMMAND_COMPLETE or PXE_STATFLAGS_COMMAND_FAILED, the command has not been executed by the UNDI.

<table>
<thead>
<tr>
<th>StatFlags</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMAND_COMPLETE</td>
<td>Command completed successfully. Nonvolatile data is updated from CPB and/or written to DB.</td>
</tr>
<tr>
<td>COMMAND_QUEUED</td>
<td>Command has been queued.</td>
</tr>
<tr>
<td>INITIALIZE</td>
<td>Command has been not executed or queued.</td>
</tr>
</tbody>
</table>

E.4.15.4 Checking Command Execution Results

After command execution completes, either successfully or not, the CDB.StatCode field contains the result of the command execution.

<table>
<thead>
<tr>
<th>StatCode</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUCCESS</td>
<td>Command completed successfully. Nonvolatile data is updated from CPB and/or written to DB.</td>
</tr>
<tr>
<td>INVALID_CDB</td>
<td>One of the CDB fields was not set correctly.</td>
</tr>
<tr>
<td>INVALID_CPB</td>
<td>One of the CPB fields was not set correctly.</td>
</tr>
<tr>
<td>BUSY</td>
<td>UNDI is already processing commands. Try again later.</td>
</tr>
<tr>
<td>QUEUE FULL</td>
<td>Command queue is full. Try again later.</td>
</tr>
<tr>
<td>NOT_STARTED</td>
<td>The UNDI is not started.</td>
</tr>
<tr>
<td>NOT_INITIALIZED</td>
<td>The UNDI is not initialized.</td>
</tr>
<tr>
<td>UNSUPPORTED</td>
<td>Requested operation is unsupported.</td>
</tr>
</tbody>
</table>
E.4.15.4.1 DB
Check the width and number of nonvolatile storage items. This information is returned by the Get Init Info command.

```c
typedef struct s_pxe_db_nvdata {
    // Arrays of data items from nonvolatile storage.
    union {
        // Array of byte-wide data items.
        PXE_UINT8 Byte[n];
        // Array of word-wide data items.
        PXE_UINT16 Word[n];
        // Array of dword-wide data items.
        PXE_UINT32 Dword[n];
    } Data;
} PXE_DB_NVDATA;
```

E.4.16 Get Status
This command returns the current interrupt status and/or the transmitted buffer addresses and the current media status. If the current interrupt status is returned, pending interrupts will be acknowledged by this command. Transmitted buffer addresses that are written to the DB are removed from the transmitted buffer queue.

This command may be used in a polled fashion with external interrupts disabled.

E.4.16.1 Issuing the Command
To issue a Get Status command, create a CDB and fill it in as shown in the table below:

<table>
<thead>
<tr>
<th>CDB Field</th>
<th>How to initialize the CDB structure for a Get Status command</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpCode</td>
<td>PXE_OPCODE_GET_STATUS</td>
</tr>
<tr>
<td>OpFlags</td>
<td>Set as needed.</td>
</tr>
<tr>
<td>CPBsize</td>
<td>PXE_CPBSIZE_NOT_USED</td>
</tr>
<tr>
<td>DBsize</td>
<td>Sizeof(PXE_DB_GET_STATUS)</td>
</tr>
<tr>
<td>CPBaddr</td>
<td>PXE_CPBADDR_NOT_USED</td>
</tr>
<tr>
<td>DBaddr</td>
<td>Address of PXE_DB_GET_STATUS structure.</td>
</tr>
<tr>
<td>StatCode</td>
<td>PXE_STATCODE_INITIALIZE</td>
</tr>
<tr>
<td>StatFlags</td>
<td>PXE_STATFLAGS_INITIALIZE</td>
</tr>
<tr>
<td>IFnum</td>
<td>A valid interface number from zero to (!PXE.IFcnt</td>
</tr>
<tr>
<td>Control</td>
<td>Set as needed.</td>
</tr>
</tbody>
</table>
E.4.16.1.1 Setting OpFlags
Set one or a combination of the OpFlags below to return the interrupt status and/or the transmitted buffer addresses and/or the media status.

- PXE_OPFLAGS_GET_INTERRUPT_STATUS
- PXE_OPFLAGS_GET_TRANSMITTED_BUFFERS
- PXE_OPFLAGS_GET_MEDIA_STATUS

E.4.16.2 Waiting for the Command to Execute
Monitor the upper two bits (14 & 15) in the CDB.StatFlags field. Until these bits change to report PXE_STATFLAGS_COMMAND_COMPLETE or PXE_STATFLAGS_COMMAND_FAILED, the command has not been executed by the UNDI.

<table>
<thead>
<tr>
<th>StatFlags</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMAND_COMPLETE</td>
<td>Command completed successfully. StatFlags and/or DB are updated.</td>
</tr>
<tr>
<td>COMMAND_QUEUED</td>
<td>Command has been queued.</td>
</tr>
<tr>
<td>INITIALIZE</td>
<td>Command has been not executed or queued.</td>
</tr>
</tbody>
</table>

E.4.16.3 Checking Command Execution Results
After command execution completes, either successfully or not, the CDB.StatCode field contains the result of the command execution.

<table>
<thead>
<tr>
<th>StatCode</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUCCESS</td>
<td>Command completed successfully. StatFlags and/or DB are updated.</td>
</tr>
<tr>
<td>INVALID_CDB</td>
<td>One of the CDB fields was not set correctly.</td>
</tr>
<tr>
<td>BUSY</td>
<td>UNDI is already processing commands. Try again later.</td>
</tr>
<tr>
<td>QUEUE_FULL</td>
<td>Command queue is full. Try again later.</td>
</tr>
<tr>
<td>NOT_STARTED</td>
<td>The UNDI is not started.</td>
</tr>
<tr>
<td>NOT_INITIALIZED</td>
<td>The UNDI is not initialized.</td>
</tr>
</tbody>
</table>

E.4.16.4 StatFlags
If the command completes successfully and the PXE_OPFLAGS_GET_INTERRUPT_STATUS OpFlag was set in the CDB, the current interrupt status is returned in the CDB.StatFlags field and any pending interrupts will have been cleared.

- PXE_STATFLAGS_GET_STATUS_RECEIVE
- PXE_STATFLAGS_GET_STATUS_TRANSMIT
- PXE_STATFLAGS_GET_STATUS_COMMAND
- PXE_STATFLAGS_GET_STATUS_SOFTWARE

The StatFlags above may not map directly to external interrupt signals. For example: Some NICs may combine both the receive and transmit interrupts to one external interrupt line. When a receive and/or transmit interrupt occurs, use the Get Status to determine which type(s) of interrupt(s) occurred.
This flag is set if the transmitted buffer queue is empty. This flag will be set if all transmitted buffer addresses get written into the DB.

PXE_STATFLAGS_GET_STATUS_TXBUF_QUEUE_EMPTY

This flag is set if no transmitted buffer addresses were written into the DB.

PXE_STATFLAGS_GET_STATUS_NO_TXBUFS_WRITTEN

This flag is set if there is no media present.

PXE_STATFLAGS_GET_STATUS_NO_MEDIA

### E.4.16.5 Using the DB

When reading the transmitted buffer addresses there should be room for at least one 64-bit address in the DB. Once a complete transmitted buffer address is written into the DB, the address is removed from the transmitted buffer queue. If the transmitted buffer queue is full, attempts to use the Transmit command will fail.

```c
#pragma pack(1)
typedef struct s_pxe_db_get_status {
    // Length of next receive frame (header + data). If this is zero, there is no next receive frame available.
    PXE_UINT32    RxFrameLen;
    // Reserved, set to zero.
    PXE_UINT32    reserved;
    // Addresses of transmitted buffers that need to be recycled.
    PXE_UINT64    xBuffer[n];
} PXE_DB_GET_STATUS;
#pragma pack()
```

### E.4.17 Fill Header

This command is used to fill the media header(s) in transmit packet(s).
E.4.17.1 Issuing the Command

To issue a Fill Header command, create a CDB and fill it in as shown in the table below:

<table>
<thead>
<tr>
<th>CDB Field</th>
<th>How to initialize the CDB structure for a Fill Header command</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpCode</td>
<td>PXE_OPCODE_FILL_HEADER</td>
</tr>
<tr>
<td>OpFlags</td>
<td>Set as needed.</td>
</tr>
<tr>
<td>CPBsize</td>
<td>PXE_CPB_FILL_HEADER</td>
</tr>
<tr>
<td>DBsize</td>
<td>PXE_DBSIZE_NOT_USED</td>
</tr>
<tr>
<td>CPBaddr</td>
<td>Address of a PXE_CPB_FILL_HEADER structure.</td>
</tr>
<tr>
<td>DBaddr</td>
<td>PXE_DBADDR_NOT_USED</td>
</tr>
<tr>
<td>StatCode</td>
<td>PXE_STATCODE_INITIALIZE</td>
</tr>
<tr>
<td>StatFlags</td>
<td>PXE_STATFLAGS_INITIALIZE</td>
</tr>
<tr>
<td>IFnum</td>
<td>A valid interface number from zero to (!PXE.IFcnt</td>
</tr>
<tr>
<td>Control</td>
<td>Set as needed.</td>
</tr>
</tbody>
</table>

E.4.17.2 OpFlags

Select one of the OpFlags below so the UNDI knows what type of CPB is being used.

- PXE_OPFLAGS_FILL_HEADER_WHOLE
- PXE_OPFLAGS_FILL_HEADER_FRAGMENTED

E.4.17.3 Preparing the CPB

If multiple frames per command are supported (see !PXE.Implementation flags), multiple CPBs can be packed together. The CDB.CPBsize field lets the UNDI know how many CPBs are packed together.

E.4.17.4 Nonfragmented Frame

```c
#pragma pack(1)
typedef struct s_pxe_cpb_fill_header {

    // Source and destination MAC addresses. These will be copied
    // into the media header without doing byte swapping.
    PXE_MAC_ADDR SrcAddr;
    PXE_MAC_ADDR DestAddr;

    // Address of first byte of media header. The first byte of
    // packet data follows the last byte of the media header.
    PXE_UINT64 MediaHeader;

    // Length of packet data in bytes (not including the media
    // header).
    PXE_UINT32 PacketLen;
}
```
// Protocol type. This will be copied into the media header
// without doing byte swapping. Protocol type numbers can be
// obtained from the Assigned Numbers RFC 3232.
PXU16 Protocol;

// Length of the media header in bytes.
PXE_UINT16 MediaHeaderLen;
}

#pragma pack()
#define PXE_PROTOCOL_ETHERNET_IP 0x0800
#define PXE_PROTOCOL_ETHERNET_ARP 0x0806

E.4.17.5 Fragmented Frame
#pragma pack(1)
typedef struct s_pxe_cpb_fill_header_fragmented {

    // Source and destination MAC addresses. These will be copied
    // into the media header without doing byte swapping.
    PXE_MAC_ADDR SrcAddr;
PXE_MAC_ADDR DestAddr;

    // Length of packet data in bytes (not including the media
    // header).
    PXE_UINT32 PacketLen;

    // Protocol type. This will be copied into the media header
    // without doing byte swapping. Protocol type numbers can be
    // obtained from the Assigned Numbers RFC 3232.
    PXE_MEDIA_PROTOCOL Protocol;

    // Length of the media header in bytes.
PXE_UINT16 MediaHeaderLen;

    // Number of packet fragment descriptors.
PXE_UINT16 FragCnt;

    // Reserved, must be set to zero.
PXE_UINT16 reserved;

    // Array of packet fragment descriptors. The first byte of the
    // media header is the first byte of the first fragment.
    struct {

        // Address of this packet fragment.
        PXE_UINT64 FragAddr;

```
E.4.17.6 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the `CDB.StatFlags` field. Until these bits change to report `PXE_STATFLAGS_COMMAND_COMPLETE` or `PXE_STATFLAGS_COMMAND_FAILED`, the command has not been executed by the UNDI.

<table>
<thead>
<tr>
<th>StatFlags</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMAND_COMPLETE</td>
<td>Command completed successfully. Frame is ready to transmit.</td>
</tr>
<tr>
<td>COMMAND_QUEUED</td>
<td>Command has been queued.</td>
</tr>
<tr>
<td>INITIALIZE</td>
<td>Command has been not executed or queued.</td>
</tr>
</tbody>
</table>

E.4.17.7 Checking Command Execution Results

After command execution completes, either successfully or not, the `CDB.StatCode` field contains the result of the command execution.

<table>
<thead>
<tr>
<th>StatCode</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUCCESS</td>
<td>Command completed successfully. Frame is ready to transmit.</td>
</tr>
<tr>
<td>INVALID_CDB</td>
<td>One of the CDB fields was not set correctly.</td>
</tr>
<tr>
<td>INVALID_CPB</td>
<td>One of the CPB fields was not set correctly.</td>
</tr>
<tr>
<td>BUSY</td>
<td>UNDI is already processing commands. Try again later.</td>
</tr>
<tr>
<td>QUEUE_FULL</td>
<td>Command queue is full. Try again later.</td>
</tr>
<tr>
<td>NOT_STARTED</td>
<td>The UNDI is not started.</td>
</tr>
<tr>
<td>NOT_INITIALIZED</td>
<td>The UNDI is not initialized.</td>
</tr>
</tbody>
</table>
E.4.18 Transmit

The Transmit command is used to place a packet into the transmit queue. The data buffers given to this command are to be considered locked and the application or universal network driver loses the ownership of those buffers and must not free or relocate them until the ownership returns.

When the packets are transmitted, a transmit complete interrupt is generated (if interrupts are disabled, the transmit interrupt status is still set and can be checked using the Get Status command).

Some UNDI implementations and network adapters support transmitting multiple packets with one transmit command. If this feature is supported, multiple transmit CPBs can be linked in one transmit command.

Though all UNDIs support fragmented frames, the same cannot be said for all network devices or protocols. If a fragmented frame CPB is given to UNDI and the network device does not support fragmented frames (see PXE.Implementation flags), the UNDI will have to copy the fragments into a local buffer before transmitting.

E.4.18.1 Issuing the Command

To issue a Transmit command, create a CDB and fill it in as shown in the table below:

<table>
<thead>
<tr>
<th>CDB Field</th>
<th>How to initialize the CDB structure for a Transmit command</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpCode</td>
<td>PXE_OPCODE_TRANSMIT</td>
</tr>
<tr>
<td>OpFlags</td>
<td>Set as needed.</td>
</tr>
<tr>
<td>CPBsize</td>
<td>sizeof(PXE_CPB_TRANSMIT)</td>
</tr>
<tr>
<td>DBsize</td>
<td>PXE_DBSIZE_NOT_USED</td>
</tr>
<tr>
<td>CPBaddr</td>
<td>Address of a PXE_CPB_TRANSMIT structure.</td>
</tr>
<tr>
<td>DBaddr</td>
<td>PXE_DBADDR_NOT_USED</td>
</tr>
<tr>
<td>StatCode</td>
<td>PXE_STATCODE_INITIALIZE</td>
</tr>
<tr>
<td>StatFlags</td>
<td>PXE_STATFLAGS_INITIALIZE</td>
</tr>
<tr>
<td>IFnum</td>
<td>A valid interface number from zero to (!PXE.IFcnt</td>
</tr>
<tr>
<td>Control</td>
<td>Set as needed.</td>
</tr>
</tbody>
</table>
E.4.18.2 OpFlags

Check the !PXE.Implementation flags to see if the network device support fragmented packets. Select one of the OpFlags below so the UNDI knows what type of CPB is being used.

- PXE_OPFLAGS_TRANSMIT_WHOLE
- PXE_OPFLAGS_TRANSMIT_FRAGMENTED

In addition to selecting whether or not fragmented packets are being given, S/W UNDI needs to know if it should block until the packets are transmitted. H/W UNDI cannot block, these two OpFlag settings have no affect when used with H/W UNDI.

- PXE_OPFLAGS_TRANSMIT_BLOCK
- PXE_OPFLAGS_TRANSMIT_DONT_BLOCK

E.4.18.3 Preparing the CPB

If multiple frames per command are supported (see !PXE.Implementation flags), multiple CPBs can be packed together. The CDB.CPBsize field lets the UNDI know how many frames are to be transmitted.

E.4.18.4 Nonfragmented Frame

```c
#pragma pack(1)
typedef struct s_pxe_cpb_transmit {
    // Address of first byte of frame buffer. This is also the first byte of the media header. This address must be a processor-based address for S/W UNDI and a device-based address for H/W UNDI.
PXE_UINT64 FrameAddr;

    // Length of the data portion of the frame buffer in bytes. Do not include the length of the media header.
PXE_UINT32 DataLen;

    // Length of the media header in bytes.
PXE_UINT16 MediaheaderLen;

    // Reserved, must be zero.
PXE_UINT16 reserved;
} PXE_CPB_TRANSMIT;
#pragma pack()
```

E.4.18.5 Fragmented Frame

```c
#pragma pack(1)
typedef struct s_pxe_cpb_transmit_fragments {
    // Length of packet data in bytes (not including the media header).
PXE_UINT32 FrameLen;
```
// Length of the media header in bytes.
PXE_UINT16 MediaheaderLen;

// Number of packet fragment descriptors.
PXE_UINT16 FragCnt;

// Array of frame fragment descriptors. The first byte of the
// first fragment is also the first byte of the media header.
struct {
// Address of this frame fragment. This address must be a
// processor-based address for S/W UNDI and a device-based
// address for H/W UNDI.
  PXE_UINT64 FragAddr;

  // Length of this frame fragment.
  PXE_UINT32 FragLen;

  // Reserved, must be set to zero.
  PXE_UINT32 reserved;
} FragDesc[n];
} PXE_CPB_TRANSMIT_FRAGMENTS;
#pragma pack()

E.4.18.6 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the CDB.StatFlags field. Until these bits change to report
PXE_STATFLAGS_COMMAND_COMPLETE or PXE_STATFLAGS_COMMAND_FAILED, the command has not
been executed by the UNDI.

<table>
<thead>
<tr>
<th>StatFlags</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMAND_COMPLETE</td>
<td>Command completed successfully. Use the Get Status command to see when frame buffers can be reused.</td>
</tr>
<tr>
<td>COMMAND_QUEUED</td>
<td>Command has been queued.</td>
</tr>
<tr>
<td>INITIALIZE</td>
<td>Command has been not executed or queued.</td>
</tr>
</tbody>
</table>
E.4.18.7 Checking Command Execution Results

After command execution completes, either successfully or not, the CDB.StatCode field contains the result of the command execution.

<table>
<thead>
<tr>
<th>StatCode</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUCCESS</td>
<td>Command completed successfully. Use the Get Status command to see when frame buffers can be reused.</td>
</tr>
<tr>
<td>INVALID_CDB</td>
<td>One of the CDB fields was not set correctly.</td>
</tr>
<tr>
<td>INVALID_CPB</td>
<td>One of the CPB fields was not set correctly.</td>
</tr>
<tr>
<td>BUSY</td>
<td>UNDI is already processing commands. Try again later.</td>
</tr>
<tr>
<td>QUEUE_FULL</td>
<td>Command queue is full. Wait for queued commands to complete. Try again later.</td>
</tr>
<tr>
<td>BUFFER_FULL</td>
<td>Transmit buffer is full. Call Get Status command to empty buffer.</td>
</tr>
<tr>
<td>NOT_STARTED</td>
<td>The UNDI is not started.</td>
</tr>
<tr>
<td>NOT_INITIALIZED</td>
<td>The UNDI is not initialized.</td>
</tr>
</tbody>
</table>

E.4.19 Receive

When the network adapter has received a frame, this command is used to copy the frame into driver/application storage. Once a frame has been copied, it is removed from the receive queue.

E.4.19.1 Issuing the Command

To issue a Receive command, create a CDB and fill it in as shown in the table below:

<table>
<thead>
<tr>
<th>CDB Field</th>
<th>How to initialize the CDB structure for a Receive command</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpCode</td>
<td>PXE_OPCODE_RECEIVE</td>
</tr>
<tr>
<td>OpFlags</td>
<td>Set as needed.</td>
</tr>
<tr>
<td>CPBsize</td>
<td>sizeof(PXE_CPB_RECEIVE)</td>
</tr>
<tr>
<td>DBsize</td>
<td>sizeof(PXE_DB_RECEIVE)</td>
</tr>
<tr>
<td>CPBaddr</td>
<td>Address of a PXE_CPB_RECEIVE structure.</td>
</tr>
<tr>
<td>DBaddr</td>
<td>Address of a PXE_DB_RECEIVE structure.</td>
</tr>
<tr>
<td>StatCode</td>
<td>PXE_STATCODE_INITIALIZE</td>
</tr>
<tr>
<td>StatFlags</td>
<td>PXE_STATFLAGS_INITIALIZE</td>
</tr>
<tr>
<td>Ifnum</td>
<td>A valid interface number from zero to (!PXE.IFcnt</td>
</tr>
<tr>
<td>Control</td>
<td>Set as needed.</td>
</tr>
</tbody>
</table>

E.4.19.2 Preparing the CPB

If multiple frames per command are supported (see !PXE.Implementation flags), multiple CPBs can be packed together. For each complete received frame, a receive buffer large enough to contain the entire unfragmented frame needs to be described in the CPB. Note that if a smaller than required buffer is provided, only a portion of the packet is received into the buffer, and the remainder of the packet is...
lost. Subsequent attempts to receive the same packet with a corrected (larger) buffer will be unsuccessful, because the packet will have been flushed from the queue.

```c
#pragma pack(1)
typedef struct s_pxe_cpb_receive {
    // Address of first byte of receive buffer. This is also the first byte of the frame header. This address must be a processor-based address for S/W UNDI and a device-based address for H/W UNDI.
    PXE_UINT64 BufferAddr;

    // Length of receive buffer. This must be large enough to hold the received frame (media header + data). If the length of smaller than the received frame, data will be lost.
    PXE_UINT32 BufferLen;

    // Reserved, must be set to zero.
    PXE_UINT32 reserved;
} PXE_CPB_RECEIVE;
#pragma pack()
```

### E.4.19.3 Waiting for the Command to Execute

E.4.19.3 Waiting for the Command to Execute

Monitor the upper two bits (14 & 15) in the `CDB.StatFlags` field. Until these bits change to report `PXE_STATFLAGS_COMMAND_COMPLETE` or `PXE_STATFLAGS_COMMAND_FAILED`, the command has not been executed by the UNDI.

<table>
<thead>
<tr>
<th>StatFlags</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMAND_COMPLETE</td>
<td>Command completed successfully. Frames received and DB is written.</td>
</tr>
<tr>
<td>COMMAND_QUEUED</td>
<td>Command has been queued.</td>
</tr>
<tr>
<td>INITIALIZE</td>
<td>Command has been not executed or queued.</td>
</tr>
</tbody>
</table>
E.4.19.4 Checking Command Execution Results

After command execution completes, either successfully or not, the CDB.StatCode field contains the result of the command execution.

<table>
<thead>
<tr>
<th>StatCode</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUCCESS</td>
<td>Command completed successfully. Frames received and DB is written.</td>
</tr>
<tr>
<td>INVALID_CDB</td>
<td>One of the CDB fields was not set correctly.</td>
</tr>
<tr>
<td>INVALID_CPB</td>
<td>One of the CPB fields was not set correctly.</td>
</tr>
<tr>
<td>BUSY</td>
<td>UNDI is already processing commands. Try again later.</td>
</tr>
<tr>
<td>QUEUE_FULL</td>
<td>Command queue is full. Wait for queued commands to complete. Try again</td>
</tr>
<tr>
<td>NO_DATA</td>
<td>Receive buffers are empty.</td>
</tr>
<tr>
<td>NOT_STARTED</td>
<td>The UNDI is not started.</td>
</tr>
<tr>
<td>NOT_INITIALIZED</td>
<td>The UNDI is not initialized.</td>
</tr>
</tbody>
</table>

E.4.19.5 Using the DB

If multiple frames per command are supported (see `!PXE.Implementation` flags), multiple DBs can be packed together.

```c
#pragma pack(1)
typedef struct s_pxe_db_receive {
    // Source and destination MAC addresses from media header.
    PXE_MAC_ADDR SrcAddr;
    PXE_MAC_ADDR DestAddr;

    // Length of received frame. May be larger than receive buffer
    // size. The receive buffer will not be overwritten. This is
    // how to tell if data was lost because the receive buffer was
    // too small.
    PXE_UINT32 FrameLen;

    // Protocol type from media header.
    PXE_PROTOCOL Protocol;

    // Length of media header in received frame.
    PXE_UINT16 MediaHeaderLen;

    // Type of receive frame.
    PXE_FRAME_TYPE Type;

    // Reserved, must be zero.
    PXE_UINT8 reserved[7];
} PXE_DB_RECEIVE;
#pragma pack()
```
E.4.20 PXE 2.1 specification wire protocol clarifications

The Preboot Execution Environment (PXE) Version 2.1 specification was published in September 1999. Since then, this specification has not been maintained or updated for a new version. For adapting the IPv6 stack, the definition of an IPv6-based PXE process has been described in UEFI specification since version 2.2. Other clarifications for the IPv4-based PXE process defined in the PXE 2.1 specification are provided in this section.

E.4.20.1 Issue #1-time-outs

Where the PXE 2.1 specification reads:

DHCP Discover will be retried four times. The four timeouts are 4, 8, 16 and 32 seconds respectively.

If a DHCPOFFER is received without an Option #60 tag "PXEClient", DHCP Discover will be retried on the 4-and 8-second timeouts in an attempt to receive a PXE response.

Because of spanning tree algorithms in routers, the behavior should be as follows:

DHCP Discover will be retried four times. The four timeouts are 4, 8, 16 and 32 seconds respectively.

This process could be iterated three times.

If a DHCPOFFER is received without an Option #60 tag "PXEClient", DHCP Discover will be retried on the 4-and 8-second timeouts in an attempt to receive a PXE response.

E.4.20.2 Issue #2 - siaddr/option 54 precedence

Where the PXE 2.1 specification reads:

Boot server IP address (Read from the DHCP option 54 (server identifier), if not found, use the siaddr field.)

The behavior should be reversed, namely:

Ascertain the Boot server IP address from siaddr field. If not found, use the value in the DHCP option 54 (server identifier).

E.4.20.3 Issue #3 - PXE Vendor Options Existence

The PXE 2.1 specification is ambiguous about whether the following PXE Vendor Options need to be provided in DHCP messages. These options are marked as “Required” in Table 2-1 “PXE DHCP Options (Full List)”, but other parts of the specification state that these options may not be supplied in certain condition.

This section clarifies the existence of these PXE Vendor Options:

1. PXE_DISCOVERY_CONTROL (Tag 6)
   Where the PXE 2.1 specification reads:
   - Required, Note #3
   - If this tag is not supplied all bits assumed to be 0.
The behavior should be clarified as:
-This tag is not mandatory required. If not supplied, all bits are assumed to be 0.

2. **PXE_BOOT_SERVERS (Tag 8)**
Where the PXE 2.1 specification reads:
-Required for PXE client. Note #3
  -PXE_DISCOVERY_CONTROL (Tag 6), bit 2 = If set, only use/accept servers in PXE_BOOT_SERVERS.

The behavior should be clarified as:
-This tag is required only if bit 2 of PXE_DISCOVERY_CONTROL (Tag 6) is set.

3. **PXE_BOOT_MENU (Tag 9)**
Where the PXE 2.1 specification reads:
-Required, Note #4
  -Note #4: These options define the information, if any, displayed by the client during a network boot.

The behavior should be clarified as:
-This tag is required only if the PXE client wants to display boot menu information during a network boot.

4. **PXE_CREDENTIAL_TYPES (Tag 12)**
Where the PXE 2.1 specification reads:
-Required for security. Note #5
  -This option is required for security requests and acknowledges between the client and the server.

The behavior should be clarified as:
-This tag is not required if PXE client does not apply security requests.

5. **PXE_BOOT_ITEM (Tag 71)**
Where the PXE 2.1 specification reads:
-Required. Note #6
  -If this tag is missing, type 0 and layer 0 is assumed.

The behavior should be clarified as:
-This tag is not mandatory required. If not supplied, type 0 and layer 0 is assumed.

6. **Vendor Options (Tag 43)**
The PXE 2.1 specification is not clear whether this option is required.

The behavior should be clarified as:
-Vendor Options (Tag 43) is required only if encapsulated PXE options need be supplied.
Appendix F - Using the Simple Pointer Protocol

The Simple Pointer Protocol is intended to provide a simple mechanism for an application to interact with the user with some type of pointer device. To keep this interface simple, many of the custom controls that are typically present in an OS-present environment were left out. This includes the ability to adjust the double-click speed and the ability to adjust the pointer speed. Instead, the recommendations for how the Simple Pointer Protocol should be used are listed here.

X-Axis Movement:
If the Simple Pointer Protocol is being used to move a pointer or cursor around on an output display, the movement along the x-axis should move the pointer or cursor horizontally.

Y-Axis Movement:
If the Simple Pointer Protocol is being used to move a pointer or cursor around on an output display, the movement along the y-axis should move the pointer or cursor vertically.

Z-Axis Movement:
If the Simple Pointer Protocol is being used to move a pointer or cursor around on an output display, and the application that is using the Simple Pointer Protocol supports scrolling, then the movement along the z-axis should scroll the output display.

Double Click Speed:
If two clicks of the same button on a pointer occur in less than 0.5 seconds, then a double-click event has occurred. If a the same button is pressed with more than 0.5 seconds between clicks, then this is interpreted as two single-click events.

Pointer Speed:
The Simple Pointer Protocol returns the movement of the pointer device along an axis in counts. The Simple Pointer Protocol also contains a set of resolution fields that define the number of counts that will be received for each millimeter of movement of the pointer device along an axis. From these two values, the consumer of this protocol can determine the distance the pointer device has been moved in millimeters along an axis. For most applications, movement of a pointer device will result in the movement of a pointer on the screen. For each millimeter of motion by the pointer device in the x-axis, the pointer on the screen will be moved 2 percent of the screen width. For each millimeter of motion by the pointer device in the y-axis, the pointer on the screen will be moved 2 percent of the screen height.
Appendix G - Using the EFI Extended SCSI Pass Thru Protocol

This appendix describes how an EFI utility might gain access to the EFI SCSI Pass Thru interfaces. The basic concept is to use the EFI_BOOT_SERVICES.LocateHandle() boot service to retrieve the list of handles that support the EFI_EXT_SCSI_PASS_THRU_PROTOCOL. Each of these handles represents a different SCSI channel present in the system. Each of these handles can then be used to retrieve the EFI_EXT_SCSI_PASS_THRU_PROTOCOL interface with the EFI_BOOT_SERVICES.HandleProtocol() boot service. The EFI_EXT_SCSI_PASS_THRU_PROTOCOL interface provides the services required to access any of the SCSI devices attached to a SCSI channel. The services of the EFI_EXT_SCSI_PASS_THRU_PROTOCOL are then to loop through the Target IDs of all the SCSI devices on the SCSI channel.

```
#include "efi.h"
#include "efilib.h"

#include EFI_PROTOCOL_DEFINITION(ExtScsiPassThru)

EFI_GUID gEfiExtScsiPassThruProtocolGuid = 
  EFI_EXT_SCSI_PASS_THRU_PROTOCOL_GUID;

EFI_STATUS
UtilityEntryPoint(
  EFI_HANDLE     ImageHandle,
  EFI_SYSTEM_TABLE  SystemTable
)
{
  EFI_STATUS   Status;
  UINTN        NoHandles;
  EFI_HANDLE   *HandleBuffer;
  UINTN        Index;
  EFI_EXT_SCSI_PASS_THRU_PROTOCOL *ExtScsiPassThruProtocol;

  // Initialize EFI Library
  //
  InitializeLib (ImageHandle, SystemTable);

  // Get list of handles that support the
  // EFI_EXT_SCSI_PASS_THRU_PROTOCOL
  //
  NoHandles = 0;
  HandleBuffer = NULL;
  Status = LibLocateHandle(
    ByProtocol,
    &gEfiExtScsiPassThruProtocolGuid,
    NULL,
    &NoHandles,
    &HandleBuffer,
  );
```
if (EFI_ERROR(Status)) {
    BS->Exit(ImageHandle, EFI_SUCCESS, 0, NULL);
}

// Loop through all the handles that support // EFI_EXT_SCSI_PASS_THRU //
for (Index = 0; Index < NoHandles; Index++) {

    // Get the EFI_EXT_SCSI_PASS_THRU_PROTOCOL Interface // on each handle //
    BS->HandleProtocol(
        HandleBuffer[Index],
        &gEfiExtScsiPassThruProtocolGuid,
        (VOID **)&ExtScsiPassThruProtocol
    );

    if (!EFI_ERROR(Status)) {

Appendix H - Compression Source Code

/*++

Copyright (c) 2001–2002 Intel Corporation

Module Name:

Compress.c

Abstract:

Compression routine. The compression algorithm is a mixture of LZ77 and Huffman Coding. LZ77 transforms the source data into a sequence of Original Characters and Pointers to repeated strings. This sequence is further divided into Blocks and Huffman codings are applied to each Block.

Revision History:

Appendix J - EFI Byte Code Virtual Machine Opcode List

The following table lists the opcodes for EBC instructions. Note that opcodes only require 6 bits of the opcode byte of EBC instructions. The other two bits are used for other encodings that are dependent on the particular instruction.

Appendix K - Alphabetic Function Lists

This appendix was redacted in version 2.6.
Appendix L - EFI 1.10 Protocol Changes and Deprecation List

L.1 Protocol and GUID Name Changes from EFI 1.10

This appendix lists the Protocol, GUID, and revision identifier name changes and the deprecated protocols compared to the EFI Specification 1.10. The protocols listed are not Runtime, Reentrant or MP Safe. Protocols are listed by EFI 1.10 name.

For protocols in the table whose TPL is not <= TPL_NOTIFY:

This function must be called at a TPL level less then or equal to %%%%. %%% is TPL_CALLBACK or TPL_APPLICATION. The <= is done via text.

---

UEFI Forum, Inc.  March 2021
L.2 Deprecated Protocols

**Device I/O Protocol** – The support of the Device I/O Protocol (see EFI 1.1 Chapter 18) has been replaced by the use of the **PCI Root Bridge I/O** protocols which are described in **Section 14.2** of the UEFI Specification. Note: certain “legacy” EFI applications such as some of the ones that reside in the EFI Toolkit assume the presence of Device I/O.

**UGA I/O + UGA Draw Protocol** – The support of the UGA * Protocols (see EFI 1.1 Section 10.7) have been replaced by the use of the **EFI Graphics Output Protocol** described in **Section 12** of the UEFI Specification.

**USB Host Controller Protocol** (version that existed for EFI 1.1) – The support of the USB Host Controller Protocol (see EFI 1.1 Section 14.1) has been replaced by the use of a UEFI instance that covers both USB 1.1 and USB 2.0 support, and is described in **Section 17** of the UEFI Specification. It replaces the pre-existing protocol definition.

**SCSI Passthru Protocol** – The support of the SCSI Passthru Protocol (see EFI 1.1 Section 13.1) has been replaced by the use of the **Extended SCSI Passthru Protocol** which is described in Chapter **Section 15.7** of the UEFI Specification.

**BIS Protocol** – Remains as an optional protocol.

**Driver Configuration Protocol** - the **EFI_DRIVER_CONFIGURATION_PROTOCOL** has been removed.
Appendix M - Formats — Language Codes and Language Code Arrays

This appendix lists the formats for language codes and language code arrays.

M.1 Specifying individual language codes

The preferred representation of a language code is done via an RFC 4646 language code identifier*.

Table M-1 Alias codes supported in addition to RFC 4646

<table>
<thead>
<tr>
<th>RFC string</th>
<th>Supported Alias String</th>
</tr>
</thead>
<tbody>
<tr>
<td>zh-Hans</td>
<td>zh-chs</td>
</tr>
<tr>
<td>zh-Hant</td>
<td>zh-cht</td>
</tr>
</tbody>
</table>

An RFC 4646 language code is represented as a null-terminated ASCII string.

An RFC 4646 language string must be constructed according to the tag creation rules in section 2.3 of RFC 4646. For example, when constructing the primary language tag for a locale identifier, if a 2 character ISO 639-1 language code exists along with a 3 character ISO 639-2 language code, then the ISO 639-1 language code must be used. Further, if an ISO 639-1 tag does not exist, then the ISO 639-2/T (Terminology) tag must be for the primary locale before an ISO 639-2/B (Bibliographic) tag may be used. See RFC 4646 for a complete discussion of this topic.

To provide backwards compatibility with preexisting EFI 1.10 drivers, a UEFI platforms may support deprecated protocols which represent languages in the ISO 639-2 format. This includes the following protocols: `UNICODE_COLLATION_INTERFACE`, `EFI_DRIVER_CONFIGURATION_PROTOCOL`, `EFI_DRIVER_DIAGNOSTICS_PROTOCOL`, and `EFI_COMPONENT_NAME_PROTOCOL`. The deprecated `LangCodes` and `Lang` global variables may also be supported by a platform for backwards compatibility.

M.1.1 Specifying language code arrays:

Native RFC 4646 format array:

An array of RFC 4646 character codes is represented as a NULL terminated char8 array of RFC 4646 language code strings. Each of these strings is delimited by a semicolon (";") character. For example, an array of US English and Traditional Chinese would be represented as the NULL-terminated string “en-us;zh-Hant”.
Appendix N - Common Platform Error Record

N.1 Introduction
This appendix describes the common platform error record format for representing platform hardware errors.

N.2 Format
The general format of the common platform error record is illustrated in Figure N-1. The record consists of a header; followed by one or more section descriptors; and for each descriptor, an associated section which may contain either error or informational data.

N.2.1 Record Header
The record header includes information which uniquely identifies a hardware error record on a given system. The contents of the record header are described in Table N-1. The header is immediately followed by an array of one or more section descriptors. Sections may be either error sections, which contain error information retrieved from hardware, or they may be informational sections, which contain contextual information relevant to the error. An error record must contain at least one section.
## Table N-1 Error record header

<table>
<thead>
<tr>
<th>Mnemonic</th>
<th>Byte Offset</th>
<th>Byte Length</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Signature Start</td>
<td>0</td>
<td>4</td>
<td>ASCII 4-character array &quot;CPER&quot; (0x43,0x50,0x45,0x52). Identifies this structure as a hardware error record.</td>
</tr>
<tr>
<td>Revision</td>
<td>4</td>
<td>2</td>
<td>This is a 2-byte field representing a major and minor version number for the error record definition in BCD format. The interpretation of the major and minor version number is as follows:   · Byte 0 – Minor (01): An increase in this revision indicates that changes to the headers and sections are backward compatible with software that use earlier revisions. Addition of new GUID types, errata fixes or clarifications are covered by a bump up. · Byte 1 – Major (01): An increase in this revision indicates that the changes are not backward compatible from a software perspective.</td>
</tr>
<tr>
<td>Signature End</td>
<td>6</td>
<td>4</td>
<td>Must be 0xFFFFFFFF</td>
</tr>
<tr>
<td>Section Count</td>
<td>10</td>
<td>2</td>
<td>This field indicates the number of valid sections associated with the record, corresponding to each of the following section descriptors.</td>
</tr>
<tr>
<td>Error Severity</td>
<td>12</td>
<td>4</td>
<td>Indicates the severity of the error condition. The severity of the error record corresponds to the most severe error section.   · 0 - Recoverable (also called non-fatal uncorrected)   · 1 - Fatal   · 2 - Corrected   · 3 - Informational   · All other values are reserved. Note that severity of &quot;Informational&quot; indicates that the record could be safely ignored by error handling software.</td>
</tr>
<tr>
<td>Validation Bits</td>
<td>16</td>
<td>4</td>
<td>This field indicates the validity of the following fields:   · Bit 0 – If 1, the PlatformID field contains valid information   · Bit 1 – If 1, the TimeStamp field contains valid information   · Bit2 – If 1, the PartitionID field contains valid information   · Bits 3-31: Reserved, must be zero.</td>
</tr>
<tr>
<td>Record Length</td>
<td>20</td>
<td>4</td>
<td>Indicates the size of the actual error record, including the size of the record header, all section descriptors, and section bodies. The size may include extra buffer space to allow for the dynamic addition of error sections descriptors and bodies.</td>
</tr>
</tbody>
</table>
The timestamp correlates to the time when the error information was collected by the system software and may not necessarily represent the time of the error event. The timestamp contains the local time in BCD format.  
- Byte 7 – Byte 0:  
  - Byte 7: Timestamp is precise if this bit is set and correlates to the time of the error event.  
  - Bit 7:1: Reserved  
  - Byte 4: Day  
  - Byte 5: Month  
  - Byte 6: Year  
  - Byte 7: Century

This field uniquely identifies the platform with a GUID. The platform’s SMBIOS UUID should be used to populate this field. Error analysis software may use this value to uniquely identify a platform.

If the platform has multiple software partitions, system software may associate a GUID with the partition on which the error occurred.

This field contains a GUID indicating the creator of the error record. This value may be overwritten by subsequent owners of the record.

Table N-2.Error Record Header Flags

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>HW_ERROR_FLAGS_RECOVERED: Qualifies an error condition as one that has been recovered by system software.</td>
</tr>
<tr>
<td>2</td>
<td>HW_ERROR_FLAGS_PREERR: Qualifies an error condition as one that occurred during a previous session. For instance, if the OS detects an error and determines that the system must be reset; it will save the error record before stopping the system. Upon restarting the OS marks the error record with this flag to know that the error is not live.</td>
</tr>
<tr>
<td>4</td>
<td>HW_ERROR_FLAGS_SIMULATED: Qualifies an error condition as one that was intentionally caused. This allows system software to recognize errors that are injected as a means of validating or testing error handling mechanisms.</td>
</tr>
</tbody>
</table>

**N.2.1.1 Notification Type**

A notification type identifies the mechanism by which an error event is reported to system software. This information helps consumers of error information (e.g. management applications or humans) by identifying the source of the error information. This allows, for instance, all CMC error log entries to be filtered from an error event log.

Listed below are the standard notification types. Each standard notification type is identified by a GUID. For error notification types that do not conform to one of the standard types, a platform-specific GUID may be defined to identify the notification type.

- **Machine Check Exception (MCE):** {0xE8F56FFE, 0x919C, 0x4cc5, {0xBA, 0x88, 0x65, 0xAB, 0xE1, 0x49, 0x13, 0xBB}}
  A Machine Check Exception is a processor-generated exception class interrupt used to system software of the presence of a fatal or recoverable error condition.
- **Corrected Machine Check (CMC):** {0x2DCE8BB1, 0xBDD7, 0x450e, {0xB9, 0xAD, 0x9C, 0xF4,0xEB, 0xD4, 0xF8, 0x90}}
  Corrected Machine Checks identify error conditions that have been corrected by hardware or system firmware. CMCs are reported by the processor and may be reported via interrupt or by polling error status registers.
• Corrected Platform Error (CPE): {0x4E292F96, 0xD843, 0x4a55, {0xA8, 0xC2, 0xD4, 0x81, 0xF2, 0x7E, 0xBE, 0xEE}}
Corrected Platform Errors identify corrected errors from the platform (i.e., external memory controller, system bus, etc.). CPEs can be reported via interrupt or by polling error status registers.

• Non-Maskable Interrupt (NMI): {0x5BAD89FF, 0xB7E6, 0x42c9, {0x81, 0x4A, 0xCF, 0x24, 0x85, 0xD6, 0xE9, 0x8A}}
Non-Maskable Interrupts are used on X64 platforms to report fatal or recoverable platform error conditions. NMIs are reported via interrupt vector 2 on IA32 and X64 processor architecture platforms.

• PCI Express Error (Pcie): {0xCF93C01F, 0x1A16, 0xdfc, {0xB8, 0xBC, 0x9C, 0x4D, 0xAF, 0x67, 0xC1, 0x04}}
See the PCI Express standard v1.1 for details regarding PCI Express Error Reporting. This notification type identifies errors that were reported to the system via an interrupt on a PCI Express root port.

• INIT Record (INIT): {0xCC5263E8, 0x9308, 0x454a, {0x89, 0xD0, 0x34, 0x0B, 0xD3, 0x9B, 0xC9, 0x8E}}
IPF Platforms optionally implement a mechanism (switch or button on the chassis) by which an operator may reset a system and have the system generate an INIT error record. This error record is documented in the IPF SAL specification. System software retrieves an INIT error record by querying the SAL for existing INIT records.

• BOOT Error Record (BOOT): {0x3D61A466, 0xAB40, 0x409a, {0xA6, 0x98, 0xF3, 0x62, 0xD4, 0x64, 0xB3, 0x8F}}
The BOOT Notification Type represents error conditions which are unhandled by system software and which result in a system shutdown/reset. System software retrieves a BOOT error record during boot by querying the platform for existing BOOT records. As an example, consider an x64 platform which implements a service processor. In some scenarios, the service processor may detect that the system is either hung or is in such a state that it cannot safely proceed without risking data corruption. In such a scenario the service processor may record some minimal error information in its system event log (SEL) and unilaterally reset the machine without notifying the OS or other system software. In such scenarios, system software is unaware of the condition that caused the system reset. A BOOT error record would contain information that describes the error condition that led to the reset so system software can log the information and use it for health monitoring.

• DMA Remapping Error (DMAr): {0x667DD791, 0xC6B3, 0x4c27, {0x8A, 0x6B, 0xOF, 0x8E, 0x72, 0x2D, 0xEB, 0x41}}
The DMA Remapping Notification Type identifies fault conditions generated by the DMAr unit when processing un-translated, translation and translated DMA requests. The fault conditions are reported to the system using a message signaled interrupt.

• Synchronous External Abort (SEA): {0x9A78788A, 0xBBE8, 0x11E4, {0x80, 0x9E, 0x67, 0x61, 0x1E, 0x5D, 0x46, 0x80}}
Synchronous External Aborts represent precise processor error conditions on ARM systems (uncorrectable and/or recoverable) as described in D3.5 of the ARMv8 ARM reference manual. This notification may be triggered by one of the following scenarios: cache parity error, cache ECC error, external bus error, micro-architectural error, data poisoning, and other platform errors.
• SError Interrupt (SEI): {0x5C284C81, 0xB0AE, 0x4E87, {0xA3, 0x22, 0xB0, 0x4C, 0x85, 0x62, 0x43, 0x23}}
  SError Interrupts represent asynchronous **imprecise** (or possibly precise) processor error conditions on ARM systems (corrected, uncorrectable, and recoverable) as described in D3.5 of the ARM ARM reference manual. This notification may be triggered by one of the following scenarios: cache parity error, cache ECC error, external bus error, micro-architectural error, data poisoning, and other platform errors.

• Platform Error Interrupt (PEI): {0x09A9D5AC, 0x5204, 0x4214, {0x96, 0xE5, 0x94, 0x99, 0x2E, 0x75, 0x2B, 0xCD}}
  Platform Error Interrupt represent asynchronous **imprecise** platform error conditions on ARM systems that may be triggered by the following scenarios: system memory ECC error, ECC errors in system cache (e.g. shared high-level caches), vendor specific chip errors, external platform errors.

• Compute Express Link (CXL) Component: {0x69293BC9, 0x41DF, 0x49A3 {0xB4, 0xBD, 0x4F, 0xB0, 0xDB, 0x30, 0x41, 0xF6}}
  This Notification Type identifies errors that were reported to the system by CXL components that support error reporting via the CXL RAS Mailbox interface. See the CXL Specification, Rev 2.0 or later, for details regarding CXL Error Reporting.

### N.2.1.2 Error Status

The error status definition provides the capability to abstract information from implementation-specific error registers into generic error codes.

#### Table N-3 Error Status Fields

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>

</tr>
<tr>
<td>17</td>
<td>Control: Error was detected on the control signals or in the control portion of the transaction.</td>
</tr>
<tr>
<td>18</td>
<td>Data: Error was detected on the data signals or in the data portion of the transaction.</td>
</tr>
<tr>
<td>19</td>
<td>Responder: Error was detected by the responder of the transaction.</td>
</tr>
<tr>
<td>20</td>
<td>Requester: Error was detected by the requester of the transaction.</td>
</tr>
<tr>
<td>21</td>
<td>First Error: If multiple errors are logged for a section type, this is the first error in the chronological sequence. Setting of this bit is optional.</td>
</tr>
<tr>
<td>22</td>
<td>Overflow: Additional errors occurred and were not logged due to lack of logging resources.</td>
</tr>
<tr>
<td>63:23</td>
<td>Reserved.</td>
</tr>
</tbody>
</table>

#### Table N-4 Error Types

<table>
<thead>
<tr>
<th>Encoding</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>ERR_INTERNAL Error detected internal to the component.</td>
</tr>
<tr>
<td>16</td>
<td>ERR_BUS Error detected in the bus.</td>
</tr>
</tbody>
</table>

**Detailed Internal Errors**
### Encoding | Description
--- | ---
4 | ERR_MEM Storage error in memory (DRAM).
5 | ERR_TLB Storage error in TLB.
6 | ERR_CACHE Storage error in cache.
7 | ERR_FUNCTION Error in one or more functional units.
8 | ERR_SELFTEST component failed self test.
9 | ERR_FLOW Overflow or undervalue of internal queue.

#### Detailed Bus Errors

17 | ERR_MAP Virtual address not found on IO-TLB or IO-PDIR.
18 | ERR_IMPROPER Improper access error.
19 | ERR_UNIMPL Access to a memory address which is not mapped to any component
20 | ERR_LOL Loss of Lockstep
21 | ERR_RESPONSE Response not associated with a request
22 | ERR_PARITY Bus parity error (must also set the A, C, or D Bits).
23 | ERR_PROTOCOL Detection of a protocol error.
24 | ERR_ERROR Detection of a PATH_ERROR
25 | ERR_TIMEOUT Bus operation timeout.
26 | ERR_POISONED A read was issued to data that has been poisoned.

All Others Reserved.

---

### N.2.2 Section Descriptor

#### Table N-5 Section Descriptor

<table>
<thead>
<tr>
<th>Mnemonic</th>
<th>Byte Offset</th>
<th>Byte Length</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Section Offset</td>
<td>0</td>
<td>4</td>
<td>Offset in bytes of the section body from the base of the record header.</td>
</tr>
<tr>
<td>Section Length</td>
<td>4</td>
<td>4</td>
<td>The length in bytes of the section body.</td>
</tr>
</tbody>
</table>
| Revision | 8 | 2 | This is a 2-byte field representing a major and minor version number for the error record definition in BCD format. The interpretation of the major and minor version number is as follows:  
  · Byte 0 – Minor (00): An increase in this revision indicates that changes to the headers and sections are backward compatible with software that uses earlier revisions. Addition of new GUID types, errata fixes or clarifications are covered by a bump up.  
  · Byte 1 – Major (01): An increase in this revision indicates that the changes are not backward compatible from a software perspective |
Validation Bits

- Bit 0: If 1, the FRUId field contains valid information
- Bit 1: If 1, the FRUString field contains valid information
- Bits 7:2: Reserved, must be zero.

Reserved

Flag field contains information that describes the error section as follows:

- Bit 0: Primary: If set, identifies the section as the section to be associated with the error condition. This allows for FRU determination and for error recovery operations. By identifying a primary section, the consumer of an error record can determine which section to focus on. It is not always possible to identify a primary section so this flag should be taken as a hint.
- Bit 1: Containment Warning: If set, the error was not contained within the processor or memory hierarchy and the error may have propagated to persistent storage or network.
- Bit 2: Reset: If set, the component has been reset and must be re-initialized or re-enabled by the operating system prior to use.
- Bit 3: Error threshold exceeded: If set, OS may choose to discontinue use of this resource.
- Bit 4: Resource not accessible: If set, the resource could not be queried for error information due to conflicts with other system software or resources. Some fields of the section will be invalid.
- Bit 5: Latent error: If set this flag indicates that action has been taken to ensure error containment (such as poisoning data), but the error has not been fully corrected and the data has not been consumed. System software may choose to take further corrective action before the data is consumed.
- Bit 6: Propagated: If set this flag indicates the section is to be associated with an error that has been propagated due to hardware poisoning. This implies the error is a symptom of another error. It is not always possible to ascertain whether this is the case for an error, therefore if the flag is not set, it is unknown whether the error was propagated. This helps determining FRU when dealing with HW failures.
- Bit 7: Overflow: If set this flag indicates the firmware has detected an overflow of buffers/queues that are used to accumulate, collect, or report errors (e.g. the error status control block exposed to the OS). When this occurs, some error records may be lost.

Bit 8 through 31: Reserved.
Section Type 16

This field holds a pre-assigned GUID value indicating that it is a section of a particular error. The different error section types are as defined below:

Processor Generic
- {0x9876CCAD, 0x4784, 0x4b3db, {0x86, 0x5E, 0x16, 0xF1, 0x93, 0xC4, 0xF3, 0xDB}}

Processor Specific
- IA32/X64: {0xDC3EA0B0, 0xA144, 0x4797, {0xB9, 0x5B, 0x53, 0xFA, 0x24, 0x2B, 0x6E, 0x1D}}
- IPF: {0xe429fa1, 0x3cb7, 0x11d4, {0xb, 0xca, 0x7, 0x00, 0x80, 0xc7, 0x3c, 0x88, 0x81}}
- ARM: {0xE19E3D16, 0x8C11, 0x11E4, {0x9C, 0xAA, 0xC2, 0x05, 0x1D, 0x5D, 0x46, 0x80}}

NOTE: In addition to the types listed above, there may exist vendor specific GUIDs that describe vendor specific section types.

Platform Memory
- {0xA5BC1114, 0x6F64, 0x4EDE, {0xB8, 0x63, 0x3E, 0x83, 0xED, 0x7C, 0x83, 0xB1}}

PCIe
- {0xD995E954, 0xBB1C, 0x430F, {0xAD, 0x91, 0xB4, 0x4D, 0xCB, 0x3C, 0x6F, 0x35}}

Firmware Error Record Reference
- {0xB1212A96, 0x09ED, 0x9496, {0x94, 0x71, 0x8D, 0x72, 0x9C, 0x8E, 0x69, 0xED}}

PCI/PCI-X Bus
- {0xC5753963, 0x3B84, 0x4095, {0xBF, 0x78, 0xED, 0xDA, 0xD3, 0x9F, 0xC9, 0xDD}}

PCI Component/Device
- {0xEB5E4685, 0xCA66, 0x4769, {0xB6, 0xA2, 0x26, 0x06, 0x8B, 0x00, 0x13, 0x26}}

DMAr Generic
- {0x5B51FEF7, 0x79D, 0x4434, {0x8F, 0x1B, 0xAA, 0x62, 0x3E, 0xC2, 0x64}}

Intel® VT for Directed I/O specific DMAr section
- {0x71761D37, 0x32B2, 0x45cd, {0xA7, 0xD0, 0xB0, 0xFE, 0xDD, 0x93, 0xEE, 0xCF}}

IOMMU specific DMAr section
- {0x036F84E1, 0x7F37, 0x428c, {0xA7, 0x9E, 0x57, 0x5F, 0xDF, 0xAA, 0x84, 0xEC}}

CXL Component Events
- See Table N-42 CXL Component Events Section

FRU Id 32

GUID representing the FRU ID, if it exists, for the section reporting the error. The default value is zero indicating an invalid FRU ID. System software can use this to uniquely identify a physical device for tracking purposes. Association of a GUID to a physical device is done by the platform in an implementation-specific way (i.e., PCIe Device can lock a GUID to a PCIe Device ID).
N.2.3 Non-standard Section Body

Information that does not conform to one the standard formats (i.e., those defined in sections 2.4 through 2.9 of this document) may be recorded in the error record in a non-standard section. The type (e.g. format) of a non-standard section is identified by the GUID populated in the Section Descriptor’s Section Type field. This allows the information to be decoded by consumers if the format is externally documented. Examples of information that might be placed in a non-standard section include the IPF raw SAL error record, Error information recorded in implementation-specific PCI configuration space, and IPMI error information recorded in an IPMI SEL.

N.2.4 Processor Error Sections

The processor error sections are divided into two different components as described below:

1. Processor Generic Error Section: This section holds information about processor errors in a generic form and will be common across all processor architectures. An example or error information provided is the generic information of cache, tlb, etc., errors.

2. Processor Specific Error Section: This section consists of error information, which is specific to a processor architecture. In addition, certain processor architecture state at the time of error may also be captured in this section. This section is unique to each processor architecture (Itanium Processor Family, IA32/X64, ARM).

N.2.4.1 Generic Processor Error Section

The Generic Processor Error Section describes processor reported hardware errors for logical processors in the system.

Section Type: {0x9876CCAD, 0x47B4, 0x4bdb, {0xB6, 0x5E, 0x16, 0xF1, 0x93, 0xC4, 0xF3, 0xDB}}

</table>
| CPU Version Info | 16         | 8           | This field represents the CPU Version Information and returns Family, Model, and stepping information (e.g. As provided by CPUID instruction with EAX=1 input with output values from EAX on the IA32/X64 processor or as provided by CPUID Register 3 register – Version Information on IA64 processors). On ARM processors, this field will be provided as:  
Bits 127:64 - Reserved and must be zero  
Bits 63:0 - MIDR_EL1 of the processor |
| CPU Brand String | 24         | 128         | This field represents the null-terminated ASCII Processor Brand String (e.g. As provided by the CPUID instruction with EAX=0x80000002 and ECX=0x80000003 for IA32/X64 processors or the return from PAL_BRAND_INFO for IA64 processors). This field is optional for ARM processors. |
| Processor ID  | 152         | 8           | This value uniquely identifies the logical processor (e.g. As programmed into the local APIC ID register on IA32/X64 processors or programmed into the LID register on IA64 processors). On ARM processors, this field will be provided as programmed in the architected MPIDR_EL1. |
| Target Address | 160        | 8           | Identifies the target address associated with the error. |
| Requestor Identifier | 168     | 8           | Identifies the requestor associated with the error. |
| Responder Identifier | 176       | 8           | Identifies the responder associated with the error. |
| Instruction IP | 184         | 8           | Identifies the instruction pointer when the error occurred. |

## N.2.4.2 IA32/X64 Processor Error Section

Type:{0xDC3E0A0B0, 0xA144, 0x4797, {0xB9, 0x5B, 0x53, 0xFA, 0x24, 0x2B, 0x6E, 0x1D}}
**N.2.4.2.1 IA32/X64 Processor Error Information Structure**

As described above, the processor error section contains a collection of structures called Processor Error Information Structures that contain processor structure specific error information. This section details the layout of the Processor Error Information Structure and the detailed check information which is contained within.

### Table N-8 IA32/X64 Processor Error Information Structure

<table>
<thead>
<tr>
<th>Mnemonic</th>
<th>Byte Offset</th>
<th>Byte Length</th>
<th>Description</th>
</tr>
</thead>
</table>
| Error Structure Type      | 0           | 16          | This field holds a pre-assigned GUID indicating the type of Processor Error Information structure. The following Processor Error Information Structure Types have pre-defined GUID.  
  - Cache Error Information (Cache Check)  
  - TLB Error Information (TLB Check)  
  - Bus Error Information (Bus Check)  
  - Micro-architecture Specific Error Information (MS Check) |
### IA32/X64 Cache Check Structure

Type: {0xA55701F5, 0xE3EF, 0x43de, {0xAC, 0x72, 0x24, 0x9B, 0x57, 0x3F, 0xAD, 0x2C}}

#### Table N-9 IA32/X64 Cache Check Structure

<table>

</tbody>
</table>

**Validation Bits**
- Bit 0 – Check Info Valid
- Bit 1 – Target Address Identifier Valid
- Bit 2 – Requestor Identifier Valid
- Bit 3 – Responder Identifier Valid
- Bit 4 – Instruction Pointer Valid
- Bits 5-63 – Reserved

**Check Information**
- StructureErrorType specific error check structure.

**Target Identifier**
- Identifies the target associated with the error.

**Requestor Identifier**
- Identifies the requestor associated with the error.

**Responder Identifier**
- Identifies the responder associated with the error.

**Instruction Pointer**
- Identifies the instruction executing when the error occurred.
IA32/X64 TLB Check Structure
Type:{0xFC06B535, 0x5E1F, 0x4562, {0x9F, 0x25, 0x0A, 0x3B, 0x9A, 0xDB, 0x63, 0xC3}}

N.2.4.3 IA64 Processor Error Section

Refer to the Intel Itanium Processor Family System Abstraction Layer specification for finding the IA64 specific error section body definition.

N.2.4.4 ARM Processor Error Section

Type: {0xE19E3D16, 0xBC11, 0x11E4, {0x9C, 0xAA, 0xC2, 0x05, 0x1D, 0x5D, 0x46, 0xB0}}

The ARM Processor Error Section may contain multiple instances of error information structures associated to a single error event. An error may propagate to other hardware components (e.g. poisoned data) or cause subsequent errors, all of which may be captured in a single ARM processor error section. The processor context information describes the observed state of the processor at the point of error detection.

It is optional for vendors to capture processor context information. The specifics of capturing processor context is vendor specific. Vendors must take care when handling errors that have originated whilst a processor was executing in a secure exception level. In those cases providing processor context information to non-secure agents could be unsafe and lead to security attacks.

Table N-16 ARM Processor Error Section

<table>
<thead>
<tr>

### Error affinity level

<table>
<thead>
<tr>
<th>Mnemonic</th>
<th>Byte Offset</th>
<th>Byte Length</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error affinity level</td>
<td>12</td>
<td>1</td>
<td>For errors that can be attributed to a specific affinity level, this field defines the affinity level at which the error was produced, detected, and/or consumed. This is a value between 0 and 3. All other values (4-255) are reserved. For example, a vendor may choose to define affinity levels as follows: Level 0: errors that can be precisely attributed to a specific CPU (e.g. due to a synchronous external abort) Level 1: Cache parity and/or ECC errors detected at cache of affinity level 1 (e.g. only attributed to higher level cache due to prefetching and/or error propagation) <strong>NOTE:</strong> Detailed meanings and groupings of affinity level are chip and/or platform specific. The affinity level described here must be consistent with the platform definitions used MPIDR. For cache/TLB errors, the cache/TLB level is provided by the cache/TLB error structure, which may differ from affinity level.</td>
</tr>
</tbody>
</table>

### Reserved

<table>

ARM Vendor Specific Micro-Architecture Error Structure

This is a vendor specific structure. Please refer to your hardware vendor documentation for the format of this structure.

N.2.4.4.2 ARM Processor Context Information

As described above, the processor error section contains a collection of structures called Processor Context Information. These provide processor context state specific to the ARM processor architecture. This section details the layout of the Processor Error Context Information Header Structure (Table N-21) and the detailed processor context type information structures (Table N-21 - Table N-30).

Care must be taken when reporting context information structures. The amount of context reported depends on the agent that is going to observe the data. The following are recommended guidelines:

1. If the error happens whilst the processor is in the secure world, EL3, Secure EL1 or secure EL0, context information can contain sensitive data, and should not be exposed to unauthorized parties.

2. If the error information is being provided to a software agent running at EL2, then the context information should only include any registers visible in EL2, e.g. GPR, EL1 and EL2 registers.
3. If the error information is being provided to a software agent running at EL1, then the context information should only include any registers visible in EL1, e.g. GPR, EL1 and registers.

For context information on processor running in AArch64 mode, even though some registers are defined as 4 bytes in length, following tables provide 8 bytes space to account for possible future expansion.

The following structure (Table 275) describes additional AArch64/AArch32 miscellaneous system registers captured from the perspective of the processor that took the hardware error exception. Each register array entry will be per the following table. The number of register entries present in the register array is based on the register array size (i.e. N/10).

N.2.11 DMAr Error Sections

The DMAr error sections are divided into two different components as described below:

**DMAr Generic Error Section:**

This section holds information about DMAr errors in a generic form and will be common across all DMAr unit architectures.

**Architecture specific DMAr Error Section:**

This section consists of DMA remapping errors specific to the architecture. In addition, certain state information of the DMAr unit is captured at the time of error. This section is unique for each DMAr architecture (VT-d, IOMMU).
### N.2.11.1 DMAr Generic Error Section

Type: `{0x5B51FEF7, 0xC79D, 0x4434, {0x8F, 0x1B, 0xAA, 0x62, 0xDE, 0x3E, 0x2C, 0x64}}`

### N.2.14 CXL Component Events Section

Refer to the Events Record Format for CXL components in the CXL Specification, Rev 2.0 or later.

- For the Section Type GUID: Refer to the Event Record Identifier field (Offset 0) of the Events Record Format for each CXL component.
- For the CXL Component Event Log: Refer to the Common Event Record field (Offset 16) of the Events Record Format for each CXL component.

Appendix O - UEFI ACPI Data Table

To prevent ACPI namespace collision, a UEFI ACPI table format is defined. This allows creation of ACPI tables without colliding with tables reserved in the namespace.

Table O-1 UEFI Table Structure

<table>
<thead>
<tr>
<th>Field</th>
<th>Byte Length</th>
<th>Byte Offset</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Signature</td>
<td>4</td>
<td>0</td>
<td>‘UEFI’ (0x55, 0x45, 0x46, 0x49). Signature for UEFI drivers that produce ACPI tables.</td>
</tr>
<tr>
<td>Length</td>
<td>4</td>
<td>4</td>
<td>Length, in bytes, of the entire UEFI Table</td>
</tr>
<tr>
<td>Revision</td>
<td>1</td>
<td>8</td>
<td>1</td>
</tr>
<tr>
<td>Checksum</td>
<td>1</td>
<td>9</td>
<td>Entire table must sum to zero.</td>
</tr>
<tr>
<td>OEMID</td>
<td>6</td>
<td>10</td>
<td>OEM ID.</td>
</tr>
<tr>
<td>OEM Table ID</td>
<td>8</td>
<td>16</td>
<td>For the UEFI Table, the table ID is the manufacture model ID.</td>
</tr>
<tr>
<td>OEM Revision</td>
<td>4</td>
<td>24</td>
<td>OEM revision of UEFI table for supplied OEM Table ID.</td>
</tr>
<tr>
<td>Creator ID</td>
<td>4</td>
<td>28</td>
<td>Vendor ID of utility that created the table.</td>
</tr>
<tr>
<td>Creator Revision</td>
<td>4</td>
<td>32</td>
<td>Revision of utility that created the table.</td>
</tr>
<tr>
<td>Identifier</td>
<td>16</td>
<td>36</td>
<td>This value contains a GUID which identifies the remaining table contents.</td>
</tr>
<tr>
<td>DataOffset</td>
<td>2</td>
<td>52</td>
<td>Specifies the byte offset to the remaining data in the UEFI table.</td>
</tr>
<tr>
<td>Data</td>
<td>X</td>
<td>DataOffset</td>
<td>Contains the rest of the UEFI table contents</td>
</tr>
</tbody>
</table>

The first use of this UEFI ACPI table format is the SMM Communication ACPI Table. This table describes a special software SMI that can be used to initiate inter-mode communication in the OS present environment by non-firmware agents with SMM code.

**Note:** The use of the SMM Communication ACPI table is deprecated in UEFI spec. 2.7. This is due to the lack of a use case for inter-mode communication by non-firmware agents with SMM code and support for initiating this form of communication in common OSes.

Table O-2 SMM Communication ACPI Table.

<table>
<thead>
<tr>

<td>8</td>
<td>2</td>
</tr>
<tr>
<td>Checksum</td>
<td>1</td>
<td>9</td>
<td>Entire table must sum to zero.</td>
</tr>
</tbody>
</table>
Invocation method

There are two methods of invocation provided by this specification:

1. Using invocation register

If the invocation register is non-zero, this then this method takes precedence and the SW SMI number field and DataOffset fields must be ignored. The invocation register entry provides the address of a register that must be written to in order to invoke the SMM service. The caller must write the communication buffer address into the register. This will cause an SMM invocation. Upon return from the SMM service call the value in the register provides a return error codes from the SMM invocation. See PI/SMM Vol 4 version xx.yy `EFI_SMM_COMMUNICATION_PROTOCOL.Communicate` function for valid error codes.

<tr>
<td>Buffer Ptr Address</td>
<td>8</td>
<td>58</td>
<td>Address of the communication buffer pointer. The pointer address (this field) and the pointer value (the actual address of the communication buffer) are 64-bit physical addresses. The creator of this table must initialize pointer value with 0. The communication buffer must begin with the <code>EFI_SMM_COMMUNICATE_HEADER</code> defined in the &quot;Related Definitions&quot; section below. The communication buffer must be physically contiguous.</td>
</tr>
<tr>
<td>Invocation register</td>
<td>12</td>
<td>66</td>
<td>Generic Address Structure (GAS) which provides the address of a register that must be written to with the address of a communication buffer to invoke a management mode service. Using this method of invocation is optional, and if not present this span of the table should be populated with zeros. See ACPI6.0 &quot;Generic Address Structure&quot;</td>
</tr>
</tbody>
</table>
The invocation address field uses generic address structure to specify the register address. GAS allows the address space of the register to be Functional Fixed Hardware (FFH). If this address space is used please refer to CPU architecture specific documentation for ascertaining how the write to the register should be performed. For more details on the GAS format please see the ACPI Specification.

Note that for implementations that support concurrent invocation of SMM from multiple processors, the register provided must be a per processor register. In such implementation, the calling execution context must not migrate from one CPU to another between writing to the register, to make the SMM call, and reading the value of the register, to read the error return code.

2. Using the SW SMI number

This method is specific to x86 CPUs.

In order to initiate inter-mode communication OS present agent has to perform the following tasks:

- Prepare communication data buffer that starts with the **EFI_SMM_COMMUNICATE_HEADER**.
- Check the value of the communication buffer pointer (a value at the address specified by the Buffer Ptr Address field). If the pointer's value is zero, update it with the address of the communication buffer. If the pointer's value is non-zero, another inter-mode communication transaction is in progress, and the current communication attempt has to be postponed or canceled.

**Note:** These steps must be performed as an atomic transaction. For example, on IA-32/x64 platforms this can be done using the CMPXCHG CPU instruction.

- Generate software SMI using value from the SMM Communication ACPI Table. The actual means of generating the software SMI is platform-specific.
- Set communication buffer pointer's value to zero.

**Related Definitions**

typedef struct {
    EFI_GUID HeaderGuid;
    UINTN MessageLength;
    UINT8 Data[ANYSIZE_ARRAY];
} EFI_SMM_COMMUNICATE_HEADER;

*HeaderGuid*  
Allows for disambiguation of the message format. Type **EFI_GUID** is defined in `InstallProtocolInterface()`.

*MessageLength*  
Describes the size of **Data** (in bytes) and does not include the size of the header.

*Data*  
Designates an array of bytes that is **MessageLength** in size.
Appendix P - Hardware Error Record Persistence Usage

The OS determines if a platform implements support for Hardware Error Record Persistence by reading the HwErrRecSupport globally defined variable. If the attempt to read this variable returns EFI_NOT_FOUND (14), then the OS will infer that the platform does not implement Hardware Error Record Persistence. If the attempt to read this variable succeeds, then the OS uses the returned value to determine whether the platform supports Hardware Error Record Persistence. A non-zero value indicates that the platform supports Hardware Error Record Persistence.

P.1 Determining space
To determine the amount of space (in bytes) guaranteed by the platform for saving hardware error records, the OS invokes QueryVariableInfo, setting the HR bit in the Attributes bitmask.

P.2 Saving Hardware error records
To save a hardware error record, the OS invokes SetVariable, supplying EFI_HARDWARE_ERROR_VARIABLE as the VendorGuid and setting the HR bit in the Attributes bitmask. The VariableName will be constructed by the OS by concatenating an index to the string “HwErrRec” (i.e., HwErrRec0001). The index portion of the variable name is determined by reading all of the hardware error record variables currently stored on the platform and choosing an appropriate index value based on the names of the existing variables. The platform saves the supplied Data. If insufficient space is present to store the record, the platform will return EFI_OUT_OF_RESOURCES, in which case, the OS may clear an existing record and retry. A retry attempt may continue to fail with status EFI_OUT_OF_RESOURCES if a reboot is required to coalesce resources after deletion. The OS may only save error records after ExitBootServices is called. Firmware may also use the Hardware Error Record Persistence interface to write error records, but it may only do so before ExitBootServices is called. If firmware uses this interface to write an error record, it must use the VariableName format used by the OS as described above and the error records it creates must contain the firmware’s CreatorId. Firmware may overwrite error records whose CreatorId matches the firmware’s CreatorId. Firmware may overwrite error records that have been cleared by other components.

During OS initialization, the OS discovers the names of all persisted error record variables by enumerating the current variable names using GetNextVariableName. Having identified the names of all error record variables, the OS will then read and process all of the error records from the store. After the OS processes an error record, it clears the variable if it was the creator of the variable (determined by checking the CreatorId field of the error record).

P.3 Clearing error record variables
To clear error record variables, the OS invokes SetVariable, supplying EFI_HARDWARE_ERROR_VARIABLE as the VendorGuid and setting the HR bit in the Attributes bitmask. The supplied DataSize, and Data parameters will all be set to zero to indicate that the variable is to be cleared. The supplied VariableName identifies which error record variable is to be cleared. The OS may only clear error records after ExitBootServices has been called. The OS itself may only clear error records which it created (e.g. error records whose CreatorId matches that of the OS). However, a management application running on the OS
may clear error records created by other components. This enables error records created by firmware or other OSes to be cleared by the currently running OS.

Q.2 Prerequisite Specifications

In general, this specification requires that functionality defined in a number of other existing specifications be present on a system that implements this specification. This specification requires that those specifications be implemented at least to the extent that all the required elements are present.

This specification prescribes the use and extension of previously established industry specification tables whenever possible. The trend to remove runtime call-based interfaces is well documented. The ACPI (Advanced Configuration and Power Interface) specification is an example of new and innovative firmware technologies that were designed on the premise that OS developers prefer to minimize runtime calls into firmware. ACPI focuses on no runtime calls to the BIOS.

Q.2.1 ACPI Specification

The interface defined by the Advanced Configuration and Power Interface (ACPI) Specification is the primary OS runtime interface for IA-32, x64 and Itanium platforms. ACPI fully defines the methodology that allows the OS to discover and configure all platform resources. ACPI allows the description of non-Plug and Play motherboard devices in a plug and play manner. ACPI also is capable of describing power management and hot plug events to the OS. (For more information on ACPI, see “Links to UEFI-Related Documents” (http://uefi.org/uefi) under the heading "ACPI"; see also http://uefi.org/acpi).

Q.2.2 Additional Considerations for Itanium-Based Platforms

Any information or service that is available in Itanium architecture firmware specifications supercedes any requirement in the common supported 32-bit and Itanium architecture specifications listed above. The Itanium architecture firmware specifications (currently the Itanium® System Abstraction Layer Specification and portions of the Intel® Itanium® Architecture Software Developer’s Manual, volumes 1–3) define the baseline functionality required for all Itanium architecture platforms. The major addition that UEFI makes to these Itanium architecture firmware specifications is that it defines a boot infrastructure and a set of services that constitute a common platform definition for high-volume Itanium architecture–based systems to implement based on the more generalized Itanium architecture firmware specifications.

The following specifications are the required Intel Itanium architecture specifications for all Itanium architecture–based platforms:

Appendix R - Glossary

_ADR
A reserved name in ACPI name space. It refers to an address on a bus that has standard enumeration. An example would be PCI, where the enumeration method is described in the PCI Local Bus specification.

_CRS
A reserved name in ACPI name space. It refers to the current resource setting of a device. A _CRS is required for devices that are not enumerated in a standard fashion. _CRS is how ACPI converts nonstandard devices into Plug and Play devices.

_HID
A reserved name in ACPI name space. It represents a device’s plug and play hardware ID and is stored as a 32-bit compressed EISA ID. _HID objects are optional in ACPI. However, a _HID object must be used to describe any device that will be enumerated by the ACPI driver in the OS. This is how ACPI deals with non–Plug and Play devices.

_UID
A reserved name in ACPI name space. It is a serial number style ID that does not change across reboots. If a system contains more than one device that reports the same _HID, each device must have a unique _UID. The _UID only needs to be unique for device that have the exact same _HID value.

ACPI Device Path
A Device Path that is used to describe devices whose enumeration is not described in an industry-standard fashion. These devices must be described using ACPI AML in the ACPI name space; this type of node provides linkage to the ACPI name space.

ACPI
Refers to the Advanced Configuration and Power Interface Specification and to the concepts and technology it discusses. The specification defines a new interface to the system board that enables the operating system to implement operating system-directed power management and system configuration.

Alt-GR Unicode
Represents the character code of a key when the Alt-GR modifier key is held down. This key (A2) in some keyboard layouts is defined as the right alternate key and serves the same function as the left alternate key. However, in many other layouts it is a secondary modifier key similar to shift. For instance, key C1 is equated to the letter a and its Unicode character code in the typical U.K. keyboard is a non-shifted character code of 0x0061. When holding down the Alt-GR key in conjunction with the pressing of key C1, , the value on the same keyboard often produces an á, which is a character code 0x00E1.
**Base Code (BC)**

The PXE Base Code, included as a core protocol in EFI, is comprised of a simple network stack (UDP/IP) and a few common network protocols (DHCP, Bootserver Discovery, TFTP) that are useful for remote booting machines.

**BC**

See Base Code (BC)

**Big Endian**

A memory architecture in which the low-order byte of a multibyte datum is at the highest address, while the high-order byte is at the lowest address. See Little Endian.

**BIOS Boot Specification Device Path**

A Device Path that is used to point to boot legacy operating systems; it is based on the BIOS Boot Specification, Version 1.01.

**BIOS Parameter Block (BPB)**

The first block (sector) of a partition. It defines the type and location of the FAT File System on a drive.

**BIOS**

**Block I/O Protocol**

A protocol that is used during boot services to abstract mass storage devices. It allows boot services code to perform block I/O without knowing the type of a device or its controller.

**Block Size**

The fundamental allocation unit for devices that support the Block I/O Protocol. Not less than 512 bytes. This is commonly referred to as sector size on hard disk drives.

**Boot Device**

The Device Handle that corresponds to the device from which the currently executing image was loaded.

**Boot Manager**

The part of the firmware implementation that is responsible for implementing system boot policy. Although a particular boot manager implementation is not specified in this document, such code is generally expected to be able to enumerate and handle transfers of control to the available OS loaders as well as UEFI applications and drivers on a given system. The boot manager would typically be responsible for interacting with the system user, where applicable, to determine what to load during system startup. In cases where user interaction is not indicated, the boot manager would determine what to load and, if multiple items are to be loaded, what the sequencing of such loads would be.
**Block Size**

The fundamental allocation unit for devices that support the Block I/O Protocol. Not less than 512 bytes. This is commonly referred to as sector size on disk drives.

**Boot Services Table**

A table that contains the firmware entry points for accessing boot services functions such as [Task Priority Services](#) and [Memory Allocation Services](#). The table is accessed through a pointer in the [System Table](#).

**Boot Services Time**

The period of time between platform initialization and the call to `ExitBootServices()`. During this time, [UEFI Driver](#) and applications are loaded iteratively and the system boots from an ordered list of EFI OS loaders.

**Boot Services**

The collection of interfaces and protocols that are present in the boot environment. The services minimally provide an OS loader with access to platform capabilities required to complete OS boot. Services are also available to drivers and applications that need access to platform capability. Boot services are terminated once the operating system takes control of the platform.

**BPB**

See [BIOS Parameter Block (BPB)](#).

**BTT**

Block Translation Table: A software mechanism for adding single block write atomicity to any Block Mode ranges or byte-addressable Persistent Memory ranges.

**Callback**

Target function which augments the Forms Processor’s ability to evaluate or process configuration settings. Callbacks are not available when the Forms Processor is operating in a Disconnected state.

**CIM**

See [Common Information Model (CIM)](#).

**Cluster**

A collection of disk sectors. Clusters are the basic storage units for disk files. See [File Allocation Table (FAT)](#).

**COFF**

Common Object File Format, a standard file format for binary images.

**Coherency Domain**

1. The global set of resources that is visible to at least one processor in a platform.
2. The address resources of a system as seen by a processor. It consists of both system memory and I/O space.
Common Information Model (CIM)
An object-oriented schema defined by the DMTF. CIM is an information model that provides a common way to describe and share management information enterprise-wide.

Console I/O Protocol
A protocol that is used during Boot Services to handle input and output of text-based information intended for the system administrator. It has two parts, a Simple Input Protocol that is used to obtain input from the ConsoleIn device and a Simple Text Output Protocol that is used to control text-based output devices. The Console I/O Protocol is also known as the EFI Console I/O Protocol.

ConsoleIn
The device handle that corresponds to the device used for user input in the boot services environment. Typically the system keyboard.

ConsoleOut
The device handle that corresponds to the device used to display messages to the user from the boot services environment. Typically a display screen.

DBCS
Double Byte Character Set.

Desktop Management Interface (DMI)
A platform management information framework, built by the DMTF and designed to provide manageability for desktop and server computing platforms by providing an interface that is:
1) independent of any specific desktop operating system, network operating system, network protocol, management protocol, processor, or hardware platform;
2) easy for vendors to implement; and
3) easily mapped to higher-level protocols.

DMTF (formerly Desktop Management Task Force)
The DMTF is a standards organization comprised of companies from all areas of the computer industry. DMTF creates open manageability standards spanning diverse emerging and traditional IT infrastructures including cloud, virtualization, network, servers and storage.

Device Handle
A handle points to a list of one or more protocols that can respond to requests for services for a given device referred to by the handle.

Device I/O Protocol
A protocol that is used during boot services to access memory and I/O. Also called the EFI Device I/O Protocol.

Device Path Instance
When an environment variable represents multiple devices, it is possible for a device path to contain multiple device paths. An example of this would be the ConsoleOut.
environment variable that consists of both a VGA console and a serial output console. This environment variable would describe a console output stream that would send output to both devices and therefore has a Device Path that consists of two complete device paths. Each of these paths is a device path instance.

**Device Path Node**
A variable-length generic data structure that is used to build a device path. Nodes are distinguished by type, subtype, length, and path-specific data. See [Device Path](#).

**Device Path Protocol**
A protocol that is used during boot services to provide the information needed to construct and manage Device Paths. Also called the EFI Device Path Protocol.

**Device Path**
A variable-length binary data structure that is composed of variable-length generic device path nodes and is used to define the programmatic path to a logical or physical device. There are six major types of device paths: [Hardware Device Path](#), [ACPI Device Path](#), [Messaging Device Path](#), [Media Device Path](#), [BIOS Boot Specification Device Path](#), and [End of Hardware Device Path](#).

**DHCP**
See [Dynamic Host Configuration Protocol (DHCP)](#).

**Disconnected**
The state when a Forms Processor is manipulating a form set without being connected to the Target’s pre-OS environment. For example, after booting an OS, a Forms Processor cannot execute call-backs or read the configuration settings. For example, when running a Forms Browser while on a remote machine that is not connected to the Target. In these cases, the Forms Processor has limited knowledge of the Target’s current configuration settings and limited or no ability to use call-backs.

**Disk I/O Protocol**
A protocol that is used during boot services to abstract Block I/O devices to allow non-block-sized I/O operations. Also called the EFI Disk I/O Protocol.

**DMI**
See [DBCS](#).

**DMTF**
See [DMTF (formerly Desktop Management Task Force)](#).

**DNS**
Domain Name System. A protocol used manipulating and translating hostname and IP address

**DTLS**
Datagram Transport Layer Security. A protocol to provide communication privacy above UDP.
**Dynamic Host Configuration Protocol (DHCP)**
A protocol that is used to get information from a configuration server. DHCP is defined by the DMTF (formerly Desktop Management Task Force), not EFI.

**EAP**

**EBC Image**
Executable EBC image following the PE32 file format.

**EBC**
See EFI Byte Code (EBC).

**EFI**
Extensible Firmware Interface. An interface between the operating system (OS) and the platform firmware.

**EFI Byte Code (EBC)**
The binary encoding of instructions as output by the EBC C compiler and linker. The EBC Image is executed by the interpreter.

**EFI File**
A container consisting of a number of blocks that holds an image or a data file within a file system that complies with this specification.

**EFI Hard Disk**
A hard disk that supports the new EFI partitioning scheme (GUID Partition).

**EFI-compliant**
Refers to a platform that complies with this specification.

**EFI-conformant**
See EFI-compliant.

**End of Hardware Device Path**
A Device Path which, depending on the subtype, is used to indicate the end of the Device Path instance or Device Path structure.

**Enhanced Mode (EM)**
The 64-bit architecture extension that makes up part of the Intel® Itanium® architecture.

**Event Services**
The set of functions used to manage events. Includes EFI_BOOT_SERVICES.CheckEvent(), EFI_BOOT_SERVICES.CreateEvent(), EFI_BOOT_SERVICES.CloseEvent(), EFI_BOOT_SERVICES.SignalEvent(), and EFI_BOOT_SERVICES.WaitForEvent().
Event
An EFI data structure that describes an “event”—for example, the expiration of a timer.

Event Services
The set of functions used to manage events. Includes EFI_BOOT_SERVICES.CheckEvent(), EFI_BOOT_SERVICES.CreateEvent(), EFI_BOOT_SERVICES.CloseEvent(), EFI_BOOT_SERVICES.SignalEvent(), and EFI_BOOT_SERVICES.WaitForEvent().

FAT File System
The file system on which the EFI File system is based. See File Allocation Table (FAT) and GUID Partition Table (GPT).

FAT
See File Allocation Table (FAT).

File Allocation Table (FAT)
A table that is used to identify the clusters that make up a disk file. File allocation tables come in three flavors: FAT12, which uses 12 bits for cluster numbers; FAT16, which uses 16 bits; and FAT32, which allots 32 bits but only uses 28 (the other 4 bits are reserved for future use).

File Handle Protocol
A component of the File System Protocol. It provides access to a file or directory. Also called the EFI File Handle Protocol.

File System Protocol
A protocol that is used during boot services to obtain file-based access to a device. It has two parts, a Simple File System Protocol that provides a minimal interface for file-type access to a device, and a File Handle Protocol that provides access to a file or directory.

Firmware
Any software that is included in read-only memory (ROM).

Font
A graphical representation corresponding to a character set, in this case Unicode. The following are the same Latin letter in three fonts using the same size (14):

A
A
A

Font glyph
The individual elements of a font corresponding to single characters are called font glyphs or simply glyphs. The first character in each of the above three lines is a glyph for the letter "A" in three different fonts.
Form
Logical grouping of questions with a unique identifier.

Form Set
An HII database package describing a group of forms, including one parent form and zero or more child forms.

Forms Browser
A Forms Processor capable of displaying the user-interface information a display and interacting with a user.

Forms Processor
An application capable of reading and processing the forms data within a forms set.

Globally Unique Identifier (GUID)
A 128-bit value used to differentiate services and structures in the boot services environment. The format of a GUID is defined in Appendix A. See Protocol.

Glyph
The individual elements of a font corresponding to single characters. May also be called font keyboard layout glyphs. Also see font glyph above.

GPT: See GUID Partition Table (GPT).

GPT disk layout:
The data layout on a disk consisting of a protective MBR in LBA 0, a GPT Header in LBA 1, and additional GPT structures and partitions in the remaining LBAs. See chapter 5.

GPTHeader
The header in a GUID Partition Table (GPT). Among other things, it contains the number of GPT Partition Entries and the first and last LBAs that can be used for the entries.

GPT Partition Entry
A data structure that characterizes a Partition in the GPT disk layout. Among other things, it specifies the starting and ending LBA of the partition.

GUID Partition Table (GPT)
A data structure that describes one or more partitions. It consists of a GPTHeader and, typically, at least one GPTPartition Entry. There are two GUID partition tables: the Primary Partition Table (located in LBA 1 of the disk) and a Backup Partition Table (located in the last LBA of the disk). The Backup Partition Table is a copy of the Primary Partition Table.

GPTPartition Entry
A data structure that characterizes a GUID Partition. Among other things, it specifies the starting and ending LBA of the partition.
GUID Partition
A contiguous group of sectors on an EFI Hard Disk.

Handle
See Device Handle.

Hardware Device Path
A Device Path that defines how a hardware device is attached to the resource domain of a system (the resource domain is simply the shared memory, memory mapped I/O, and I/O space of the system).

HII
Human Interface Infrastructure.

HII Database
The centralized repository for HII-related information, organized as package lists.

HTML
Hypertext Markup Language. A particular implementation of SGML focused on hypertext applications. HTML is a fairly simple language that enables the description of pages (generally Internet pages) that include links to other pages and other data types (such as graphics). When applied to a larger world, HTML has many shortcomings, including localization (q.v.) and formatting issues. The HTML form concept is of particular interest to this application.

HTTP
Hypertext transfer protocol. HTTP functions as request-response protocol in the client-server computing rule.

IA-32
See Intel® Architecture-32 (IA-32).

IFR
Internal Form Representation. Used to represent forms in EFI so that it can be interpreted as is or expanded easily into XHTML.

Image Handle
A handle for a loaded image; image handles support the loaded image protocol.

Image Handoff State
The information handed off to a loaded image as it begins execution; it consists of the image’s handle and a pointer to the image’s system table.

Image Header
The initial set of bytes in a loaded image. They define the image’s encoding.

Image Services
The set of functions used to manage EFI images. Includes EFI_BOOT_SERVICES.LoadImage(), EFI_BOOT_SERVICES.StartImage(),
 EFI_BOOT_SERVICES.UnloadImage(), EFI_BOOT_SERVICES.Exit(),
EFI_BOOT_SERVICES.ExitBootServices(), and EFI_IMAGE_ENTRY_POINT.

**Image**

(1) An executable file stored in a file system that complies with this specification. Images may be drivers, applications or OS loaders. Also called an EFI Image.

(2) Executable binary file containing EBC and data. Output by the EBC linker.

**IME**

Input Method Editor. A program or subprogram that is used to map keystrokes to logographic characters. For example, IMEs are used (possibly with user intervention) to map the Kana (Hirigana or Katakana) characters on Japanese keyboards to Kanji.

**Intel® Architecture-32 (IA-32)**

**Intel® Itanium® Architecture**

The Intel architecture that has 64-bit instruction capabilities, new performance-enhancing features, and support for the IA-32 instruction set. This architecture is described in the *Itanium™ Architecture Software Developer’s Manual*.

**Internationalization**

In this context, is the process of making a system usable across languages and cultures by using universally understood symbols. Internationalization is difficult due to the differences in cultures and the difficulty of creating obvious symbols; for example, why does a red octagon mean "Stop"?

**Interpreter**

The software implementation that decodes EBC binary instructions and executes them on a VM. Also called EBC interpreter.

**Keyboard layout**

The physical representation of a user’s keyboard. The usage of this is in conjunction to a structure that equates the physical key(s) and the associated action it represents. For instance, key C1 is equated to the letter a and its Unicode value in the typical U.K. keyboard is a non-shifted value of 0x0061.

**LAN On Motherboard (LOM)**

This is a network device that is built onto the motherboard (or baseboard) of the machine.

**LBA:**

See Logical Block Address (LBA).
**Legacy Platform**
A platform which, in the interests of providing backward-compatibility, retains obsolete technology.

**LFN**
See Long File Names (LFN).

**Little Endian**
A memory architecture in which the low-order byte of a multibyte datum is at the lowest address, while the high-order byte is at the highest address. See Big Endian.

**Load File Protocol**
A protocol that is used during boot services to find and load other modules of code.

**Loaded Image Protocol**
A protocol that is used during boot services to obtain information about a loaded image. Also called the EFI Loaded Image Protocol.

**Loaded Image**
A file containing executable code. When started, a loaded image is given its image handle and can use it to obtain relevant image data.

**Localization**
The process of focusing a system in so that it works using the symbols of a language/culture. To a major extent the following design is influenced by the requirements of localization.

**Logical Block Address (LBA):**
The address of a logical block on a disk. The first LBA on a disk is LBA 0.

**Logographic**
A character set that uses characters to represent words or parts of words rather than syllables or sounds. Kanji is logographic but Kana characters are not.

**LOM**
See LAN On Motherboard (LOM).

**Long File Names (LFN)**
Refers to an extension to the FAT File System that allows file names to be longer than the original standard (eight characters plus a three-character extension).

**Machine Check Abort (MCA)**
The system management and error correction facilities built into the Intel Itanium processors.

**Master Boot Record (MBR)**
The data structure that resides on the LBA 0 of a hard disk and defines the partitions on the disk.
MBR

See Master Boot Record (MBR).

MBR boot code:

x86 code in the first LBA of a disk.

MBR disk layout:

The data layout on a disk consisting of an MBR in LBA 0 and partitions described by the MBR in the remaining LBAs. See chapter 5 and Appendix NEW.

MBR Partition Record

A data structure that characterizes a Partition in the MBR disk layout.

MCA

See Machine Check Abort (MCA).

Media Device Path

A Device Path that is used to describe the portion of a medium that is being abstracted by a boot service. For example, a Media Device Path could define which partition on a hard drive was being used.

Memory Allocation Services

The set of functions used to allocate and free memory, and to retrieve the memory map. Includes `EFI_BOOT_SERVICES.AllocatePages()`, `EFI_BOOT_SERVICES.FreePages()`, `EFI_BOOT_SERVICES.AllocatePool()`, `EFI_BOOT_SERVICES.FreePool()`, and `EFI_BOOT_SERVICES.GetMemoryMap()`.

Memory Map

A collection of structures that defines the layout and allocation of system memory during the boot process. Drivers and applications that run during the boot process prior to OS control may require memory. The boot services implementation is required to ensure that an appropriate representation of available and allocated memory is communicated to the OS as part of the hand-off of control.

Memory Type

One of the memory types defined by UEFI for use by the firmware and UEFI applications. Among others, there are types for boot services code, boot services data, Runtime Services code, and runtime services data. Some of the types are used for one purpose before `EFI_BOOT_SERVICES.ExitBootServices()` is called and another purpose after.

Messaging Device Path

A Device Path that is used to describe the connection of devices outside the Coherency Domain of the system. This type of node can describe physical messaging information (e.g., a SCSI ID) or abstract information (e.g., networking protocol IP addresses).
Miscellaneous Service

Various functions that are needed to support the EFI environment. Includes EFI_BOOT_SERVICES.InstallConfigurationTable(), ResetSystem(), EFI_BOOT_SERVICES.Stall(), EFI_BOOT_SERVICES.SetWatchdogTimer(), EFI_BOOT_SERVICES.GetNextMonotonicCount(), and EFI_BOOT_SERVICES.GetNextHighMonotonicCount().

MTFTP

See Multicast Trivial File Transfer Protocol (MTFTP).

Multicast Trivial File Transfer Protocol (MTFTP)

A protocol used to download a Network Boot Program to many clients simultaneously from a TFTP server.

Name Space or Namespace

A namespace defines a contiguously-addressed range of Non-Volatile Memory conceptually similar to a SCSI Logical Unit (LUN) or a NVM Express namespace. In general, a collection of device paths; in an EFI Device Path.

Native Code

Low level instructions that are native to the host processor. As such, the processor executes them directly with no overhead of interpretation. Contrast this with EBC, which must be interpreted by native code to operate on a VM.

NBP

See Network Bootstrap Program (NBP) or Network Boot Program.

Network Boot Program

A remote boot image downloaded by a PXE client using the Trivial File Transport Protocol (TFTP) or the Multicast Trivial File Transfer Protocol (MTFTP). See Network Bootstrap Program (NBP).

Network Bootstrap Program (NBP)

This is the first program that is downloaded into a machine that has selected a PXE capable device for remote boot services.

A typical NBP examines the machine it is running on to try to determine if the machine is capable of running the next layer (OS or application). If the machine is not capable of running the next layer, control is returned to the EFI boot manager and the next boot device is selected. If the machine is capable, the next layer is downloaded and control can then be passed to the downloaded program.

Though most NBPs are OS loaders, NBPs can be written to be standalone applications such as diagnostics, backup/restore, remote management agents, browsers, etc.

Network Interface Card (NIC)

Technically, this is a network device that is inserted into a bus on the motherboard or in an expansion board. For the purposes of this document, the term NIC will be used
in a generic sense, meaning any device that enables a network connection (including LOMs and network devices on external buses (USB, 1394, etc.)).

**NIC**

See [Network Interface Card (NIC)](#).

**Non-spacing key**

Typically an accent key that does not advance the cursor and is used to create special characters similar to ÄäÊê. This function is provided only on certain keyboard layouts.

**NV**

Nonvolatile.

**Package**

HII information with a unique type, such as strings, fonts, images or forms.

**Package List**

Group of packages identified by a GUID.

**Page Memory**

A set of contiguous pages. Page memory is allocated by `EFI_BOOT_SERVICES.AllocatePages()` and returned by ` EFI_BOOT_SERVICES.FreePages()`.

**Partition Discovery**

The process of scanning a block device to determine whether it contains a Partition.

**Partition**

A contiguous set of LBAs on a disk, described by the MBR and/or GPT disk layouts.

**PC-AT**

Refers to a PC platform that uses the AT form factor for their motherboards.

**PCI Bus Driver**

Software that creates a handle for every PCI Controller on a PCI Host Bus Controller and installs both the PCI I/O Protocol and the Device Path Protocol onto that handle. It may optionally perform PCI Enumeration if resources have not already been allocated to all the PCI Controllers on a PCI Host Bus Controller. It also loads and starts any UEFI drivers found in any PCI Option ROMs discovered during PCI Enumeration. If a driver is found in a PCI Option ROM, the PCI Bus Driver will also attach the Bus Specific Driver Override Protocol to the handle for the PCI Controller that is associated with the PCI Option ROM that the driver was loaded from.

**PCI Bus**

A collection of up to 32 physical PCI Devices that share the same physical PCI bus. All devices on a PCI Bus share the same PCI Configuration Space.
**PCI Configuration Space**

The configuration channel defined by PCI to configure **PCI Devices** into the resource domain of the system. Each PCI device must produce a standard set of registers in the form of a PCI Configuration Header, and can optionally produce device specific registers. The registers are addressed via Type 0 or Type 1 PCI Configuration Cycles as described by the **PCI Specification**. The PCI Configuration Space can be shared across multiple **PCI Buses**. On most **PC-AT** architecture systems and typical Intel® chipsets, the PCI Configuration Space is accessed via I/O ports 0xCF8 and 0xCFC. Many other implementations are possible.

**PCI Controller**

A hardware component that is discovered by a **PCI Bus Driver**, and is managed by a **PCI Device Driver, PCI Functions** and **PCI Controller** are used equivalently in this document.

**PCI Device Driver**

Software that manages one or more PCI Controllers of a specific type. A driver will use the **PCI I/O Protocol** to produce a device I/O abstraction in the form of another protocol (i.e., Block I/O, Simple Network, Simple Input, Simple Text Output, Serial I/O, Load File).

**PCI Devices**

A collection of up to 8 **PCI Functions** that share the same **PCI Configuration Space**. A PCI Device is physically connected to a **PCI Buses**.

**PCI Enumeration**

The process of assigning resources to all the PCI Controllers on a given **PCI Host Bus Controller**. This includes PCI Bus Number assignments, PCI Interrupt assignments, PCI I/O resource allocation, the PCI Memory resource allocation, the PCI Prefetchable Memory resource allocation, and miscellaneous PCI DMA settings.

**PCI Functions**

A controller that provides some type of I/O services. It consumes some combination of PCI I/O, PCI Memory, and PCI Prefetchable Memory regions, and up to 256 bytes of the **PCI Configuration Space**. The PCI Function is the basic unit of configuration for PCI.

**PCI Host Bus Controller**

A chipset component that produces PCI I/O, PCI Memory, and PCI Prefetchable Memory regions in a single Coherency Domain. A PCI Host Bus Controller is composed of one or more **PCI Root Bridges**.

**PCI I/O Protocol**

A software interface that provides access to PCI Memory, PCI I/O, and PCI Configuration spaces for a PCI Controller. It also provides an abstraction for PCI Bus Master DMA.
PCI Option ROM
A ROM device that is accessed through a PCI Controller, and is described in the PCI Controller’s Configuration Header. It may contain one or more PCI Device Drivers that are used to manage the PCI Controller.

PCI Root Bridge I/O Protocol
A software abstraction that provides access to the PCI I/O, PCI Memory, and PCI Prefetchable Memory regions in a single Coherency Domain.

PCI Root Bridge
A chipset component(s) that produces a physical PCI Local Bus.

PCI Segment
A collection of up to 256 PCI Buses that share the same PCI Configuration Space. PCI Segment is defined in the ACPI Specification as the _SEG object. The SAL_PCI_CONFIG_READ and SAL_PCI_CONFIG_WRITE procedures defined in chapter 9 of the SAL Specification define how to access the PCI Configuration Space in a system that supports multiple PCI Segments. If a system only supports a single PCI Segment the PCI Segment number is defined to be zero. The existence of PCI Segments enables the construction of systems with greater than 256 PCI buses.

Pool Memory
A set of contiguous bytes. A pool begins on, but need not end on, an “8-byte” boundary. Pool memory is allocated in pages—that is, firmware allocates enough contiguous pages to contain the number of bytes specified in the allocation request. Hence, a pool can be contained within a single page or extend across multiple pages. Pool memory is allocated by EFI_BOOT_SERVICES.AllocatePool() and returned by EFI_BOOT_SERVICES.FreePool().

Preboot Execution Environment (PXE)
A means by which agents can be loaded remotely onto systems to perform management tasks in the absence of a running OS. To enable the interoperability of clients and downloaded bootstrap programs, the client preboot code must provide a set of services for use by a downloaded bootstrap. It also must ensure certain aspects of the client state at the point in time when the bootstrap begins executing.

The complete PXE specification covers three areas; the client, the network and the server.

Client
• Makes network devices into bootable devices.
• Provides APIs for PXE protocol modules in EFI and for universal drivers in the OS.

Network
• Uses existing technology: DHCP, TFTP, etc.
• Adds “vendor-specific” tags to DHCP to define PXE-specific operation within DHCP.
- Adds multicast TFTP for high bandwidth remote boot applications.
- Defines Bootserver discovery based on DHCP packet format.

**Server**

- **Bootserver**: Responds to Bootserver discovery requests and serves up remote boot images.

- **proxyDHCP**: Used to ease the transition of PXE clients and servers into existing network infrastructure. proxyDHCP provides the additional DHCP information that is needed by PXE clients and Bootservers without making changes to existing DHCP servers.

- **MTFTP**: Adds multicast support to a TFTP server.

- **Plug-In Modules**: Example proxyDHCP and Bootservers provided in the PXE SDK (software development kit) have the ability to take plug-in modules (PIMs). These PIMs are used to change/enhance the capabilities of the proxyDHCP and Bootservers.

**Protocol Handler Services**

The set of functions used to manipulate handles, protocols, and protocol interfaces. Includes `EFI_BOOT_SERVICES.InstallProtocolInterface()`, `EFI_BOOT_SERVICES.UninstallProtocolInterface()`, `EFI_BOOT_SERVICES.ReinstallProtocolInterface()`, `EFI_BOOT_SERVICES.HandleProtocol()`, `EFI_BOOT_SERVICES.RegisterProtocolNotify()`, `EFI_BOOT_SERVICES.LocateHandle()`, and `EFI_BOOT_SERVICES.LocateDevicePath()`.

**Protocol Handler**

A function that responds to a call to a `HandleProtocol` request for a given handle. A protocol handler returns a protocol interface structure.

**Protocol Interface Structure**

The set of data definitions and functions used to access a particular type of device. For example, `BLOCK_IO` is a protocol that encompasses interfaces to read and write blocks from mass storage devices. See **Protocol**.

**Protocol Revision Number**

The revision number associated with a protocol. See **Protocol**.

**Protocol**

The information that defines how to access a certain type of device during boot services. A protocol consists of a **Globally Unique Identifier (GUID)**, a protocol revision number, and a protocol interface structure. The interface structure contains data definitions and a set of functions for accessing the device. A device can have multiple protocols. Each protocol is accessible through the device’s handle.
PXE Base Code Protocol
A protocol that is used to control PXE-compatible devices. It may be used by the firmware’s boot manager to support booting from remote locations. Also called the EFI PXE Base Code Protocol.

PXE
See Preboot Execution Environment (PXE).

Question
IFR which describes how a single configuration setting should be presented, stored, and validated.

Read-Only Memory (ROM)
When used with reference to the UNDI specification, ROM refers to a nonvolatile memory storage device on a NIC.

Reset
The action which forces question values to be reset to their defaults.

ROM
See Question.

Runtime Services Table
A table that contains the firmware entry points for accessing runtime services functions such as Time Services and Virtual Memory Services. The table is accessed through a pointer in the System Table.

Runtime Services
Interfaces that provide access to underlying platform specific hardware that may be useful during OS runtime, such as timers. These services are available during the boot process but also persist after the OS loader terminates boot services.

SAL
See System Abstraction Layer (SAL).

scan code
A value representing the location of a key on a keyboard. Scan codes may also encode make (key press) and break (key release) and auto-repeat information.

Serial Protocol
A Protocol that is used during boot services to abstract byte stream devices—that is, to communicate with character-based I/O devices.

SGML
shifted Unicode

Shifted Unicode represents the Unicode character code of a key when the shift modifier key is held down. For instance, key C1 is equated to the letter a and its Unicode character code in the typical U.K. keyboard is a non-shifted value of 0x0061. When the shift key is held down in conjunction with the pressing of key C1, however, the value on the same keyboard often produces an A, which is a the Unicode character code 0x0041.

Protocol that is used during boot services to abstract byte stream devices—that is, to communicate with character-based I/O devices.

Simple File System Protocol

A component of the File System Protocol. It provides a minimal interface for file-type access to a device.

Simple Input Protocol

A protocol that is used to obtain input from the ConsoleIn device. It is one of two protocols that make up the Console I/O Protocol.

Simple Network Protocol

A protocol that is used to provide a packet-level interface to a network adapter. Also called the EFI Simple Network Protocol.

Simple Text Output Protocol

A protocol that is used to control text-based output devices. It is one of two protocols that make up the Console I/O Protocol.

SKU

Stock keeping unit. An acronym commonly used to reference a “version” of a particular platform. An example might be “We have three different SKUs of this platform.”

SMBIOS

See System Management BIOS (SMBIOS).

SNIA

Storage Network Industry Association.(www.snia.org)

SNIA Common RAID Disk Data Format

SSL

Secure Sockets Layer. A security protocol that provides communications privacy over the Internet. It is predecessor to TLS.
**StandardError**

The device handle that corresponds to the device used to display error messages to the user from the boot services environment.

**Status Codes**

Success, error, and warning codes returned by boot services and runtime services functions.

**string**

A null-terminated array of 16-bit UCS-2 encoded Unicode characters. All strings in this specification are encoded using UCS-2 unless otherwise specified.

**Submit**

The action which forces modified question values to be written back to storage.

**System Abstraction Layer (SAL)**

Firmware that abstracts platform implementation differences, and provides the basic platform software interface to all higher level software.

**System Management BIOS (SMBIOS)**

A table-based interface that is required by the *Wired for Management Baseline Specification*. It is used to relate platform-specific management information to the OS or to an OS-based management agent.

**System Table**

Table that contains the standard input and output handles for a UEFI application, as well as pointers to the boot services and runtime services tables. It may also contain pointers to other standard tables such as the ACPI, SMBIOS, and SAL System tables. A loaded image receives a pointer to its system table when it begins execution. Also called the EFI System Table.

**Target**

The system being configured.

**Task Priority Level (TPL)**

The boot services environment exposes three task priority levels: “normal,” “callback,” and “notify.”

**Task Priority Services**

The set of functions used to manipulate task priority levels. Includes EFI_BOOT_SERVICES.RaiseTPL() and EFI_BOOT_SERVICES.RestoreTPL().

**TFTP**

See *Trivial File Transport Protocol (TFTP)*.

**Time Format**

The format for expressing time in an EFI-compliant platform. For more information, see Appendix A.
Time Services
The set of functions used to manage time. Includes `GetTime()`, `SetTime()`, `GetWakeupTime()`, and `SetWakeupTime()`.

Timer Services
The set of functions used to manipulate timers. Contains a single function, `EFI_BOOT_SERVICES.SetTimer()`.

TLS
Transport Layer Security. A protocol to provide privacy and data integrity between two communicating applications above TCP.

TPL
See Target.

Trivial File Transport Protocol (TFTP)
A protocol used to download a Network Boot Program from a TFTP server.

UEFI
Unified Extensible Firmware Interface. The interface between the operating system (OS) and the platform firmware defined by this specification.

UEFI Application
Modular code that may be loaded in the boot services environment to accomplish platform specific tasks within that environment. Examples of possible applications might include diagnostics or disaster recovery tools shipped with a platform that run outside the OS environment. UEFI applications may be loaded in accordance with policy implemented by the platform firmware to accomplish a specific task. Control is then returned from the UEFI application to the platform firmware.

UEFI Boot Service Driver
A UEFI driver that is loaded into boot services memory and stays resident until boot services terminate.

UEFI Driver
A module of code typically inserted into the firmware via protocol interfaces. Drivers may provide device support during the boot process or they may provide platform services. It is important not to confuse UEFI drivers with OS drivers that load to provide device support once the OS takes control of the platform.

UEFI OS Loader
A UEFI application that is the first piece of operating system code loaded by the firmware to initiate the OS boot process. This code is loaded at a fixed address and then executed. The OS takes control of the system prior to completing the OS boot process by calling the interface that terminates all boot services.

UEFI Runtime Services Driver
A UEFI driver that is loaded into runtime services memory and stays resident during runtime.
**Unaccepted Memory**

Some Virtual Machine platforms, such as AMD SEV-SNP, introduce the concept of memory acceptance, requiring memory to be accepted before it can be used by the guest. This protects against a class of attacks by the virtual machine platform.

**UNDI**

See [Universal Network Device Interface (UNDI)](#).

**Unicode Collation Protocol**

A protocol that is used during boot services to perform case-insensitive comparisons of strings.

**Unicode**

An industry standard internationalized character set used for human readable message display.

**Universal Network Device Interface (UNDI)**

UNDI is an architectural interface to NICs. Traditionally NICs have had custom interfaces and custom drivers (each NIC had a driver for each OS on each platform architecture). Two variations of UNDI are defined in this specification: H/W UNDI and S/W UNDI. H/W UNDI is an architectural hardware interface to a NIC. S/W UNDI is a software implementation of the H/W UNDI.

**Universal Serial Bus (USB)**

A bi-directional, isochronous, dynamically attachable serial interface for adding peripheral devices such as serial ports, parallel ports, and input devices on a single bus.

**URI**

Uniform resource identifier. URI is a string of characters used to identify a name of a resource.

**USB Bus Driver**

Software that enumerates and creates a handle for each newly attached USB Controller and installs both the USB I/O Protocol and the Device Path Protocol onto that handle, starts that device driver if applicable. For each newly detached USB Controller, the device driver is stopped, the USB I/O Protocol and the Device Path Protocol are uninstalled from the device handle, and the device handle is destroyed.

**USB Bus**

A collection of up to 127 physical USB Devices that share the same physical USB bus. All devices on a USB Bus share the bandwidth of the USB Bus.

**USB Controller**

A hardware component that is discovered by a USB Bus Driver, and is managed by a USB Device Driver. USB Interface and USB Controller are used equivalently in this document.
**USB Device Driver**
Software that manages one or more USB Controller of a specific type. A driver will use the USB I/O Protocol to produce a device I/O abstraction in the form of another protocol (i.e., Block I/O, Simple Network, Simple Input, Simple Text Output, Serial I/O, Load File).

**USB Device**
A USB peripheral that is physically attached to the USB Bus.

**USB Enumeration**
A periodical process to search the USB Bus to detect if there have been any USB Controller attached or detached. If an attach event is detected, then the USB Controllers device address is assigned, and a child handle is created. If a detach event is detected, then the child handle is destroyed.

**USB Host Controller**
Moves data between system memory and devices on the USB Bus by processing data structures and generating the USB transactions. For USB 1.1, there are currently two types of USB Host Controllers: UHCI and OHCI.

**USB Hub**
A special USB Device through which more USB devices can be attached to the USB Bus.

**USB I/O Protocol**
A software interface that provides services to manage a USB Controller, and services to move data between a USB Controller and system memory.

**USB Interface**
The USB Interface is the basic unit of a physical USB Device.

**USB**
See Universal Serial Bus (USB).

**Variable Services**
The set of functions used to manage variables. Includes GetVariable(), SetVariable(), and GetNextVariableName().

**Virtual Memory Services**
The set of functions used to manage virtual memory. Includes SetVirtualAddressMap() and ConvertPointer().

**VM**
The Virtual Machine, a pseudo processor implementation consisting of registers which are manipulated by the interpreter when executing EBC instructions.
Watchdog Time
An alarm timer that may be set to go off. This can be used to regain control in cases where a code path in the boot services environment fails to or is unable to return control by the expected path.

WfM
See Wired for Management (WfM).

Wired for Management (WfM)
Refers to the Wired for Management Baseline Specification. The Specification defines a baseline for system manageability issues; its intent is to help lower the cost of computer ownership.

x64
Processors that are compatible with instruction sets and operation modes as exemplified by the AMD64 or Intel® Extended Memory 64 Technology (Intel® EM64T) architecture.

XHTML
Extensible HTML. XHTML "will obey all of the grammar rules of XML (properly nested elements, quoted attributes, and so on), while conforming to the vocabulary of HTML (the elements and attributes that are available for use and their relationships to one another)." [PXML, pg., 153]. Although not completely defined, XHTML is basically the intersection of XML and HTML and does support forms.

XML
Extensible Markup Language. A subset of SGML. Addresses many of the problems with HTML but does not currently (1.0) support forms in any specified way.

Stall() 228
StandardError 448
StandardError, definition of 2422
Start 2236
Start() 368, 1021
Start(), PXE Base Code Protocol 1051
StartImage() 220
Station Address 2261
StationAddress() 1028
Statistics 2263
Statistics() 1029
Status Codes, definition of 2422
Stop 2243
Stop() 377, 1022
Stop(), PXE Base Code Protocol 1053
STORESP 960
StriColl() 905
StrLwr() 907
StrToFat() 909
StrUpf() 907
SUB 960
success codes 2194
Supported() 363
SyncInterruptTransfer() 793
System Abstraction Layer (SAL), definition of 2422
System Management BIOS (SMBIOS), definition of 2422
System Partition 504, 506
system partition 7
System Table, definition of 2422
System Table, EFI 91

T
table-based interfaces 7
Task Priority Level (TPL), definition of 2422

task priority levels
  general 144
  restrictions 145
  usage 144

Task Priority Services 144
  function list 144
  functions
    RestoreTPL() 162
    overview 144

terminology, definitions 2403

TestString() 454

TFTP error packet 1047

Time Format, definition of 2422

Time Services
  function list 257
  functions
    GetTime() 257
    GetWakeupTime() 262
    SetTime() 261
    SetWakeupTime() 263
    overview 257

Timer Services 144
  function list 144
  functions
    SetTimer() 160
    overview 144

TPL restrictions 145

TPL See task priority levels

TPL_APPLICATION level 144, 145

TPL_HIGH_LEVEL 145

TPL_NOTIFY level 145

Transmit 2276

Trivial() 1035

Trivial File Transport Protocol (TFTP), definition of 2423

U

UDP port filter operation 1066

UDP4 Service Binding Protocol
  GUID 1280, 1584, 1602

UdpRead() 1064

UdpWrite() 1062

UGA Draw Protocol
Functions
  Blt() 491
  SetMode() 490, 495
GUID 485
  protocol interface structure 485
UGA protocols 483
  _UID 296
  _UID, definition of 2403
UNDI C definitions 2209
UNDI CDB 2207
UNDI CDB field definitions 2207
UNDI command descriptor block 2207
UNDI command format 2206
UNDI commands 2231
  Fill Header 2272
  Get Config Info 2247
  Get Init Info 2244
  Get State 2234
  Get Status 2270
  Initialize 2250
  Interrupt Enables 2256
  issuing 2206
  linking & queuing 2233
  MCast IP To MAC 2266
  NvData 2267
  Receive 2279
  Receive Filters 2258
  Reset 2253
  Shutdown 2255
  Start 2236
  Station Address 2261
  Statistics 2263
  Stop 2243
  Transmit 2276
UNDI Specification
  Definitions 2197
  driver types 2201
  Referenced Specifications 2198
UNDI Specification, 32/64-Bit 2197
Unicode Collation Protocol 904
Functions
  FatToStr() 908
  MetaiMatch() 906
StriColl() 905
StrLwr() 907
StrToFat() 909
StrUpr() 907
GUID 904
Interface Structure 904
Unicode control characters, supported 436
UNICODE DRAWING CHARACTERS 452
Unicode, definition of 2424
UninstallMultipleProtocolInterfaces() 215
UninstallProtocolInterface() 182
Universal Graphics Adapter protocols 483
Universal Network Device Interface (UNDI), definition of 2424
Universal Serial Bus (USB), definition of 2424
Unload() 289
UnloadImage() 221, 966
Unmap() 671, 713
Update Capsule 271
UpdateBootObjectAuthorization() 1096
   Manifest Syntax 1097
UpdateCapsule() 271
USB Bus Driver 807
   Bus Enumeration 808
   Driver Binding Protocol 807
   Entry Point 807
   Hot-Plug Event 807
USB Bus Driver, definition of 2424
USB Bus, definition of 2424
USB Controller, definition of 2424
USB Device Driver 808
   Driver Binding Protocol 808
   Entry Point 808
USB Device Driver, definition of 2425
USB Device, definition of 2425
USB Driver Model 806
USB Enumeration, definition of 2425
USB Host Controller Protocol 778
   GUID 778
   Interface Structure 778
USB host controller protocol 778
USB Host Controller, definition of 2425
USB hub port change status bitmap 801
USB hub port status bitmap 800
USB Hub, definition of 2425
USB I/O Protocol functions
  UsbAsyncInterruptTransfer () 814
  UsbAsyncIsochronousTransfer () 820
  UsbBulkTransfer () 813
  UsbControlTransfer() 811
  UsbGetConfigDescriptor () 823
  UsbGetDeviceDescriptor () 822
  UsbGetEndpointDescriptor() 826
  UsbGetInterfaceDescriptor () 825
  UsbGetStringDescriptor() 828
  UsbGetSupportedLanguages() 829
  UsbIsochronousTransfer () 819
  UsbPortReset() 830
  UsbSyncInterruptTransfer () 818
USB I/O protocol 809
  GUID 809
    Interface Structure 809
USB Interface, definition of 2425
USB port feature 803
USB transfer result error codes 812
UsbAsyncInterruptTransfer() 814
UsbAsyncIsochronousTransfer () 820
UsbBulkTransfer() 813
UsbControlTransfer() 811
UsbGetConfigDescriptor() 823
UsbGetDeviceDescriptor () 822
UsbGetEndpointDescriptor() 826
UsbGetInterfaceDescriptor () 825
UsbGetStringDescriptor() 828
UsbGetSupportedLanguages() 829
UsbIsochronousTransfer () 819
UsbPortReset() 830
UsbSyncInterruptTransfer () 818

V
Variable Attributes 237
Variable Services
  function list 236
  functions
    GetNextVariableName() 239
    GetVariable() 236
SetVariable() 241
overview 236
variables
